LogiCole is the technical refresh of the Defense Medical Logistics Standard Support business processes in an intuitive user experience with the power of authoritative data.

LogiCole provides a range of capabilities including trusted product data, health care facilities management, shelf-life extension management, and capital equipment request and approval management. LogiCole, which supports both the Defense Health Agency and the Department of Veterans Affairs, leverages its interoperability with the Federal Electronic Health Record to effectively manage medical supply and device product catalogs. This compatibility facilitates supply replenishment and supports patient safety recall processes by associating items and equipment with patient records.

Upon reaching full operating capability in August 2027, LogiCole will roll all legacy medical logistics applications into a single, web-based application and provide an enterprise view of all logistics lines of business.

Key Features

- Replaces capabilities in legacy MEDLOG IT applications
- Integrates with electronic health record
- Enables compliance with federal regulations and industry standards
- Facilitates enterprise management of all MEDLOG lines of business

Key Benefits

- Provides an intuitive user interface via a single, web-enabled login
- Leverages authoritative product and sourcing data
- Fully integrates federal and industry partners, including the Defense Logistics Agency

This program is managed by the **Solution Delivery Division** Medical Logistics Information Technology Program Management Office.
