Adalimumab (Humira)	• Reducing signs and symptoms and inhibiting the progression of structural damage in adult patients with moderately to severely active rheumatoid arthritis who have had an inadequate response to one or more DMARDs.	• Coverage provided for the treatment of moderately to severely active rheumatoid arthritis in patients 18 years of age or older when the patient has had an inadequate response to at least one disease-modifying antirheumatic drug (DMARD). • Coverage NOT provided for concomitant use with anakinra (Kineret), etanercept (Enbrel), or infliximab (Remicade).
Anakinra (Kineret)	• Reduction in signs and symptoms of moderately to severely active rheumatoid arthritis, in patients 18 years of age or older who have failed 1 or more disease modifying antirheumatic drugs (DMARDs).	• Coverage provided for the treatment of moderately to severely active rheumatoid arthritis in patients 18 years of age or older when the patient has had an inadequate response to at least one disease-modifying antirheumatic drug (DMARD). • Coverage NOT provided for concomitant use with adalimumab (Humira), etanercept (Enbrel) or infliximab (Remicade). *Changes to previous criteria:* • Listing adalimumab, etanercept, and infliximab as DMARDs. • Adding adalimumab to the statement: "Coverage NOT provided for concomitant use with etanercept (Enbrel) or infliximab (Remicade)." • Making criteria more consistent with package labeling and with criteria for adalimumab by changing the previous requirement that the patient fail (or be unable to take) MTX AND fail at least one other DMARD.
Etanercept (Enbrel)	• Reducing signs and symptoms and inhibiting the progression of structural damage in patients with moderately to severely active rheumatoid arthritis. • Reducing signs and symptoms of moderately to severely active polyarticular-course juvenile rheumatoid arthritis in patients who have had an inadequate response to one or more DMARDs. • Reducing signs and symptoms of active arthritis in patients with psoriatic arthritis.	• Coverage provided for the treatment of moderately to severely active rheumatoid arthritis OR active psoriatic arthritis. • Coverage provided for the treatment of juvenile rheumatoid arthritis when the patient has an inadequate response to at least one disease-modifying antirheumatic drug (DMARD). • Coverage NOT provided for concomitant use with adalimumab (Humira), anakinra (Kineret), or infliximab (Remicade). *Changes to previous criteria:* • Listing adalimumab, anakinra, and infliximab as DMARDs. • Adding the provision that coverage is not provided for concomitant use with adalimumab, anakinra, or infliximab.

For all three prior authorizations:

The following are examples of DMARDs:

- o adalimumab
- o anakinra
- o etanercept
- o infliximab
- o azathioprine
- o hydroxychloroquine
- o gold compounds, oral/injectable (e.g., auranofin, aurothioglucose, gold sodium thiomalate)
- o leflunomide
- o methotrexate
- o d-penicillamine
- o sulfasalazine

Fort Sam Houston, TX 78234-5081

MCCS-GPE **5 March 2003**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The DoD P&T Executive Council met from 0800 to 1600 hours on 5 March 2003 at the DoD Pharmacoeconomic Center, Fort Sam Houston, Texas.

2. VOTING MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL Joel Schmidt, MC	Army
COL Doreen Lounsbery, MC	Army
MAJ Travis Watson, MS	Army
COL John R. Downs, MC	Air Force
COL Mark Nadeau, MC (For COL Bill Sykora, MC)	Air Force
LtCol George Jones, BSC	Air Force
CAPT Matt Nutaitis, MC	Navy
CDR Mark Richerson, MSC	Navy
CAPT Robert Rist	Coast Guard
Mike Valentino	Department of Veterans Affairs

VOTING MEMBERS ABSENT

None	

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TMA
Howard Altschwager	Deputy General Counsel, TMA
CAPT Betsy Nolan, MSC	Navy Pharmacy Specialty Leader
COL Mike Heath, MS	Army Pharmacy Consultant Chair, DoD Pharmacy Board of Directors
MAJ John Howe, BSC	Defense Supply Center Philadelphia
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
CDR Denise Graham, MSC	DoD Pharmacoeconomic Center
CDR (sel) Ted Briski, MSC	DoD Pharmacoeconomic Center
LtCol Dave Bennett, BSC	DoD Pharmacoeconomic Center
LtCol Barb Roach, MC	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Dave Bretzke	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Kathy Tortorice	Department of Veterans Affairs, PBM
Capt Cherie-Anne Mauntel, BSC	USAF AFIT Student
CPT Tamba Dauda, MS	Pharmacy Resident, WHMC/BAMC
Capt Glenn L. Laird, BSC	Pharmacy Resident, WHMC/BAMC
Capt Agnes Kim, BSC	Pharmacy Resident, WHMC/BAMC
CPT Larry Ricks, MS	Pharmacy Resident, WHMC/BAMC

3. REVIEW MINUTES OF LAST MEETING

The minutes from the last meeting were accepted as written.

4. ADMINISTRATIVE ISSUES

A. *Membership and Meeting Frequency*: The Council discussed potential changes in its membership and the need to conduct additional Council meetings via teleconference in order to make timely decisions regarding joint VA/DoD pharmaceutical procurement strategies. The Council concluded that the charter that governs the DoD P&T Committee and Executive Council should be revised. COL Remund will develop an initial draft of a new charter.

The Council welcomed new members COL Doreen Lounsbery and CDR Mark Richerson, taking the place as voting members for COL Rosa Stith and CDR Kevin Cook, respectively.

B. *Clinical Reviews:* A Clinical Workgroup comprised of three members each from the VA PBM and the PEC are working to integrate and standardize the processes for completing clinical reviews of drug classes and drug monographs for new molecular entities.

C. *Rx NET:* RxNET is a web forum that the PEC established to facilitate communication among health care professionals involved in the delivery and management of drug therapy in the Military Health System. Dave Bretzke serves

as the administrator for RxNET. Council members are encouraged to use the forum that has been established for the DoD P&T Council within RxNET.

5. NATIONAL PHARMACEUTICAL CONTRACTS AND BLANKET PURCHASE AGREEMENT (BPA) AWARD, RENEWALS AND TERMINATIONS

A. New joint DoD/VA contracts were awarded for permethrin cream (West-ward), tretinoin topical cream (Allergan), and colchicine tablets (West-ward).

B. Joint DoD/VA contracts for erythromycin topical and clindamycin topical were not awarded because the bid prices were higher than existing FSS prices. The hydrochlorothiazide/triamterene joint contract was not awarded due to lack of offers.

C. New joint DoD/VA blanket purchase agreements were awarded for fluticasone (Flonase; Pharmacia), nisoldipine (Sular; 1st Horizon), tolterodine tartrate extended release capsules (Detrol LA; Pharmacia), lansoprazole (Prevacid; TAP), rabeprazole (Aciphex; Janssen), and levothyroxine (Synthroid; Abbott).

6. PROCUREMENT INITIATIVES

A. The following joint DoD/VA contracts are in various stages of solicitation: isosorbide dinitrate, ketoconazole cream, midazolam injectable, pamidronate injectable, and tramadol tablets.

B. A joint DoD/VA solicitation for a "triptan" closed 20 Dec 02, but the solicitation has been protested to the General Accounting Office (GAO).

C. A joint DoD/VA solicitation for bisphosphonates is being developed. A projected issue date is not yet identified.

D. A joint DoD/VA solicitation for angiotensin receptor blockers (ARBs) has been drafted and is currently being reviewed and edited.

E. A joint DoD/VA solicitation for a thiazolidinedione is being developed. A projected issue date is not yet identified.

F. Levothyroxine (Synthroid) – The price for the Synthroid brand of levothyroxine recently increased from $0.02 per tablet to $0.07 per tablet. In light of the price increase, the Council considered the possibility of a contracting action that would compete various levothyroxine products. Synthroid accounts for 97% of the levothyroxine market at MTF pharmacies. None of the levothyroxine tablets marketed by other companies are "A-rated" to Synthroid. A contracting action that caused patients to be switched from Synthroid to another levothyroxine product would result in therapeutic substitutions requiring additional laboratory tests to monitor thyroid levels. The Council unanimously voted not to pursue a contract for a single levothyroxine product on the BCF.

G. Statins – A joint DoD/VA solicitation for a high potency statin closed 28 February 2003. The solicitation permits (but does not mandate) the addition of generic lovastatin and/or a non-CYP3A4 metabolized statin (pravastatin or fluvastatin) to the BCF. Lovastatin, pravastatin and fluvastatin have not been on

any MTF formularies since the current closed class statin contract was awarded in August 1999.

1) Lovastatin accounts for less than 1% of statin usage at MTFs. Lovastatin costs $0.26 per tablet (joint VA/DoD contract price), so it does not offer any price advantage compared to the current contract prices for the strengths of simvastatin that achieve similar reductions in LDL-cholesterol. The future contract prices for a high potency statin are expected to be even lower. The Council voted to not add lovastatin to the BCF. Individual MTFs may add lovastatin to their local formularies if they determine there is a need to do so.

2) Pravastatin and fluvastatin together account for less than 1% of MTF statin usage. Pravastatin and fluvastatin prices are higher than the contract prices for the strengths of simvastatin that achieve similar reductions in LDL-cholesterol. Since pravastatin and fluvastatin do not offer an economic advantage, their use should be limited to patients who have a clinical need for a non-CYP3A4-metabolized statin. If pravastatin or fluvastatin were added to the BCF, MTFs would no longer be able to use the non-formulary request process to limit usage to patients who have a specific clinical need for these agents. The Council voted to not add a non-CYP3A4 metabolized statin to the BCF and also to not participate in any contracting initiative that would require addition of pravastatin or fluvastatin to the BCF. Individual MTFs may add either pravastatin or fluvastatin to their local formularies if they determine there is a need to do so.

H. LHRH Agonists – The Council voted to add goserelin acetate (Zoladex) 3.6 mg and 10.8 mg implants to the BCF for the treatment of prostate cancer based on a joint DoD/VA contract that was awarded to Astra Zeneca. The contract specifies that Zoladex is the sole LHRH agonist on the Basic Core Formulary (BCF) **for the treatment of prostate cancer**, and that other LHRH agonist dosage forms used for prostate cancer are not allowed on MTF formularies. MTFs are allowed to have additional LHRH agonist products on their formularies for the treatment of conditions other than prostate cancer. Detailed guidance regarding the Zoladex contract is on the PEC website at:

http://www.pec.ha.osd.mil/Contracts/LHRH_Agonist_Contract_Guidance.htm

I. Prostaglandins – The Council voted at the November 2002 meeting to add a prostaglandin to the BCF utilizing a closed class contracting strategy competing latanoprost, bimatoprost and travoprost, which would not require patients to be switched from one agent to another. The ophthalmology consultants for the three services subsequently expressed disagreement with the Council's decision. The consultants' concerns centered on (1) evidence from clinical trials and clinical experience that bimatoprost and travoprost have a higher incidence of hyperemia than latanoprost and (2) less certainty regarding the safety of bimatoprost and travoprost because they have been on the market for less time than latanoprost.

The Council reviewed safety and tolerability data from clinical trials of ophthalmic prostaglandins, data on adverse effects and discontinuation rates from a phase IV study of bimatoprost, VA and DoD usage data, and information about

a switch from latanoprost to bimatoprost by a Kaiser health plan. After a lengthy discussion the Council passed a motion (by an 8 to 3 vote) to reaffirm its decision to seek a contract for a single ophthalmic prostaglandin. Members voting in favor of the motion tended to agree with the argument that differences in the incidence of hyperemia were unlikely to lead to clinical problems of a magnitude that would make bimatoprost or travoprost an unacceptable choice as the sole ophthalmic prostaglandin on the BCF. Members voting in favor of the motion also acknowledged that the longer a drug is on the market the more we generally know about its safety profile, but they concluded that selection of any of the ophthalmic prostaglandins as the sole agent on the BCF would not pose an unacceptable safety risk.

J. Proton Pump Inhibitors (PPIs) – In December 2002 Janssen communicated that Eisai, the manufacturer of rabeprazole (Aciphex), had decided to raise the price of rabeprazole (Aciphex) to the DoD and VA from $0.22 per unit to $0.35 per unit on 1 January 2003, and then to approximately $1.90 per unit on 1 April 2003. The impending price increases caused DoD and the VA to negotiate vigorously with all manufacturers of branded PPIs. Three of the four current manufacturers of branded PPIs submitted proposals to the DoD and VA.

The Council voted unanimously to accept blanket purchase agreements offered by Eisai/Janssen for Aciphex and TAP Pharmaceuticals for lansoprazole (Prevacid). Aciphex will remain on the BCF, and Prevacid will be added to the BCF.

7. Place In Therapy (PIT) Recommendations – PIT recommendations are intended to aid practitioners in the appropriate use of selected medications. The Council reviewed and accepted the revised PIT recommendations for angiotensin II receptor blocker (ARBs). The ARB PIT recommendations will be disseminated to MTFs.

The PEC is developing PIT recommendations for topical immunomodulators (TIMS) and overactive bladder (OAB). The draft PIT recommendations will be disseminated to Council members through RxNET or email. Council members will have a 10-day period to review and comment. The PEC will then modify the PIT recommendations as necessary and disseminate them to MTFs.

8. FORMULARY DECISION FOLLOW-UP

A. *Evista* — Evista was added to the BCF in May 2002. The PEC analyzed prescription data from PDTS to determine the extent to which patients who obtained Evista from retail pharmacies before it was added to the BCF subsequently obtained Evista from MTF pharmacies. An analysis of 11,108 patients who obtained Evista from retail network pharmacies between 1 March 2002 and 1 June 2002 showed that:

- 864 patients (8%) subsequently obtained Evista from MTF pharmacies between 1 September 2002 and 6 December 2002
- 10,244 patients (92%) continued to obtain Evista only from retail network pharmacies between 1 September 2002 and 6 December 2002

The PEC repeated the analysis after dividing the 11,108 patients into two groups. Group 1 included 3,092 patients who obtained prescriptions for drugs other than Evista from MTF pharmacies between 1 March 2002 and 1 June 2002. Group 2 included 8,016 patients who obtained prescriptions for drugs other than Evista at retail network pharmacies only between 1 March 2002 and 1 June 2002. The analysis showed that:

- 693 (22%) of the patients in Group 1 obtained Evista from MTF pharmacies between 1 September 2002 and 6 December 2002
- 171 (2%) of the patients in Group 2 obtained Evista from MTF pharmacies between 1 September 2002 and 6 December 2002

B. *Advair* — Advair was added to the BCF February 2002. The PEC analyzed prescription data from PDTS to determine the extent to which patients who obtained Advair from retail pharmacies before it was added to the BCF subsequently obtained Advair from MTF pharmacies. An analysis of 9,853 patients who obtained Advair from retail network pharmacies between 1 December 2001 and 1 March 2002 showed that:

- 1,874 patients (19%) subsequently obtained Advair from MTF pharmacies between 1 June 2002 and 20 February 2003
- 7,979 patients (81%) continued to obtain Advair only from retail network pharmacies between 1 June 2002 and 20 February 2003

The PEC repeated the analysis after dividing the 9,853 patients into two groups. Group 1 included 2,838 patients who obtained prescriptions for drugs other than Advair from MTF pharmacies between 1 December 2001 and 1 March 2002. Group 2 included 7,015 patients who obtained prescriptions for drugs obtained at retail network pharmacies only between 1 December 2001 and 1 March 2002. The analysis showed that:

- 1,457 (51%) of the patients in Group 1 obtained Advair from MTF pharmacies between 1 June 2002 and 20 February 2003
- 417 (6%) of the patients in Group 2 obtained Advair from MTF pharmacies between 1 June 2002 and 20 February 2003

9. DRUG CLASS EVALUATIONS TO DETERMINE CLINICALLY ACCEPTABLE CONTRACTING/FORMULARY STRATEGIES:

A. *Cholinesterase Inhibitors* — Cholinesterase inhibitors are the primary treatment for cognitive symptoms and functional disability of Alzheimer's disease (AD). Four cholinesterase inhibitors are currently available in the United States: tacrine (Cognex), donepezil (Aricept), rivastigmine (Exelon), and galantamine (Reminyl). The VA plans to conduct a clinical review of the class to determine potential contracting opportunities. The BCF does not include a cholinesterase inhibitor. CDR Graham presented a brief overview of cholinesterase inhibitors to assist the Council in deciding whether or not a cholinesterase inhibitor should be added to the BCF.

Efficacy: Cholinesterase inhibitors have been shown to delay neuropsychiatric, cognitive and functional decline in patients with mild to moderate AD. Long-term studies on outcomes such as patient quality of life, institutionalization, and caregiver burden have not been conducted, but short-term trials have shown that cholinesterase inhibitors delay nursing home placement and reduce costs of care in the home.

Safety/Tolerability: Generally the agents are well tolerated with common adverse effects managed with titration and dose adjustments. Common adverse effects are related to excessive cholinergic activity consisting of nausea, diarrhea, vomiting, and occasionally excessively vivid dreaming. Tacrine (Cognex) use has been limited due to associated risks of hepatotoxicity.

Other factors: The following table displays FSS cost of cholinesterase inhibitors.

	Tacrine	Donepezil	Rivastigmine	Galantamine
FSS Price/Unit	$0.80/cap	$2.54/tab	$1.30/tab	$1.30/tab
Dosage Frequency	QID	QD	BID	BID
Cost/day	$3.20/day	$2.54/day	$2.60/day	$2.60/day
Cost/month	$96.00/month	$76.20/month	$78.00/month	$78.00/month

PDTS data from October 2002 to January 2003 show that donepezil (Aricept) has the majority of the DoD market share in all three points of service, with a steady increase in prescription fills for donepezil, rivastigmine, and galantamine in all three points of service. MTFs are currently spending nearly $100,000 per month on cholinesterase inhibitors.

A Council member expressed the opinion that the cholinesterase inhibitors are very expensive compared to the relatively modest clinical benefits they offer. The Council voted 10 to 1 not to consider the addition of a cholinesterase inhibitor to the BCF.

B. *Parkinson's Disease*

Carbidopa/ levodopa immediate release (Sinemet IR) formulation is currently the only drug on the BCF for the treatment of Parkinson's disease. The Council addressed the following questions:

- Should carbidopa/levodopa controlled release (Sinemet CR) be added to the BCF or replace carbidopa/levodopa immediate release on the BCF?
- Should adjunctive therapy agents (anticholinergic agents and amantadine) be added to the BCF?
- Should one or more of the dopamine agonists (bromocriptine, pergolide, pramipexole, ropinirole) be added to the BCF?

Carbidopa/levodopa controlled release: Carbidopa/levodopa is the most effective drug for the symptomatic treatment of idiopathic Parkinson's disease. There is no

evidence of a clinical advantage for the controlled release (CR) form of carbidopa/levodopa compared to the immediate release (IR). The daily cost of therapy with the CR is substantially higher, ranging from $1.00 to $2.50 vs $0.20 to $0.80 for the immediate release (IR). The Council unanimously voted to not add carbidopa/levodopa CR to the BCF.

Adjunctive therapy: Adjunctive treatment for Parkinson's disease includes anticholinergic agents (trihexyphenidyl, benztropine) and amantadine. Adjunctive therapy agents are effective monotherapy treatment for tremors in patients under the age of 70 in whom akinesia is not a significant problem. Additionally, they may be useful in patients with more advanced disease that have persistent tremor despite treatment with carbidopa/levodopa or dopamine agonists.

- Anticholinergic agents: There is little evidence to suggest that one anticholinergic agent is superior to another. Trihexyphenidyl is the most widely prescribed anticholinergic agent in the MTFs, with benztropine being reserved for use in the management of antipsychotic drug-induced Parkinsonism. The adverse effects of the anticholinergic medications are common and often limit their use, especially in the elderly population.
- Amantadine is an antiviral agent that has mild antiparkinsonian activity with its main advantage being a lower side effect profile than the anticholinergic agents. All three agents are available as generics and are inexpensive.

Since the goal of treatment for Parkinson's is control of symptoms, and no drug gives excellent relief by itself, the Council voted to add these three medications to the BCF.

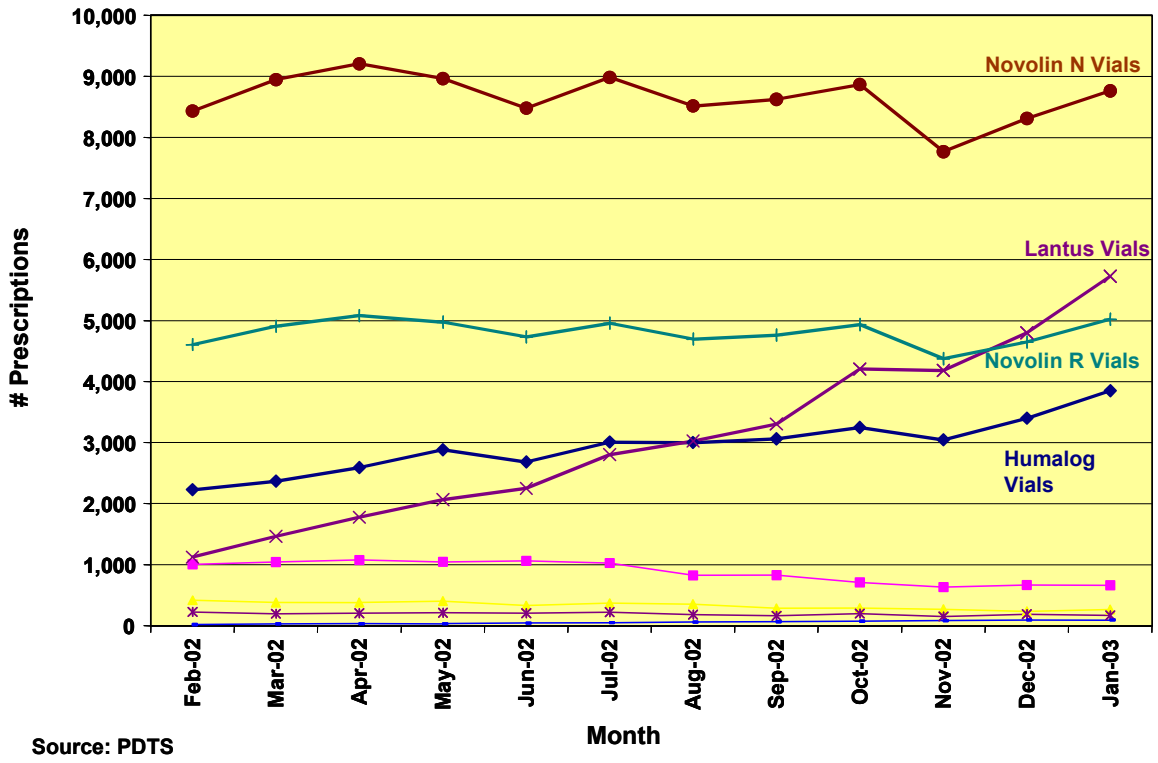
Dopamine agonists: A recent consensus opinion stated that dopamine agents are appropriate for the initial treatment of Parkinson's disease. Controlled trials have shown that bromocriptine (Parlodel), pergolide (Permax), pramipexole (Mirapax), and ropinirole (Requip) are all effective in patients with advanced Parkinson's disease complicated by motor fluctuations and dyskinesias. Dopamine agonists, however, are ineffective in patients who have shown no therapeutic response to carbidopa/levodopa. Side effects caused by dopamine agonists are similar to those of levodopa and patients who are intolerant of one agonist may tolerate another. The Council requested the PEC conduct a drug class review to determine which, if any, dopamine agonists, to add to the BCF.

C. *Insulin Pens* – CAPT Torkildson discussed the need to consider the addition of insulin pens and/or cartridges to the BCF. This question had been raised following the addition of insulin glargine (Lantus) to the BCF in August 2002. A perception had developed that this would result in an increased utilization of these insulin delivery systems, especially for the pre-prandial administration of short-acting and ultra-short-acting insulins. A joint contract was awarded to Novo Nordisk Pharmaceuticals, Inc. in 1999 to provide the DoD and VA with human regular, NPH, lente, and NPH/regular 70/30 mix insulin products. However, this contract included only the 10 ml vial package size of these products. Since the cost per unit of insulin delivered is much higher for the pen and cartridge delivery systems

compared to vials, and these delivery systems are not included in the current insulin contract, the PEC felt it would be prudent to look at this issue in greater detail.

CAPT Torkildson presented current data regarding insulin utilization within the direct care system (see Figure 1). Two of the top four insulin products by prescription volume (Novolin N and Novolin R) are currently under contract, while the other two products (Lantus and Humalog) are not. The other two contracted insulin products, Novolin L and Novolin 70/30, have no appreciable utilization at MTFs. A similar usage pattern exists in the mail order program.

Figure 1: MTF Prescription Volume for Most Commonly Prescribed Insulin Products

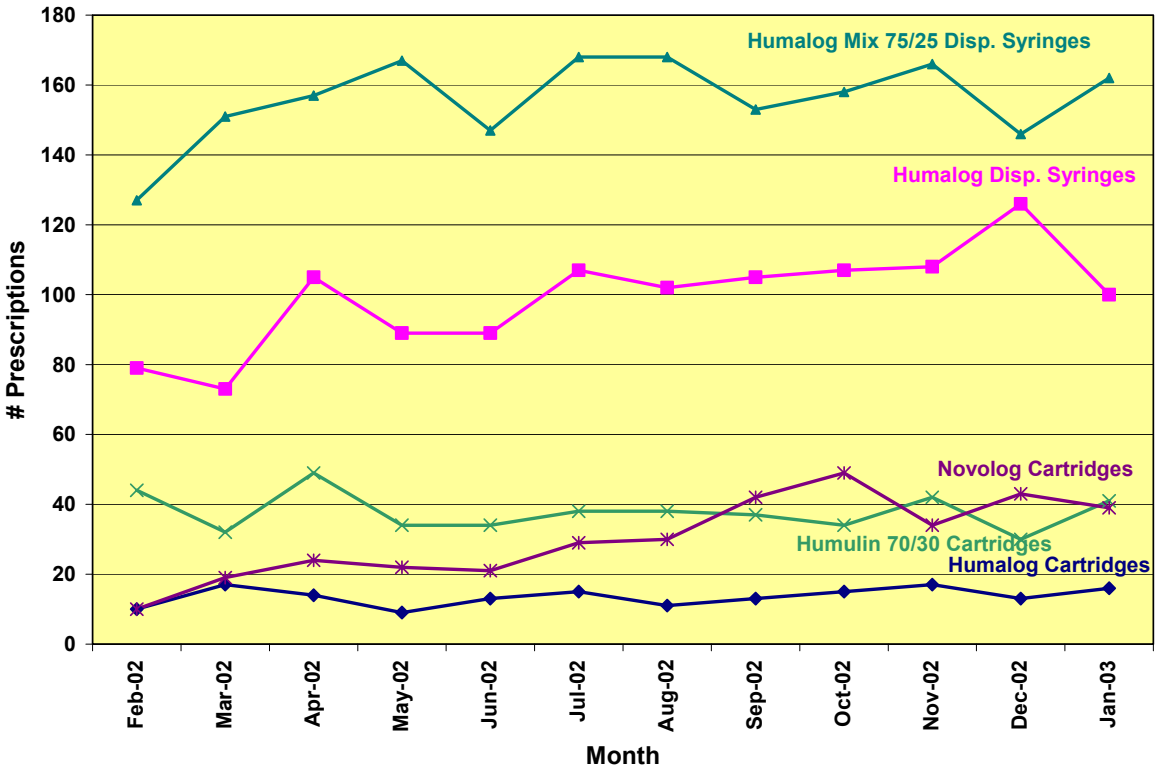


Source: PDTS

The data on utilization of insulin pens and cartridges within the direct care system is presented in Figure 2. Overall, insulin pens and cartridges currently represent a very small fraction of insulin product utilization. For the period 1 March 2002-28 Feb 2003, prescriptions for insulin pens and cartridges represented only 6% of the total number of insulin prescriptions filled in MTFs and the mail order program. However, as can be seen in Figure 2, the number of prescriptions for pen and cartridge delivery systems for ultra-short-acting insulin preparations (Humalog and Novolog) grew by about 50% over this period. In contrast, the prescription volume for other pen and cartridge insulin delivery products remained relatively flat. However, MTF expenditures for insulin pens and cartridges have increased

more rapidly. For example, MTFs spent $15,000 for Humalog pens in January 2003 compared to $5,000 in February 2002.

Figure 2: MTF Prescription Volume for Selected Insulin Disposable Syringe and Cartridge Products



A brief review of the clinical data highlighted the following information: While there are data to support the superiority of the ultra-short-acting insulin products (insulin lispro and insulin aspart) compared to regular insulin in terms of glycemic control, HbA1c levels, and frequency of hypoglycemia; there are currently no data that suggest that one ultra-short-acting insulin product is superior to the other. No data have been published since the award of the current insulin contract to suggest that any significant clinical differences exist between the products that were competed at that time, and no additional manufacturers of the products that are currently under contract have been identified.

From this information, the PEC came to the following conclusions:

- There is substantial and growing use of ultra-short-acting insulin products, primarily Humalog, at MTFs.
- There is almost no utilization of two of the four contracted insulin products, Lente and 70/30.
- There is currently little use of insulin pen devices.

- The monthly MTF expenditures for ultra-short-acting insulin pen devices has more than tripled over the past 12 months, from $6,000 to $20,000/month overall.

The PEC made the following recommendations to the Council:

- The DoD and VA should not exercise the final option year of insulin contract, which would begin on 1 November 2003
- The DoD and VA should instead begin development of a solicitation for a new insulin contract that covers different products than the current contract.
  - Lente insulin and the 70/30 product should not be included in the solicitation
  - The ultra-short-acting products (insulin lispro and insulin aspart) should be included in the solicitation
  - The pen/cartridge delivery system for the ultra-short-acting products only should be included in the solicitation

The Council voted unanimously to accept the PEC's recommendation and forward the above conclusions and recommendations for consideration by the Contracting Officer.

10. DRUG/DRUG CLASS EVALUATIONS TO DETERMINE BCF ADDITION

A. *Atypical antipsychotics* – The PEC is working on a review of the atypical antipsychotics. After the review is completed, the PEC will estimate the relative cost-effectiveness of the atypical antipsychotics and recommend how many of these agents should be added to the BCF.

B. *Ethinyl estradiol 20 mcg / Norelgestromin 150 mcg transdermal system (Ortho Evra)*

A MTF provider requested the addition of Ortho Evra to the BCF due to its unique administration route (topical) and potential for increased compliance.

Efficacy: A head-to-head that trial that compared 812 patients on Ortho Evra to 605 patients on Triphasil (30/40 mcg ethinyl estradiol with 50/75/125 mcg levonorgestrel) found that:

- The mean proportion of each participant's cycles that demonstrated perfect compliance was higher with Ortho Evra than with Triphasil (88.2% vs 77.7%, $p<0.0001$). [Note: Back-up contraception must be used if a patient exceeds a 7-day patch-free interval between Ortho Evra patches.]
- Despite better compliance with Ortho Evra, there was not a statistically significant difference in pregnancies: 5 with Ortho Evra vs 7 with Triphasil; $p=0.57$.

Safety/Tolerability: A higher percentage of patients on Ortho Evra discontinued the study due to adverse events than patients on Triphasil:

- Nausea: 1.8% with Ortho Evra vs 0.8% with Triphasil (p=0.12)
- Headache: 1.5% with Ortho Evra vs 0.3% with Triphasil (p=0.03)
- Dysmenorrhea: 1.5% with Ortho Evra vs 0.2% with Triphasil (p=0.01)
- Breast discomfort 1% with Ortho Evra vs 0.2% with Triphasil (p = 0.09)
- Application site reactions: 2.6% with Ortho Evra—not applicable for Triphasil

Other factors: A pooled analysis of clinical trial data (N=3319, 16,673 cycles) showed that 4.6% of Ortho Evra patches had to be replaced due to complete or partial detachment.

Price and usage: Ortho Evra costs $15.06/cycle, compared to $0.21-$8.00/cycle for oral contraceptives that are on the BCF. Ortho TriCyclen (which is not on the BCF) costs $15.21 per cycle. Ortho TriCyclen is the most commonly used contraceptive in the Military Health System (approximately 32,000 Rxs/month in all 3 points of service), compared to approximately 40,000 Rxs/month for all the oral contraceptives on the BCF combined. As of Jan 03, Ortho Evra had exceeded 10,000 Rxs/month.

The Council concluded that Ortho Evra does not offer any advantages in efficacy or safety/tolerability that justify its higher price compared to oral contraceptives already on the BCF. The Council voted unanimously not to add Ortho-Evra to the BCF.

C. *Topical Immunomodulators (TIMS)*

The PEC is still exploring procurement options for topical immunomodulators, so the Council took no action on these agents.

11. MTF REQUESTS FOR BCF CHANGES

A. *Request to add metoprolol extended release tablets (Toprol XL) to the BCF–* A MTF provider requested the addition of metoprolol succinate extended release tablets (metoprolol XL) to the BCF for congestive heart failure (CHF). The requestor's rationale was that "metoprolol XL is indicated for CHF and is not equivalent to the metoprolol tartrate immediate release preparation (metoprolol IR); additionally the XL formulation provides more dose flexibility by providing low doses to the patient and is the standard of care for CHF patients." No supporting literature was submitted along with the request.

Efficacy: Metoprolol XL is labeled for treating New York Heart Association (NYHA) functional class II/III CHF. A placebo-controlled trial conducted with metoprolol XL (MERIT-HF; Lancet 1999) in approximately 4000 subjects reported that 7.2% of patients receiving the drug died, compared with 11% in the placebo group (34% risk reduction, p<0.00009).

Metoprolol IR lacks an FDA-approved indication for CHF. A placebo-controlled trial conducted with metoprolol IR in approximately 400 patients with dilated idiopathic cardiomyopathy (MDC trial; Lancet 1993) found that 13% of patients

receiving the drug died, compared with 20% in the placebo group. The mortality rate of 13% is within range of the mortality rate seen in other beta blocker trials (7%-16%). Due to the small sample size, the survival benefit did not reach statistical significance ($p<0.058$). However, the risk reduction of 34% achieved with the metoprolol IR is similar to the risk reductions reported in other trials of similar design conducted with the beta blockers bisoprolol, carvedilol, and metoprolol XL.

The metoprolol IR study measured other parameters that showed significant benefits, including a reduced need for cardiac transplantation and improvements in left ventricular ejection fraction and exercise capacity. A head to head mortality study of metoprolol IR in comparison with carvedilol (COMET study) is currently underway in Europe, with results expected in summer 2003.

Safety/Tolerability: The XL formulation produces more consistent blood levels than the IR formulation. More consistent blood levels would theoretically produce more consistent beta-1 receptor blockade and cause fewer adverse events. However, head-to-head trials comparing metoprolol XL and metoprolol IR in small numbers of patients show no difference in safety and tolerability between the two formulations.

Other factors: Metoprolol IR is formulated in tablet strengths required for treating hypertensive patients (50 and 100 mg scored tablets), and is not available in the low doses required for initiating therapy in CHF patients (12.5 –25 mg). Metoprolol IR requires twice daily dosing. Metoprolol XL offers an advantage over metoprolol IR in that it is available in 25 mg scored tablets and is dosed once daily.

An analysis of PDTS prescription data showed that metoprolol XL is responsible for the 2nd highest number of beta blocker prescriptions in the NMOP and Retail Network, second only to atenolol. In the MTF setting, atenolol generates the most beta blocker prescriptions, followed by metoprolol IR, then metoprolol XL.

The Council voted unanimously not to add metoprolol XL to the BCF. Despite the lack of an FDA-approved indication, DoD providers use metoprolol IR for CHF. Although metoprolol XL offers the convenience of once daily administration and dosing flexibility, the absence of a significant difference in efficacy, safety or tolerability compared to metoprolol IR does not justify the higher expense for metoprolol XL ($9.90-$14.70 /month for metoprolol XL vs $0.90-$2.42/month for metoprolol IR). In the absence of a mechanism for MTFs to target the usage of metoprolol XL to patients with CHF, the addition of metoprolol XL to the BCF would likely result in increased use of metoprolol XL for hypertension in lieu of using other less-expensive beta blockers. The Council requested re-evaluation of the use of beta blockers for CHF upon completion of the COMET study.

B. *Request to add chlorthalidone 25 and 50 mg tablets to the BCF–* A MTF provider requested the addition of chlorthalidone, a generic thiazide diuretic, to the BCF in light of the recently completed landmark study (Anti-hypertensive and Lipid-Lowering Treatment to Prevent Heart Attack Trial; ALLHAT; JAMA 2002). This study showed that the thiazide diuretic chlorthalidone was equally efficacious to a

calcium channel blocker (amlodipine) and an ACE inhibitor (lisinopril) in reducing blood pressure in hypertensive patients, at a much lower cost than the other agents. Efficacy of chlorthalidone was also proven in the Systolic Hypertension in the Elderly Program (SHEP; JAMA 1991), which showed a reduced incidence of stroke and major cardiovascular events in the diuretic arm.

Chlorthalidone has historically has been used more commonly in Europe than the US. Chlorthalidone may have a higher incidence of hypokalemia than hydrochlorothiazide (HCTZ), however, all patients receiving thiazide diuretics require electrolyte monitoring. The incidence of hypokalemia (serum potassium < 3.5 mEq/L) in patients receiving chlorthalidone in both the ALLHAT and SHEP trials was <10% (8.5% and 7.2%, respectively).

Although current DoD utilization of chlorthalidone is low (10,000 chlorthalidone Rxs in all 3 venues, vs 1 million Rxs for HCTZ), the extensive publicity of the results of ALLHAT may cause usage to increase. HCTZ and chlorthalidone are both very inexpensive, with tablet costs as low as $0.01/tablet. Although the current BCF thiazide diuretic HCTZ meets the needs of the majority of DoD patients, practitioners of evidence-based medicine may want to use chlorthalidone, and its availability should be ensured at MTF pharmacies. Providers should be encouraged to take advantage of a low cost drug with excellent evidence of benefit in the treatment of hypertension. The Council voted unanimously to add chlorthalidone to the BCF.

12. ADJOURNMENT

The meeting adjourned at 1530 hours. The next meeting will be held at Fort Sam Houston, TX at 0800 on Tuesday, 6 May 2003. All agenda items should be submitted to the co-chairs no later than 18 April 2003.

MCCS-GPE **21 NOVEMBER 2002**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T Committee convened at 0800 hours on 21 November 2002, at the Uniformed Services University of the Health Sciences, Bethesda, Maryland.

2. VOTING MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL Joel Schmidt, MC	Army
MAJ Travis Watson, MS	Army
COL John R. Downs, MC (via VTC)	Air Force
COL Bill Sykora, MC	Air Force
LtCol George Jones, BSC	Air Force
CAPT Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
CAPT Robert Rist	Coast Guard
Kathy Tortorice (Representing Dick Rooney)	Department of Veterans Affairs
Dr. Trevor Rabie	Uniformed Services Family Health Plan

VOTING MEMBERS ABSENT

Physician	Army

OTHERS PRESENT

LTC Marc Caouette, MS	Joint Readiness Clinical Advisory Board
Howard Altschwager	Deputy General Counsel, TMA
CAPT Joe Torkildson, MC, USN	DoD Pharmacoeconomic Center
LtCol Dave Bennett, USAF, BSC (via VTC)	DoD Pharmacoeconomic Center
CDR Denise Graham, MSC, USN	DoD Pharmacoeconomic Center
Maj Barb Roach, USAF, MC (via VTC)	DoD Pharmacoeconomic Center
CDR (sel) Ted Briski, MSC, USN	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center

Elizabeth Scaturro	Medco Health
Victor Diaz, MD, MPH	Humana
William Hudson	Humana
Gene Lakey	TriWest
Ray Nan Berry	Health Net Federal Services
Lisa LeGette	DoD Tricare Information Center
LTC Emery Spaar	U.S. Army Officer resident at AMCP

3. **REVIEW MINUTES OF LAST MEETING**– The minutes from the last meeting were accepted as written.

4. **INTERIM/ ADMINISTRATIVE DECISIONS** –

A. *Membership*: Currently the DoD P&T Committee has 13 voting members. All other members are listed as other attendees. COL Remund will send out a copy of the existing charter to all members and recommendations for changes to the charter regarding membership should be sent to the chairs prior to the March meeting. The Council will decide at that time whether changes need to be made to the charter.

B. *Venlafaxine extended release capsules (Effexor XR) Blanket Purchase Agreement (BPA):* At the August 2002 meeting, the Council voted to add venlafaxine extended release 37.5, 75, and 150 mg capsules to the BCF, contingent on the signing of a BPA between Wyeth-Ayerst and DSCP. The BPA was recently signed, so Effexor XR is now on the BCF and facilities are required to include it on their formularies.

5. **UNIFORM FORMULARY (UF) PROPOSED RULE**- Howard Altschwager, TMA Deputy General Counsel, briefed the Committee on the status of the UF proposed rule. The TMA Pharmacy Program Office is currently in the process of formulating responses to comments submitted by the public.

6. **BCF AND NATIONAL MAIL ORDER PHARMACY (NMOP) FORMULARY ISSUES** – The Committee determined the NMOP formulary status, NMOP or retail network formulary restrictions (quantity limits or prior authorization), and Basic Core Formulary (BCF) status for 13 new drugs or formulations (see Appendix A). The PEC also presented brief information on six additional new drugs or formulations not requiring a complete review by the Committee. The Committee agreed that no further review was required (see Appendix B for comments).

7. **NMOP AND RETAIL NETWORK ISSUES**

A. Review of the NMOP and retail network quantity limits for antiemetics – A review of the quantity limits established for oral 5-HT3 receptor agonists, used for the treatment of chemotherapy-induced nausea and vomiting, was initiated based on an inquiry received from a customer service representative at TMA West. A complaint was filed with this individual by a retired beneficiary, who stated that the quantity limit that currently exists was insufficient to meet the clinical needs of his wife, who was receiving treatment for cancer. CAPT Torkildson (PEC) performed the analysis and reported to the Committee.

There currently are three 5-HT3 receptor antagonists available in the U.S. for prophylaxis or treatment of chemotherapy-induced nausea or emesis: ondansetron (Zofran), granisetron (Kytril), and dolasetron (Anzemet). The P&T Committee established the following quantity limits for these products at their August 1999 meeting. These quantity limits apply both to the NMOP and the retail network:

Table 1: Quantity Limits for 5-HT3 Receptor Antagonists

Drug	30-day quantity limit	90-day quantity limit
Ondansetron tablets and orally disintegrating tablets	15	45
Granisetron tablets	8	24
Dolasetron tablets	5	15

In each case the quantity limit was established based on the drug's use for the FDA-approved indication: the prevention or treatment of chemotherapy induced nausea or vomiting. The first step of the analysis was to determine if additional FDA-approved indications had been added for one or more of these drugs that would materially change the number of tablets needed during a 30- or 90-day period. Since the quantity limits were initially established, the FDA has approved both ondansetron and granisetron for use in the prevention or treatment of nausea and vomiting associated with radiation therapy. Additionally, ondansetron and dolasetron were approved for treatment of postoperative nausea and vomiting. While the latter indication requires no modification in the quantity limit, the former could be associated with the use of a substantially greater number of tablets than specified by the current quantity limits. Based on the doses recommended for prevention or treatment of radiation-induced nausea and vomiting,

as many as 80 tablets of ondansetron or 40 tablets of granisetron could be required in a 30-day period, well above the current 30-day quantity limits for both products.

The second step of the analysis involved determining the actual number of tablets dispensed per prescription from each point of service and comparing these figures to the established quantity limits. In FY02, 29,645 oral 5-HT3 tablet prescriptions were filled in the MHS. Of these, 53% were filled at MTFs, 45% at retail network pharmacies, and 2% at the NMOP. Table 1 provides information regarding the number and percentage of prescriptions filled in each venue that exceed the currently established 30-day and 90-day quantity limits. No standard quantity limits exist at the MTFs; these figures are provided solely for comparison. It is notable that 13%-18% of prescriptions in the retail network exceed the established 30-day quantity limits. The representatives from each of the MCSC pharmacy benefit managers indicated that this was done only after a review was performed to ensure clinical appropriateness. A small number of prescriptions filled in the NMOP exceeded the 90-day quantity limit; Maj Bellemin indicated that this occurred only after a similar review process had taken been performed by him.

Table 2: Number (percentage) of Prescriptions Filled in FY 02 that Exceed Current NMOP and Retail Quantity Limits

		Point of Service		
Drug	**Qty Limit**	**MTF**	**Retail**	**NMOP**
Ondansetron 4 mg	> 15	1708 (52.2)	404 (13.2)	N/A
	> 45	427 (13)	63 (2.1)	1 (1.3)
Ondansetron 8 mg	>15	2897 (32.1)	812 (10.2)	N/A
	> 45	647 (7.2)	159 (2.0)	8 (3.1)
Granisetron 1 mg	> 8	468 (14.4)	196 (18.3)	N/A
	> 24	101 (3.1)	43 (4)	2 (4.1)
Dolasetron 50 mg	> 5	1 (100)	1 (5.6)	N/A
	> 15	1 (100)	0 (0)	0 (0)
Dolasetron 100 mg	> 5	37 (19.3)	177 (13.2)	N/A
	> 15	13 (6.8)	37 (2.8)	3 (5.6)

The conclusion reached by the PEC was that the current quantity limits are not sufficient to meet the clinical needs of patients undergoing radiation therapy. However, it does not appear that this creates a significant problem for patients. This is most likely due to two factors: 1) the low number of patients requiring treatment with antiemetics during their radiation therapy. Studies have suggested that only patients receiving higher dose abdominal radiation and some patients receiving radiation therapy to the head and neck will require antiemetic therapy. 2) a fair and effective review process for approval of prescriptions that exceed the established quantity limits. This is supported by the fact that only one complaint has been forwarded to the PEC in the three years since the quantity limits were established. Given the growing number of 5-HT3 receptor antagonist prescriptions being written for off-label indications such as hyperemesis gravidarum, the committee felt it would not be prudent to increase the quantity limits above the current levels, as these prescriptions should all be reviewed for clinical appropriateness. The PEC will monitor the situation and report back if the need arises.

8. **CONTROLLED DISTRIBUTION OF PRESCRIPTION DRUGS** – Gamma hydroxy butyrate solution (Xyrem) has been approved by the FDA with distribution limited to a single pharmacy, Express Scripts' Specialty Distribution Services. Since Express Script's Specialty Distribution Services may not be a member of each MCSC network, patients will likely have to file out-of-network claims to get reimbursed for this drug. The MCSC Pharmacy Directors will look into enrolling Express Scripts into their networks so only a copay will be required.
9. **ADJOURNMENT –** The meeting adjourned at 1130 hours. The next meeting will be held at Fort Sam Houston, TX at 0800 on Thursday, 6 March 2003. All agenda items should be submitted to the co-chairs no later than 14 February 2003.

List of Appendices

APPENDIX A: NEWLY APPROVED DRUGS CONSIDERED FOR THE NATIONAL MAIL ORDER PHARMACY FORMULARY AND DOD BASIC CORE FORMULARY

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Amoxicillin clavulanate extended release tablets (Augmentin XR; GSK)	2 Oct 02: Treatment of community acquired pneumonia (CAP) or acute bacterial sinusitis caused by beta-lactamase-producing bacteria or *Strep. pneumoniae* with reduced susceptibility to penicillin (e.g., penicillin MICs = 2 mcg/ml). Not indicated for treating infections due to *S. pneumoniae* with penicillin MIC [≥] 4 mcg/ml, due to only limited data. This formulation has 62.5 mg of clavulanate, instead of 125 mg found in other Augmentin preparations. The dose cannot be duplicated with existing Augmentin preparations. Augmentin XR still requires twice daily dosing; the controlled release mechanism appears to provide higher sustained blood levels of amoxicillin.	Added to the NMOP Formulary	**Quantity Limits** General Rule applies **Prior Authorization:** None	Not added to the BCF The BCF listing for amoxicillin/ clavulanate acid oral was clarified to exclude Augmentin XR **Similar BCF agents:** Amoxicillin/ clavulanate is listed on the BCF. The listing includes the pediatric suspension Augmentin ES-600. A generic version of Augmentin is now available.
Tazarotene 0.1% topical cream (Avage; Allergan)	2-Oct 02: Tazarotene is a retinoid prodrug. As Avage, it is indicated for palliation of facial fine wrinkling, hyper- and hypo-pigmentation, and benign facial lentigines in patients using skin care and sunlight avoidance programs. The same active ingredient (0.1% tazarotene) is marketed in a gel formulation under the trade name Tazorac, with indications for the treatment of psoriasis and acne vulgaris.	The Avage brand of tazarotene was specifically excluded from the NMOP Formulary, since its use is limited to cosmetic applications; other drugs intended solely for cosmetic use as a result of the aging process have been determined to be excluded from coverage by TRICARE rule. Tazorac usage will be monitored for any changes in age distribution.	**Quantity Limits** General rule applies. **Prior Authorization** None	Not added to the BCF. **Similar BCF agents:** Tretinoin 0.05% and 0.025% topical cream is listed on the BCF; the listing excludes Renova, a product that is only indicated for wrinkles.
Clindamycin 1% / benzoyl peroxide 5% topical gel (Duac; Steifel Labs)	26 Aug 02: Topical treatment of inflammatory acne vulgaris. This is the second clindamycin 1% / benzoyl peroxide 5% combination product to become available. The other product (BenzaClin; Aventis) is available in 25 and 50-gram jars that require reconstitution prior to dispensing. The Duac product does not require reconstitution; it is available in a 45-gram tube.	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF agents**: Clindamycin 1% solution

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Glipizide / metformin tablets (Metaglip; BMS)	21 Oct 02: Initial therapy in type 2 diabetics who are not achieving adequate glycemic control with diet and exercise alone. Also approved for second-line therapy in patients with type 2 diabetes who are not achieving adequate glycemic control with diet, exercise, and initial treatment with metformin or a sulfonylurea.	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF agents**: Metformin is listed on the BCF; a mandatory source contract is in effect. Glipizide immediate release is also listed on the BCF
Rosiglitazone / metformin tablets (Avandamet; GSK)	10 Oct 02: Use as an adjunct to diet and exercise in type 2 diabetics who are already receiving rosiglitazone and metformin as separate tablets, or who are not adequately controlled with metformin alone (second line therapy). Avandamet is not labeled for use as initial therapy in type 2 diabetics.	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF agents:** Metformin is listed on the BCF; a mandatory source contract is in effect. The DoD P&T committee has recommended addition of a TZD to the BCF; a contracting solicitation is in progress.
Dutasteride tablets (Avodart; GSK)	9 Oct 02: Treatment of symptomatic benign prostatic hyperplasia (BPH) in men with an enlarged prostate to include: Symptom reduction of BPH Reduction of the risk of urinary retention associated with BPH Reduction of the risk of BPH-related surgery	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF agents**: None. The alpha-blockers terazosin and prazosin are BCF items
Ethinyl estradiol 25 mcg / norgestimate tablets (Ortho Tri-Cyclen Lo; Ortho McNeil)	22 Aug 02. Prevention of pregnancy. Oral tri-phasic contraceptive containing 25 mcg of ethinyl estradiol, and three different doses of norgestimate, a low androgenic-potential progestin. Ortho Tri-Cyclin Lo is not indicated for acne.	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF agents**: No low estrogen triphasic OCPs are listed on the BCF. A low-dose monophasic preparation (20 mcg ethinyl estradiol / 1 mg norethindrone / 75 mg ferrous fumarate (Loestrin FE or its generic equivalent) was added to the BCF at this meeting.

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Alosetron tablets (Lotronex; GSK)	7 Jun 02; treatment of severe diarrhea-predominant irritable bowel syndrome in women who have failed to respond to conventional therapy. Alosetron is not expected to be available until Dec 2002. A controlled distribution program is in place that requires physician self-certification and stickers to be placed on all prescriptions. More information is available on the FDA web site at http://www.fda.gov/cder/drug/infopage/lotronex/lotronex.htm. Alosetron was originally pulled off the market in Jun 2000 due to cases of GI toxicity (ischemic colitis ad constipation resulting in 2 deaths). The new indication is narrower than the original labeling, and the dosage is now 1 mg qd instead of 1 mg bid.	Added to the NMOP Formulary. The controlled distribution program requirements can be met through the NMOP, however faxed prescriptions cannot be accepted.	**Quantity Limits** General rule applies; however, the controlled distribution program will necessitate dispensing in pre-packaged quantities. The NMOP will fill Rxs with the amount of tablets that is as close as possible to the original Rx. **Prior Authorization** None	Not added to the BCF **Similar BCF agents:** None
Tegaserod tablets (Zelnorm; Novartis)	6 Aug 02: short-term treatment of constipation-predominant irritable bowel syndrome.	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF agents**: None
Adefovir tablets (Hepsera; Gilead)	20 Sep 02 (priority review): treatment of chronic hepatitis B in adults with evidence of active viral replication and either elevations in ALT or AST, or histologically active disease. Labeling has evidence of efficacy for lamivudine-resistant hepatitis B.	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF agents**: None
PEG interferon alfa-2a injection (Pegasys; Roche)	16 Oct 02: treatment of adults with chronic hepatitis C who have compensated liver disease and have not been previously treated with interferon alfa	Added to the NMOP Covered Injectables List	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF. Re-examine potential BCF addition in 3-6 months. **Similar BCF agents:** None
Comments regarding pegylated interferon alfa products for hepatitis C: PEG interferon alfa-2a (Pegasys) is not associated with a patient enrollment program; supplies are expected to be sufficient to meet demand. Schering's peg interferon alfa-2b product (PEG-Intron) previously had a patient enrollment program, but it was recently discontinued. The P&T Committee decided to readdress the potential BCF addition of a pegylated interferon alfa product for hepatitis C in 3-6 months.				

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Ezetimibe tablets (Zetia; Merck)	25 Oct 02: Treatment of: Primary Hypercholesterolemia: Monotherapy – as an adjunct to diet to reduce TC, LDL-C, and Apo B Combination therapy – when administered with a statin as an adjunct to diet to reduce TC, LDL-C, and Apo B Homozygous familial hypercholesterolemia: when used in combination with atorvastatin or simvastatin Homozygous sitosterolemia: as an adjunct to diet	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF. The P&T Committee voted to reconsider BCF addition of ezetimibe in 6 months **Similar BCF agents**: None
Guaifenesin extended release tablets (Mucinex; Adams Labs)	As of 12 Jul 2002, Mucinex (Adams Labs) became the first single ingredient guaifenesin extended release product to be 1) approved as safe and effective under a New Drug Application (NDA) and 2) to be approved as an over-the-counter (OTC) product. As a consequence of approval, the FDA has sent warning letters to manufacturers of guaifenesin extended release products explaining that currently marketed single ingredient guaifenesin extended release products without an approved application are considered misbranded and in violation of section 505(a) of the Food, Drug, and Cosmetic Act (FDCA). In addition, provisions of the Durham-Humphrey amendment (products cannot be marketed as both Rx and OTC products) effectively mean all single ingredient extended release will be OTC products. At least one affected manufacturer is known to be petitioning this action, but it is not known if any single ingredient guaifenesin extended release product other than Mucinex will continue to be available in the near future.	Since single ingredient guaifenesin extended release products are now OTC products, they will no longer be available from the NMOP and will not be included on the NMOP Formulary. Prescription extended release guaifenesin products will be dispensed by the NMOP as long as current supplies permit.	**Quantity Limits** N/A **Prior Authorization** None	The DoD P&T Executive Council removed the BCF listing for guaifenesin 600 mg extended release. MTFs may decide whether to retain the product on their formularies or not. See minutes of the DoD P&T Executive Council meeting for more information.

APPENDIX B: NEWLY APPROVED DRUGS NOT REQUIRING FULL REVIEW BY THE P&T COMMITTEE

Generic (Trade name; manufacturer)	**Indication**	**Comments**
Oxaliplatin injection (Eloxatin; Sanofi)	Treatment of metastatic colon/rectal CA in combination with 5-FU and leucovorin.	Not considered for the NMOP Formulary since the injection is not designed for self-administration. Not considered for the BCF due to the specialized nature of the indication.
Rasburicase injection (Elitek; Sanofi)	Orphan drug for the management of uric acid levels in pediatric patients receiving chemotherapy.	Not considered for the NMOP Formulary since the injection is not designed for self-administration. Not considered for the BCF due to the specialized nature of the indication.
Urokinase injection (Abbokinase; Abbott)	Treatment of thrombolysis of acute PE. Indication for catheter clearance is underway. Re-introduced 10 Oct 02, following market withdrawal in 1999 due to manufacturing problems.	Not considered for the NMOP Formulary since the injection is not designed for self-administration and because of the emergent nature of the indication. Not considered for the BCF due to the specialized nature of the indication and the emergent nature of the indication.
Buprenorphine / naloxone; buprenorphine tablets (Suboxone; Subutex; Schering Plough)	Treatment of opioid dependence. Patients can be treated in MD offices outside of methadone maintenance programs. Controlled distribution program is in effect.	Not considered for the NMOP Formulary because a legal interpretation is needed to determine if treatment of opioid dependence outside of a methadone maintenance program is a covered Tricare benefit. It is not known if requirements of the controlled distribution program could be meet in the NMOP. Not considered for the BCF due to the specialized nature of the indication.
Sodium oxybate (gamma hydroxy butyrate) solution (Xyrem; Orphan Medical)	Treatment of cataplexy related to narcolepsy	Not considered for the NMOP Formulary because availability from the NMOP is not feasible; the restricted distribution program for this product is limited to a single pharmacy (see Paragraph 8 in these minutes). Not considered for the BCF due to the specialized nature of the indication.

APPENDIX C: COMBINED SUMMARY OF FORMULARY CHANGES FROM THE DOD P&T EXECUTIVE COUNCIL MEETING AND THE DOD P&T COMMITTEE MEETING

1. BCF CHANGES

A. Additions to the BCF

1) Tolterodine extended release capsules (Detrol LA)
2) Timolol maleate, solution, gel-forming 0.25%, 0.5% (Timoptic XE; Merck brand only - mandatory source contract)
3) Norethindrone/EE/ferrous fumarate 1/0.02 mg (Loestrin FE or its generic equivalent [Microgestin FE])
4) Niacin extended release tablets (Niaspan)
5) Venlafaxine extended release capsules (Effexor XR)

B. Deletions from the BCF

1) Niacin immediate release oral
2) Guaifenesin 600 mg extended (sustained) release tablets

C. Changes and clarifications to the BCF - None

D. Exclusions from the BCF

1) Paroxetine controlled release (Paxil CR) was excluded from the BCF listing for paroxetine
2) Amoxicillin/clavulanate extended release tablets (Augmentin XR) were excluded from the BCF listing for augmentin/clavulanate acid oral

2. NMOP FORMULARY CHANGES

A. Additions to the NMOP Formulary

1) Augmentin/clavulanate acid extended release tablets (Augmentin XR; GSK)
2) Clindamycin 1%/benzoyl peroxide 5% topical gel (Duac; Steifel Labs)
3) Glipizide / metformin tablets (Metaglip; BMS)
4) Rosiglitazone/metformin tablets (Avandamet; GSK)
5) Dutasteride tablets (Avodart; GSK)
6) Ethinyl estradiol 25 mcg/norgestimate (varying doses) tablets (Ortho Tri-Cyclen Lo; Ortho McNeil)
7) Alosetron tablets (Lotronex; GSK) – The controlled distribution program requirements can be met through the NMOP, however faxed prescriptions cannot be accepted.
8) Tegaserod tablets (Zelnorm; Novartis)
9) Adefovir tablets (Hepsera; Gilead)
10) PEG interferon alfa-2a injection (Pegasys; Roche) – added to the NMOP Covered Injectables List
11) Ezetimibe tablets (Zetia; Merck)

B. Exclusions from the NMOP Formulary

1) Avage brand of tazarotene 0.1% topical cream (Allergan) – specifically excluded from the NMOP Formulary, since its use is limited to cosmetic applications; other drugs intended solely for cosmetic use as a result of the aging process are not available from the NMOP.

C. Removed from the NMOP Formulary; no longer available from the NMOP

1) Single ingredient guaifenesin extended release tablets – approved as an OTC product 12 July 02

D. Clarifications to the NMOP Formulary - None

3. **QUANTITY LIMIT CHANGES (NMOP AND RETAIL NETWORK) -** None

4. **CHANGES TO THE PRIOR AUTHORIZATION PROGRAM (NMOP AND RETAIL NETWORK)** - None

Department of Defense

CAPT Sandra Yerkes, MC	Deputy, Chief Medical Corps BUMED
LTC Emery Spaar, MS	U.S. Army Officer resident at AMCP
Michael Valentino	Department of Veterans Affairs, PBM

3. REVIEW MINUTES OF LAST MEETING

The minutes from the last meeting were accepted as written.

4. INTERIM DECISIONS/ADMINISTRATIVE ISSUES

A. Membership: Currently the DoD P&T Executive Council has 12 voting members and the DoD P&T Committee has 13 voting members. All other members are listed as others present. COL Remund will send out a copy of the existing charter to all members and recommendations for changes to the charter regarding membership should be sent to the chairs prior to the March meeting. The Council will decide at that time whether changes need to be made to the charter.

B. Venlafaxine extended release capsules (Effexor XR) blanket purchase agreement (BPA): At the August 2002 meeting, the Council voted to add venlafaxine extended release 37.5, 75, and 150 mg capsules to the BCF, contingent on the signing of a BPA between Wyeth-Ayerst and Defense Supply Center Philadelphia (DSCP). The BPA was recently signed, so Effexor XR is now on the BCF and facilities are required to include it on their formularies.

5. NATIONAL PHARMACEUTICAL CONTRACTS AND BLANKET PURCHASE AGREEMENTS (BPAs)

Contract awards, renewals, and terminations

- New joint DoD/VA contracts were awarded for albuterol inhaler and lisinopril (West-ward; bottles of 100 effective November 21, 2002 and bottles of 1000 effective March 2003).
- The following joint DoD/VA contracts were not awarded because the bid prices were higher than existing FSS prices: penicillin, amoxicillin, dicloxacillin, and cephalexin.
- The following joint DoD/VA contract is in various stages of solicitation: tretinoin cream.

6. PENDING PROCUREMENT INITIATIVES

A. Status of contracting initiatives

- The joint DoD/VA solicitation for a leutinizing hormone releasing hormone (LHRH) agonist has closed. An award is expected in January 03.
- A joint DoD/VA solicitation will not be issued for a nasal corticosteroid. A DoD/VA incentive agreement for fluticasone (Flonase) is being developed and will likely be finalized in December 02.
- A joint DoD/VA solicitation for a "triptan" has been issued and is scheduled to close in early December.
- A revision of the current incentive agreement for levofloxacin is being negotiated.
- A joint DoD/VA solicitation is being developed for an angiotensin receptor blocker (ARB) and is scheduled to be issued during the first quarter of CY 03.
- A joint DoD/VA solicitation for a "statin" is scheduled to be issued in late December 02.
- A joint DoD/VA solicitation for a thiazolidinedione is being developed. A projected issue date is not yet identified.
- The lisinopril contract has been awarded. Details are available at: http://www.dmmonline.com/pharm/indivdrugs.asp?id=83

B. Proposed BPA for tolterodine extended release capsules (Detrol LA) – In June 2001 the Council discussed the drugs used for treating overactive bladder (OAB) in response to several requests to add Detrol LA to the Basic Core Formulary (BCF). At that time the Council concluded that none of the drugs should be added to the BCF because none of them offered sufficient clinical benefit to justify their significantly higher cost compared to oxybutynin immediate release. Pharmacia is now offering a BPA that would reduce the price of Detrol LA if it were added to the BCF.

The Council considered the following information:

- A head-to-head study of Ditropan XL and Detrol LA found that Detrol LA was better tolerated (patients' perceptions reported on a visual analog scale) and slightly more effective (patients' perceptions reported on a 6-point Likert scale)
- An analysis of PDTS data from Jul 01 to Oct 02 showed that 58.4% of patients prescribed Detrol LA obtained at least one refill of their prescription, compared to only 36.7% for Detrol, 36.1% for Ditropan XL, and 30.7% for oxybutynin immediate release. The higher

refill rate for Detrol LA may indicate that patients tolerate it better than other agents and/or that patients perceive that it works better than the other agents.

- Dr. John Fischer, an Air Force urogynecologist, briefed the Council via VTC on his clinical experiences with patients and patient perceptions of benefit. Dr. Fischer recommended that the Council add Detrol LA to the BCF.
- Detrol LA usage has increased much more than other agents for OAB. Data from all outpatient pharmacy points of service in the MHS show that the number of patients getting prescriptions filled for Detrol LA more than tripled from 4,000 patients in Jul 01 to nearly 13,000 patients in Oct 02.

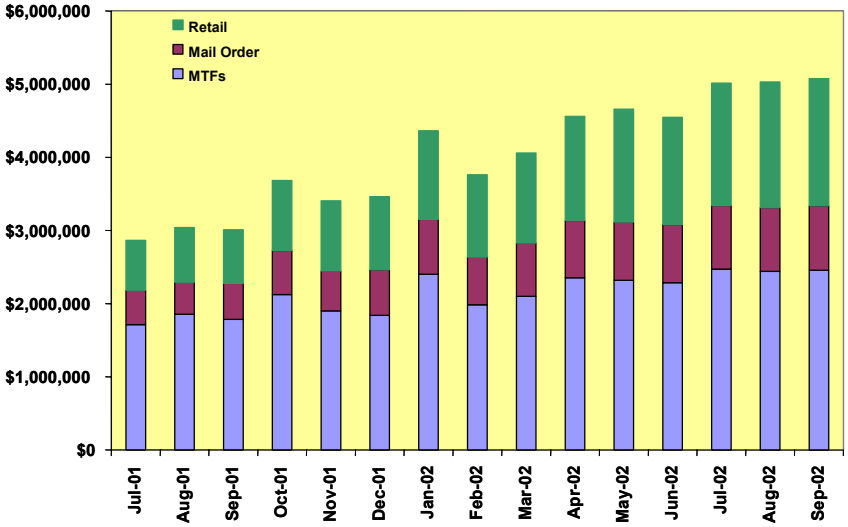
The Council voted to add Detrol LA to the BCF and advise DSCP to accept the proposed BPA.

7. **GENERIC CONTRACTS -** CDR (sel) Ted Briski informed the Council that some solicitations for joint DoD/VA generic contracts do not elicit competitive bids because the generic companies have trouble meeting the large demand from both agencies. He asked the Council whether the need for standardization was still a legitimate reason for pursuing these contracts. Council members stated that standardization is needed by both agencies, particularly to support the use of automation. The Council suggested the two agencies might be more successful by pursuing separate contracts to avoid overwhelming the production capabilities of the generic manufacturers. CDR (sel) Briski stated he would work with the Federal Pharmacy Executive Steering Committee (FPESC) sub-committee for contracting to find viable solutions to the problems encountered. The Council unanimously agreed on the motion to strive to achieve inter-agency standardization through whatever means are available.

8. **ARB Place In Therapy (PIT) Recommendation –** The Council discussed a draft of the Angiotensin II receptor blocker (ARB) place in therapy recommendations. The Council had requested guidelines for ARB use at the last meeting as part of their decision to pursue a procurement strategy to select one of these agents for BCF status, as these agents are significantly more expensive than ACE inhibitors, and their place in therapy is not yet clearly defined. The PIT recommendation is intended to aid practitioners in the appropriate use of the ARBs, and provides a summary of the literature for use in hypertension, congestive heart failure, and diabetic nephropathy. COL Downs expressed concern about the designation of ARBs as the initial agents of choice for diabetic nephropathy in Type 2 diabetes. Members also expressed concern about placement of pricing information at the beginning of the document. The Council asked the Pharmacoeconomic Center (PEC) to work with COL Downs to revise the document and report back at the next meeting.

9. **DRUG CLASS EVALUATIONS TO DETERMINE CLINICALLY ACCEPTABLE CONTRACTING/FORMULARY STRATEGIES**:

A. Bisphosphonates — Oral bisphosphonates are the most frequently prescribed drug therapy for the treatment of osteoporosis. Alendronate and risedronate are currently indicated for the prevention and treatment of postmenopausal osteoporosis, glucocorticoid-induced osteoporosis, and Paget's disease. Alendronate is also indicated for osteoporosis in men. Both bisphosphonates are available in daily or weekly dosing formulations. The weekly dosage forms account for the majority of DoD usage. The DoD now spends about $5 million a month on oral bisphosphonates across all outpatient pharmacy points of service. Bisphosphonates rank number 8 in Military Treatment Facility (MTF) overall drug expenditures.



MHS Bisphosphonate Monthly Expenditures

Source: PDTS & Prime Vendor Data

Therapeutic Interchangeability:

- *Efficacy* – There are no head-to-head trials that compare fracture rates for alendronate and risedronate. Tables 1-4 in Appendix A show 'funnel' diagrams of the relative risk of vertebral and non-vetebral fractures for each drug compared to placebo from a recently published meta-analysis. Table 5 in Appendix A shows the results of studies that compared each drug to placebo for hip fractures. In their responses to a PEC survey, 50 out of 57 DoD providers stated that they believe alendronate and risedronate have similar efficacy. The Council concluded that alendronate and risedronate have similar efficacy in reducing fractures.
- *Safety/Tolerability* – Oral bisphosphonates are well tolerated when taken according to manufacturers' recommendations. Clinical trials show adverse event rates that are not statistically different from placebo, but gastrointestinal disturbances (sometimes severe) can occur if patients do not follow dosing instructions. Two head-to-head trials examined the tolerability of alendronate and risedronate. The first head-to-head trial compared 28-day regimens of alendronate 40 mg and risedronate 30 mg. The study failed to find a statistically significant difference in endoscopically diagnosed ulceration or patient-reported GI toxicity. The second study evaluated 14-day regimen of alendronate 10 mg and risedronate 5mg. A significant difference in endoscopically diagnosed ulceration was found for gastric ulcers (13.2% for alendronate group and 4.1% for risedronate group), but not for esophageal or duodenal ulcers. No significant difference in patient-reported upper GI adverse events was seen between each group and no correlation was found between upper GI events and the presence or absence of gastric or esophageal ulcers. An accompanying editorial regarding this study stated, "the clinical relevance of small endoscopic ulceration observed is unclear." The editorial also stated, "it is controversial whether acute endoscopically diagnosed superficial mucosal injury (including gastric ulcers as small as 3mm in diameter) is at all related to subsequent development of serious clinical consequences..." The Council concluded that alendronate and risedronate are similar in regard to safety and tolerability.

Coverage of Clinical Needs: Although alendronate is the only bisphosphonate that has an FDA-approved indication to increase bone mass in men with osteoporosis, an analysis of DoD prescription data showed that the percent of total days of therapy dispensed to men were similar for both alendronate and risedronate. The difference in FDA-approved indications does not

appear to affect usage of the two drugs in clinical practice. The Council concluded that either agent would likely meet the clinical needs for more than 90% of the population requiring treatment.

Provider Acceptance:

- *New Starts*- The majority (48 - 7) of providers responding to a PEC survey were willing to use either agent equally. Some providers preferred alendronate because of its indication for osteoporosis in men and perception of greater efficacy in reducing hip fractures.
- *Patient Switches* – The majority (43 - 16) of providers were also willing to switch current patients to the selected agent if the switch could be done at a regularly scheduled visit rather than incurring an extra visit.

The Council voted unanimously to support any contracting/formulary strategy (to include a closed class contract with patient switches) designed to lower the cost of bisphosphonate drug therapy for DoD.

B. Glaucoma Agents — Primary open-angle glaucoma (POAG) is the most common type of glaucoma. POAG leads to progressive visual field loss followed by central field loss, usually but not always in the presence of elevated intraocular pressure (IOP). Lowering IOP remains the primary modality for therapy for POAG and appears to protect against further damage. The therapy for POAG often is characterized by poor compliance since POAG is entirely asymptomatic.

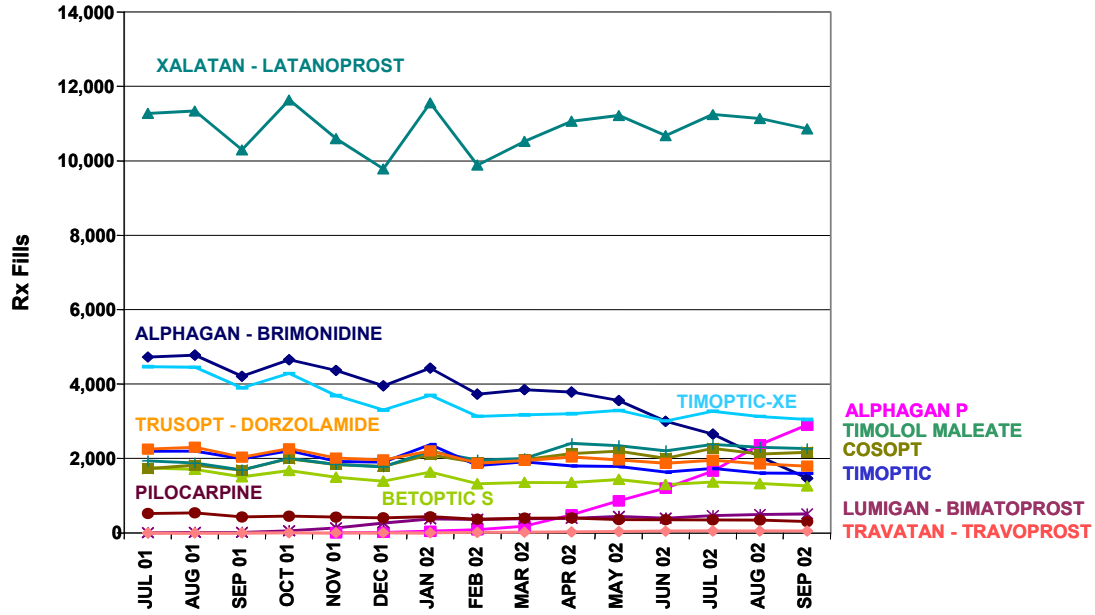
High utilization of latanoprost (Xalatan) and timolol maleate gel (Timoptic XE), which are not currently on the BCF, and new products for the treatment of glaucoma, triggered this class review. The PEC also received a request from the field to delete pilocarpine from the BCF due to low utilization.

Currently the BCF contains the following glaucoma medications:

- *Topical β-blocker* (timolol 0.25%, 0.5% ophth soln – Alcon Labs brand only- DoD mandatory source contract): This drug effectively lowers IOP by 27-35% and is considered initial drug therapy in primary open angle glaucoma (POAG) and ocular hypertension, except in patients with cardiac or pulmonary contraindications. Topical β-blockers have few ocular side effects, however major side effects are similar to those associated with systemic beta-blocker therapy (worsening of heart failure, bradycardia, heart block, and increased airway resistance). The current BCF listing does not include timolol maleate gel (Timoptic XE), which is applied once daily vs. the twice-daily ophthalmic solution.
- *Sympathomimetic agent* (brimonidine 0.15% ophth soln – Alphagan P): Efficacy studies report a decrease in IOP of 20-27%. These agents are indicated for both short-term treatment to prevent intraocular pressure (IOP) spikes after laser trabeculoplasty and for chronic treatment in patients with ocular hypertension or POAG. The Alphagan Purite 0.15% formulation has a 41% lower rate of ocular allergy than brimonidine 0.2% resulting in a reduced rate of discontinuation due to adverse events.
- *Miotic* (pilocarpine ophthalmic solution): Efficacy studies report a decrease in IOP of 20-30%. Pilocarpine's unique place in therapy is in the use for glaucoma emergencies such as acute angle closure glaucoma and glaucoma laser surgery.

MTF RX Fills for Anti-glaucoma Agents

(July 01-September 02)



Source: PDTS

The BCF does not contain medications in the following classes of glaucoma medications:

- *Carbonic anhydrase inhibitors (CAI):* Acetazolamide is the most commonly used oral CAI. These drugs effectively lower IOP by 20-40% with low ocular adverse effects, however their systemic adverse effects hamper their use in the management of glaucoma. These agents are contraindicated in patients with renal failure, hepatic insufficiency, lowered plasma potassium and sodium levels, and chronic obstructive pulmonary disease. Due to low utilization of these agents and their poor tolerability these agents were not considered for BCF inclusion.
- *Prostaglandins (latanoprost, bimatoprost, travoprost, unoprostone)*: These agents are indicated for the reduction of elevated IOP in patients with open angle glaucoma or ocular hypertension who are intolerant of other IOP-lowering medications or insufficiently responsive to another IOP-lowering medication.

Despite their "second line" place in therapy, the prostaglandin class has been targeted for a procurement strategy due to increased utilization, increased cost, and potential for price competition due to the number of agents in the market basket. A significant price reduction might be achieved through a procurement initiative that places one or more prostaglandin on the BCF. The following analysis focuses on prostaglandins.

Prostaglandin Clinical Efficacy: Clinical trials have not demonstrated *a priori* that treating to predefined IOP targets preserves vision. Nor have there been clinical trials demonstrating that more aggressive IOP lowering targets result in preservation of vision. Limited observational data suggests that patients achieving lower IOP with combined surgical and medical treatment experience less visual field deterioration. Finally, there are no clinical trials comparing the amount of preservation of visual acuity afforded by the different topical ophthalmic drops. All

comparisons of efficacy rely on the surrogate marker of lowering IOP. A measurement error of 1-2 mmHg may be seen in IOP measurement.

Randomized controlled clinical trials demonstrated that bimatoprost, travoprost, and latanoprost given once daily produced equal or superior efficacy to twice-daily timolol. Appendix B shows the results of prostaglandin head-to-head comparison trials.

Prostaglandin Safety and Tolerability: Both bimatoprost and travoprost have shown to have statistically significant more cases of hyperemia and pruritis than latanoprost. Mean hyperemia scores in all treatment groups, however, were in the trace to mild hyperemia range. Local adverse effects seem to be unassociated with long-term effects or increased discontinuation of medications in the clinical trials. See table 1 for adverse events related to prostaglandin ophthalmic agents found in head-to-head comparison trials.

Table 1: Adverse events related to prostaglandin ophthalmics

Study	Adverse Event	Timolol 0.5%	Latanoprost 0.005%	Bimatoprost 0.03%	Travoprost 0.004%	Unoprostone 0.12%
Tin Aung 2001	Ocular irritation	N/A	12/37 (32%)	N/A	N/A	21/34 (62%)
	Iris pigment changes	N/A	0	N/A	N/A	0
	Eye redness	N/A	13/37 (35%)	N/A	N/A	6/34 (18%)
Netland 2001	Hyperemia*	14%	27.6%	N/A	49.5%	N/A
	Iris pigment changes*	0%	5.2%	N/A	3.1%	N/A
	Eyelash changes*	3.1%	25.8%	N/A	57.1%	N/A
Gandolfi 2001	Hyperemia*	N/A	14.2%	36.1%	N/A	N/A
	Iris pigment changes	N/A	Not reported	Not reported	N/A	N/A
	Eyelash changes*	N/A	4.4%	12.6%	N/A	N/A
DuBiner 2001	Hyperemia	N/A	3/21 (14%)	3/21 (14%)	N/A	N/A
	Iris pigment changes	N/A	Not reported	Not reported	N/A	N/A
	Eyelash changes	N/A	Not reported	Not reported	N/A	N/A

Tin Aung: One patient on latanoprost did not complete the study because of severe swelling of the eyelids.
Netland: No reported discontinuations in article due to adverse events
Gandolfi: Six bimatoprost patients discontinued due to adverse events: 4 due to ocular events, 2 due to systemic and ocular adverse events. Five latanoprost patients discontinued due to adverse events: 2 due to ocular events, 3 due to systemic and ocular adverse events.
DuBiner: One patient discontinued from the latanoprost group because of body aches and stomach cramps. Two patients discontinued from the bimatoprost group because of ocular symptoms (eyelid edema, conjunctival hyperemia, foreign body sensation) or nausea and ocular symptoms (eyelid edema, asthenopia, conjunctival hyperemia).

Therapeutic Interchangeability: Unoprostone is not considered therapeutically equivalent to latanoprost, bimatoprost or travoprost because of its lower efficacy (Appendix B, Table 1) and twice-daily dosage schedule. Latanoprost, bimatoprost, and travoprost have each been demonstrated to provide statistically significantly greater reductions in IOP than timolol. Head-to-head trials did not show statistically significant differences between latanoprost and travoprost 0.004% or between latanoprost and bimatoprost in lowering IOP. Post-hoc subgroup analysis of the data from the clinical trial by Netland et al. showed that travoprost lowered IOP more than latanoprost at specific time points among African American study subjects. However, the IOP differences in the travoprost vs. latanoprost group in African American patients during treatment may have resulted from preexisting differences in baseline IOPs, some of which were statistically significant. If the results were expressed as a change in IOP from baseline measurements, no significant difference in efficacy of the drugs in African American population exists. The effect of travoprost in the African American population requires further analysis and clarification.

Both bimatoprost and travoprost may have more hyperemia and pruritis than latanoprost, but less iris or eyelash pigment changes. Mean hyperemia scores in all treatment groups were in the trace and mild hyperemia score. Local adverse effects seem to be unassociated with long-term effects or increased discontinuation of medication in the clinical trials.

Latanoprost currently requires refrigeration prior to dispensing to maintain a 36-month shelf life, while bimatoprost and travoprost do not. The manufacturer of latanoprost has stated their belief that the FDA will eliminate this requirement in early 2003.

Coverage of Clinical Needs: Latanoprost has 95% of the market share in MTFs and 79% in the MHS (MTF, NMOP, and retail). To date there are no studies to show that if one patient fails to respond to one prostaglandin that they will respond to another.

Provider Acceptance: Responses from ophthalmologists agreed that a prostaglandin should be on the BCF. Currently 75% of MTF formularies contain latanoprost, 9% bimatoprost, 4% travoprost, and 2% unoprostone. Providers stated that they are standard second line therapy in the treatment of glaucoma and first line therapy when beta-blockers are contraindicated. Two of the five ophthalmologists preferred latanoprost to other prostaglandins; the other three had no preference. Latanoprost has been on the market longer than the other prostaglandins, so providers have more confidence in its safety profile. Providers were uniformly opposed to a contract that would require patients to be switched from one prostaglandin to another.

Although pilocarpine has low utilization in the MTFs the Council unanimously voted to maintain its BCF status due to its unique place in therapy in the treatment of acute closed angle glaucoma. Timoptic XE has a utilization rate that is consistently higher than the contracted timolol ophthalmic solution, once daily vs. twice daily dosing that may potentially increase compliance, and a current contract price that makes its cost comparable to the ophthalmic solution. The Council unanimously voted to add Timoptic XE to the BCF. The Council voted unanimously to add a prostaglandin to the BCF utilizing a closed class contracting strategy competing latanoprost, bimatoprost and travoprost, which would not require patients to be switched from one agent to another.

10. DRUG/DRUG CLASS EVALUATIONS TO DETERMINE BCF ADDITION

A. *Atypical antipsychotics* –In November 2001, the DoD P&T Executive Council removed oral haloperidol from the BCF due to decreasing utilization and the perception that primary care providers in the outpatient setting do not commonly prescribe antipsychotics. The BCF does not currently include any agents approved specifically for the treatment of psychosis.

After considering the following, the Council agreed that one or more atypical antipsychotic agents are needed on the BCF:

- The PEC received two requests from MTF providers to add one or more atypical antipsychotics to the BCF (one for olanzapine and one for olanzapine and risperidone). The requestors argued that: atypicals are first-line agents in treating psychotic manifestations of psychiatric disorders, they are utilized by civilian and military psychiatrists and should be readily available for continuation treatment, and that typical antipsychotics are no longer standard of care for patients who need long-term therapy.
- All eleven MTF providers (10 psychiatrists, 1 internist) who responded to a PEC survey responded “yes” to the following question: “In your opinion, is there a need to make one or more atypical antipsychotic uniformly available across the MHS by adding it or them to the BCF (which would require all MTFs to add them to their formularies)?”

- Utilization of atypical antipsychotics at MTFs is increasing, both in absolute number of prescriptions and relative to prescriptions for typical antipsychotics.
- An analysis of formulary information from 102 MTFs revealed that 69 facilities had at least one atypical antipsychotic on formulary.
- Atypical antipsychotics are termed atypical due to a decreased propensity to induce extrapyramidal side effects (EPS) and decreased risk of tardive dyskinesia relative to typical antipsychotics. Atypical antipsychotics may also be more effective than typical antipsychotics for treating the negative symptoms of schizophrenia and may be effective in patients refractory to typical antipsychotics.
- Atypical antipsychotics are used for multiple conditions besides schizophrenia (e.g., bipolar mania, depression with psychosis, acute agitation in the elderly; symptoms of dementia including agitation, hyperactivity, hallucinations, suspiciousness, hostility and uncooperativeness; bipolar disorder, anxiety disorders, developmental disorders, autism, aggression/self injurious behavior, and Tourette's syndrome), some of which may be treated by primary care providers. In addition, primary care providers may continue medications written by specialists.
- Addition of an atypical antipsychotic to the BCF may foster the recapture of prescriptions from the retail point of service. However, the potential for recapture may be somewhat limited by the fact that civilian providers write about 50% of prescriptions for atypical antipsychotics filled by MTFs. Overall, civilian providers write about 40% of the prescriptions filled by MTFs (based on prescription data from the Uniformed Services Prescription Database).

The Council unanimously approved a recommendation that the PEC complete its review of the atypical antipsychotics and make a specific recommendation to the Council at the next meeting regarding the number of agents that should be added, and which agent(s) represent the most cost-effective choice.

B. *Oral contraceptives* – The BCF does not currently include an oral contraceptive (OC) with low estrogen content (20 mcg ethinyl estradiol [EE]). OCs with low estrogen content have a lower risk of venous thromboembolism and other adverse events. The two monophasic OCs with 20 mcg ethinyl estradiol most commonly used in MTFs are norethindrone/EE/ferrous fumarate 1/0.02 mg and levonorgestrel/EE 0.1/0.02 mg. The brand of norethindrone/EE/ferrous fumarate 1/0.02 mg most commonly used in MTFs is Loestrin FE, which is available at a cost of about $0.21 per cycle. A generic equivalent for Loestrin FE, Microgestin FE, is available but is not currently listed on the FSS. The brand of levonorgestrel/EE 0.1/0.02 mg most commonly used in MTFs is Alesse, which is available at a cost of about $6.03 per cycle. A generic equivalent for Alesse, Aviane, is available but is not currently listed on the FSS. Aviane is the most commonly used product in this category in the retail network and NMOP.

After noting that previous attempts to contract for OCs met with limited success, the Council voted to add norethindrone/EE/ferrous fumarate 1/0.02 mg (Loestrin FE or its generic equivalent) to the BCF.

The Council was also informed that a generic version of ethinyl estradiol 35/norethindrone 0.5/0.75/1 mg oral (Ortho-Novum 7/7/7) is expected to be available early in 2003. The Council has previously discussed the difficulty of obtaining the best price for this product, since lower priced "clinic" packs are available only by direct purchase from the manufacturer, not from Prime Vendor, and the previous depot contract expired at the end of February 2002.

C. *Paroxetine controlled release (Paxil CR)* – Paxil CR is a controlled release formulation of paroxetine that shifts absorption to the small intestine and controls release of paroxetine over 4-5 hours. Because of reduced bioavailability, Paxil CR is formulated as 12.5, 25, and 37.5 mg tablets, which are equivalent to 10, 20, and 30 mg of immediate release paroxetine, respectively. Paxil CR was added to the NMOP formulary in May 2002, but it was not added to the BCF because the information available at that time did not demonstrate that Paxil CR offered any significant advantages compared to Paxil. Paxil CR was to be reviewed again at the November 2002 meeting for potential addition to the BCF.

The clinical trials of Paxil CR for major depressive disorder (MDD) included Paxil treatment arms, but the studies were not designed to compare the efficacy of Paxil CR to the efficacy of Paxil. The clinical trials of Paxil CR for treatment of panic disorder did not include Paxil treatment arms.

Pooled data from MDD trials showed that 23% of Paxil patients and 14% of Paxil CR patients reported nausea during the first week of therapy (a statistically significant difference). Statistically significant differences were not seen in the percentages of patients reporting nausea during weeks 2, 3, 4,or 12 of the trials. According to manufacturer information, the dropout rate in the two adult MDD trials was 6% for placebo, 10% for Paxil CR (non-significant difference), 16% for Paxil (significantly higher than placebo). Paxil CR and Paxil were not directly compared. The percentage of patients dropping out due to nausea was 3.7% in the Paxil CR arm and 0.5% in the placebo arm, but patient dropouts due to nausea were not reported for the Paxil arm.

Provider opinion survey results (12 total; 9 from psychiatry) are summarized as follows:

- 1 “add”
- 6 “don’t add”
- 3 “not sure/no opinion”
- 1 “if replaces Paxil at less cost
- 1 “may be some value; slower release may decrease dizziness, vertigo side effects”

Usage of Paxil CR is increasing in the retail network and NMOP, but very few prescriptions for Paxil CR are filled at MTFs. The FSS prices for Paxil CR and all strengths of paroxetine immediate release except the 40 mg tablet are currently the same: $1.31 per tablet ($1.49 for 40 mg). The prices for Paxil and Paxil CR are similar to FSS prices for other SSRIs, with the exception of the $0.04 contract price for generic fluoxetine 20 mg. It is unclear when a generic version of paroxetine will become available; patent litigation has been in progress since 1998.

The Council concluded that Paxil CR has not been shown to offer any significant clinical advantages over Paxil or other SSRIs on the BCF. The four SSRIs currently on the BCF are more than adequate to meet the clinical needs of DoD beneficiaries. The Council also noted that Paxil CR offers no economic advantage over Paxil or other SSRIs on the BCF and that generic fluoxetine is much less expensive than Paxil CR. Inexpensive generic paroxetine will eventually become available. The addition of Paxil CR to the BCF would likely result in higher costs in the long run, because Paxil CR users would be less likely than Paxil users to switch to generic paroxetine when it becomes available. The Council voted unanimously to exclude Paxil CR from the BCF listing for paroxetine. MTFs are not required to add Paxil CR to their formularies.

D. *Escitalopram (Lexapro; Forest Labs)* – Escitalopram is the S-isomer of citalopram (Celexa; Forest Labs). Citalopram is a racemic mixture (equal amounts of S- and R-citalopram). The s-isomer of citalopram appears to be solely responsible for the antidepressant properties of citalopram. The r-isomer exhibits little binding to serotonin receptors and demonstrates no antidepressant properties. Whether or not the r-isomer results in any clinically significant effect is unclear. Comparable efficacy of 10 mg escitalopram and 40 mg citalopram in clinical trials has led to the theory that the r-isomer may impede binding of the s-isomer at the serotonin receptor or impede receptor function in some other way. The r-isomer does demonstrate affinity for histamine receptors, which could theoretically increase side effects (e.g., sedation) with the racemic mixture compared to the s-isomer alone.

The Committee reviewed escitalopram for addition to the NMOP Formulary in May 2002, just prior to FDA approval. Review of escitalopram for the BCF was tabled until after the drug had been approved by the FDA and was on the market. There are currently four SSRIs on the BCF: citalopram (Celexa); generic fluoxetine - excludes Prozac, Sarafem & Prozac Weekly; paroxetine (Paxil); and sertraline (Zoloft). Forest Labs, which manufactures both citalopram and escitalopram, has ceased promoting citalopram (Celexa), although it will continue to be available. Forest has stated that it does not advocate switching patients who are stable on citalopram or other antidepressants to escitalopram.

Escitalopram is indicated for the treatment of major depressive disorder. The manufacturer's dossier of clinical information for escitalopram includes summaries of the following studies of escitalopram in the treatment of depression:

- Two published 8-week, fixed dose trials, one comparing escitalopram 10 mg to placebo and the other comparing escitalopram 10 mg, escitalopram 20 mg, or citalopram 40 mg to placebo.
- Unpublished data from two 8-week flexible-dose trials comparing escitalopram and citalopram to placebo.
- Unpublished data from a long-term (36 week) extension study
- A published analysis of pooled trial data focusing on anxiety symptoms in depressed patients

Unpublished data addressing the use of escitalopram in generalized anxiety disorder, social anxiety disorder, and panic disorder are also available.

The following table summarizes published efficacy data for escitalopram:

Reference	Trial Design	Primary Endpoint	Results
Burke et al. (J Clin Psych 2002; 63:331-6)	Double-blind, RCT in outpatients aged 18-65 years, with MDD for at least 4 weeks 1-week washout, period, then randomized to 8-week treatment with E10 (n=118), E20 (n=123), C40 (n=125), or placebo (n=119)	Change from baseline in MADRS score at Week 8	Placebo: -9.4 E10: -12.8* E20: -13.9* C40: -12.0*
Wade et al (Int Clin Psycopharmacol 2002; 17(3):95-102)	Double-blind, RCT in primary care patients aged 18-65 years, with MDD for at least 4 weeks 1-week washout period, then randomized to 8-week treatment with E10 (n=191) or placebo (n=189)	Change from baseline to final assessment of MADRS score	Placebo: -13.6 E10: -16.3*
Gorman et al (CNS Spectrums 2002: 7 (suppl 1):40-4)	Pooled data from fixed dose study (E10, E20, C40, placebo) & two flexible dose studies (E10-20, C20-40, placebo) combined n = 1321	Mean change in MADRS score at Week 8	Placebo: -11.2 E: -13.8* C: -13.1*

*p<0.05 vs. placebo
RCT = randomized controlled trial; MDD = major depressive disorder; MADRS = Montgomery Asberg Depression Rating Scale ;E10 = escitalopram 10 mg daily; E20 = escitalopram 20 mg daily; C40 = citalopram 20 mg daily

In the pooled data analysis, two different assessments were evaluated, with two additional analyses of one measure: the Montgomery Asberg Depression Rating Scale (MADRS), the MADRS among patients severely depressed at baseline, the MADRS Inner Tension Item Score, & CGI-I. In each case, the mean change from baseline was determined. For each measure, the mean change from baseline appeared to be significantly different than placebo at earlier time points for escitalopram than for citalopram. Given limited data and the *post priori* nature of the analysis, the existence of a real difference between escitalopram and citalopram with respect to onset of therapeutic effect remains unclear, as do the effect size and clinical importance of any such difference.

Escitalopram appears to have the same generally favorable drug interaction profile as citalopram. Based on available clinical trial data, there is little evidence of differences between the two products with respect to side effect profile. In an 8-week, fixed dose trial (Burke et al) comparing placebo, escitalopram 10 mg, escitalopram 20 mg, and citalopram 40 mg, withdrawal rates due to adverse events were 2.5%, 4.2%, 10.4%*, and 8.8%*, respectively (*p<0.05 vs. placebo). Somnolence occurred in less than 10% of patients in either group.

Provider opinion survey results (12 total; 8 from psychiatry):

- 2 “add”
- 7 “don’t add”
- 1 “too early to tell”
- 1 “add if it’s cheaper”
- 1 “don’t know”

Usage of escitalopram is increasing in the retail network, but very few prescriptions are filled at MTFs or in the NMOP. Forest has offered BPA prices for citalopram and escitalopram. Approval of a generic version of citalopram is not likely until 2005; citalopram’s new molecular entity patent expires July 2003 with a pediatric extension until January 2004.

The Council concluded that escitalopram does not offer significant clinical advantages over citalopram or other SSRIs on the BCF. The four SSRIs currently on the BCF are more than adequate to meet the clinical needs of DoD beneficiaries. The Council also noted that escitalopram offers no economic advantage over citalopram or other SSRIs on the BCF and that generic fluoxetine is much less expensive than escitalopram. Inexpensive generic citalopram will eventually become available. The addition of escitalopram to the BCF would likely result in higher costs in the long run, because escitalopram users would be less likely to switch to generic citalopram when it becomes available. The Council voted unanimously to exclude escitalopram from the BCF. MTFs are not required to add escitalopram to their formularies.

E. *Methylphenidate extended release capsules (Metadate CD)* – The Council reviewed Metadate CD for inclusion on the BCF, secondary to new clinical information and a BPA offer from Celltech Pharmaceuticals in exchange for placement on the BCF. The Council voted not to add Metadate CD to the BCF. The reasons for this decision were:

- The new clinical information presented by Celltech did not demonstrate that Metadate CD was clinically superior to Concerta.
  - The information provided was a summary of unpublished data that was not peer-reviewed.
  - There were concerns about the study design, statistical methods, and reporting of the results.
  - The assessment tools used to demonstrate the statistical superiority of Metadate CD are not routinely used in clinical practice, making it difficult to determine the clinical relevance of the research findings.
  - These assessment tools appeared to show that the active comparator Concerta was more efficacious at 12 hours post dose.
- Concerta was added to the BCF to take advantage of its long duration of action, which hopefully would eliminate the need for additional immediate release (IR) methylphenidate later in the school day. A subsequent analysis of PDTS data revealed that 7% of patients receiving Concerta required additional doses of IR methylphenidate later in the school day, compared to 43% receiving Ritalin SR. The data provided to the Council suggested that Metadate CD has a shorter duration of action than Concerta; some members of the Council were therefore concerned that it would be less effective than Concerta in eliminating the need for additional doses of IR methylphenidate later in the day.
- MTF providers responded negatively to the proposal to add Metadate CD to the BCF.
- The offered prices in the BPA proposal would not provide a substantial cost avoidance. While the daily cost of therapy would be lower for Metadate CD at low doses of medication, Metadate CD would actually still be more expensive at higher doses. Also, this price consideration does not take into account the increased likelihood of having to add afternoon or evening doses of immediate release methylphenidate to the regimen. The Council also felt it would be extremely unlikely that Metadate CD would achieve a 35% market share given that most providers surveyed were very pleased with the once-daily stimulant currently on the BCF (Concerta).

F. *Niacin extended release tablets (Niaspan)* – Since the publication of the National Cholesterol Education Program's Adult Treatment Panel III (ATP-III) last year, increasing focus is placed on positively affecting the entire lipid profile by using statin adjuncts for patients with mixed dyslipidemias. The DoD P&T Executive Council evaluated Niaspan (prescription only, extended–release niacin tablets) shortly after its FDA approval. The result was not to add Niaspan to the BCF at that time because sufficient data did not exist to justify its benefit over niacin immediate release therapy. Niacin immediate release oral (OTC) is currently on the BCF.

Since Niaspan's approval, clinical trials using Niaspan in combination with simvastatin and in type 2 diabetics have been published reinforcing niacin's beneficial effects in these populations. The PEC completed a database analysis assessing the tolerability of Niaspan and immediate release niacin treated patients. Niacin-naïve patients beginning Niaspan or other niacins in January and February of 2002 were identified and included for analysis. Patients remaining on therapy at least 6 months later were deemed a success for this analysis. In the Niaspan group, 55% (1676/3044) of the Niaspan group were successful versus 37% (282/769) of the other niacin group were successful in tolerating niacin therapy using continued therapy as the marker.

Niaspan is currently on approximately 40% of MTF formularies and is also on the VA National Formulary. The drug cost for Niaspan remains significantly more than immediate release niacin (~$0.30/tab of Niaspan vs. $0.02/tab of immediate release niacin). Fibrates are the mostly likely alternative to niacin therapy, and the drug costs are comparable ($0.20-$0.85/day) to Niaspan. Fibrates are better tolerated than niacin, but niacin is more effective at raising HDL and is generally considered less likely to cause myopathy than fibrates. Responses from healthcare providers at MTFs were overwhelmingly in favor of adding Niaspan to the BCF.

The Council concluded that niacin therapy remains a recommended treatment in many dyslipidemias. Niaspan significantly improves patient's ability to remain on niacin compared to older formulations, thus reducing the number of patients requiring less effective, and possibly less safe, alternatives.

The Council unanimously voted to replace immediate-release niacin with Niaspan on the BCF. MTFs may continue to have other niacin products on their formularies.

11. DRUG/DRUG CLASS EVALUATIONS TO DETERMINE BCF DELETION

A. *Guaifenesin extended release tablets* – Based on the following information, the Council voted to remove guaifenesin 600 mg extended release from the BCF. MTFs may decide whether or not to remove the product from their formularies.

- As of 12 July 2002, Mucinex (Adams Labs) became the first single ingredient guaifenesin extended release product to be 1) approved as safe and effective under a New Drug Application (NDA) and 2) to be approved as an over-the-counter (OTC) product.
- The FDA has determined that single ingredient guaifenesin extended release drug products are new drugs and require an approved application for marketing. The Durham-Humphrey Amendment of 1951 to the Food, Drug, and Cosmetic Act (FDCA) forbids simultaneous marketing of products of the same strength, dose, and indication for both OTC and prescription use. Manufacturers can no longer market single ingredient guaifenesin extended release products as prescription drugs. In October 2002, the FDA sent warning letters to manufacturers and distributors explaining that currently marketed single ingredient guaifenesin extended release products without an approved application are considered

misbranded and in violation of section 505(a) of the FDCA. The FDA requested action plans to bring their products into legal compliance. At least one affected manufacturer is known to be petitioning this action, but it is not known if any single ingredient guaifenesin extended release product other than Mucinex will continue to be available in the near future.

- The Council reviewed the issue of OTC coverage on the BCF at the May 2002 meeting. Although TRICARE policy (which limits coverage of OTCs to insulin, diabetic supplies, and vitamins when used as a specific treatment of a medical condition) does not govern the availability of OTC products at MTF pharmacies, the Council has historically refrained from adding OTC products to the BCF. In addition, the Uniform Formulary Proposed Rule states, "The Basic Core Formulary (BCF) is a subset of the Uniform Formulary and is a mandatory component of all MTF pharmacy formularies." If the BCF is to be a subset of the Uniform Formulary, the inclusion of OTCs on the BCF will be limited by TRICARE policy. The Council voted not to add any additional OTC products to the BCF beyond those identified in the TRICARE Policy Manual. The Council encouraged MTFs to continue providing OTC medications when they represent cost-effective alternatives to legend drugs.

As an OTC product, Mucinex will not be available from the retail network or NMOP.

12. MTF REQUESTS FOR BCF CHANGES

A. Requests to add zonisamide (Zonegran) to the BCF – A MTF provider requested the addition of zonisamide to the BCF. The rationale for the request was that zonisamide is a useful and safe drug to use for diabetic peripheral neuropathy, chronic headache syndromes, restless leg syndrome, and chronic back pain. No supporting literature was presented along with the request. CAPT Torkildson performed the analysis and presented the findings to the Council for consideration.

The FDA approved zonisamide in March 2000 as "adjunctive therapy in the treatment of partial seizures in adults with epilepsy". This approval was based on three registration trials that demonstrated statistical and clinical superiority over placebo in treating patients with partial seizures who were inadequately controlled on at least one other antiepileptic drug (AED). There are no data at present supporting its use as monotherapy for partial seizures. Also, despite the statement in the BCF request that zonisamide was useful for the off label indications listed, there are no published data supporting its utility in treating any of the listed conditions. One open-label study was identified that suggested that zonisamide might be of some benefit in treating patients with Parkinson's disease, but this had not yet been confirmed.

Analysis of available safety data raised some concerns. Zonisamide is a sulfonamide derivative, and is contraindicated in patients with an allergy to sulfonamides. Three cases of severe hematologic adverse events (2 cases of aplastic anemia, 1 case of agranulocytosis) have been reported in Japan, where the drug has been on the market for approximately 10 years. Based on the number of patient-years of exposure, the frequency of this adverse event is higher than that observed in the general population. Several cases of oligohydrosis and hyperthermia have been reported in pediatric patients treated with this agent; the FDA added a bolded warning to the package insert in June 2002 notifying prescribers of this concern. Additionally, 4% of 991 patients treated with the drug during its development phase developed renal stones, and in several studies it was noted that patients treated with zonisamide had a mean increase in their BUN and creatinine of 8%, compared to essentially no change in the placebo group. Of particular concern was the fact that these values did not return to baseline following discontinuation of the drug.

Regarding tolerability, it was noted that in several controlled trials the discontinuation rate due to adverse events in the zonisamide group was twice that of the placebo group (12% vs. 6%), while a separate analysis of several trials with a total of 1,336 treated patients revealed that 21% of patients discontinued therapy due to adverse events.

Finally, a utilization analysis revealed that only 61 MTFs filled prescriptions for zonisamide in FY02, only 23 MTFs filled more than 6 zonisamide prescriptions in that year, while 26 sites filled 3 or fewer. During that same period a total of 3,800 prescriptions for zonisamide were filled in the retail network.

Based on this review, the PEC concluded that there was insufficient evidence to support the use of zonisamide for the conditions outlined in the BCF request. Additionally, the level of concern regarding safety is higher for zonisamide than for other products, such as gabapentin, used for the treatment of these conditions. Gabapentin was added to the BCF in August 2002, providing uniform availability of a similar product with a more acceptable safety and efficacy profile. Finally, the overall utilization of this product across the MHS appears insufficient to require all facilities to make this product available. The PEC recommended that zonisamide not be added to the BCF. The Council unanimously approved this recommendation.

B. *Request to add pimecrolimus (Elidel) to the BCF–* A MTF provider requested that pimecrolimus, a topical immunomodulator (TIM), be added to the BCF. This is a new class of topical, nonsteroidal medications indicated for the treatment of atopic dermatitis (AD). Tacrolimus (Protopic) has been available since December 2000, and is FDA approved for treatment of moderate to severe atopic dermatitis. Pimecrolimus (Elidel) has been available since early 2002, and is FDA approved for the treatment of mild to moderate atopic dermatitis. Atopic dermatitis starts in early childhood and causes significant quality of life issues related to the pruritis and appearance of the rash. Ninety percent of AD patients have mild to moderate severity of disease and the rest are moderate to severe.

Efficacy: Randomized-controlled trials demonstrate that both agents are more efficacious than placebo in the treatment of AD. Tacrolimus appears to be as efficacious as a medium potency topical corticosteroid, where pimecrolimus is as efficacious as a low potency topical corticosteroid.

Safety/tolerability: Neither drug has clinically significant adverse effects, which cause the patients to discontinue use. The drugs are not systemically absorbed, so can be used long term without the worries associated with long-term topical corticosteroids (CS) use. They can also be used in sensitive body areas such as the face and intertriginous regions where one would not want to use topical CS.

Other: Provider response was markedly positive regarding the potential of having an alternative to topical steroids for patients that require one. At the same time, providers noted that these will not take the place of the low potency topical CS and the usual initial therapies for mild AD. Pimecrolimus prescription fills in all points of service (MTF, NMOP, and retail) are increasing, with the majority of its use in the very young (ages 0 - 4) and elderly (ages 65+) population. Providers feel that usage will continue to increase significantly in this class.

The Council agreed that topical immunomodulators (TIMS) are a unique class and have a substantial place in therapy for the treatment of AD, however there is concern regarding the cost of these agents and the potential for misuse. The Council agreed to consider one or both of these medications for addition to the BCF at their next meeting. They asked the PEC to explore procurement options and report back in three months.

13. DEPLOYMENT FORMULARY AND SUPPORTING HOMELAND SECURITY (JRCAB) – LTC Marc Caouette presented information and a short brief on homeland security and deployment formulary to the DoD P&T Executive Council.

14. ADJOURNMENT

The meeting adjourned at 1530 hours on 20 November 2002. The next meeting will be held at Fort Sam Houston, TX at 0800 on Wednesday, 6 March 2003. All agenda items should be submitted to the co-chairs no later than 14 February 2003.

APPENDIX B: PROSTAGLANDIN CLINICAL EFFICACY - HEAD-TO-HEAD COMPARISON TRIALS

Table 1: Latanoprost vs. Unoprostone

Trial	Study Design	Latanoprost	Unoprostone	Duration	N	Baseline IOP (SEM)		End point IOP Reduction1 (SEM)	
						L	U	L	U
Tin Aung 2001	Randomized double-masked crossover	0.005% once daily	0.12% twice daily	2 tx periods of 1 month separated by a 3 week washout period	56	22.3 (0.5)	23.2 (0.4)	6.1 (0.5) p<.001	4.2 (0.4) p<.001

L = latanoprost, U = unoprostone, IOP = intraocular pressure
The difference of 1.9 mmHg between treatments was statistically significant in favor of latanoprost (p = .003, ANCOVA)

Table 2: Latanoprost vs. Travoprost

Trial	Study Design	L	TR	T	Duration	N	Mean Baseline IOP			Mean End point IOP		
							L	TR	T	L	TR	T
Netland 2001	Randomized multicenter, double-masked active-controlled, parallel	0.005% once daily n = 194	0.0015% n = 201 and 0.004% n = 196 once daily	O.5% Twice daily N = 196	12 months	787	25.7	25.1 (0.0015%) 25.5 (0.004%)	25.7	18.7	18.6 (0.0015%) 18.6 (0.004%)	20.2

L = Latanoprost, TR = Travoprost, T = timolol, IOP = intraocular pressure
Baseline and end point IOP difference between timolol and travoprost was statistically significant for both strengths (p<0.001, ANOVA)
Baseline and end point IOP difference between travoprost (both strengths) and latanoprost were statistically insignificant at alpha = 0.05

Table 3: Latanoprost vs. Bimatoprost

Trial	Study Design	L	B	Duration	N	Mean Baseline IOP Range		Mean End point IOP	
						L	B	L	B
Gandolfi 2001	Randomized multicenter, investigator-masked, parallel group trial	0.005% n = 113 once daily	0.03% n = 119 once daily	Three month	232	22.4 to 25.7	22.6 to 25.7	17.4 to 18	17 to 17.5
Trial	**Study Design**	**L**	**B**	**Duration**	**N**	**8 AM Mean Baseline IOP (SEM)**		**Reduction in IOP from baseline at day 29**	
						L	**B**	**L**	**B**
DuBiner 2001	Multicenter, double-masked, randomized, clinical trial	0.005% n = 21 once daily	0.03% n = 21 once daily	30-days	63	25.2 (0.6)	25.6 (0.5)	4.4 – 7.6 20-30%	5.9 – 8.0 25.4–30.9%
		Vehicle n = 21				Vehicle 25.8 (0.6)		Vehicle -0.3 – 1.7 -2 – 6.5%	

L = latanoprost, B = bimatoprost, IOP = intraocular pressure
Gandolfi: Mean IOP was lower with bimatoprost than with latanoprost at all time points (8AM, 12, 4PM, 8PM) during the three month follow-up, although the between group difference was not always statistically significant.
DuBiner: Bimatoprost and latanoprost significantly lowered IOP from baseline (p<0.001). Bimatoprost lowered IOP more than latanoprost at every time point measured, although the between group differences did not reach statistical significance.

MCCS-GPE **8 AUGUST 2002**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T Committee convened at 0800 hours on 8 August 2002, at the Uniformed Services University of the Health Sciences, Bethesda, Maryland

2. VOTING MEMBERS PRESENT

CDR Terrance Egland, MC, USN	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS, USA	DoD P& T Committee Co-chair
COL Mike Heath, MS (Representing MAJ Brett Kelly, MS)	Army Pharmacy Consultant Chair, DoD Pharmacy Board of Directors
Col Bill Sykora, MC	Air Force
COL Ardis Meier, BSC (Representing LtCol George Jones, BSC)	Air Force Pharmacy Consultant
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
CAPT Robert Rist	Coast Guard
Dick Rooney	Department of Veterans Affairs

VOTING MEMBERS ABSENT

COL Rosa Stith, MC	Army
Col John R. Downs, MC	Air Force
LTC (P) Joel Schmidt, MC	Army

OTHERS PRESENT

COL William Davies, MS, USA	DoD Pharmacy Program Director, TMA
Howard Altschwager	Deputy General Counsel, TMA
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
CAPT Joe Torkildson, MC, USN	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, USAF, BSC	DoD Pharmacoeconomic Center
CDR Denise Graham, MSC, USN	DoD Pharmacoeconomic Center
Maj Barb Roach, USAF, MC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC, USN	DoD Pharmacoeconomic Center
HM1 Lisa Drumm, USN	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
David Bretzke	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia
David Chicoine	Uniformed Services Family Health Plan
Mark Petruzzi	Medco Health
Ron McDonald	Sierra Military Health Services
Kelly Lenhart	Humana
William Hudson	Humana
Gene Lakey	TriWest
Ray Nan Berry	Health Net Federal Services
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)

3. **REVIEW MINUTES OF LAST MEETING / ADMINISTRATIVE ISSUES** – The minutes from the last meeting were accepted as written.

4. **INTERIM DECISIONS** – No interim decisions.

5. **UNIFORM FORMULARY (UF) PROPOSED RULE**- COL Davies reported that the comment period for the UF proposed rule has closed. The TMA Pharmacy Program Office is currently in the process of formulating responses to comments submitted by the public.

6. **BCF AND NATIONAL MAIL ORDER PHARMACY (NMOP) FORMULARY ISSUES** – The Committee determined the NMOP formulary status, NMOP or retail network formulary restrictions (quantity limits or prior authorization), and Basic Core Formulary (BCF) status for 5 new drugs or formulations (see Appendix A). The PEC also presented brief information on six additional new drugs or formulations not felt to require a complete review by the Committee. The Committee agreed that no further review was required (see Appendix B for comments).

7. NMOP AND RETAIL NETWORK ISSUES

A. Clarification of the NMOP quantity limits for antibiotics – LtCol Ed Zastawny (PEC) reported on a re-evaluation of the 30-day quantity limit that the DoD P&T Committee established in July 1998 for antibiotics dispensed through the NMOP. The Committee agreed that providers are unlikely to prescribe large quantities of antibiotics unless the patient needs long-term antibiotic therapy. The 30-day quantity limit increases the administrative burden for patients with a legitimate need for long-term antibiotic therapy because they have to reorder medication more frequently. More frequent reordering of medication also increases the risk that patients will run out of medication. Patients' costs are higher because they have to pay more copays.

The Committee concluded that the 30-day quantity limit probably creates more problems than it prevents and unanimously voted to eliminate the 30-day quantity limit on antibiotics in the NMOP. Antibiotics will be dispensed according to the general rule applied to other drugs in the NMOP (up to a 90 day supply). Existing quantity limits for specific antibiotics will remain in force. All quantity limits will be posted on the quantity limit page on the PEC website.

B. Clarification of the NMOP quantity limits for myeloid stimulants, interferon gamma, interferon alpha, and sandostatin injection – The current NMOP quantity limit for these products is 30 days. Because literature supports chronic use of the interferons and sandostatin for specific indications, the Committee unanimously voted to remove the 30-day quantity limit from interferon alpha, interferon gamma, and sandostatin. The Committee agreed that a 30-day quantity limit on myeloid stimulants was reasonable given the products' indications and uses. They noted that the NMOP quantity limit for PEG-filgrastim was set at 2 syringes per 45-day supply at the May 2002 meeting. The Committee voted to retain the 30-day quantity limit for myeloid stimulants, except for PEG-filgrastim, which will remain as 2 syringes per 45-day supply limit. The quantity limits will be posted on the PEC website quantity limit page. The NMOP will not use quantity limits other than those listed on the PEC website and will revise their database(s) accordingly.

C. Clarification of NMOP quantity limits for testosterone transdermal patches (Androderm) – Current NMOP quantity limit for Androderm patches is 30 days. Testosterone topical gel (Androgel) has a NMOP quantity limit of 90 days. Both are chronic replacement products with low abuse potential. The Committee voted unanimously to remove the 30-day quantity limit on all topical/transdermal testosterone or androgen replacement products.

8. COST AVOIDANCE FROM NMOP PRIOR AUTHORIZATIONS (PAs) –Shana Trice reported on the estimated cost avoidance due to PAs in the NMOP. The cost avoidance per prescription is based on the cost avoidance model that was outlined in the Aug 00 DoD P&T Committee minutes. The Committee did not make any changes to these PAs.

Drug	2nd Quarter FY 02	3rd Quarter FY 02
Sildenafil	$11.54	-$7.79
COX-2 inhibitors	$4.10	$2.65
Etanercept	$62.84	$15.30
Anakinra	-	$1132.00

Note: Cost avoidance due to the PA for antifungals for onychomycosis (ciclopirox, itraconazole, terbinafine) is not calculated using this model because the PA differs substantially from the other PAs. Unlike the other PAs, which authorize dispensing of new and refill prescriptions for a year, each course of therapy with antifungal medications for the treatment of onychomycosis goes through the PA process.

9. SUBCOMMITTEE REPORT: PROVISION OF INJECTABLE DRUGS IN THE NMOP OR RETAIL NETWORK PHARMACIES – At the May 2002 meeting the Committee asked the PEC to analyze the prescriptions filled in the retail network for injectable drugs to determine if there were additional drugs that should be added to the NMOP Covered Injectables List. CAPT Torkildson reported on the results of that analysis.

A report was generated from PDTS listing all prescriptions filled for injectable drugs in the retail network and at the NMOP during the period 1 April 2001 – 3 May 2002. Prescriptions for drugs currently included on the NMOP Covered Injectables List were then excluded. Remaining prescriptions were then sorted based on volume of prescriptions filled and total cost to the government. The greatest volume of prescriptions filled for non-list items was for methotrexate, with 3,072 prescriptions filled over 12 months. No other non-listed medication had greater than 1,000 prescription fills. In contrast, over 39,000 prescriptions for NPH insulin, which is on the covered injectables list, were filled at retail pharmacies during the surveyed period. The drug with the highest total submitted cost due was colistimithate, with a total due of $65,792. Only colistimithate and hydromorphone had costs greater than $50,000. In contrast, the retail network cost for epoetin alpha, which is on the covered injectables list, was almost $5.9 million over the same period.

The Committee decided to add dihydroergotamine 1 mg/ml, heparin sodium 5,000 & 10,000 units/ml, and promethazine 25 mg/ml to the NMOP Covered Injectables List. Because other migraine medications are subject to quantity limits and because use of dihydroergotamine should not exceed 6 ampules per week for safety reasons, the Committee established a quantity limit for dihydroergotamine: 3 boxes (30 ampules) per 30 days in the retail network and 9 boxes (90 ampules) per 90 days in the NMOP.

The Committee also recognized that a substantially greater opportunity for cost avoidance hinged on a more aggressive use of the NMOP by patients and providers to fill prescriptions for injectable drugs already available at the NMOP.

10. **CONTROLLED DISTRIBUTION OF PRESCRIPTION DRUGS** – All the Managed Care Support Contractors have established network agreements with CVS Procare Specialty Pharmacy, making CVS Procare the preferred site for DoD patients to obtain drugs requiring controlled distribution. The current plan is to use CVS Procare, whenever possible, for future drugs requiring controlled distribution. Information about specific drugs is available on the PEC website.

11. **ADJOURNMENT –** The meeting adjourned at 1100 hours. The next meeting will be held at the Uniformed Services University of the Health Sciences, Bethesda, Maryland starting at 0800 on Thursday, 21 November 2002. All agenda items should be submitted to the co-chairs no later than 18 October 2002.

List of Appendices

APPENDIX A: NEWLY APPROVED DRUGS CONSIDERED FOR THE NATIONAL MAIL ORDER PHARMACY FORMULARY AND DOD BASIC CORE FORMULARY

Generic name (Trade name; manufacturer)	FDA approval date, drug class, FDA-approved indication	NMOP Formulary Status	NMOP and/or retail network formulary restrictions	BCF Status
Voriconazole (Vfend; Pfizer)	29 May 02; Treatment of invasive aspergillosis primarily due to *Aspergillus fumigatus* and treatment of serious fungal infections caused by *Scedosporium apiospermum* and *Fusarium spp*., including *Fusarium solani* in patients intolerant of, or refractory to, other therapy.	Oral 50 mg and 200 mg tablets were added to the NMOP Formulary; IV formulation was excluded (not for self-administration)	**Quantity Limits** General Rule applies **Prior Authorization:** None	Not added to the BCF **Similar BCF Drugs:** None. Fluconazole 150 mg for vaginal candidiasis has a different spectrum of activity
Etonogestrel / ethinyl estradiol vaginal ring (Nuva-Ring; Organon)	01 Oct 01; Vaginal ring composed of an estrogen and progestin indicated for the prevention of pregnancy.	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** None
Methylphenidate long-acting capsules (Ritalin LA; Novartis)	06 Jun 01; for the treatment of attention deficit hyperactivity disorder (ADHD) in children aged 6 to 12 years of age	Added to the NMOP Formulary **Note**: Schedule II controlled substance; would fall under standard rule in NMOP for Schedule II products for treatment of ADHD (90 days supply, no refills)	**Quantity Limits** NMOP: General rule for Schedule II controlled substances for treatment of ADHD applies. (90 days supply, no refills) **Prior Authorization** None	Not added to the BCF. Excluded from the current BCF listing for methylphenidate. **Similar BCF Drugs:** Methylphenidate extended release (Concerta)
Escitalopram (Lexapro; Forest)	Approvable at time of Committee meeting – FDA approval imminent (note: approved by the FDA 14 Aug 02); single-isomer formulation of the selective serotonin reuptake inhibitor citalopram (Celexa)	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF. Will reconsider possible BCF addition following formal FDA approval & availability of pricing information. **Similar BCF Drugs:** fluoxetine, paroxetine, sertraline, citalopram
Lovastatin extended-release tablets (Altocor; Andrx/Aura	27 Jun 02 (will not be marketed until Sept 02); indicated for use in addition to dietary restrictions to lower total cholesterol and LDL cholesterol; and to slow the progression of coronary atherosclerosis in patients with coronary heart disease. Also has indication for primary prevention of CHD in patients with elevated cholesterol (based on the AFCAPS/TexCAPS study).	Not added to the NMOP Formulary. Existence of the current statin contract precludes addition of Altocor to the NMOP formulary.	**Quantity Limits** N/A **Prior Authorization** None	Not added to the BCF. Existence of the current statin contract precludes addition of Altocor to the NMOP formulary.

APPENDIX B: NEWLY APPROVED DRUGS NOT REQUIRING FULL REVIEW BY THE P&T COMMITTEE.

Generic (Trade name; manufacturer)	**Indication**	**Comments**
Desloratadine orally disintegrating tablets (Clarinex Redi-tabs; Schering)	Treatment of allergy symptoms and chronic idiopathic urticaria	Line extension. Desloratadine tablets are already available; both formulations will be available from the NMOP. Consideration for the BCF precluded by current non-sedation antihistamine contract.
Fulvestrant for injection (IM) (Faslodex; Astra-Zeneca)	Treatment of hormone-receptor metastatic breast cancer in postmenopausal women	Not considered for the NMOP Formulary since the IM injection is not designed for self-administration.
Human insulin (rDNA origin) for injection (SC) in a 3 mL disposable prefilled syringe (InnoLet; NovoNordisk)	Human insulin (Novolin) in a 3 mL disposable prefilled syringe	Will be available from the NMOP. Existing BCF listings for Novolin insulin are for 10mL vials. MTFs may decide whether or not to add InnoLet or other alternative insulin delivery devices (e.g., insulin pens) to their formularies.
Treprostinol Na for Injection (Remodulin; United Therapeutics)	Continuous SC infusion for treatment of pulmonary hypertension with NYHA class II-IV symptoms	Restricted drug distribution
Urofollitropin for Injection (Bravelle; Ferring)	Fertility agent	Will be added to the NMOP Covered Injectables List, which already includes other brands of urofollitropin.
Ziprasidone for Injection (IM) (Geodon IM; Pfizer)	Acute episodes of paranoia, and schizophrenia	Not considered for the NMOP Formulary since the IM injection is not designed for self-administration. Emergent use agent not appropriate for the BCF.

APPENDIX C: COMBINED SUMMARY OF FORMULARY CHANGES FROM THE DOD P&T EXECUTIVE COUNCIL MEETING AND THE DOD P&T COMMITTEE MEETING

1. **BCF CHANGES**

A. Additions to the BCF

1) Venlafaxine extended release capsules (Effexor XR) - contingent on signing of BPA (see Paragraph 10A)
2) Insulin glargine injection (Lantus)
3) Gabapentin (Neurontin)
4) Budesonide inhalation solution (Pulmicort Respules)
5) Meloxicam tablets (Mobic)
6) D, L-amphetamine 10-, 20-, 30-mg extended release capsules (Adderall XR)

B. Deletions from the BCF

1) Cimetidine oral
2) Methylphenidate SR (sustained release) tablets were removed from the BCF listing for methylphenidate.

C. Changes and clarifications to the BCF

1) The current BCF listing for methylphenidate was clarified to specify the following strengths for methylphenidate extended release (Concerta): 18-, 27-, 36-, and 54-mg
2) Existing BCF listings for Novolin insulin are for 10 ml vials. MTFs may decide whether or not to add alternative insulin delivery devices (e.g., insulin pens, InnoLet) to their formularies.
3) Precision products remain the only blood glucose strips on the BCF. MTFs are encouraged to transition to the newer Precision product, Precision Extra, as soon as possible.

D. Exclusions from the BCF

1) Methylphenidate long acting capsules (Ritalin LA, Novartis) were excluded from the BCF listing for methylphenidate.
2) Lovastatin extended-release tablets (Altocor; Andrx/Aura) – existing statin contract precludes addition to the BCF

2. **NMOP FORMULARY CHANGES**

A. *Additions to the NMOP Formulary*

1) Voriconazole 50- and 200-mg tablets (Vfend; Pfizer); injectable formulation not added since it is not for self-administration
2) Etonogestrel/ethinyl estradiol vaginal ring (Nuva-Ring; Organon)
3) Methylphenidate long acting capsules (Ritalin LA; Novartis) – General NMOP rule for schedule II controlled substances for treatment of ADHD applies (90 days supply; no refills)
4) Escitalopram tablets (Lexapro; Forest)

5) Bravelle brand of urofollitropin added to the NMOP Covered Injectables List, which already includes other brands of urofollitropin

6) Dihydroergotamine 1 mg/ml injection added to the NMOP Covered Injectables List

7) Heparin sodium 5,000 & 10,000 units/ml injection added to the NMOP Covered Injectables List

8) Promethazine 25 mg/ml injection added to the NMOP Covered Injectables List

9) InnoLet brand of human insulin for injection (3 mL prefilled syringes) added to the NMOP Covered Injectables List

B. *Exclusions from the NMOP Formulary*

1) Lovastatin extended-release tablets (Altocor; Andrx/Aura) – Existing statin contract precludes addition to the NMOP Formulary.

C. *Clarifications to the NMOP Formulary* - None

3. **QUANTITY LIMIT CHANGES (NMOP AND RETAIL NETWORK)**

A. Quantity limit for dihydroergotamine 1 mg/ml injection: 3 boxes (30 ampules) per 30 days in the retail network, 9 boxes (90 ampules) per 90 days in the NMOP.

B. NMOP 30-day quantity limit for antibiotics was eliminated. Antibiotics will be dispensed consistent with the general rule applied to all other drugs in the NMOP (up to a 90 day supply), unless otherwise specified on the quantity limit page on the PEC website.

C. NMOP 30-day quantity limits for interferon alpha, interferon gamma, and sandostatin were removed. The quantity limit for myeloid stimulants remains 30 days, with the exception of PEG-filgrastim, which has a quantity limit of 2 syringes per 45 days in the NMOP, and 1 syringe per 21 days in the retail network.

D. NMOP 30-day quantity limit for topical/transdermal testosterone or androgen replacement products was removed.

4. **CHANGES TO THE PRIOR AUTHORIZATION PROGRAM (NMOP AND RETAIL NETWORK)** - None

Department of Defense

Fort Sam Houston, TX 78234-5081

MCCS-GPE **7 August 2002**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The DoD P&T Executive Council met from 0800 to 1430 hours on 7 August 2002 at the Uniformed Services University of the Health Sciences, Bethesda, Maryland

2. VOTING MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL Mike Heath, MS (Representing MAJ Brett Kelly, MS)	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
COL John R. Downs, MC	Air Force
COL Bill Sykora, MC	Air Force
COL Ardis Meier, BSC (Representing LtCol George Jones, BSC)	Air Force Pharmacy Consultant
CAPT Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
CAPT Robert Rist	Coast Guard
Dick Rooney	Department of Veterans Affairs

VOTING MEMBERS ABSENT

COL Rosa Stith, MC	Army
LTC (P) Joel Schmidt, MC	Army

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TMA
Howard Altschwager	Deputy General Counsel, TMA
CAPT Betsy Nolan, MSC	Navy Pharmacy Specialty Leader
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, BSC	DoD Pharmacoeconomic Center
CDR Denise Graham, MSC	DoD Pharmacoeconomic Center
CDR (sel) Ted Briski, MSC	DoD Pharmacoeconomic Center
LtCol Barb Roach, MC	DoD Pharmacoeconomic Center
HM1 Lisa Drumm, USN	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Dave Bretzke	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia
Alexandra Masterson, Pharm.D.	Dewitt Army Hospital, Ft. Belvoir, VA

3. REVIEW MINUTES OF LAST MEETING/ADMINISTRATIVE ISSUES

The minutes from the last meeting were accepted as written.

4. INTERIM DECISIONS – None

5. NATIONAL PHARMACEUTICAL CONTRACTS AND BLANKET PURCHASE AGREEMENTS (BPAs)

Contract awards, renewals, and terminations

- New joint DoD/VA contracts were awarded for benztropine, carbidopa/levodopa IR, famotidine, digoxin, indomethacin, metformin, captopril, paclitaxel, trazadone, and chlorhexidine.
- The following joint DoD/VA contracts were not awarded because the bid prices were higher than existing FSS prices: prednisone and cimetidine.
- The following joint DoD/VA contracts are in various stages of solicitation: penicillin, dicloxacillin, tretinoin cream, amoxicillin, and cephalexin.
- The following joint DoD/VA contracts were extended: salsalate and all Geneva generics.

6. EXPIRATION OF LISINOPRIL CONTRACT

LCDR Briski provided information concerning the availability and pricing of lisinopril within the direct care system. The DoD contract with Astra Zeneca that provided the Zestril brand of lisinopril at $0.14 per tablet expired on 31 July 2002. Astra-Zeneca refused a DoD request to extend the Zestril contract. The VA's contract with Merck for the Prinivil brand of lisinopril expires 19 October 2002. Astra-Zeneca and Merck are phasing out production of lisinopril. Although several companies market generic versions of lisinopril, none are listed on the Federal Supply Schedule, and all are priced significantly higher than $0.14 per tablet. The DoD and VA are seeking a joint contract for a generic version of lisinopril, but that contract will not be awarded until after the VA's

Prinivil contract expires. MTFs will probably have to pay higher prices for lisinopril until the contract for a generic version of lisinopril is awarded—hopefully by November 2002.

7. PENDING CONTRACT INITIATIVES

A. *Status of contracting initiatives for Leutinizing Hormone Releasing Hormone (LHRH) agonists, nasal corticosteroids, triptans, and quinolones* – The joint DoD/VA solicitations for these items are still pending.

B. *Status of contracting initiative for Angiotensin Receptor Blockers (ARBs)* – In order for DoD to potentially join the VA in seeking a closed class contract for an ARB, LCDR Briski asked the Council to reconsider its May 2002 decision that the procurement strategy must leave the ARB class "open" on the BCF. The Council's decision not to support a closed class contract centered on concerns about therapeutic interchangeability and clinical coverage for treating congestive heart failure (CHF) and preventing the progression of renal disease in type 2 diabetics.

   The Council considered new information about the extent to which ARBs are prescribed at MTFs for conditions other than hypertension. An analysis of data from the Uniformed Services Prescription Database (USPD) and the M2 (formerly known as the ARS Bridge) database found ICD-9 codes consistent with a diagnosis of CHF or type 2 diabetic renal disease for only 289 (5%) of 5,680 patients who were prescribed two or more daily doses of an ARB (Note: patients with CHF are more likely to be prescribed multiple daily doses of an ARB than patients who are being treated for hypertension). The Council concluded that a closed class contract would be acceptable because the usage of ARBs for these conditions is low enough that MTFs could use the non-formulary request process to provide non-contracted ARBs to patients in the event that the contracted ARB does not meet the clinical needs of patients with CHF or type 2 diabetes. The Council voted unanimously to expand the authorized procurement strategies for the ARB class to include a closed class contract that does not mandate that patients be switched from non-contracted ARBs to the contracted ARB.

C. *Status of contracting initiative for thiazolidinediones (TZDs, "glitazones")* – In order for DoD to potentially join the VA in seeking a closed class contract for a TZD, LCDR Briski asked the Council to reconsider its May 2002 decision that the procurement strategy must leave the TZD class "open" on the BCF. The Council's decision not to support a closed class contract stemmed from concerns that rosiglitazone and pioglitazone may differ significantly in their effects on LDL-cholesterol (LDL-C) levels. The Council considered the results of (1) a more extensive analysis of changes in LDL-C levels reported in clinical trials of TZDs, and (2) an analysis of concomitant statin therapy for DoD patients who were newly started on TZD therapy.

   Comparison of changes in LDL-C levels in clinical trials of TZDs: There are no head-to-head trials that compare the changes in LDL-C levels that are associated with the use of rosiglitazone and pioglitazone. In order to compare the changes in LDL-C levels while attempting to control for known and unknown variations that exist across clinical trials of TZDs, the PEC calculated the percentage change in LDL-C incremental to placebo in nine rosiglitazone trials and five pioglitazone trials. As shown in Tables 1 and 2 below, the incremental percentage increases in LDL-C are consistently larger for rosiglitazone than pioglitazone.

Table 1: Monotherapy trials with TZDs and corresponding LDL changes, incremental to placebo

Rosiglitazone				Pioglitazone			
Dose (N)	**Base-line LDL**	**% change in LDL**	**% change incremental to placebo**	**Dose (N)**	**Base-line LDL**	**% change in LDL**	**% change incremental to placebo**
Patel				Aronoff			
2 mg bid (79)	125	↑ 13.6%	**↑ 12.4%**	30 mg qd (87)	136	↑ 5.2%	**↑ 0.42**

Fonesca*				No combination trials with 45 mg pioglitazone			
8 mg qd + met (113)	112	↑ 18.7%	**↑ 15.3%**				
Met + placebo (116)	116	↑ 3.4%					

SU = sulfonylurea, glyb = glyburide, met = metformin
*Concomitant lipid-lowering drugs were allowed

Analysis of concomitant statin therapy among DoD patients newly started on TZD therapy: Using data from the Pharmacy Data Transaction Service (PDTS), the PEC identified 14,301 patients who began therapy with rosiglitazone or pioglitazone between 1 November 2001 and 28 February 2002 and analyzed their concomitant statin usage through 30 June 2002. The PEC identified patients who had received prescriptions for statins before starting their TZD therapy, patients who initiated statin therapy after starting TZD therapy, and patients who experienced an increase in the dosage of their pre-existing statin therapy. Table 3 shows that the percentages of patients who were on statin therapy at baseline, were started on a statin, or whose statin dose was increased are very similar for rosiglitazone and pioglitazone.

Table 3: Statin use in DoD patients newly started on TZDs

	Rosiglitazone (n=8369)	Pioglitazone (n=5932)
Statin therapy change	**2120 (25.3%)**	**1371 (23.1%)**
Statin started after TZD started	1702 (20.3%)	1103 (18.6%)
Statin dose increased	418 (5%)	268 (4.5%)
No statin therapy change	**6249 (74.7%)**	**4561 (76.9%)**
No statin prescription	3606 (43.1%)	2641 (44.5%)
Statin dose not increased	2643 (31.6%)	1920 (32.4%)

Conclusion: While the data from clinical trials suggest that rosiglitazone is associated with larger increases in LDL-C than pioglitazone, concomitant usage of statins by DoD patients is very similar for both drugs. The Council voted 8-2 to expand the authorized procurement strategies for the TZD class to include a closed class contract that does not mandate that patients be switched from a non-contracted TZD to a contracted TZD.

D. *Status of contracting initiative for statins* – The Council reviewed recent label changes for simvastatin (Zocor) that Merck voluntarily initiated with the FDA as a result of normal post-marketing surveillance and monitoring of ongoing clinical trials. The label changes approved by the FDA on 6 June 2002 further clarify the risk of myopathy and rhabdomyolysis, particularly with higher doses of simvastatin and when used with other drugs. Myopathy and rhabdomyolysis are well-known side effects of all statins. The revised label includes the following:

- *Concomitant use with fibrates and niacin (≥1g/day)* – simvastatin dose should not exceed 10 mg daily unless the benefit outweighs the increased risk.
- *Concomitant use with amiodarone or verapamil* – simvastatin dose should not exceed 20 mg daily unless the benefit outweighs the increased risk. In a clinical trial, 6% of patients taking amiodarone and simvastatin 80 mg daily developed myopathy. Combined clinical trial data showed a 0.6% risk of myopathy with simvastatin (20-80 mg) and verapamil.
- *Dose-related risk of myopathy/rhabdomyolysis* – the incidence in clinical trials, in which patients were carefully monitored and some interacting drugs were excluded, has been approximately 0.02% at 20 mg, 0.07% at 40 mg & 0.3% at 80 mg.

The Council noted that a recent Clinical Advisory on the Use and Safety of Statins from the National Heart, Lung, and Blood Institute, the American College of Cardiology, and the American Heart Association states that a review of data regarding reports of fatal rhabdomyolysis among the different statins strongly suggests that there are no clinically important differences in the rate of

fatal complications among the five statins now available in the U.S., and that clinicians should consider the rates of severe myopathy as equivalent among these statins.

The Council unanimously concluded that the simvastatin label change is not cause to alter its previous decision to support any contracting/formulary strategy (to include a closed class contract) that places at least one high potency statin on the BCF and does not require patients to be switched from one agent to another.

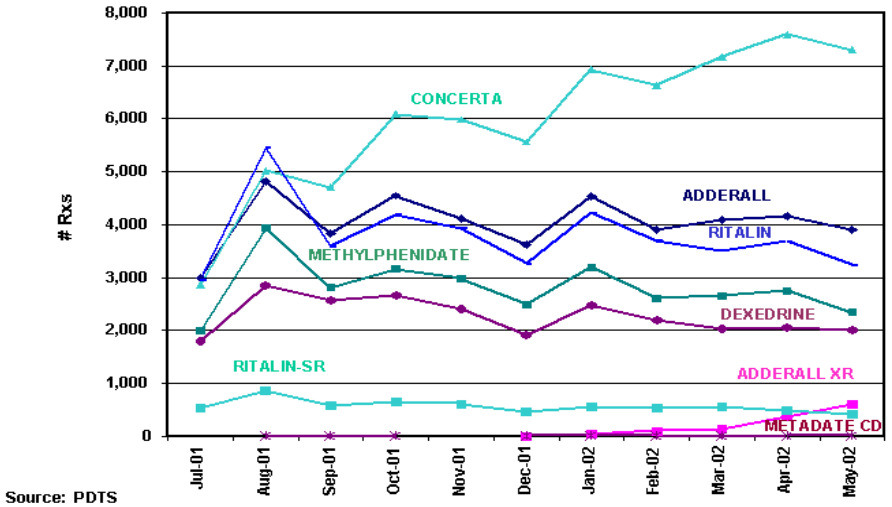
8. DRUG CLASS EVALUATIONS TO DETERMINE CLINICALLY ACCEPTABLE CONTRACTING/FORMULARY STRATEGIES:

A. *Attention Deficit Hyperactivity Disorder (ADHD) stimulant medications* — Based on a recommendation from the PEC, the Council reviewed the list of stimulant medications currently included on the BCF for the treatment of ADHD. The stimulants most widely used for ADHD treatment are methylphenidate, dextroamphetamine, and mixed salts of amphetamine/dextroamphetamine. Methylphenidate is available in immediate-release, sustained-release, and extended release forms. Dextroamphetamine is available in immediate and extended release forms, while the mixed salts of amphetamine/dextroamphetamine are available in sustained release (Adderall and generics) and extended release (Adderall XR) forms. The three agents currently on the BCF are all methylphenidate products: methylphenidate immediate release, methylphenidate sustained release, and Concerta. Pemoline is another stimulant medication used for ADHD, but its side effect profile is not acceptable to most clinicians. Pemoline is reserved as a last-line therapy when all other treatments have failed, and was not considered further in this review.

Therapeutic interchangeability/clinical coverage: There appear to be two subsets of ADHD patients: those who respond to methylphenidate and those who respond to amphetamine products. According to the literature, initial treatment of ADHD with a stimulant medication from a particular class has approximately a 65% likelihood of success. A substantial number of treatment failures can be successfully treated with the alternate drug class. Which class is used first is largely a matter of prescriber preference, as there are no clinical features that predict which class of drugs is more likely to be successful for a given patient. Given these facts, a health system should have products and dosage forms from both the methylphenidate and amphetamine classes available to meet the clinical needs of its ADHD patients. Once a class of drugs is found to be effective, current practice guidelines for the treatment of ADHD recommend that patients be changed to an extended release formulation to enhance compliance, decrease the risk of drug diversion within the school setting, and minimize the stigma associated with school-age children taking midday doses of stimulants. Therefore, optimal management of ADHD requires the availability of both methylphenidate and amphetamine products, and requires that preference be given to dosage forms that minimize the likelihood that patients will need to take additional doses of medication during the school day.

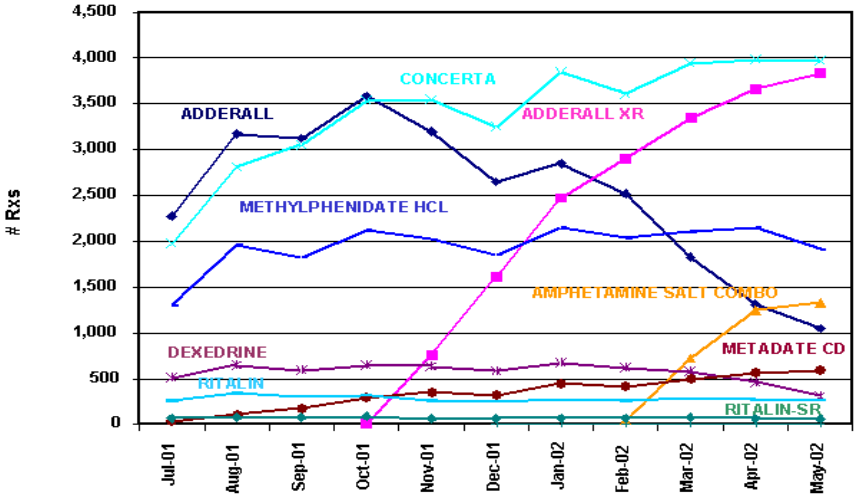
Utilization: The utilization trends within the MTFs and retail network pharmacies are presented in Figures 1 and 2.

Figure 1: MTF Prescriptions for ADHD Stimulant Medications (Jul 01 – May 02)



Source: PDTS

Figure 2: Retail Network Prescriptions for ADHD Stimulant Medications (Jul 01 – May 02)



Source: PDTS

Concerta is the most commonly dispensed stimulant medication at MTFs, with Adderall currently in second place. This is in sharp contrast to the retail network, where Concerta is also the most commonly dispensed drug, but Adderall XR is in second place and rapidly gaining ground. It is also noteworthy that use of Ritalin SR is very low in both points of service, despite its current position on the BCF. The retail network utilization trends (where all products are uniformly available) support the contention that methylphenidate and amphetamine products should both be available for the provision of comprehensive care to patients with ADHD, and also show that providers preferentially select the extended release formulation of these products for long-term therapy.

Provider acceptance: There was strong support among DoD providers who treat children with ADHD for a more robust BCF with broadened clinical coverage for ADHD patients. More than half of the respondents felt that an amphetamine product (Adderall or Adderall XR) should be added to the BCF to improve clinical coverage. Providers indicated that they would not favor any procurement strategy that resulted in a closed class with a single entity or required patients to be switched from one drug class to another. Most physicians felt that parents would be very resistant to medication changes mandated by contract once their child was being effectively treated with a particular medication. All agreed that pemoline is not a candidate for the BCF due to its side effect profile.

Based on this review, the Council approved the following decisions:

- Retain Concerta and methylphenidate IR on the BCF.
- Remove methylphenidate SR from the BCF
- Add Adderall XR 10-, 20- and 30-mg strengths to the BCF. Facilities may add additional strengths if they desire, but they are not mandated to do so.

9. DRUG/DRUG CLASS EVALUATIONS TO DETERMINE BCF ADDITION

A. *Venlafaxine extended release capsules (Effexor XR)* – In February 2002 the Council reviewed the anxiolytic class and concluded that venlafaxine extended release (Effexor XR; Wyeth-Ayerst) was useful in the treatment of several anxiety disorders, particularly in patients with co-morbid depression. A decision to add venlafaxine extended release to the BCF was tabled at that time pending discussions with the company intended to increase the cost-effectiveness of this therapy. Consideration was deferred again in May, as discussions with the company were still ongoing. Subsequently, the company presented a verbal offer of a $0.10 per tablet price reduction on the 150 mg tablet in return for BCF status.

Table 4: Current FSS pricing of Effexor/Effexor XR:

Drug	Strength	Price/tablet	Cost/30 days
Effexor	25 mg	$0.57	$34.20
	37.5 mg	$0.60	$35.76
	50 mg	$0.61	$36.84
	75 mg	$0.66	$39.30
	100 mg	$0.69	$41.52
Effexor XR	37.5 mg	$1.06	$31.80
	75 mg	$1.19	$35.70
	150 mg	$1.29	$38.70

Given the current rate of growth in utilization of venlafaxine extended release, the MHS would likely realize a cost avoidance of over $200,000 annually by accepting this offer. More savings are possible if BCF addition facilitates MTF recapture of venlafaxine extended release prescriptions from the retail network. The Council voted unanimously to add venlafaxine extended release 37.5, 75, and 150 mg tablets to the BCF, contingent on the signing of a BPA between Wyeth-Ayerst and DSCP establishing the $0.10 price reduction for the 150 mg tablet.

B. *Insulin glargine (Lantus)* – The Council considered a proposal to add insulin glargine (Lantus; Aventis Pharmaceuticals) to the BCF. Insulin glargine is a modified human insulin designed to act as a peakless basal insulin product with a 24-hour duration of action. It was approved by the FDA in April 2000 but was not launched until May 2001. The major advantage of insulin glargine is an approximately 10% lower incidence of symptomatic hypoglycemia, nocturnal

hypoglycemia, and severe hypoglycemia compared to NPH insulin. Initial studies suggested that the efficacy of insulin glargine in reducing HbA_{1c} levels was equivalent to that of NPH. Other brief trials demonstrated a significant decrease in the fasting plasma or whole blood glucose levels compared to NPH. Abstracts presented at the most recent American Diabetes Association meeting suggested that the enhanced safety profile of insulin glargine allows for a more aggressive approach to escalating insulin therapy in both Type 1 and Type 2 diabetics, and that this more aggressive approach in fact leads to a significant decrease in HbA_{1c} levels compared to traditional therapy with NPH insulin.

Even though insulin glargine costs much more than human NPH insulin at MTF pharmacies ($25.38 versus $4.49 per 10 ml vial) and is currently on fewer than half of MTF formularies, the prescription volume for insulin glargine increased 3.5 fold at MTF pharmacies between October 2001 and May 2002. Prescription volume for insulin glargine increased 2.5 fold in the retail network during the same period.

The Council concluded that insulin glargine represents a true advance in the treatment of both Type 1 and Type 2 diabetes and that it should be uniformly available at MTF pharmacies. The Council voted unanimously to add insulin glargine to the BCF.

C. *Gabapentin (Neurontin)* – In February 2002 the Council reviewed gabapentin for potential addition to the BCF, due to high usage rate and high expenditures in the retail network. The Council decided not to add gabapentin at that time due to concern that gabapentin was not FDA approved for pain control and that it may pose a large cost burden to small MTFs. The FDA recently approved gabapentin for treatment of post herpetic neuralgia. A generic version of gabapentin may become available in the near future. In the retail network gabapentin is in the top 20 for expenditures and top 50 for number of prescriptions. Gabapentin is among the top 100 drugs for number of prescriptions in the MTFs and is on 70% of MTF formularies. Gabapentin usage has continued to rise in all three points of service, with the majority of use for neuropathic pain in the over-65 aged population. The Council voted unanimously to add gabapentin to the BCF.

10. CLARIFICATION OF STATUS OF BLOOD GLUCOSE TEST STRIPS ON BCF – Precision (Abbott) blood glucose test strips have been on the BCF since its inception. Precision's status on the BCF is supported by an incentive price agreement that offers a lower price system-wide as market share increases. A medical/surgical product standardization initiative for TRICARE Regions 6, 7 and 8 recently selected the Accucheck (Roche Diagnostics) blood glucose test strip. Some pharmacies were incorrectly told that they had to switch from Precision test strip to the Accucheck test strip. LCDR Briski wrote an article in the May edition of the *PEC Update* and also disseminated information through the service pharmacy consultants/specialty leaders to MTF pharmacies to clarify that Precision test strips remain on the BCF and that regional medical/surgical standardization initiatives do not create "sole source" agreements that force MTFs to switch away from an item listed on the BCF.

The Army serves as the Executive Agent for medical/surgical regional standardization. The Council agreed that COL Remund should meet with COL Kissane, the Army OTSG/MEDCOM Deputy Chief of Staff for Logistics, to work out some rules of engagement that would enable national standardization through the BCF and regional standardization initiatives to productively coexist.

LCDR Briski also briefed the Council about Abbott Diagnostic's plan to phase out the Precision QID strip and meter, while phasing in their newer product, Precision Extra. The Precision Extra

product offers significant advancements over the Precision QID product. The Council voted to reaffirm its intent to keep Precision products as the sole blood glucose strip on the BCF. The Council encourages MTFs to expeditiously transition to the Precision Extra product.

11. CLARIFICATION OF 27- AND 54-MG STRENGTHS OF METHYLPHENIDATE EXTENDED RELEASE (CONCERTA) – When Concerta was first added to the BCF in November 2000, the only strengths available were 18 mg and 36 mg. A 54 mg capsule was marketed in December 2000, and a 27 mg capsule was added in April 2002. Multiple strengths allow more precise titration of dosages. During a recent PEC review of Concerta utilization at MTFs, it was noted that several large MTFs were dispensing a large number of dual prescriptions to patients for both 18 mg and 36 mg Concerta capsules rather than for 54 mg capsules. This results in an inconvenience to the patient, an increase in workload for the pharmacy, and an excess cost of $38.40 per patient per month.

To facilitate dosage titration and to maximize the likelihood that Concerta will be used in as cost-effective a manner as possible, the Council voted to add the 27 mg and 54 mg strengths of Concerta to the BCF. The vote was 8 in favor, one against, and one abstention.

12. MTF REQUESTS FOR BCF CHANGES

A. Requests to delete particular strengths or dosage forms of BCF items – The Health Affairs Policy for Basic Core Formulary and Committed Use Requirements Contracts (Policy #98-034) states, "In the case of multiple strength BCF drugs, all strengths need not be stocked but all prescriptions for that agent will be filled regardless of strength." The BCF page on the PEC website explains that a listing for an oral medication "indicates all oral dosage forms and strengths will be provided unless otherwise noted." The DoD P&T Executive Council has deleted or excluded some dosage forms/strengths from the BCF for one or more of the following reasons:

- Substantially higher cost than other dosage forms/strengths
- Excessive administrative burden associated with maintaining multiple strengths (e.g., controlled substances)
- The BCF listing is intended to cover an indication that is limited to a specific dosage form/strength (e.g., fluconazole 150 mg for vaginal yeast infections)
- New dosage form/strength offers no significant clinical advantage and is apparently designed to avert competition from generic versions of the drug
- Low usage combined with one or more of the factors above

Some MTF requests to delete a particular strength or dosage form of a BCF drug appear to be based primarily on objections to stocking an item that has a low usage rate. The Council reiterates that if an MTF has little or no demand for a particular BCF item, the MTF is not required to physically stock the item in the pharmacy. However, the MTF must provide the item if it is prescribed.

B. *Request to remove cimetidine from the BCF* – A MTF pharmacist requested the deletion of cimetidine from the BCF due to low usage. Cimetidine and ranitidine are the two H2 blockers currently on the BCF. Ranitidine prescriptions outnumber cimetidine prescriptions 9 to 1 at MTF pharmacies. Indications and efficacy are similar for both drugs, but cimetidine has more side effects and drug interactions than ranitidine. Ranitidine costs $0.06 - $0.07 per day; cimetidine costs $0.10 to $0.13 per day. The Council voted unanimously to delete cimetidine from the BCF. MTFs may decide to retain cimetidine on their local formularies if so desired.

C. *Request to remove cyproheptadine from the BCF* –An MTF pharmacist requested deletion of cyproheptadine from the BCF because there are better alternatives on the BCF to treat allergies and headache and because cyproheptadine had been dispensed fewer than 20 times in the past 6 months at the requestor's MTF. More than 90 responses were received from providers and pharmacists in the field, overwhelmingly and convincingly offering reasons why this drug should be maintained on the BCF in spite of low usage. Cyproheptadine has a unique place in therapy with no good alternative treatments for pregnant patients and young children with migraine headaches, in addition to other uses. The 4 mg tablet is priced as low as $0.03 per tablet, and the 2 mg per 5 ml syrup costs $0.15 per 5 ml. The Council voted unanimously to retain cyproheptadine on the BCF.

D. *Request to remove theophylline elixir from the BCF* –An MTF pharmacist requested deletion of theophylline oral liquid from the BCF because it has been dispensed less than 20 times in the past 6 months at the requestor's MTF. Children and elderly patients who cannot swallow solid dosage forms or are unable to use a metered-dose-inhaler effectively account for almost all of the theophylline oral liquid use. Theophylline remains on asthma and COPD treatment guidelines, and the oral liquid form is the only dosage form that is suitable for some patients. Theophylline oral liquid is inexpensive ($0.003 to $0.045 per ml). The Council voted unanimously to retain theophylline oral liquid on the BCF.

E. *Request to add budesonide inhalation suspension (Pulmicort Respules) to the BCF* – A pediatrician requested addition of budesonide inhalation suspension to the BCF for the following reasons: 1) it is the only FDA-approved, nebulized steroid available and can be used for patients as young as 12 months of age; 2) prior to the availability of budesonide inhalation suspension, steroid metered dose inhalers (MDIs) were used for persistent asthmatics—young children could not always cooperate effectively with these; 3) parents appreciate the convenience of nebulized medications in children and studies have shown them to be efficacious; and 4) one in nine children has asthma—addition would enhance primary care options for treatment.

   The safety and tolerability of nebulized budesonide are no different than other inhaled steroids. Both inpatient and outpatient studies have shown efficacy in respect to symptom relief. As expected, use of this medication is low and almost exclusively for patients in the 0 to 4 age group, which is consistent with appropriate use of the product. MDIs are still the inhaled steroid formulation of choice in the treatment of asthma. Budesonide inhalation suspension is intended for those who cannot yet use MDIs appropriately. The Council voted unanimously to add budesonide inhalation suspension (Pulmicort Respules) to the BCF.

F. *Request to add meloxicam (Mobic) to the BCF* – The PEC received two requests to add meloxicam to the BCF, one from an Air Force physician and one from an Army pharmacist. Both requestors represent facilities currently using meloxicam as an alternative to "COX-2 inhibitors" (rofecoxib, celecoxib, or valdecoxib).

The Council considered the following points:

- *Background* - Meloxicam is FDA-approved only for osteoarthritis (OA). Because patent protection/exclusivity for meloxicam is expected to expire within the next three years, the manufacturer has stated that they do not plan to pursue additional indications. The drug is approved in various European countries for rheumatoid arthritis (RA). Despite its relatively recent introduction in the U.S. in April 2000, meloxicam has been available in other countries since 1995. The manufacturer estimates that more than 45 million patients have been exposed to meloxicam worldwide.
- *Efficacy* - There are published clinical trials showing efficacy of meloxicam for the treatment of OA, RA, and other chronic painful conditions, including ankylosing spondylitis and low back pain. Publication of the IMPROVE trial, a 6-month naturalistic (effectiveness) trial in OA patients (meloxicam vs. "usual care" NSAIDs) is expected shortly; summary results are available in abstract.
- *Safety –NSAID-associated GI adverse events*
  - *COX-2 selectivity* - The most extensive analysis of COX-2/COX-1 selectivity of NSAIDs to date (Warner et al. Proc Nat Acad Sci 1999; 96:7563-8) constructed the following ranking based on a whole blood assay (from most COX-2 selective to least COX-2 selective): rofecoxib (>50-fold COX-2 selective); etodolac, meloxicam, and celecoxib (grouped together as 5-to 50-fold COX-2 selective); diclofenac, sulindac, piroxicam, ibuprofen, tolmetin, naproxen, aspirin, indomethacin, ketoprofen, ketorolac. According to other researchers, the COX-2 selectivity of meloxicam appears to be dose-related, with greater COX-2 selectivity at a daily dose of 7.5 mg than at 15 mg.
  - *Association of COX-2 selectivity with reduced incidence of serious upper GI events* - The major potential advantage of COX-2 selective NSAIDs relative to non-selective NSAIDs is a reduction in the incidence of complicated upper GI events (GI bleed, perforation, and obstruction) and symptomatic but uncomplicated ulcers. Evidence of a reduced incidence of complicated upper GI events compared to nonselective NSAIDs is most conclusive with rofecoxib, less conclusive with celecoxib and meloxicam, and not yet available for valdecoxib. Because no head-to-head trials of sufficient size and duration to discern a clinically significant difference in complicated upper GI events are available, it is difficult to compare the incidence rate of complicated upper GI events with meloxicam and celecoxib, rofecoxib, or valdecoxib. See Appendix A for a discussion of clinical studies involving meloxicam, celecoxib, and rofecoxib.
- *Safety: Cardiorenal and cardiovascular adverse events* - NSAIDs, including celecoxib, rofecoxib, and valdecoxib, are known to cause fluid retention, edema, blood pressure (BP) elevation, and loss of BP control in patients treated with antihypertensive medications. In addition, the VIGOR trial with rofecoxib showed a statistically significantly higher incidence of adjudicated serious cardiovascular thrombotic events (primarily acute myocardial infarctions) in patients treated with rofecoxib 50 mg QD compared to patients treated with naproxen 500 mg BID [1.1% vs. 0.5%, NNH=167].

Pooled data from the Meloxicam Serious GI Event Analysis, which includes clinical trial data involving 27,039 patients who received meloxicam, comparator NSAIDs, or placebo in 35 clinical trials, provides comparative information on the incidence of these adverse events in patients treated with meloxicam or comparator NSAIDs (see Table 5). Placebo data included in this analysis are very limited (736 patients, 113 patient-years of therapy) and are not included in the table because they are unlikely to accurately reflect background rates.

Table 5: Rates of cardiovascular/cardiorenal adverse events

	Meloxicam	NSAIDs
Patients	15,071	11,078
Patient-years of therapy	3129	1202
Myocardial Infarctions (incidence/100 pt-yrs)	18 (0.58%)	8 (0.67%)
Cardiac Failure (incidence/100 pt-yrs)	15 (0.48%)	7 (0.58%)
Peripheral Edema (incidence/100 pt-yrs)	98 (3.13%)	79 (6.57%)
Hypertension (incidence/100 pt-yrs)	82 (2.62%)	32 (2.66%)
Aggravated HTN (incidence/100 pt-yrs)	25 (0.80%)	15 (1.25%)

- *Tolerability* - Meloxicam appears to be as well or better tolerated than the NSAIDs to which it was compared in clinical trials. In the MELISSA study, fewer patients treated with meloxicam withdrew from the study due to GI adverse effects (e.g., dyspepsia, nausea, abdominal pain) compared with diclofenac (3.0% vs. 6.1%); similar results were observed in the SELECT trial (3.8% vs. 5.3% with piroxicam). Preliminary results from the IMPROVE study show significantly fewer discontinuations of therapy due to adverse effects compared to "usual care" NSAIDs.
- *Other Factors*
  - *Frequency of Dosing* - Meloxicam is dosed once daily.
  - *Provider Input* - The PEC requested provider (physician and pharmacist) input on this issue. Because the VA has selected etodolac for their COX-2 criteria as an alternative to salsalate for patients at significant GI risk, and because etodolac, like meloxicam, has at least some evidence of a lower incidence of GI adverse events than other NSAIDs, providers were asked about etodolac as well as meloxicam. Providers were asked: 1) if their MTF would use meloxicam or etodolac if added to the BCF, 2) the place of the drug(s) in therapy, 3) should meloxicam or etodolac be added to the BCF, and 4) how addition would affect their facility. The responses were mixed. Key points included:
    - One responder pointed out that while BCF addition would probably have a significant budgetary impact on facilities that currently have no COX-2s on formulary, the overall cost to DoD should drop significantly if these facilities would call civilian providers and switch COX-2 prescriptions to meloxicam, preventing a significant number of COX-2 prescriptions from being filled in the network at a higher overall cost to DoD. MTFs that currently do not have COX-2 inhibitors on formulary may incur increased costs.
    - Some responders were concerned that if meloxicam were added to formularies without restrictions, providers may shift from prescribing lower cost generic NSAIDs to prescribing meloxicam, even in patients at low risk for GI adverse events.

  - Some responders doubted that providers would use meloxicam or etodolac in place of rofecoxib or commented that these are low use items at their facilities.
  - Some responders commented that there was insufficient clinical trial evidence to conclude that meloxicam is COX-2 sparing.
  - With regard to etodolac, responders commented that while it is generically available and less costly than meloxicam and there is some evidence that it is COX-2 sparing; it must be dosed 2-3 times per day and is not actively marketed to providers. Comments about the effectiveness of etodolac ranged from "good success" to "useless" (and must, in any case, be regarded as anecdotal).

- *Status on MTF formularies* - Facilities that currently have meloxicam on formulary (either unrestricted or as part of a step therapy program that requires failure of one or more nonselective NSAIDs prior to meloxicam) include: Tripler Army Regional Medical Center (ARMC); Madigan ARMC; Brooke Army Medical Center, Wilford Hall Medical Center, Randolph Air Force Base (AFB); Ft. Polk; Luke AFB; Ft. Hood; Ft. Leonard Wood; William Beaumont ARMC; and Nellis AFB.
- *Dose distribution - MTFs vs. retail network* - Since the COX-2 selectivity of meloxicam appears to be dose-related, the percentage of patients receiving 7.5- vs. 15-mg daily doses is of interest. As of July 2002, about 80% of meloxicam prescriptions filled in the NMOP and retail network were for the 7.5-mg strength of meloxicam, which is consistent with the 80-85% reported by the manufacturer as typical in the civilian marketplace. Only about 35% of meloxicam prescriptions filled at MTFs were for the 7.5 mg strength; however, the true percentage of MTF meloxicam prescriptions written for a 7.5-mg daily dose is likely to be closer to 65% due to splitting of the 15-mg tablet (see following analysis).
- *Cost*
  - *Dose distribution and MTF cost per day* - The PEC analyzed signatura (directions for use) for all MTF prescriptions for meloxicam, celecoxib, rofecoxib, and etodolac with valid signatura in the Uniformed Services Prescription Database from Jan – April 2002 (134,883 Rxs). This analysis served two purposes: to analyze the dose distribution of meloxicam and to compare the weighted average cost per day of meloxicam to the COX-2 inhibitors and to etodolac. Valdecoxib was not included due to the limited number of MTF prescriptions during this time period.

Table 6: Dose distribution and weighted average daily cost

Generic	Strength / dosage form	Daily dose (# tabs/caps per day)	% of Rxs	Average cost per tab/cap purchased by MTFs	Weighted average daily cost
Meloxicam	15 mg tab	0.5 1	39.6% 34.6%	$0.97	$0.80*
	7.5 mg tab	1 2	19.5% 5.9%	$0.88	
Celecoxib	100 mg cap	1 2	5.9% 15.8%	$0.80	$1.76
	200 mg cap	1 2	54.2% 23.2%	$1.45	
Rofecoxib	12.5 mg tab	1	7.6%	$1.35	$1.43
	25 mg tab	1 2	71.5% 5.9%	$1.37	
	50 mg tab	0.5 1	6.5% 5.7%	$2.13	
Etodolac	200 mg cap	2	2.0%	$0.15	$0.52
	300 mg cap	2 3	8.4% 2.3%	$0.20	
	400 mg tab	1 2 3 4	2.6% 70.4% 6.8% 2.2%	$0.27	

Based on all prescriptions with valid signatura (directions for use) in the Uniformed Services Prescription Database Jan – April 2002 and the average price per tab/cap purchased by MTFs, based on prime vendor data for Apr – May 02. Rows representing less than 2% of all prescriptions for a specific medication are omitted; percentages may not add to 100% for this reason. Usage of extended release etodolac was extremely low and is not reflected in these results.
* Results for meloxicam reflect a high percentage of prescriptions for meloxicam 15 mg tabs as 0.5 tabs per day, most likely due to tablet-splitting. In the absence of tablet-splitting strategies (i.e., substitution of 7.5 tabs for all 15 mg half-tabs), the weighted average cost per day would be about $0.96.

- The manufacturer has offered DoD a blanket purchase agreement for meloxicam. The BPA provides a price reduction from $0.89 to $0.79 for the 7.5 mg tab and from $0.98 to $0.88 for the 15 mg tab, a reduction of about 11%, in return for placing meloxicam on the BCF. The BPA would be effective no later than Oct 2002 and run through 31 Dec 2003. The BPA does not prevent later addition of a COX-2 inhibitor or any other NSAID to the BCF. Using the same method described above, these price decreases would reduce the weighted average daily cost of meloxicam from $0.80 to $0.73 per day.

The Council agreed that the evidence for a GI-sparing effect with meloxicam is not as certain as that for rofecoxib, but that there is sufficient evidence to conclude that meloxicam is associated with fewer serious GI events than the less COX-2 selective NSAIDs with which it has been compared in clinical trials. The Council emphasized that because meloxicam is still substantially more costly than generic NSAIDs (e.g., naproxen, ibuprofen, diclofenac), it does not make sense to use meloxicam in patients at low risk of GI events.

It is difficult to accurately predict whether addition of meloxicam to the BCF will result in greater cost (if meloxicam is used in place of generic NSAIDs) or cost avoidance (if meloxicam is used in place of celecoxib, rofecoxib, or valdecoxib). One large Army MTF that previously had celecoxib and rofecoxib on formulary with a criteria-based prospective medication use evaluation form deleted celecoxib and rofecoxib from their formulary and added meloxicam after discovering that a majority of the patients receiving celecoxib or rofecoxib did not meet criteria. After 4 months, they reported substantial cost avoidance, no adverse drug reactions, no new drug requests for celecoxib or rofecoxib as a result of treatment failures, and a 100% conversion rate when outside providers were contacted requesting a change to meloxicam.

The Council voted to add meloxicam (Mobic) to the BCF. The Council agreed that facility-level guidelines or programs to ensure appropriate use of meloxicam, as well as celecoxib, rofecoxib, or valdecoxib, are consistent with BCF policy as long as the guidelines are applied uniformly and consistently (e.g., to both military and civilian providers).

The Council also considered addition of etodolac to the BCF, but decided that it did not have sufficient data concerning the clinical utility and GI-sparing effect of etodolac and tabled the issue to a later date.

G. *Request to add aspirin/extended release dipyridamole (Aggrenox) to the BCF* – Two providers, a neurologist and a neuro-ophthalmologist, requested that Aggrenox (aspirin 50 mg/extended release dipyridamole 200 mg) be added to the BCF. Aggrenox is indicated to reduce the risk of stroke in patients who have had transient ischemia of the brain or completed ischemic stroke due to thrombosis. Aggrenox does not have approval for coronary heart disease. The 1999 AHA guidelines for the Management of TIA identify Aggrenox as an acceptable option for initial therapy following a TIA, along with aspirin, clopidogrel and ticlopidine. All have been shown to reduce the risk of recurrent stroke in patients who have had a TIA. Clopidogrel is indicated for reduction of thrombotic events in patients with recent stroke or established peripheral arterial disease, and is also indicated for use in unstable angina or myocardial infarction. Clopidogrel was added to the BCF in February 2002

Safety and tolerability of Aggrenox are similar to the two separate ingredients used in combination, with headache as the major limitation. The European Stroke Prevention Study-2 (ESPS-2) was the major efficacy trial for Aggrenox. Dropout rates in the Aggrenox and dipyridamole groups of the ESPS-2 were significantly higher than those reported in the aspirin and placebo groups. The high overall dropout rate (26%) raises the question of poor patient compliance.

There is no conclusive evidence that Aggrenox offers a significant advantage over the concomitant use of aspirin and dipyridamole to reduce the risk of stroke. The relative risk reduction for aspirin and dipyridamole versus placebo in the ESPS-1 study (38.1%) was similar to the relative risk reduction for Aggrenox versus placebo in the ESPS-2 study (37.2%).

Aggrenox is significantly more expensive than using separate tablets of aspirin or dipyridamole together. Aggrenox costs $1.76/day, which is similar to clopidogrel at $1.80/day. PDTS usage data from July 2001 – June 2002 showed there were only 2000 Aggrenox prescriptions vs. 20,000 clopidogrel prescriptions in the entire DoD.

Only 25 responses were obtained from providers regarding potential BCF addition of Aggrenox, of whom 20 were against BCF addition. Aggrenox has minimal usage in DoD, is not supported by the primary care providers, and does not offer clear benefit over clopidogrel. The Council voted not to add Aggrenox to the BCF. Individual MTFs may add Aggrenox to their local formulary if desired.

13. ADJOURNMENT

The meeting adjourned at 1430 hours on 7 August 2002. The next meeting will be held at the Uniformed Services University of the Health Sciences, Bethesda, Maryland starting at 0800 on Wednesday, 20 November 2002. All agenda items should be submitted to the co-chairs no later than 18 October 2002.

Co-chair	Co-chair

Appendix A: Studies Indicating a Reduced Incidence of Complicated Upper GI Events with Rofecoxib, Celecoxib, or Meloxicam

Abbreviations used in this appendix: absolute risk reduction (ARR); confidence intervals (CI); relative risk (RR), number-needed-to-treat (NNT); number-needed-to-harm (NNH)

Rofecoxib

- The VIGOR trial (Bombardier et al. N Engl J Med 2000; 343:1520-8) compared rofecoxib and naproxen in 8000+ RA & OA patients. The median duration of the trial was 9 months; patients on aspirin were excluded. This trial provides the best evidence to date that a COX-2 selective NSAID results in fewer complicated upper GI events (perforations, obstructions, or upper GI bleeds) and symptomatic ulcers. The incidence of confirmed complicated upper GI events was 0.6% in the rofecoxib group vs. 1.4% with naproxen [absolute risk reduction (ARR) = 0.8%, relative risk (RR) = 0.43 (95% CI 0.24-0.78), p=0.005, number needed to treat (NNT) = 125], while the incidence of the combined endpoint of confirmed complicated upper GI events **or** symptomatic ulcers was 2.1% with rofecoxib vs. 4.5% with naproxen [ARR=2.4%, RR=0.46 (95% CI 0.33-0.64), p<0.001, NNT=41].

Celecoxib

- The CLASS trial (Silverstein et al. JAMA 2000; 284:1247-55) compared celecoxib vs. a pooled NSAID group (ibuprofen or diclofenac) in 8000+ OA patients. The duration of the trial was approximately 13 months (6-month results published); patients on prophylactic aspirin were included. Published (6-month) data from the CLASS trial reported fewer confirmed complicated upper GI events with celecoxib vs. pooled NSAIDs, but the difference was not statistically significant [0.76% celecoxib vs. 1.45% NSAIDs; ARR 0.69%; RR=0.53 (95% CI 0.26-1.11), p=0.09]. A statistically significant difference was found for the combined endpoint of complicated upper GI events **or** symptomatic ulcers [2.08% celecoxib vs. 3.54% NSAIDs; ARR 1.46%; RR=0.59 (95% CI 0.38-0.94), p=0.02]. About 22% of patients were receiving low-dose aspirin. A subgroup analysis of patients not receiving aspirin resulted in significant results for celecoxib vs. pooled NSAIDs for both endpoints; there were no differences between celecoxib and pooled NSAIDs in patients receiving low-dose aspirin.

  Subsequent to initial publication, FDA briefing documents and reviews (available at www.fda.gov/ohrms/dockets/ac/01/briefing/3677b1.htm) were made available addressing the entire duration of the trial. When the entire 13-month study period was considered, there was no significant difference between celecoxib and the pooled NSAID group for the primary endpoint of confirmed complicated UGI events in the overall study population, the subgroup of patients not receiving aspirin, or the subgroup of patients receiving aspirin. The differences in statistical significance between six-month data and data from the entire study period appeared to be due to the occurrence of relatively more confirmed complicated UGI events in the celecoxib group than in NSAID groups subsequent to the first six months (see Table 7).

Table 7: Number of confirmed complicated UGI events in the CLASS trial
(uncensored intent-to-treat data)

	Celecoxib (n=3987)	Diclofenac (n=1996)	Ibuprofen (n=1985)
First 6 months	11	9	11
Entire Study Period	17	10	11

Adapted from Tables 13 and 14, Medical Officer Review for Celebrex®, available at: www.fda.gov/ohrms/dockets/ac/01/briefing/3677b1_03_med.doc

FDA briefing documents and reviews also provide separate data for the two comparator NSAIDs, which was not available in the published report. All differences that were statistically significant between celecoxib and the pooled NSAID group were significant for celecoxib versus ibuprofen. Regardless of aspirin use, there was no difference between diclofenac and celecoxib in any endpoint.

Meloxicam

- Two large (8000+ patient) meloxicam safety trials have been published, SELECT (Dequeker et al. Brit J Rheumatol 1998; 37:946-51) and MELISSA (Hawkey et al. Brit J Rheumatol 1998; 37:937-45). Each of the two 28-day trials randomized patients with OA to meloxicam or a comparator NSAID (piroxicam in SELECT and diclofenac in MELISSA); the trials were otherwise of identical design. The choice of NSAID comparators facilitated comparison of results with meloxicam vs. both a relatively COX-1 selective NSAID (piroxicam) and a relatively COX-2 selective NSAID (diclofenac). In SELECT, 7 patients treated with meloxicam had complicated upper GI events or ulcerations compared to 16 patients treated with piroxicam. All four cases involving perforations or bleeding occurred with piroxicam. In MELISSA, 5 patients treated with meloxicam had complicated upper GI events or ulcerations compared to 7 patients treated with diclofenac. Although both comparisons were statistically nonsignificant, the numerical results are consistent with the known COX-2 selectivity of the comparators.
- While meloxicam lacks a GI safety study comparable in size and duration to VIGOR or CLASS, summary results of large pooled analyses of clinical trial data are becoming available. Summary results of a pooled analysis of meloxicam clinical trial data involving 27,039 patients who received meloxicam, comparator NSAIDs, or placebo in 35 clinical trials have been published in abstract by Dr. Singh and colleagues, and are available from the manufacturer as the "Meloxicam Serious GI Event Analysis." (Note: multiple abstracts concerning this analysis are available at www.eular.org; search 2001 & 2002 abstracts for "meloxicam.")
- An analysis of complicated upper GI events (perforations, obstructions, or clinically serious upper GI bleeds) per 100 patient-years in patients who received placebo, various doses of meloxicam, diclofenac, or piroxicam during meloxicam clinical trials is shown in the table below (Singh G, Triadafilopoulos G. European Congress of Rheumatology, June 2001. Abstract SAT0085). The rate of complicated upper GI events with meloxicam appeared to be dose-related and lower than rates with diclofenac or piroxicam.

Table 8: Rate of complicated UGI events & NNH

Drug	N	Cumulative pt-yrs	Events	Events per 100 pt-yrs	NNH*
Placebo	736	113	0	0	-
Mel 7.5 mg	10158	918	3	0.3	333
Mel 15 mg	2960	1451	9	0.6	167
Mel 22.5	910	600	6	1.0	100
Diclofenac	5464	524	9	1.7	59
Piroxicam	5371	603	16	2.7	37

NNH = number-needed-to-harm to cause 1 additional event compared to placebo

- Preliminary results from an even larger pooled analysis are available in abstract (Furst et al, European League Against Rheumatism 2002, Stockholm, Sweden. Abstract THU0264, available online at www.eular.org). The analysis included data from 48 clinical trials including 117,755 patients with rheumatic diseases who received meloxicam, comparator NSAIDs, or placebo during meloxicam clinical trials. Cumulative hazards (95% CI) after 3 months for complicated upper GI events (perforations, obstructions, or GI bleeds) was: 0.05% (0-0.12%) for meloxicam 7.5 mg; 0.42% (0.12-0.71%) for meloxicam 15 mg; estimate for diclofenac 0.51% (0.16-0.86%); estimate for piroxicam 1.11% (0.35-1.88%).

MCCS-GPE **8 MAY 2002**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T Committee convened at 0800 hours on 8 May 2002, at the Commissioned Officers Club, Fort Sam Houston, TX

2. MEMBERS PRESENT

CDR Terrance Egland, MC, USN	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS, USA	DoD P& T Committee Co-chair
Col John R. Downs, MC	Air Force
Col Mark Nadeau, MC (For Col Bill Sykora, MC)	Air Force
LtCol George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
LTC (P) Joel Schmidt, MC	Army
MAJ Brett Kelly	Army
CAPT Robert Rist	Coast Guard
Dick Rooney	Department of Veterans Affairs
LTC Mike Kieffer, MS	Joint Readiness Clinical Advisory Board
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
William Hudson	Humana
Gene Lakey	TriWest
Ray Nan Berry	Health Net Federal Services
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)

MEMBERS ABSENT

COL Rosa Stith, MC	Army
Ron McDonald	Sierra Military Health Services

OTHERS PRESENT

COL William Davies, MS, USA	DoD Pharmacy Program Director, TMA
Howard Altschwager	Deputy General Counsel, TMA
CAPT Joe Torkildson, MC, USN	DoD Pharmacoeconomic Center
LTC Don DeGroff	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, USAF, BSC	DoD Pharmacoeconomic Center
CDR Denise Graham, MSC, USN	DoD Pharmacoeconomic Center
Maj Barb Roach, USAF, MC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC, USN	DoD Pharmacoeconomic Center
SFC Agustin Serrano	DoD Pharmacoeconomic Center
HM1 Lisa Drumm	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
David Bretzke	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia
David Chicoine	Uniformed Services Family Health Plan
Mark Petruzzi	Merck-Medco
Elizabeth Scaturro	Merck-Medco Managed Care
David Spiler	Merck-Medco
CAPT Howard Hays	USPHS/Indian Health
CAPT Samuel Hope	USPHS/Indian Health
CAPT Robert Pittman	USPHS/Indian Health
LCDR Thomas Berry	USPHS/Indian Health

3. **REVIEW MINUTES OF LAST MEETING / ADMINISTRATIVE ISSUES** – The minutes from the last meeting were accepted as written.

4. **INTERIM DECISIONS** – COL Remund reported on interim decisions:

   - Interferon beta 1a (Rebif) was added to the NMOP covered injectables list because interferon beta 1a (Avonex) and interferon beta 1b (Betaseron) were already included on the list.
   - In response to safety concerns raised by the FDA, Roche Laboratories implemented the System to Manage Accutane Related Teratogenicity (SMART) program on 10 April 02. The SMART program includes prescribing restrictions that make it infeasible for the NMOP to continue to fill Accutane prescriptions, so Accutane was removed from the NMOP Formulary.

5. **UNIFORM FORMULARY (UF) PROPOSED RULE**- COL Davies presented an extensive description of the UF proposed rule. The UF Proposed Rule was posted on the following website: http://frwebgate.access.gpo.gov/cgi-bin/multidb.cgi; Federal Register, Vol 67, No 71, FRI 12 Apr 2002; Civilian Health and Medical Program of the Uniformed Services. The proposed rule will be open to public comment until 11 June 2002. Comments may be submitted by email to: uniformulary@tma.osd.mil.

6. **ACADEMY OF MANAGED CARE PHARMACY (AMCP) FORMAT FOR FORMULARY SUBMISSIONS** – The AMCP developed the Format for Formulary Submissions in order to (1) improve the timeliness, quality, scope, and relevance of information available to P&T committees, and (2) streamline the data acquisition and review process for managed care organization staff pharmacists. The Format requires pharmaceutical companies to construct "dossiers" that provide drug information in a standardized format. Each dossier contains the following sections: product information, supporting clinical and economic information, an impact model report (to predict system-wide consequences of formulary changes), clinical value and overall cost, supporting information. COL Remund reported that the PEC will ask pharmaceutical companies to submit dossiers on new agents. Use of the AMCP Format will hopefully reduce the burden on the PEC staff for compiling drug information and allow more time for analyzing the information.

7. **BCF AND NATIONAL MAIL ORDER PHARMACY (NMOP) FORMULARY ISSUES** – The Committee determined the NMOP formulary status, NMOP or retail network formulary restrictions (quantity limits or prior authorization), and Basic Core Formulary (BCF) status for 7 new drugs or formulations (see Appendix A).

8. **REEVALUATION OF SILDENAFIL (VIAGRA) POLICY** – Tabled until the meeting in August 02.

9. **NMOP AND RETAIL NETWORK ISSUES**

   A. Clarification of the "line extension rule" for the NMOP Formulary – Shana Trice (PEC) reported on the current process for determining the formulary status of new formulations and dosage forms of medications that are already on the NMOP Formulary. Non-injectable medications in the following categories are added to the NMOP Formulary without formal action by the DoD P&T Committee unless the NMOP contractor and the NMOP Contracting Officer's Technical Representative (COTR) identify a reason for the P&T Committee to be involved in the decision:

   a. Generic equivalent of an agent already on the NMOP formulary
   b. New dosage form of an agent already on the NMOP formulary
   c. New formulation of an agent already on the NMOP formulary
   d. New drug entity in a therapeutic class/category for which the Committee has previously approved automatic inclusion for new drug entities. Currently the only drug class to which this applies is AIDS/HIV drugs. The Committee will review drugs automatically included under this provision at the next scheduled meeting.

   New combination products of non-injectable medications that are already on the NMOP Formulary are added to the NMOP Formulary only upon the decision of the P&T Committee or by the co-chairs through the interim decision mechanism. This does not apply to therapeutic classes/categories in which the Committee has previously approved automatic inclusion for new drug entities (i.e., AIDS/HIV drugs).

   The Committee agreed that the current process is working and should be retained, but emphasized that the preceding categories should be applied as guidelines rather than absolute rules. If Merck-Medco personnel and the NMOP COTR agree that further review is warranted for any reason, the issue should be referred to the PEC for further investigation and a recommendation for the co-chairs and/or the Committee.

The Committee agreed that the same guidelines could be applied to addition of injectable medications to the NMOP Covered Injectables List, since Merck-Medco personnel and the NMOP COTR will look at new dosage forms, formulations, and combination products and will refer issues to the PEC for further review as needed.

B. Clarification of the NMOP quantity limits for antibiotics – Subsequent to a patient question regarding a quantity limit on an antibiotic prescription filled through the NMOP, Lt Col Zastawny presented information regarding quantity limits on antibiotics through the NMOP.

A general 30-day quantity limit on antibiotics from the NMOP and a list of antibiotics exempted from the 30-day quantity limit rule were approved by the Committee at the July 1998 meeting (http://www.pec.ha.osd.mil/PTC/ptmin078.pdf), and posted with the July 1998 P&T minutes. This information was never published on the PEC website's quantity limit page, so most committee members, providers, and patients are unaware of the 30-day quantity limit on antibiotics or the antibiotics that were exempt from the 30-day limit. The NMOP contractor, however, has applied the 30-day quantity limit to antibiotic prescriptions filled through the NMOP. According to the NMOP COTR, antibiotic quantity limits in the NMOP have caused very few complaints over the past 3 years.

The Committee decided to table this topic until the August 2002 meeting in order to allow members time to review the antibiotic quantity limits and make informed decisions.

10. PRIOR AUTHORIZATIONS (PAs)

A. Report on PA drugs – Shana Trice (PEC) reported that all changes to NMOP PA criteria approved at the last meeting had been completed and that PA forms, criteria, and clinical rationale explanations were posted on the PEC website.

B. Proposed revision to anakinra PA criteria – Given the current shortage of etanercept, the Committee discussed revising the anakinra PA criteria to make it easier for patients unable to obtain etanercept to be started on anakinra. They decided to make no changes because it does not appear that existing etanercept patients have been unable to receive etanercept for continuation of therapy (although the NMOP reported delays of some days in supplying etanercept to patients) and because making the administrative change to NMOP PA criteria would require at least 90 days.

C. Cost avoidance from NMOP PAs – The Committee approved the recommendation to report cost avoidance of NMOP PAs at every other meeting. The next report will be at the August 02 meeting.

11. SUBCOMMITTEE REPORT: PROVISION OF INJECTABLE DRUGS IN THE NMOP OR RETAIL NETWORK PHARMACIES – Lt Col George Jones reported that the subcommittee was uncertain about what it was supposed to do. The subsequent discussion focused on the possibility of applying the NMOP Covered Injectables List to the retail network to define what injectable products would be available from retail network pharmacies. COL Davies pointed out that the DoD P&T Committee does not have the authority to make such a decision, as this would constitute a change in the pharmacy benefit by making a group of drugs unavailable in both purchased care venues. Another committee member again stated the opinion that this was a safety issue, but the Committee felt that in general this was not the case. The Committee decided to disband the subcommittee.

The Committee subsequently considered that there may be injectable drugs being dispensed in the retail network that are not being dispensed through the NMOP that in fact could be provided through the NMOP. The PEC will use prescription data from PDTS to analyze this issue. Mr. Bill Hudson from Humana Health Care, one of the members of the original subcommittee, also expressed an interest in remaining involved with this issue. The Committee agreed with this course of action.

12. CONTROLLED DISTRIBUTION OF PRESCRIPTION DRUGS – The FDA has mandated controlled or restricted distribution mechanisms for several agents. The current status of those agents within the DoD is:

A. Schering, the manufacturer of pegylated interferon (PEG-Intron), emplaced a mechanism to allow DoD activities to order directly. Details will be available on the PEC website.

B. Pfizer, the manufacturer of dofetilide (Tikosyn), emplaced a mechanism to allow DoD activities to order directly, and the Managed Care Support Contractors are providing the drug through their retail pharmacy networks. Details will be available on the PEC website.

C. Members of the DoD Pharmacy Board of Directors are working with Roche and the FDA to establish a mechanism for Accutane to be prescribed via electronic physician order entry instead of requiring hard copy prescriptions.

D. Etanercept (Enbrel) is in short supply. Current patients' needs are being met. New patients are being placed on a waiting list. Relief is not expected soon. Providers are being advised to consider alternative therapy.

E. Actelion, the manufacture of bosentan (Tracleer), maintains five specialty distributors to distribute Tracleer. CVS Procare is one of the specialty distributors, and is part of the TRICARE retail network. All Tracleer patients should enroll into the Tracleer Access Program (TAP) by using the toll-free telephone number 866-228-3546. At that time they will be assigned to CVS Procare as their specialty pharmacy. None of the other specialty pharmacies are part of the MCSC retail pharmacy networks. Using any pharmacy other than CVS Procare would result in an out-of-network claim, which requires advance payment for the drug and the filing of a paper claim; the patient would only be reimbursed the cost of the drug minus a cost share, which is substantially greater than the network's $9.00 copay.

13. ADJOURNMENT – The meeting adjourned at 1200 hours. The next meeting will be held at the Uniformed Services University of the Health Sciences, Bethesda, Maryland starting at 0800 on Thursday, 08 August 2002. All agenda items should be submitted to the co-chairs no later than 08 July 2002.

List of Appendices

APPENDIX A: NEWLY APPROVED DRUGS CONSIDERED FOR THE NATIONAL MAIL ORDER PHARMACY FORMULARY AND DOD BASIC CORE FORMULARY

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Pegfilgrastim injection (Neulasta; Amgen)	31 Jan 02; pegylated form of filgrastim (G-CSF) indicated to reduce the incidence of infection, as manifested by febrile neutropenia, in patients with non-myeloid malignancies receiving chemotherapy associated with a clinically significant incidence of febrile neutropenia.	**Note**: Filgrastim and Epogen are both on the NMOP covered injectables list. Added to the NMOP Formulary and Covered Injectables List	**Quantity Limits** 2 syringes per 45 day supply (NMOP); 1 syringes per 21 day supply (retail network). **Rationale for quantity limits:** Potential for excessive cost due to product wastage. **Prior Authorization:** None	Not added to the BCF **Similar BCF Drugs:** None
Comments regarding pegfilgrastim injection: Pegfilgrastim is given once per chemotherapy cycle as a single dose of 6 mg administered at least 24 hours after chemotherapy. Filgrastim is administered daily for up to 14 days following chemotherapy. Pegfilgrastim, at $1730/syringe, is somewhat more costly than a 10-day course of filgrastim at a daily dose of 300 mg per day ($1037) or 480 mcg per day ($1640). Because patients may decline further courses of chemotherapy due to unacceptable toxicity, the potential for product wastage is significant. Because pegfilgrastim should not be administered during the 14 days before chemotherapy because of the potential for an increase in the sensitivity of rapidly dividing myeloid cells to cytotoxic chemotherapy, it is not suitable for chemotherapy cycles much shorter than 21 days. A quantity limit of 2 syringes per 45 days (NMOP) or 1 syringe per 21 days (retail) allows a sufficient supply to cover the next chemotherapy cycle and a sufficient time to order the next needed dose				
Norelgestromin / ethinyl estradiol transdermal patch (Ortho-Evra; Ortho-Biotec)	20 Nov 01; prevention of pregnancy; first contraceptive available in a transdermal formulation; the ethinyl estradiol component is equivalent to 20 mcg of EE/day (low-dose estrogen). Norelgestromin is produced following oral administration of norgestimate, the progestin component found in Ortho-Cyclen and Ortho-Tricyclen.	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** None
Budesonide capsules (Entocort EC; Astra Zeneca)	02 Oct 01; glucocorticoid for the treatment of mild to moderate active Crohn's disease involving the ilieum and/or ascending colon (acute flares)	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** None

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Morphine sulfate extended release capsules (Avinza; Ligand)	20 Mar 02; launched on 2 May 02. Modified-release formulation of morphine sulfate intended for once-daily administration indicated for the relief of moderate to severe pain requiring continuous, around-the-clock opioid therapy for an extended period of time; not intended for prn use.	Added to the NMOP Formulary.	**Quantity Limits:** General rule for Schedule II controlled substances applies; limited to 30 days supply at the NMOP **Rationale for quantity limits:** Existing quantity limits for Schedule II controlled substances **Prior Authorization** None	The current BCF listing for morphine sulfate extended release was clarified to exclude Avinza. **Similar BCF Drugs:** Morphine sulfate extended release (MS Contin and generic equivalents)
Olmesartan medoxomil (Benicar; Sanyko / Forrest)	25 Apr 02; approved for hypertension. This is the 7th Angiotensin Receptor Blocker (ARB) to be approved in the U.S.	Added to the NMOP Formulary.	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** None
Extended phenytoin sodium, 200 mg and 300 mg capsules (Phenytek; Bertek)	6 Dec 01; new branded formulation of phenytoin sodium indicated for the treatment of generalized tonic-clonic and complex partial seizures and prevention and treatment of seizures during or following neurosurgery 200 and 300 mg Phenytek capsules are bioequivalent to 2 and 3 Dilantin 100-mg capsules, respectively	Added to NMOP Formulary as a line extension.	**Quantity Limits** General rule applies **Prior Authorization** None	The current BCF listing for phenytoin oral was clarified to exclude Phenytek. **Similar BCF Drugs:** Oral phenytoin
Paroxetine controlled-release tablets (Paxil CR; GlaxoSmithKline)**)**	Approved for depression Feb 99 but not marketed until FDA approval for panic disorder was obtained in Feb 02. This new formulation of paroxetine does NOT extend the dosing interval (once-daily); a polymer matrix controls the dissolution rate over 4-5 hours and an enteric coating delays release until tablets have left the stomach, potentially improving tolerability. Because of reduced bioavailability, Paxil CR strengths are higher (12.5-, 25-, 37.5-mg) than Paxil immediate release (10-,20-,30-,40-mg).	Added to the NMOP Formulary	**Quantity Limits:** General rule applies **Prior Authorization:** None	The current BCF listing for paroxetine oral was clarified to exclude Paxil CR, pending a more thorough review in 6 months. **Similar BCF Drugs:** paroxetine, fluoxetine, citalopram, sertraline
Comments concerning paroxetine controlled-release tablets – The Committee agreed that information concerning the potential advantages of Paxil CR compared to immediate release paroxetine was not sufficiently complete to mandate that Paxil CR be added to all MTF formularies at this time. In addition, they wanted to obtain provider opinions concerning the utility of the new formulation that were not available at the time of the meeting. Paxil CR will be reviewed again in 6 months. It will be excluded from the BCF pending review.				

APPENDIX B: COMBINED SUMMARY OF FORMULARY CHANGES FROM THE DOD P&T EXECUTIVE COUNCIL MEETING AND THE DOD P&T COMMITTEE MEETING

1. **BCF CHANGES**

   A. Additions to the BCF

   1) Combivent (ipratropium/albuterol sulfate) oral inhaler
   2) Raloxifene (Evista)
   3) Pseudoephedrine/Guaifenesin 600/120 mg extended release (Entex PSE equivalent).
   4) Levonorgestrel 0.75 mg (Plan B)—added to the BCF on 3 April 2002, but subsequently deleted from the BCF on 8 May 2002.

   B. Deletions from the BCF

   1) Propranolol LA
   2) Levonorgestrel 0.75 mg (Plan B)—deleted from the BCF on 8 May 2002

   C. Changes and clarifications to the BCF

   1) The current BCF listing for carbinoxamine/pseudoephedrine drops was changed to the "new" formulation (1 mg/15 mg per ml) since this is the only formulation available.

   A. Exclusions from the BCF

   1) Morphine sulfate extended release capsules (Avinza; Ligand)
   2) Extended phenytoin sodium, 200- and 300 mg capsules (Phenytek; Bertek)
   3) Paroxetine controlled-release tablets (Paxil CR; GlaxoSmithKline) – pending more thorough review in 6 months.

2. **NMOP FORMULARY CHANGES**

   A. Additions to the NMOP Formulary (See Appendix A for details)

   1) Pegfilgrastim injection (Neulasta; Amgen) – added to the NMOP Covered Injectables List. Quantity limits apply, see below
   2) Norelgestromin/ethinyl estradiol transdermal patch (Ortho-Evra; Ortho-Biotec) –
   3) Budesonide capsules (Entocort EC; Astra Zeneca)
   4) Morphine sulfate extended release capsules (Avinza; Ligand)
   5) Olmesartan medoxomil (Benicar; Sanyko/Forrest)
   6) Extended phenytoin sodium 200- and 300 mg capsules (Phenytek; Bertek)
   7) Paroxetine controlled-release tablets (Paxil CR; GlaxoSmithKline)

   B. Exclusions from the NMOP Formulary -None

   C. Clarifications to the NMOP Formulary - None

3. **QUANTITY LIMIT CHANGES (NMOP AND RETAIL NETWORK)**

   A. Quantity limit for Pegfilgrastim Injection (Neulasta; Amgen): 2 syringes per 45-day supply (NMOP); 1 syringe per 21-day supply (retail network).

4. **CHANGES TO THE PRIOR AUTHORIZATION PROGRAM (NMOP AND RETAIL NETWORK)** - None

Department of Defense

Fort Sam Houston, TX 78234-5081

MCCS-GPE **7 May 2002**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The DoD P&T Executive Council met from 0800 to 1600 hours on 7 May 2002 and from 0800 to 0815 hours on 8 May 2002 at the Officers Club, Fort Sam Houston, TX.

2. MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
LTC (P) Joel Schmidt, MC	Army
MAJ Brett Kelly, MS	Army
COL John R. Downs, MC	Air Force
COL Mark Nadeau, MC (Representing COL Bill Sykora, MC)	Air Force
LtCol George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
CAPT Robert Rist	Coast Guard
Dick Rooney	Department of Veterans Affairs
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
LTC Mike Kieffer, MS	Joint Readiness Clinical Advisory Board

MEMBERS ABSENT

COL Rosa Stith, MC	Army

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TMA
Howard Altschwager	Deputy General Counsel, TMA
CAPT Betsy Nolan, MSC	Navy Pharmacy Specialty Leader
COL Mike Heath, MS	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, BSC	DoD Pharmacoeconomic Center
CDR Denise Graham, MSC	DoD Pharmacoeconomic Center
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
LTC (P) Doreen Lounsbery, MC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC	DoD Pharmacoeconomic Center
SFC Agustin Serrano	DoD Pharmacoeconomic Center
HM1 Lisa Drumm	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Dave Bretzke	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia
CAPT Howard Hays, MD	USPHS/Indian Health Service
CAPT Samuel Hope	USPHS/Indian Health Service
CAPT Robert Pittman	USPHS/Indian Health Service
LCDR Thomas Berry	USPHS/Indian Health Service

3. REVIEW MINUTES OF LAST MEETING

The minutes from the last meeting were accepted as written.

4. INTERIM DECISIONS/ADMINISTRATIVE ISSUES

Four members of the Indian Health Service (IHS) National Formulary Work Group attended the DoD P&T Executive Council meeting. The IHS is evaluating the feasibility of establishing a national formulary.

5. LEVONORGESTREL 0.75 MG (PLAN B)

At the February 2002 DoD Pharmacy & Therapeutics (P&T) Executive Council meeting, the Council recommended the addition of levonorgestrel 0.75 mg (Plan B) to the Basic Core Formulary (BCF), subject to the review and approval of the Director, TRICARE Management Activity (TMA) and/or the Assistant Secretary of Defense for Health Affairs (ASD (HA)). On 28 March 2002, the Executive Director of TMA signed an Action Memo approving the recommendation. On 3 April 2002 the co-chair of the DoD P&T Committee informed the Council members and service pharmacy consultants of the decision, and re-informed the Council on 7 May 2002. On 8 May 2002 the Executive Council was reconvened briefly to announce that the Council co-chairs had been informed that the ASD (HA) also wanted to review the Council's recommendation and that the Executive Director of TMA had rescinded his earlier approval. Therefore, Plan B has NOT been approved for addition to the BCF at this time, and the ASD (HA) is reviewing the Council's recommendation.

MTFs are required to include all BCF drugs on their local formularies. As a result of Plan B's removal from the BCF, each MTF's P&T committee must now re-evaluate whether this product is within the scope of practice at the MTF and whether the MTF wants to continue to have Plan B on its formulary.

6. NATIONAL PHARMACEUTICAL CONTRACTS AND BLANKET PURCHASE AGREEMENTS (BPAs)

Contract awards, renewals, and terminations

- Contracts for oral contraceptives, etodolac, fexofenadine, hydrochlorothiazide, insulin needle/syringes, isosorbide mononitrate, capsaicin cream, and ticlopidine were renewed.
- New contracts were awarded for ibuprofen tablets and fluoxetine capsules.
- DoD contracts for lisinopril and hepatitis A are up for renewal.
- The following joint DoD/VA contracts are up for renewal: ointment base, carbidopa/levodopa SA; glyburide tablets, amantadine capsules, fluocinonide cream/ointment, terazosin tablets/capsules, sotalol tablets, bupropion tablets, acyclovir tablets/capsules, hydroxyurea capsules, pentoxifylline tablets, rifampin capsules, and sucralfate tablets.
- The following joint DoD/VA contracts are up for resolicitation: salsalate tablets, prednisone tablets, and cimetidine tablets.
- The following joint DoD/VA contracts are in various stages of solicitation: benztropine mesylate tablets, minoxidil tablets, carbidopa/levodopa IR tablets, famotidine, chlorpromazine tablets, thiothixene, penicillin VK tablets, dicloxacillin capsules, cephalexin capsules, amoxicillin capsules, and trihexyphenidyl.

7. REEVALUATION OF THE BASIC CORE FORMULARY (BCF)

A. BCF Objective – As outlined in HA Policy 98-034, the objective of the BCF is to ensure the uniform availability of cost-effective pharmaceuticals at MTF pharmacies in order to meet the majority of patients' primary care needs. An analysis of prescriptions dispensed by MTF pharmacies between 1 Oct 01 and 15 Mar 02 revealed that 62% were for BCF items if prescriptions for OTCs were included, and 71% if OTC items were excluded. These data suggest that the BCF objective is being accomplished to a substantial degree.

Some people propose that a large number of drugs should be added to the BCF in order to retain and recapture prescription workload from retail pharmacies where the drugs cost more. This proposal assumes that the addition of a drug to the BCF will actually cause patients to get their prescriptions filled at an MTF rather than a retail pharmacy. Many factors influence patient behavior, so it is difficult to predict the impact that BCF status will actually have on the retention/recapture of prescription workload.

The Council faces a dilemma: Should inclusion on the BCF be reserved for only the more cost-effective drugs in an attempt to encourage the use of agents that offer the best overall value? Or should the Council simply ignore the BCF objective and add a bunch of drugs to the BCF (regardless of their cost-effectiveness) in the hope that it will help retain

and recapture workload from retail pharmacies? The Council did not reach a consensus on this issue.

B. *OTC Coverage on the BCF* – TRICARE policy provides limited coverage of OTC drugs at retail pharmacies and the NMOP. Chapter 7, Section 7.1 of the TRICARE Policy Manual states that: "Insulin and related supplies may be cost-shared for diabetic patients, regardless of whether or not a prescription is required under state law"; and "Vitamins may be cost-shared only when used as a specific treatment of a medical condition." Non-covered benefits include: "Drugs, including compounded preparations, that are available over the counter."

   Although TRICARE policy does not govern the availability of OTC products at MTF pharmacies, the Council has historically refrained from adding OTC products to the BCF. The BCF currently includes only 11 OTC items. The recently published Uniform Formulary Proposed Rule states, "The Basic Core Formulary (BCF) is a subset of the Uniform Formulary and is a mandatory component of all MTF pharmacy formularies". If the BCF is to be a subset of the Uniform Formulary, the inclusion of OTCs on the BCF will be limited by TRICARE policy.

   From 1 Oct 01 to 15 Mar 02, MTFs dispensed 3.7 million prescriptions for OTC drugs, which accounted for 16.3% of total prescriptions dispensed during that time period. The eleven OTC items on the BCF accounted for only 500,000 of the 3.7 million prescriptions for OTC drugs, so MTFs clearly provide many more OTC drugs than those included on the BCF.

   In light of the Uniform Formulary Proposed Rule, the Council unanimously voted not to add any additional OTC products to the BCF beyond those identified in the TRICARE Policy Manual. However, the Council encourages MTFs to continue providing OTC medications when they represent cost-effective alternatives to legend drugs. The Council will explore mechanisms other than the BCF to promote uniform availability of cost-effective OTC medication at MTFs.

C. *Comparison of the BCF to VA's National Formulary* - The term "formulary" most properly refers not only to a list of drugs on the formulary of a health care institution or system, but also to related information concerning the use of drugs and to the drug use policies of that institution or system as a whole. The BCF and the VA National Formulary (NF) have fundamental differences that reflect underlying differences in the MHS and VA drug delivery systems, despite similar underlying concepts—both are intended to make cost-effective drug therapies uniformly available across large health care systems. Formulary status on the BCF and/or the NF is increasingly being used to leverage lower prices for commonly used pharmaceuticals in classes where several therapeutically equivalent alternatives exist.

   One of the fundamental differences between DoD and the VA that affects formulary structure is the fact that VA facilities generally do not fill prescriptions from outside providers. The VA also lacks a full-service mail order point of service analogous to the NMOP (the VA Consolidated Mail Outpatient Pharmacy (CMOP) is used to expedite the processing of refills) and VA beneficiaries do not have the option of taking their prescriptions to retail network pharmacies. In addition to point of service and

administrative differences, there are well-known patient population differences between the two systems that may affect drug formularies.

DoD and the VA differ even when considering only MTFs and VA facilities, most notably in the degree to which local formulary decision-making is retained by individual facilities. In the VA, the NF is supplemented by 22 regional (VISN) formularies, but local formularies are forbidden and local formulary decision-making is restricted to antimicrobials (to accommodate local resistance patterns). The BCF is supplemented by both regional (in some cases) and local formularies; individual facilities typically have independent P&T committees that retain broad autonomy over local formularies and drug use policy.

The NF drug list contains 1214 items (individual listings) in 28 categories, while the BCF contains 176 items in 24 categories. These counts were based on using the VA classification system and the formularies as listed on the VA PBM and DoD PEC websites as of May 02, after adjusting both lists to use common terminology. The VA drug classification system was chosen for this comparison because it provides consistent categories for all items on both the NF and the BCF, including medical supply items.

Three major categories where the two formularies differ substantially are injectable medications, medical supply items, and OTC medications. The NF contains a large number of medications that have not been traditionally represented on the BCF, including 344 injectable medications, most of which are typically only used on an inpatient basis (compared to 7 on the BCF); 131 medical supply items, including syringes, dressings, IV supplies, catheters, etc. (compared to 2 on the BCF); and 185 OTC medications (vs. 11 on the BCF).

Even if injectable medications, medical supply items, and OTC medications are excluded, the NF still contains more line items than the BCF (570 vs.156). The difference can be broken down into three primary contributing factors:

1) The NF contains some categories, such as antimicrobials, central nervous system medications (including antidepressants and antipsychotics), and antineoplastics, which appear to contain virtually all commonly used drugs in those categories. This may be due to resistance concerns (as would be the case with antimicrobials) or to lack of therapeutic interchangeability of drugs in these categories. Some of these drugs may be subject to criteria for use.
2) The NF covers some types of drugs traditionally not well represented on the BCF because they are considered to be specialty drugs (e.g., antineoplastics, antivirals, diagnostic agents, topical anesthetics).
3) The NF tends to list more alternatives than the BCF even in commonly used drug classes listed on both formulary lists. For example, the NF lists 5 oral glucocorticoids while the BCF lists 2, and the NF lists 8 nonsteroidal anti-inflammatory drugs while the BCF lists 3.

8. DRUG USE AND EXPENDITURE REVIEW

The Council was unable to assess the FY 02 budget execution by MTF pharmacies because:

- Prime vendor data are missing for so many MTFs that expenditures cannot be accurately estimated.
- CHCS pharmacy cost reports are not uniformly available from MTF pharmacies.
- MTF pharmacy expenditures reported by the TMA resource management differ significantly from the pharmacy expenditures reported by the resource managers for the three services.

9. PENDING CONTRACT INITIATIVES

A. Status of Contracting Initiative for Leutinizing Hormone Releasing Hormone (LHRH) Agonists – The DoD and the VA have agreed in principle on pursuing a contract for a Leutinizing Hormone Releasing Hormone (LHRH) agonist. The solicitation will be for a 1 and 3 month product from the same manufacturer for the treatment of prostate cancer; other formulations and strengths will not be included. The solicitation is currently being written, but has not yet been released.

B. Status of Contracting Initiative for Nasal Corticosteroids – The DoD and VA issued a joint solicitation to select a single source for flunisolide nasal inhalers. This solicitation does not stipulate that the contracted drug will be on the BCF. The DoD and VA are also working on a joint solicitation for a once-daily nasal corticosteroid inhaler that will place the contracted product on the BCF.

C. Status of Contracting Initiative for Triptans – The DoD and VA are working on a joint solicitation that will comply with the Council's previous stipulation that any contracting initiative must either allow or require MTFs to have at least two triptans on their formularies.

10. DRUG CLASS EVALUATIONS TO DETERMINE CLINICALLY ACCEPTABLE CONTRACTING/FORMULARY STRATEGIES

: COL Remund briefed the Council on the PEC's attempt to outline the process that the Council has been using to identify clinically acceptable contracting/formulary strategies for drug classes. The Council followed the process described in Appendix A to evaluate the following drug classes.

A. Statins – The current DoD statin contract will expire in February 2003. A joint solicitation with the VA for a follow-on contract is currently being considered. A high potency statin (simvastatin or atorvastatin) must be included on the BCF in order for patients to attain the LDL-cholesterol goals established by the National Cholesterol Education Program (NCEP) Adult Treatment Panel (ATP) III guideline. A low potency statin could also be included on the BCF if it would enhance the cost effectiveness of cholesterol-lowering therapy in the Military Health System. The following analysis focuses on the high potency statins.

Therapeutic Interchangeability: Although atorvastatin can achieve larger reductions in LDL-cholesterol than simvastatin, less than 10% of patients require the magnitude of LDL-cholesterol reduction that can only be achieved by atorvastatin. Some studies indicate that atorvastatin may not raise HDL cholesterol levels as much as simvastatin, but the Council doubted that any difference in the effect on HDL levels would significantly affect the therapeutic interchangeability of these drugs for most patients. Long-term clinical trials prove that simvastatin reduces cardiovascular morbidity and mortality. Similar evidence is not available for atorvastatin. There are no data that demonstrate significant differences in safety or tolerability between atorvastatin and simvastatin. The Council concluded that simvastatin and atorvastatin have a high degree of therapeutic interchangeability.

Clinical Coverage: Simvastatin and atorvastatin each have the capacity to satisfy the LDL-cholesterol reduction needs of at least 90% of the DoD population. Some patients may have a clinical need to use pravastatin because of its lower potential for drug interactions, but these patients comprise less than 5% of statin patients. Providers expressed a preference for having more than one statin on the BCF, but they did not provide a clinical justification for a second statin on the BCF. The Council concluded that either atorvastatin or simvastatin would provide adequate clinical coverage.

Provider Acceptance: Provider acceptance of simvastatin is clearly supported by the fact that simvastatin currently accounts for about 95% of all statin prescription fills at MTF pharmacies. Providers also expressed a willingness to use atorvastatin. Providers voiced strong opposition to any contract that would require patients to be switched from one statin to another statin. Opposition to switching patients is understandable because (1) approximately 150,000 patients had to switch statins after the DoD statin contracts were awarded in August 1999 and (2) approximately 100,000 patients had to switch statins after cerivastatin was withdrawn from the market in August 2001.

The Council voted unanimously to support any contracting/formulary strategy (to include a closed class contract) that places at least one high potency statin on the BCF and does not require patients to be switched from one agent to another. The Council also supports the inclusion of a low-potency statin on the BCF if it is projected to enhance the cost-efficiency of statin therapy.

B. *Angiotensin Receptor Blockers (ARBs)* –Seven ARBs are available: losartan (Cozaar, FDA-approved in Apr 95), valsartan (Diovan, Dec 96), irbesartan (Avapro, Sep 97), candesartan (Atacand, Jun 98), telmisartan (Micardis, Oct 98), eprosartan (Teveten, Oct 99), and olmesartan (Benicar, Apr 02). All the ARBs are FDA-approved for hypertension.

ARBs offer a slight clinical advantage (lower incidence of cough and angioedema) compared to angiotensin-converting enzyme inhibitors (ACEIs) in the treatment of hypertension, but ARBs cost much more than ACEIs. The JNC-VI Guideline advises that ARBs should be reserved for hypertensive patients who are unable to tolerate ACEIs. ARBs are also used “off-label” for congestive heart failure (CHF) and prevention of renal disease progression in diabetics. Despite a recent ADA recommendation that an ARB should be used as first line therapy in type 2 diabetes with hypertension and

microalbuminuria or clinical albuminuria, many providers still think that ARBs should be reserved for second line therapy when patients experience adverse effects on an ACEI.

Despite their "second line" place in therapy, ARB purchases by MTFs increased about 56% from $9 million in FY 00 to $14 million in FY 01. A significant price reduction might be achieved through a contracting initiative that places one or more ARBs on the BCF.

Therapeutic Interchangeability

- *Hypertension*: The Council considered the information contained in a joint VA/DoD clinical review of the ARBs (published on the PEC website). The Council concluded that ARBs have a high degree of therapeutic interchangeability in the treatment of hypertension.
- *CHF*: The FDA has characterized valsartan as "approvable" for CHF in patients not receiving an ACEI or as a substitute for an ACEI (despite the FDA advisory committee recommendation against approval). The ELITE I study showed increased survival for CHF patients on losartan compared to an ACEI, but the larger ELITE II study showed no significant difference in all-cause mortality for patients on losartan compared to an ACEI. The RESOLVD trial was discontinued because candesartan was associated with an increase in hospitalizations and death compared to CHF patients treated with enalapril. A large CHF trial comparing candesartan to an ACEI (the CHARM trial) is underway. Data are not available for the other ARBs in the treatment of CHF. The Council decided that the data are insufficient to conclude that the ARBs are therapeutically interchangeable for CHF.
- *Prevention of renal disease progression in diabetics*: A FDA advisory committee concluded that the IDNT and IRMA-2 trials were suggestive of efficacy, but the data were insufficient to support approval of irbesartan for prevention of renal disease progression in patients with type 2 diabetes. An FDA advisory committee recommended approval of losartan for the prevention of renal disease progression in diabetics based on the RENAAL trial. Data are not available for the other ARBs for this indication. The Council decided that the data are insufficient to conclude that the ARBs are therapeutically interchangeable for prevention of renal disease progression in diabetics.

Clinical Coverage: There is no evidence that if a hypertensive patient fails therapy with one ARB, a better response would occur with another ARB. Any of the ARBs would probably provide adequate clinical coverage when used for hypertension, but there are no data to support a conclusion that one or more of the ARBs is sufficiently safe, tolerable, and effective to satisfy the clinical needs of at least 90% of the patients when used for CHF or prevention of renal disease progression in diabetics.

Provider Acceptance: Losartan, valsartan, and irbesartan account for about 90% of prescription fills for ARBs at MTF pharmacies, and providers expressed a preference for these three ARBs. Nephrologists and endocrinologists prefer irbesartan and losartan. Cardiologists prefer valsartan. These three have been on the market longer than the other ARBs, so providers have more confidence in their safety profiles. Providers were uniformly opposed to switching patients from one ARB to another.

The Council unanimously voted to add at least one ARB to the BCF in an open class, with guidelines for appropriate use. The Council also stipulated that any contract for an ARB should not require patients to be switched from one ARB to another ARB.

C. *Thiazolidinediones (TZDs, "glitazones")* – While the TZDs offer a relatively modest reduction in HbA1C compared to other antidiabetics, diabetic patients frequently require combination therapy with two or more agents. Even small reductions in HbA1C correlate with a decreased risk of microvascular complications. There has now been sufficient clinical experience with TZDs to lessen the concern regarding hepatoxicity. The VA is currently considering adding a TZD to its National Formulary. A DoD and VA joint procurement strategy for TZDs might achieve a substantial price reduction.

Therapeutic Interchangeability: There are no large, randomized, controlled head-to-head trials comparing rosiglitazone (Avandia) and pioglitazone (Actos). However, comparison of clinical trial data suggests that they reduce HbA1C by the same degree when equivalent doses are used (pioglitazone 45 mg qd = rosiglitazone 4 mg bid, or pioglitazone 30 mg qd = rosiglitazone 8 mg qd). Both drugs are approved for monotherapy and for use in combination with metformin or a sulfonylurea. Pioglitazone is approved for use with insulin, and the FDA has classified rosiglitazone as "approvable" for use with insulin. There are case reports of heart failure occurring with both drugs when used in combination with insulin. There is insufficient evidence to conclude that the drugs differ in their propensity to cause or exacerbate heart failure.

Comparison of data from clinical trials suggests that pioglitazone has a more favorable effect on LDL-cholesterol and triglycerides than rosiglitazone. However, due to the significant intra-person and inter-person variability in lipid levels, the variability in methods used to measure lipid levels, and potential differences in study subjects across the trials, it is difficult to draw a definitive conclusion about any true differences in lipid effects. The clinical significance of the potential differences in lipid effects is also unknown. Table 1 shows the range of changes in mean lipid levels from clinical trials for rosiglitazone and pioglitazone.

Table 1: Range of Mean Lipid Changes from TZD Clinical Trials

	Rosiglitazone[a]	Pioglitazone[b]
LDL	↑ 5.3 – 22%	↑ 2.8 – 7.7%
HDL	↑ 8.4 – 18%	↑ 9.1– 15.8%
Triglycerides	↑9 – 19.6%	↓ 9.6 – 15.9%

[a] Rosiglitazone LDL results from 7 studies, HDL results from 5 studies, and triglyceride results from 2 studies.
[b] Pioglitazone results from 5 studies.

Rosiglitazone and pioglitazone appear similar to placebo in their propensity to cause elevation in liver transaminases. There are no data to suggest that they differ significantly in their potential to cause hepatotoxicity, edema or weight gain.

Clinical Coverage: Based on their FDA-approved indications, either of these drugs can be expected to have the desired clinical effect in over 90% of patients.

Provider Acceptance: Providers would generally accept either agent, but some indicate a preference for pioglitazone due to its more favorable lipid profile. PDTS prescription data

show that pioglitazone has consistently increased its share of prescription fills for TZDs across all three outpatient pharmacy points of service over the past year.

Council members had difficulty reaching consensus on whether this class is suitable for a closed class contract. Objections to a closed class contract centered on the potential lack of therapeutic interchangeability between pioglitazone and rosiglitazone in regard to their effects on LDL-cholesterol and triglycerides. Some Council members also expressed concern that the potential for discovery of new clinical information about these drugs makes a closed class contract risky for this drug class. After two motions failed, the Council approved a third motion to add one TZD to the BCF via a procurement initiative that leaves the TZD class open and does not require patients to be switched from one TZD to another.

11. DRUG/DRUG CLASS EVALUATIONS TO DETERMINE BCF ADDITION

A. *COX-2 Selective Nonsteroidal Anti-Inflammatory Drugs (NSAIDs)* – The major advantage of COX-2 selective NSAIDs ("COX-2 inhibitors") compared to non-specific NSAIDs is a reduced incidence of complicated upper gastrointestinal (GI) events (GI bleed, perforation, and obstruction) and symptomatic but uncomplicated ulcers. Evidence that COX-2 inhibitors actually provide this benefit is primarily derived from two large trials: the Vioxx Gastrointestinal Outcomes Research Study (VIGOR) and the Celecoxib Long-term Arthritis Safety Study (CLASS).

VIGOR demonstrated a statistically significant reduction in the annualized incidence of complicated upper GI events in patients receiving rofecoxib (0.6%) vs. naproxen (1.4%), which equates to a number-needed-to-treat (NNT) of 125. In other words, 125 patients would need to be treated with rofecoxib rather than naproxen for one year to prevent one complicated upper GI event. CLASS (celecoxib vs. ibuprofen and diclofenac) failed to demonstrate a statistically significant reduction in complicated upper GI events for its overall patient population, but a statistically significant reduction in complicated upper GI events did occur in the subgroup of patients not receiving aspirin. A statistically significant reduction also occurred for the broader endpoint of complicated upper GI events plus symptomatic but uncomplicated ulcers regardless of aspirin use.

If the reduction in complicated upper GI events in VIGOR is generalized to all COX-2 inhibitors and the daily cost of COX-2 inhibitor and nonspecific NSAID therapy is estimated to be $1.50 and $0.15, respectively, treating 125 patients for one year with COX-2 inhibitors rather than nonspecific NSAIDs would prevent one complicated GI event at an incremental drug cost of about $61,600. This does not take into account the effect of reductions in the incidence of symptomatic but uncomplicated ulcers and possibly in the incidence of GI symptoms and the use of medications to treat GI symptoms (e.g., H2-blockers and PPIs).

Because the risk of NSAID-associated GI events is known to differ among patient populations (based on factors such as age, use of other medications that increase GI risk, use of prophylactic medications, and history of peptic ulcer disease and/or prior GI events), the NNT from the VIGOR trial and the associated cost to prevent one GI event cannot be generalized to all patients. The NNT and the associated costs would be much higher in a patient population without known risk factors (e.g., young patients, many of

whom would receive relatively short-term treatment with NSAIDs) than in the patient population studied in VIGOR (older RA patients requiring chronic NSAID therapy).

Estimates of the background risk of GI events in a general patient population are not readily available. However, if the baseline annualized risk of NSAID-associated GI events in such a patient population is assumed to be about 0.5%, and the relative reduction in events with COX-2 inhibitors vs. nonspecific NSAIDs is assumed to be similar to the reduction in VIGOR (about 50%), the NNT would be 400. Using the same daily medication costs described above, 400 patients would have to be treated for one year with COX-2 inhibitors rather than nonspecific NSAIDs to prevent one complicated GI event, at an incremental drug cost of $197,000.

COX-2 inhibitors appear to be somewhat better tolerated with regard to dyspepsia and other GI symptoms than the non-specific NSAIDs to which they have been compared. COX-2 inhibitors appear similar to non-specific NSAIDs in regard to other adverse effects (e.g., renal adverse effects and propensity to cause edema and blood pressure elevation). COX-2 inhibitors do not affect platelet aggregation.

The VIGOR trial demonstrated a statistically significant increased risk in serious cardiovascular (CV) thrombotic events (primarily acute myocardial infarctions) in patients treated with rofecoxib compared to patients treated with naproxen (1.1% vs. 0.5%). The cause of this finding, its potential applicability to other COX-2 inhibitors, and its real meaning in day-to-day clinical practice are subject to considerable debate. Subsequent analyses of pooled data comparing rofecoxib to NSAIDs other than naproxen or to placebo have not shown an increased in CV risk for rofecoxib.

COX-2 inhibitors do NOT appear to be any more effective than non-specific NSAIDs in the treatment of osteoarthritis, rheumatoid arthritis, acute pain, or dysmenorrhea.

After reviewing the clinical data, the Council reiterated its conclusion that even if COX-2 inhibitors are used only in patients at increased risk for NSAID-associated GI events, the DoD would incur a large increase in drug costs for a rather small decrease in GI events. If COX-2 inhibitors are used in patients with a “normal” risk for GI events, the DoD would incur huge incremental costs for miniscule incremental benefits. The Council acknowledged that the COX-2 inhibitors are being considered for addition to the BCF because of the potential financial impact of shifting prescriptions from the retail network to MTFs—not because of the clinical value they offer in comparison to their cost.

To estimate the potential for increased use of COX-2 inhibitors if a COX-2 inhibitor were added to the BCF, the PEC compared COX-2 inhibitor prescription fill rates (as a percent of all Rx fills) at MTFs that have one or more COX-2 inhibitors on formulary to MTFs that do not have a COX-2 inhibitor on formulary. Assuming that the prescription fill rates at sites that do not currently have a COX-2 inhibitor on formulary would increase to the same rate as sites that do, the total number of COX-2 Rx fills at MTFs would increase by 180,000 per year (32.8%) if a COX-2 inhibitor were added to the BCF. This increase would inevitably include use of COX-2s in both patients likely to benefit (i.e., long-term use in patients with risk factors for GI complications) and patients unlikely to benefit (short-term use in patients without risk factors) from using COX-2 inhibitors.

At the last meeting, the Council asked DSCP to issue a request for Blanket Purchase Agreement (BPA) price quotes to the pharmaceutical companies that market COX-2 inhibitors for the purpose of adding a COX-2 inhibitor to the BCF in an open class. The request for BPA price quotes also asked companies to submit their plans for assisting MTFs in targeting the use of COX-2 inhibitors to the patients at greatest risk for GI events. The VA decided not to participate in this BPA request for quotes.

The Council evaluated the projected weighted average daily cost per patient that would result from the price quotes offered for each COX-2 inhibitor. The Council also used a mathematical model to estimate the potential financial impact of adding each COX-2 inhibitor to the BCF. The model took into account likely increases in use and projected shifts in utilization amongst the three points of service. After evaluating a variety of scenarios, the Council concluded that it was in the best interest of the government not to accept any of the BPA price quotes, so a COX-2 inhibitor was not added to the BCF.

B. Raloxifene (Evista) – Raloxifene was evaluated for potential addition to the BCF based on high retail network use. PDTS data from July through December 2001 showed 37,200 prescriptions for 13,000 unique patients in the retail network, with an annual cost to DoD of $5 million.

Raloxifene is the first of a new class of agents known as selective estrogen receptor modifiers (SERMs). A derivative of tamoxifen, raloxifene has a mixed agonist-antagonist effect on estrogen receptors throughout the body. It is indicated for the prevention and treatment of osteoporosis in postmenopausal women. Alendronate, also approved for the treatment of osteoporosis, is currently on the BCF.

The most common side effects of raloxifene are hot flashes and leg cramps. Patients treated with raloxifene were at higher risk of venous thromboembolism (NNH 143) than the placebo group. The increased risk is similar to the risk of venous thromboembolism seen with hormone replacement therapy (HRT). In the MORE trial, raloxifene reduced the risk for new vertebral fractures by 50% in women without previous fractures (NNT 46) and by 30% in those with previous fractures (NNT16). Both reductions were statistically significant. Raloxifene also increased BMD of the femoral neck and spine by 2-3%. The drug cost to prevent one vertebral fracture in 3 years is $42,000 compared to a cost of $27,000 for alendronate to prevent one vertebral fracture in 3 years.

Raloxifene's nonskeletal effects include reductions in LDL cholesterol (11%) and total cholesterol (7%), without changes in HDL cholesterol. Raloxifene reduced the risk of invasive breast cancer by 76% in the MORE trial. Studies are underway to investigate the cardiovascular benefits of raloxifene and to compare it to tamoxifen in the prevention of breast cancer.

Providers and pharmacists were surveyed regarding their use and potential use of raloxifene. Eighty-five responses were obtained. All responses favored the addition of raloxifene to the BCF. Raloxifene 60 mg is currently on the formulary of approximately 20% of MTFs.

The Council voted to add raloxifene to the BCF.

C. *Calcium (calcium and calcium + vitamin D)* – Given the Council's previous decision not to add any OTC medications to the BCF beyond those identified in the TRICARE Policy Manual, the Council did not consider the proposal to add calcium and calcium + vitamin D to the BCF. The Council acknowledged that clinical data fully support the use of calcium in patients with osteoporosis and especially in patients treated for osteoporosis with prescription medications. The Council encourages all MTFs to make available and promote adequate calcium supplementation in patients for the prevention and treatment of osteoporosis.

D. *Guaifenesin/pseudoephedrine sustained release tablet (generic Entex-PSE)* – Entex-LA eq. (guaifenesin & phenylpropanolamine long-acting) was removed from the BCF at the Nov 00 P&T Committee meeting because of safety concerns expressed by the FDA regarding phenylpropanolamine. The Committee had intended to select an alternative agent for the BCF after manufacturers reformulated their products, but an alternative agent was not selected. The PEC recently identified that guaifenesin (GFN) and pseudoephedrine (PSE) long-acting, the logical replacement for Entex-LA eq., was the second most prescribed non-BCF drug. Many different brands and formulations exist (e.g., Entex-PSE, Duratuss, Deconsal-II), but MTFs overwhelmingly use the GFN 600mg/PSE 120mg formulation. Three manufacturers currently offer prices of less than $0.07 per tablet for this product. The Council unanimously voted to add GFN 600 mg/PSE 120 mg long acting to the BCF.

12. CLARIFICATION OF BCF LISTING

Carbinoxamine/pseudoephedrine (Rondec) Drops — Lt Col Zastawny presented a clarification of the BCF listing of carbinoxamine/pseudoephedrine drops. A recent formulation change for the branded product (Rondec®) decreased the concentrations of the ingredients from 2mg carbinoxamine and 25mg of pseudoephedrine per mL to 1mg carbinoxamine and 15 mg of pseudoephedrine per mL. Changes were also made in the recommended dosing schedule included with the product. The new 1mg/15mg per mL formulation appears to be the only formulation currently being produced by the brand and generic manufacturers. The change in recommended dosing raises concern about the potential for dosing errors resulting in excessive dosing of pseudoephedrine in pediatric patients if the two dosage forms were used interchangeably.

The Council agreed to (1) specify the newer carbinoxamine 1mg and pseudoephedrine 15mg per mL formulation on the BCF, 2) remove the Rondec® brand name reference from carbinoxamine/pseudoephedrine drops listing on the BCF, and 3) provide a link from the BCF listing to a drug and dosing information page.

13. MTF REQUESTS FOR BCF CHANGES

A. *Request to remove propranolol LA from the BCF* – A request to delete propranolol long-acting (LA) from the BCF cited lack of generic availability and low utilization. The PEC confirmed the shrinking availability of generic forms of propranolol LA. Approximately 4000 patients use propranolol LA. The number of unique users has remained relatively constant over the past three years. The Council voted to delete propranolol LA from the BCF because of decreasing generic availability and availability of preferable alternatives on the BCF (e.g., metoprolol, atenolol).

B. *Request to add Combivent (18 mcg ipratropium/103 mcg albuterol) MDI to the BCF –* An Air Force pulmonologist provided the following rationale for the request:

- Seven studies have shown that the addition of an anticholinergic with a beta agonist can achieve enhance bronchodilation.
- Patients with COPD (stage II and III) are required to take both medications. Combivent is included as the standard of care in the VHA/DoD, ATS, and new GOLD guidelines for the management of COPD.
- Compliance with a MDI increases when only one device or inhaler is used and guarantees the patient receives both medications for maximal effect.

Safety and tolerability of the combination product are similar to the same dosages of the products administered by separate inhalers. Combination therapy with ipratropium and albuterol has been shown to produce superior bronchodilation without additional side effects compared to monotherapy with albuterol or ipratropium. In stage II and III COPD, a combination of ipratropium plus a beta-agonist is associated with lower rate of exacerbations and lower total health-care costs than compared to albuterol or ipratropium monotherapy. Efficacy of Combivent is similar to the same dosages of the ipratropium and albuterol administered by separate inhalers.

The PEC requested provider (physician and pharmacist) input on this issue and received 33 responses: 26 favoring, 5 against, and 2 inconclusive regarding addition of Combivent to the BCF. Providers made several key points:

- This medication is used in patients with COPD, who frequently are noncompliant and smoke. They need the ipratropium to assist with lung function, but they don't necessarily feel the effect like they do with albuterol.
- Each inhaler requires 2 inhaled puffs 3-5 minutes apart, and to do both albuterol and ipratropium at a time would take up to 20 minutes, which most patients are not willing to do. Combivent only takes 3-5 minutes, and they won't get the two confused.
- The addition of Combivent to the BCF may improve patient satisfaction and compliance.
- Although we see a fair amount of civilian prescriptions, it is not on our MTF formulary. If it is cheaper for us to fill than the Tricare network, than I guess that would be a positive.
- There is a potential to reduce waste and pharmacy labeling costs from the use of two products.

Prime vendor data show that nonavailability of the contracted brand of albuterol MDI causes MTFs to actually pay more than the contract price for albuterol MDIs. FSS and contract pricing as of April 02 for Combivent and the individual products compared to the MTF average price paid (Nov 01- Jan 02) are presented in the following table:

Item Description	Doses/container	FSS Price As of April 02	MTF Ave Price (PV data Nov 01 – Jan 02)
Albuterol MDI	200	$ 1.65 (Contract price as of Nov 01)	$ 3.26
Ipratropium MDI	200	$ 19.59	$ 18.82
Combivent MDI	200	$ 22.47	$ 21.59

The cost of Combivent is compared to the cost of the individual products using both lowest available FSS price and MTF average price in the following table:

	Combivent cost/day 2 puffs four times daily	Cost/day of equivalent dose of individual products	Additional cost per day for Combivent
FSS Price	$ 0.90	$ 0.85	$ 0.05
MTF Ave Price	$ 0.86	$ 0.88	($ 0.02)

Combivent is on approximately 53% of MTF formularies. It ranks #25 in total MTF prescription fills of legend drugs that are not currently on the BCF. Combivent also falls in the top 100 prescriptions filled in the retail network.

Addition of Combivent to the BCF could improve patient satisfaction and compliance. There is also a potential reduction in waste. There is a potential for cost savings to the government since the average MTF price for Combivent is $0.02/day less expensive than the cost/day of equivalent dose of individual products. The Council voted to add ipratropium/albuterol (Combivent) to the BCF.

C. *Request to remove Fosamax 5 and 10 mg from the BCF* – The PEC received a request to remove the 5 mg and 10 mg strengths of alendronate, citing low usage of the daily dosage forms of these agents since the weekly forms became available. In general, the BCF listing of a drug includes all formulations and dosage strengths. The Council found no compelling reason to change the listing for alendronate, and voted unanimously to retain alendronate 5 mg and 10 mg on the BCF. Individual MTFs must make the drug available, in all strengths, when needed. Decisions about stocking levels may be made at the MTF level based on usage at that facility.

14. ADJOURNMENT

The meeting adjourned at 1600 hours on 7 May 2002. The next meeting will be held at the Uniformed Services University of the Health Sciences, Bethesda, Maryland at 0800 on 7 August 2002. All agenda items should be submitted to the co-chairs no later than 8 July 2002.

Appendix A: Drug Class Evaluations to Determine Clinically Acceptable Contracting/Formulary Strategies

1. The DoD P&T Executive Council evaluates the relative safety, tolerability, efficacy, price/cost and other pertinent issues ("STEPO" evaluation) to assess three factors that affect the acceptability of various contracting/formulary strategies:

   a. *Therapeutic interchangeability*: Therapeutic interchangeability is the extent to which drugs have similar clinical attributes, are used for the same indications, are used for the same patient populations, and can be expected to achieve similar clinical outcomes. Closed class contracts that require patients to be switched to the contracted drug require the highest degree of therapeutic interchangeability.

   b. *Coverage of clinical needs*: The drug(s) selected for a closed class contract must be sufficiently safe, tolerable, and effective to satisfy the clinical needs of at least 90% of the patients for whom the drug will be prescribed. Too many patients and providers will be forced to use the non-formulary/special order process if fewer than 90% of the patients can be successfully treated with the contract drug.

   c. *Provider acceptance*: Provider acceptance is the extent to which DoD providers are willing to use the contracted drugs and refrain from using the non-contracted drugs. There are two components to this condition. The first relates to provider behavior when first starting a patient on one of the agents in the class. For some drug classes providers will not accept a requirement to prescribe a particular agent even though it has been determined to be therapeutically equivalent to other members of the class. This is often true of newly approved drugs, but may apply to other members of the class as well. A lack of long-term safety data is a common cause for this concern. The second component relates to whether prescribers are willing to switch patients currently being treated with one drug in a class to the contract winner following contract award. Willingness to switch is tied to the perceived likelihood that the contracted drug will effectively substitute for the patient's current therapy and the amount of effort it takes to make the switch.

2. The DoD P&T Executive Council then decides which (one or more) of the contracting/formulary strategies described below are clinically acceptable and specifies any "clinical imperatives" that must accompany a given strategy. The VA/DoD Pharmaceutical Contracting Workgroup decides which specific contracting strategy to use from among the strategies that are acceptable to the DoD P&T Executive Council. Potential contracting/formulary strategies include the selection of one or more drugs for:

   a. A closed class contract that puts the contracted drug(s) on the BCF and requires patients to be switched to the contract drug(s).

   b. A closed class contract that puts the contracted drug(s) on the BCF, but does not require existing patients to be switched to the contracted drug(s).

   c. A closed class contract that does not put the contracted drugs(s) on the BCF, but requires existing patients to be switched to the contract drug(s).

   d. A closed class contract that does not put the contracted drugs(s) on the BCF and does not require existing patients to be switched to the contract drugs.

   e. A contract that puts the contracted drug(s) on the BCF but leaves the class open.

   f. The BCF based on an evaluation of the responses to a Blanket Purchase Agreement (BPA) request for price quotes

   g. The BCF based on a BPA(s) offered by one or more companies

   h. The BCF based on existing BPA(s)

   i. The BCF based on existing FSS prices

MCCS-GPE **13 FEBRUARY 2002**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T committee convened at 0800 hours on 13 February 2002, at the Non-Commissioned Officers Club, Fort Sam Houston, TX

2. MEMBERS PRESENT

CDR Terrance Egland, MC, USN	DoD P& T Committee Co-chair
Col John R. Downs, MC	Air Force
Col Mark Nadeau, MC (For Col Bill Sykora, MC)	Air Force
LtCol (select) George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
MAJ Brett Kelly	Army
LTC (P) Joel Schmidt, MC	Army
CAPT Robert Rist	Coast Guard
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
William Hudson	Humana
Gene Lakey	TriWest
Ron McDonald	Sierra Military Health Services
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)
Dick Rooney	Department of Veterans Affairs

MEMBERS ABSENT

COL Daniel D. Remund, MS, USA	DoD P& T Committee Co-chair
COL Rosa Stith, MC	Army
LTC Mike Kieffer, MS	Joint Readiness Clinical Advisory Board
Ray Nan Berry	Health Net Federal Services

OTHERS PRESENT

COL William Davies, MS, USA	DoD Pharmacy Program Director, TMA
Howard Altschwager	Deputy General Counsel, TMA
CAPT Joe Torkildson, MC, USN	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC, USN	DoD Pharmacoeconomic Center
LCDR Denise Graham, MSC, USN	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, USAF BSC	DoD Pharmacoeconomic Center
LTC Doreen Lounsbery, MC, USA	DoD Pharmacoeconomic Center
Maj Barb Roach, USAF MC	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
David Bretzke	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
SFC Agustin Serrano	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS, USA	Defense Supply Center Philadelphia
CDR Brian Kerr, MSC, USN	Defense Supply Center Philadelphia
Paul Vasquez	Defense Supply Center Philadelphia
Vincent Valinotti	Defense Supply Center Philadelphia
David Chicoine	Uniformed Services Family Health Plan
Mark Petruzzi	Merck-Medco
Elizabeth Scaturro	Merck-Medco Managed Care

3. **REVIEW MINUTES OF LAST MEETING / ADM INISTRATIVE ISSUES** – The minutes from the last meeting were accepted as written.

4. **INTERIM DECISIONS** – No interim decisions.

5. **REPORT FROM THE DOD EXECUTIVE COUNCIL MEETING –** CAPT Torkildson reported on the additions to the BCF:

   - Advair (fluticasone/salmeterol) Inhaler: all strengths
   - Prempro (conjugated estrogen and medroxyprogesterone): all strengths.
   - Zithromax (azithromycin) 250 mg tablets; does not require the Z-pak dosage formulation.

6. **IMPLEMENTATION OF PHARMACY BENEFIT PROVISIONS IN THE FY00 AND FY01 NATIONAL DEFENSE AUTHORIZATION ACTS** - COL Davies will present the proposed rules at the next meeting if the document has been published. COL Davies stated that Managed Care Support Contractors have submitted nominations for providers to the DoD P&T Committee.

7. **PPI UTILIZATION IN THE NMOP** – CAPT Torkildson reported on proton pump inhibitor (PPI) use in all three points of service. There was a substantial decrease in the number of PPI prescriptions filled at MTFs during the Thanksgiving and Christmas holiday seasons, which raises questions regarding access. The total number of prescriptions for PPIs filled in the NMOP remains fairly flat while the retail network is showing a gradual growth rate. An analysis of the market share of the various PPIs by point of service reveals an increase in rabeprazole (Aciphex) use in the MTFs,

while the retail network analysis reveals a growing use of esomeprazole (Nexium) and stable use of omeprazole. The market share of omeprazole in the NMOP remains high at around 75% of all PPI prescriptions, with a slight upward trend in esomeprazole use. An analysis of the average cost per unit for PPIs for each point of service shows that the cost has declined by over 50% in MTFs, has remained flat in the retail network, and increased in the NMOP due to an omeprazole price increase. The Committee took no action on this information, but will continue to monitor the class.

8. **GENERIC LOVASTATIN IN THE NMOP** –The impact of the recent approval of a generic formulation of lovastatin on the current statin contract and the potential for creating patient dissatisfaction regarding the current structure of copays was discussed. The situation has been created in which a patient might submit a prescription for lovastatin to the NMOP in order to obtain the $3.00 generic copay, only to be told that they must use the contracted drug simvastatin and pay a $9.00 copay. COL Davies stated that it is not within the purview of this committee to reduce the co-pay for simvastatin to the generic copay since it did not compete directly against generic products. In a closed class contract, medical necessity is required in order to go outside the contract. When presented with a statin prescription other than simvastatin, the NMOP should call the provider and determine if there is a medical necessity for the noncontracted statin. If not, the contract situation should be explained to the provider, and an opportunity presented to switch to simvastatin. If the provider is not willing to change the prescription, the prescription should be returned to the patient and their options explained to them.

9. **BCF AND NATIONAL MAIL ORDER PHARMACY (NMOP) FORMULARY ISSUES** – The Committee determined the NMOP formulary status, NMOP or retail network formulary restrictions (quantity limits or prior authorization), and Basic Core Formulary (BCF) status for 13 new drugs (see Appendix A).

10. **ANTIBIOTIC PROPHYLAXIS FOR ANTHRAX EXPOSURE** – CAPT Torkildson reported that the utilization of doxycycline and ciprofloxacin at the NMOP and in the retail network has returned to baseline levels. The Committee concluded that there is no further need to report on this subject unless subsequent events create the possibility of change.

11. **PRIOR AUTHORIZATIONS**

A. *Cost avoidance from NMOP prior authorizations (PAs)* – Shana Trice (PEC) reported that, for the 1st quarter of FY 02, the NMOP PAs for sildenafil, COX-2 inhibitors, and etanercept resulted in an estimated cost avoidance per new prescription submitted of $51.91 for sildenafil, $15.64 for COX-2 inhibitors, and $276.74 for etanercept. The estimated cost avoidance per new prescription submitted is based on the cost avoidance model outlined in the Aug 00 DoD P&T Committee minutes. Since these estimates are consistent with previous reports, the Committee did not make any changes to these PAs.

B. *Changes to PA criteria for COX-2 inhibitors* – The Committee addressed two issues: 1) a new FDA-approved indication for celecoxib (Celebrex) for acute pain in adults and treatment of primary dysmenorrhea; and 2) the availability of a new COX-2 inhibitor valdecoxib (Bextra). The FDA approved valdecoxib in Nov 01 for treatment of osteoarthritis (OA), adult rheumatoid arthritis (RA), and primary dysmenorrhea.

Existing NMOP PA criteria for COX-2 inhibitors allow use of rofecoxib but not celecoxib for 20 days or less in patients with risk factors for GI adverse events, since celecoxib previously lacked any indication for acute use. The Committee approved the following revised COX-2 inhibitor criteria for all COX-2 inhibitors (celecoxib, rofecoxib, valdecoxib):

- *Benefit coverage NOT provided for:*
    - *Concurrent anti-inflammatory therapy with any NSAID or aspirin at doses > 325 mg per day, or*
    - *The prevention of colon cancer, or*
    - *The prevention or treatment of Alzheimer's disease*
- *Benefit coverage provided for:*
    - *Patient has previously failed an adequate trial with at least two different NSAIDS,*

      OR
    - *COX-2 therapy AND high risk for NSAID-induced gastropathy OR use of a NSAID could result in destabilization or risk. Identified by an of the following:*
        - *Concurrent oral corticosteroids, anticoagulants, antiplatelet agents*
        - *History of PU*
        - *History of NSAID related ulcer*
        - *History of clinically significant GI bleeding*
        - *Hereditary or acquired coagulation defect*
        - *Age 65 years or older*

C. *Criteria for etanercept PA* – The FDA recently approved psoriatic arthritis as a new indication for etanercept (Enbrel). The Committee voted to add this indication to etanercept's PA criteria.

D. *Anakinra (Kineret)* – This is a new IL-1 receptor antagonist product with a mechanism of action similar to the TNF receptor antagonist etanercept. However, it differs from etanercept in its FDA approved indications (see Appendix A), and therefore requires a separate PA. The Committee voted to adopt the Merck Medco criteria currently in place:

1. Coverage provided for the treatment of moderately to severely active rheumatoid arthritis in patients ≥ 18 years of age.
2. Coverage provided in situations where the use of methotrexate and at least one other DMARD have failed to treat the patient's rheumatoid arthritis.
3. Coverage provided in situations where the patient has had an inadequate response to methotrexate, unless the use of methotrexate is contraindicated for the patient.
4. Benefit coverage not provided for use of anakinra in combination with etanercept or infliximab.

The Committee discussed quantity limits for anakinra, given the exiting 6-week quantity limits in the NMOP for etanercept. They felt that, given the similarities between etanercept and anakinra, it would be most appropriate to apply the same quantity limits to both drugs. The

Committee established a 6-week quantity limit was established for anakinra in the NMOP and a 4-week supply in the retail network. The reason for the quantity limit is the same for both etanercept and anakinra: potential for significant unnecessary expense resulting from discontinuation, given the extremely high unit cost of these medications.

12. SUBCOMMITTEE REPORT: PROVISION OF INJECTABLE DRUGS IN THE NMOP OR RETAIL NETWORK PHARMACIES – Tabled until the May DoD P&T Committee meeting

13. CONTROLLED DISTRIBUTION OF PEGINTERFERON ALFA 2B (PEG-INTRON; SCHERING) – LCDR Briski reported that the distribution process has been complicated due to the unexpected demand for Peg-Intron. A formal understanding with Schering has been reached. Currently, any new patients will go onto a waiting list. The wait is expected to be one to two months. All current patients will be provided product to complete their course of therapy. LCDR Briski provided an outline of the current distribution method:

- New patients should be instructed to call the Schering 800 number to get on the waiting list. The patient will be called when it is their turn to move off the list and be instructed to take their prescription to the MTF pharmacy. All new starts, as they move off the wait list, will receive product via a drop-ship to MTF mechanism, which will be billed through Prime Vendor.
- Any current patients should complete their therapy by continuing to use their current mechanism for acquiring the drug. If the patient was enrolled into the "Assured Access" program and assigned an identifying number, they should complete their course using that mechanism. Sites that have been getting the Peg-Intron drop-shipped without registering the patient should continue to do so. As the current patients using assured access identifiers complete their therapy, the need for using the numbers will also go away.
- LCDR Briski is the point of contact for distribution issues. The PEC will provide a monthly report to Schering regarding the number of MTF patients receiving Peg-Intron so Schering can reconcile this with the amount of product shipped. If an imbalance occurs, the PEC will clarify the situation by contacting the MTFs involved directly.

14. ADJOURNMENT – The meeting adjourned at 1200 hours. The next meeting will be held at the Non-Commissioned Officers Club, Fort Sam Houston, TX starting at 0800 on Wednesday, 09 May 2002. All agenda items should be submitted to the co-chairs no later than April 8, 2002.

List of Appendices

APPENDIX A: NEWLY APPROVED DRUGS CONSIDERED FOR THE NATIONAL MAIL ORDER PHARMACY FORMULARY AND DOD BASIC CORE FORMULARY

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Valdecoxib tablets (Bextra; Pharmacia)	19 Nov 01; COX-II inhibitor for treatment of signs and symptoms of osteoarthritis (OA) and adult rheumatoid arthritis (RA), and for the pain associated with menstrual cramping	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization:** Add to (NMOP only) COX-2 inhibitor PA as modified in the Feb 02 DoD P&T Committee minutes. **Rationale for PA:** The COX-II inhibitors celecoxib and rofecoxib require prior authorization in the NMOP. The potential for inappropriate use is substantial.	Not added to the BCF **Similar BCF Drugs:** none
Frovatriptan tablets (Frova; Elan)	09 Nov 01; 5HT agonist ("triptan") for the treatment of migraine with and without aura in adults	Added to the NMOP Formulary	**Quantity Limits** 9 tablets per 30 days; 27 tablets per 90 days; consistent with existing quantity limits for other triptans **Rationale for Quantity Limits:** Clinical appropriateness concerns: potential for overuse and increased likelihood of rebound headaches **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** Sumatriptan
Desloratadine tablets Clarinex; Schering-Plough)	21 Dec 01; non-sedating 2nd-generation antihistamine for the treatment of seasonal allergic rhinitis in adults and children 12 years of age and older	Added to the NMOP Formulary **Note**: Closed class contract is in place for 2nd generation NSA (fexofenadine) in the MTFs, but it does not apply to the NMOP. Three other 2nd generation products are currently available through the NMOP.	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** Closed class contract exists for fexofenadine (Allegra) that includes BCF status.

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Anakinra injection (Kineret; Amgen)	14 Nov 01; interleukin-1 receptor antagonist administered subcutaneously for the reduction in signs and symptoms of moderately to severely active RA in adult patients who have failed one or more disease modifying antirheumatic drugs (DMARDs)	Added to the NMOP Formulary and Covered Injectables List **Note**: Etanercept for RA is included in the NMOP Covered Injectables List, subject to quantity limits and prior authorization	**Quantity Limits:** 6-weeks **Rationale for quantity limits:** Extremely high unit cost increases negative impact of premature discontinuation. **Prior Authorization** Yes, approved use of PA criteria already established by Merck Medco.	Not added to the BCF **Similar BCF Drugs:** none
Comments about anakinra injection: Can be used alone or in combination with DMARDs other than Tumor Necrosis Factor (TNF) blocking agents [etanercept (Enbrel); infliximab (Remicade)]. Potential for serious infections and neutropenia is increased when used in combination with TNF blocking agents; combination use is not authorized in current PA criteria. Injection site problems are very common (71% of patients) upon initiation of therapy.				
Triptorelin pamoate depot injection (Trelstar LA; Debiopharm/ Pharmacia)	Jun 01; injectable leutinizing hormone releasing hormone (LHRH) agonist administered every 3 months for the treatment of advanced stage prostate cancer. Product is extension of previously approved one-month product, Trelstar Depot	Added to the NMOP Formulary and Covered Injectables List **Note**: Other depot LHRH agonists (Lupron and Zoladex) are included on the NMOP Covered Injectables List. Both 1-month and 3-month products added	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** none
Fondaparinux injection (Arixtra; Sanofi/Organon)	11 Dec 01; injectable factor Xa inhibitor (different than a low - molecular-weight heparin [LMWH]) for the prevention of venous thromboembolism following orthopedic surgery (knee replacement, hip replacement, hip fracture repair)	Added to the NMOP Formulary and Covered Injectables List **Note**: Injectable LMWHs are included on the NMOP Covered Injectables List	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** none
Comments about fondaparinux injection: The Committee discussed the fact that the current BCF mandates MTFs to have at one LMWH (enoxaparin, dalteparin, tinzaparin) on their formulary; individual MTFs choose which LMWH to have on formulary. Fondaparinux is not a LMWH and is not yet approved for outpatient treatment of VTE. The Committee determined that fondaparinux would not be considered a suitable substitution for one of the other LMWH products.				

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Pimecrolimus 1% cream (Elidel; Novartis)	13 Dec 01; treatment of mild to moderate atopic dermatitis in patients aged two years and older	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** See comments
Comments about Pimecrolimus 1% cream: There are no non-steroidal topical immunomodulators (TIMS) currently on the BCF. The BCF does include a medium potency steroid agent (triamcinolone acetonide 0.1% cream; Kenalog) and a high potency steroid agent (fluocinonide 0.05% cream; Lidex).				
Diclofenac sodium topical gel (Solaraze; Sky Pharma)	23 Oct 00; treatment of actinic keratoses; topical NSAID	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** None	Not added to the BCF **Similar BCF Drugs:** None
Dexmethyl-phenidate tablets (Focalin; Novartis)	13 Nov 01; d-isomer of methylphenidate administered twice daily for the treatment of attention deficit hyperactivity disorder; not an extended or sustained release product	Added to the NMOP Formulary	**Quantity Limits** Standard NMOP rule for Schedule II products for treatment of ADHD applies– up to 90 day supply, no refills **Rationale for Quantity Limits: F**alls under standard rule in NMOP for Schedule II products for treatment of ADHD **Prior Authorization:** None	Not added to the BCF **Similar BCF Drugs:** Methylphenidate, methylphenidate SR and methylphenidate extended release (Concerta)
Comments about dexmethylphenidate tablets: The pharmacokinetic properties of the isomer are sufficiently different such that the FDA considers dexmethylphenidate to be a new drug. Therefore, it should not be considered the same as methylphenidate. There is no evidence that this is a significant advance in therapy for ADHD. A head-to-head trial against other forms of methylphenidate (instead of placebo) would help to clarify its place in therapy. It is specifically excluded from the BCF listing for methylphenidate.				

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Bosentan tablets (Tracleer; Actelion)	20 Nov 01; non-selective endothelin receptor antagonist for the treatment of pulmonary artery hypertension	NOT Added to the NMOP Formulary **Note**: Not feasible to provide bosentan through the NMOP due to its restricted distribution process	**Quantity Limits** N/A **Prior Authorization** Need to coordinate with TRICARE	Not added to the BCF **Similar BCF Drugs:** none
Comments about bosentan tablets: Although bosentan will be used in only a limited number of patients; it needs to be available to DoD beneficiaries. There are approximately 1,900 patients in the DoD with a diagnosis of PAH, but the severity of disease cannot be determined. Bosentan cannot be added to the NMOP due to the closed distribution system initiated by the manufacturer. The limited distribution system is due to the potential toxicities (hepatic and fetal) of this agent. Bosentan will be made available upon referral from specialty care physicians. When the distribution process is finalized, it will be disseminated via the service pharmacy consultants.				
Lovastatin/niacin tablets (Advicor; KOS)	18 Dec 01; combination of a statin and extended release niacin for the treatment of 1° hypercholesterolemia and mixed dyslipidemia who require additional lipid modification for LDL and HDL cholesterol and triglycerides beyond that achieved by the individual components	NOT Added to the NMOP Formulary	**Quantity Limits** N/A **Prior Authorization** N/A	Not added to the BCF **Similar BCF Drugs:** Closed class contract exists for simvastatin (Zocor)
Comments about lovastatin/niacin tablets: Addition of Advicor to either the BCF or NMOP formulary would be a violation of the simvastatin contract. Advicor should be available through the NMOP only in cases of documented medical necessity.				
Extended phenytoin sodium, 200 mg and 300 mg capsules (Phenytek; Bertek)	6 Dec 01; New branded generic formulation of phenytoin sodium indicated for the treatment of generalized tonic-clonic and complex partial seizures and prevention and treatment of seizures during or following neurosurgery 200 and 300 mg Phenytek capsules are bioequivalent to 2 and 3 Dilantin 100-mg capsules, respectively	Automatic addition to NMOP Formulary as line extension	**Quantity Limits** General rule applies **Prior Authorization** None	Need to clarify whether the current BCF listing for phenytoin oral will include Phenytek. This issue was tabled until pricing and provider input is available.
Brimonidine tartrate ophthalmic solution (Alphagan P; Allergan**)**	Reformulation of brimonidine tartrate ophthalmic solution with a different preservative, a lower concentration of brimonidine, and a modified pH	Added to the NMOP Formulary Conversion from Alphagan 0.2% to Alphagan P 0.15% is expected due to the planned phase out of Alphagan P 0.2%.	**Quantity Limits** General rule applies **Prior Authorization** None	Added to the BCF **Clarification:** The BCF listing will be clarified to identify brimonidine 0.15% (Alphagan P) as the specific agent on the BCF for the reasons outlined in the comments below.
Comments about brimonidine tartrate ophthalmic solution: Alphagan P 0.15% provides comparable IOP-lowering efficacy to Alphagan 0.2% (potentially due to increased bioavailability of the purite formulation as demonstrated in animal studies). No clinically significant differences were found in mean IOP or mean change from baseline in IOP between the two formulations. The incidence rate of allergic conjunctivitis in the Alphagan P 0.15% group was 41% less than in the Alphagan 0.2% group. Both products are used BID 95% of the time vs. the TID package insert recommended dosing. Company plans on phasing out the Alphagan 0.2%.				

APPENDIX B: COMBINED SUMMARY OF FORMULARY CHANGES FROM THE DOD P&T EXECUTIVE COUNCIL MEETING AND THE DOD P&T COMMITTEE MEETING

1. **BCF CHANGES**

   A. *Additions to the BCF*

      1) Advair (fluticasone/salmeterol) Inhaler: all strengths

      2) Prempro (conjugated estrogen and medroxyprogesterone): all strengths.

      3) Zithromax (azithromycin) 250 mg tablets, does not require the Z-pak dosage formulation.

      4) Plavix (clopidogrel) *[NOTE: Clopidogrel added to Appendix B subsequent to the initial release of these minutes on 8 Mar 2002. Please see Section 11 of the Feb 02 DoD P&T Executive Council meeting minutes.]*

   B. *Deletions from the BCF*

      None

   C. *Changes and clarifications to the BCF*

      1) The current BCF listing for brimonidine tartrate ophthalmic solution was clarified to identify the new Alphagan P 0.15% formulation as the specific agent included on the BCF.

2. **NMOP FORMULARY CHANGES**

   A. *Additions to the NMOP Formulary* (See Appendix A for details)

      1) Valdecoxib tablets (Bextra; Pharmacia) – added to NMOP with PA criteria

      2) Frovatriptan tablets (Frova; Elan) – quantity limits apply, see below

      3) Desloratadine tablets (Clarinex; Schering-Plough)

      4) Anakinra injection (Kineret; Amgen) –added to NMOP Covered Injectables List with PA criteria, quantity limits apply, see below

      5) Triptorelin pamoate depot injection (Trelstar LA; Debiopharm/Pharmacia) – added to NMOP Covered Injectables List

      6) Fondaparinux injection (Arixtra; Sanofi/Organon) – added to NMOP Covered Injectables List

      7) Pimecrolimus 1% cream (Elidel; Novartis)

      8) Diclofenac sodium topical gel (Solaraze; Sky Pharma)

      9) Dexmethylphenidate tablets (Focalin; Novartis) – quantity limits apply, see below

      10) Extended phenytoin sodium, 200 mg and 300 mg capsules (Phenytek; Bertek) – automatic line extension

      11) Brimonidine tartrate ophthalmic solution (Alphagan P; Allergan) - with natural attrition from Alphagan 0.2% to Alphagan P 0.15%

   B. *Exclusions from the NMOP Formulary*

      1) *Bosentan (Tracleer; Actelion)* - excluded from the NMOP due to closed distribution system initiated by the manufacturer.

2) *Lovastatin/niacin (Advicor; KOS) sustained release tablets* – lovastatin is currently excluded as a formulary agent due to existing statin contract (simvastatin) that is in effect through Feb 02.

C. Clarifications to the NMOP Formulary

None

3. **QUANTITY LIMIT CHANGES (NMOP AND RETAIL NETWORK)**

A. Quantity limit for frovatriptan tablets: 9 tablets per 30 days; 27 tablets per 90 days; consistent with existing quantity limits for other triptans.

B. Quantity limit for anakinra injection (Kineret; Amgen): NMOP: 6 packs of 7 syringes per 6 weeks; Retail: 4 packs of 7 syringes per 4 weeks.

C. Quantity limit for dexmethylphenidate tablets: Standard NMOP rule for Schedule II controlled products for treatment of ADHD applies – up to 90 days supply, no refills

4. **CHANGES TO THE PRIOR AUTHORIZATION PROGRAM (NMOP AND RETAIL NETWORK)**

A. *Etanercept (Enbrel)* -The FDA recently approved psoriatic arthritis as a new indication for etanercept (Enbrel). The Committee voted to add this indication to etanercept's PA criteria.

B. *COX-2 Inhibitors* - The Committee voted to have the same PA criteria apply to all COX-2 Inhibitors. See Section 11B for revised PA criteria.

C. *Anakinara (Kineret)* - The Committee voted to adopt the Merck Medco criteria currently in place. See Section 11D, of minutes for PA criteria.

Fort Sam Houston, TX 78234-5081

MCCS-GPE **12 February 2002**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The DoD P&T Executive Council met from 0800 to 1600 hours on 12 February 2002 at the Non-Commissioned Officers Club, Fort Sam Houston, TX.

2. MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL John R. Downs, MC	Air Force
COL Mark Nadeau, MC (Representing COL Bill Sykora, MC)	Air Force
LtCol (select) George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
MAJ Brett Kelly, MS	Army
LTC (P) Joel Schmidt, MC	Army
CAPT Robert Rist	Coast Guard
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
Dick Rooney	Department of Veterans Affairs

MEMBERS ABSENT

COL Rosa Stith, MC	Army
LTC Mike Kieffer, MS	Joint Readiness Clinical Advisory Board

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TMA
Howard Altschwager	Deputy General Counsel, TMA
CAPT Betsy Nolan, MSC	Navy Pharmacy Specialty Leader
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, BSC	DoD Pharmacoeconomic Center
CDR Denise Graham, MSC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC	DoD Pharmacoeconomic Center
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
LTC (P) Doreen Lounsbery, MC	DoD Pharmacoeconomic Center
LtCol (select) Barb Roach, MC	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Dave Bretzke	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
SFC Agustin Serrano	DoD Pharmacoeconomic Center
CAPT Andy Meadows, USAF	Lead Agent Region 6
Leticia Ramirez	Pharmacy Student, University of Texas at Austin Pharm.D. Program
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
Paul Vasquez	Defense Supply Center Philadelphia
CDR Brian Kerr, MSC	Defense Supply Center Philadelphia
Vincent Valinotti	Defense Supply Center Philadelphia

3. REVIEW MINUTES OF LAST MEETING / ADMINISTRATIVE ISSUES

The Council approved the minutes of the last meeting with a correction in the last sentence of the fourth paragraph in section 10:

- Incorrect sentence: The percentage of *fatal bleeding episodes* was 2.2% for clopidogrel plus aspirin compared to 1.8% with aspirin plus placebo (a statistically non-significant difference).
- Corrected sentence: The percentage of *life-threatening bleeding episodes* was 2.2% for clopidogrel plus aspirin compared to 1.8% with aspirin plus placebo (a statistically non-significant difference).

4. ADVANCES IN MEDICAL PRACTICE (AMP) PROGRAM

AMP funds will not be used to reimburse MTF pharmacies for pharmaceutical purchases in FY 02 because Program Budget Decision (PBD) 812 is supposed to provide sufficient funding for MTF pharmacies. PBD 812 provides MTF pharmacies with 15% more funding in FY 02 than was actually spent in FY 01.

5. NATIONAL PHARMACEUTICAL CONTRACTS AND BLANKET PURCHASE AGREEMENTS (BPAs)

A. *Contract awards, renewals, and terminations*

- Contracts for Diltiazem XR, acetaminophen tablets, levobunolol ophthalmic solution, timolol ophthalmic solution, clotrimazole cream, and simvastatin were renewed.
- Contract for gemfibrozil was cancelled due to the manufacturer not being able to meet the terms of the contract.
- New contracts were awarded for cyclobenzaprine tablets, isosorbide dinitrate tablets, loperamide capsules, methocarbamol tablets, metoprolol tablets, verapamil immediate release tablets, and lactulose syrup, nitroglycerin patch, and glyburide micronized tablets.
- DoD contracts for lisinopril and hepatitis A are up for renewal.
- Joint DoD/VA contracts up for renewal: salsalate tablets, oral contraceptives, etodolac, fexofenadine, hydrochlorothiazide, insulin needle/syringes, isosorbide mononitrate, prednisone, capsaicin cream, cimetidine, ticlopidine, nicotine patches, and valproic acid.

B. *Status of Contracting Initiative for Leutinizing Hormone Releasing Hormone (LHRH) agonists* – CAPT Torkildson reported that the joint VA/DoD solicitation to select an LHRH agonist (for the treatment of prostate cancer only) has still not been released, pending completion of the update to the VA clinical review. The VA and AstraZeneca have agreed to further extend the VA's contract for Zoladex until such time as the joint VA/DoD contract has been awarded. AstraZeneca and TAP have indicated that the DoD Blanket Purchase Agreements (BPAs) for Zoladex and Lupron will remain in place until the new contract is awarded.

CAPT Torkildson presented an assessment of the clinical significance of the entry of triptorelin (Trelstar) into the LHRH agonist marketplace. Debio Recherche Pharmaceutique manufactures this agent in Switzerland; Pharmacia holds the marketing rights in the United States. This is another LHRH agonist that has been in use in Europe since 1985. The FDA approved the 1-month depot in June 2000; the 3-month depot was approved in June 2001. Both preparations are approved for the treatment of advanced prostate cancer. Unlike leuprolide and goserelin, triptorelin has no additional FDA-approved indications, although it is used in other countries for many of the same indications. Pharmacia has not yet begun marketing this product extensively in the United States. However, a company representative has indicated that they intend to bid on the joint VA/DoD LHRH agonist contract.

Two major clinical concerns have been raised regarding triptorelin. The first relates to the paucity of clinical trial data available for this agent. The majority of published reports were conducted and published in Europe in the mid to late 1980s. The primary study submitted for approval of the 3-month depot was an unpublished study that took place in South Africa. There are also no survival studies; efficacy was measured using the surrogate endpoint of a reduction in serum testosterone levels established as being equivalent to those seen following surgical castration. The second concern relates to the

drug's ability to continue to suppress testosterone production with repeated dosing, the so-called "acute on chronic effect". Following the initial dose of LHRH agonists, there is a surge in testosterone production that produces a disease flare in a small percentage of patients. This surge is followed by a predicable fall in serum testosterone concentrations to castrate levels. However, with some agents a second surge in testosterone production is seen following the second dose of the agent. This has led the FDA to require manufacturers of LHRH agonists to submit data with their approval applications regarding the likelihood that their product will induce this effect. Data were submitted for only 15/151 subjects enrolled in the South African trial noted above, 2/15 had secondary surges in testosterone levels above the acceptable level. As a result, in its approval letter the FDA has required the company to conduct a Phase IV pharmacology study to determine if this ratio is observed with a larger group of patients. While the clinical significance of this observation is unknown, it does create a concern regarding the ability of this agent to maintain serum testosterone levels within the range defined as acceptable.

The Council shared the concerns raised during the presentation, and voted unanimously that triptorelin should not be considered therapeutically equivalent to leuprolide and goserelin at this time. Triptorelin should not be included in a solicitation for a contract for an LHRH agonist for the treatment of prostate cancer.

C. *Non-sedating antihistamine contract* – Lt Col Zastawny informed the Council that prescriptions for fexofenadine (Allegra) continue to outnumber prescriptions for loratidine (Claritin) by a 9 to 1 margin at MTF pharmacies. The weighted average cost per tablet/capsule for non-sedating antihistamines purchased by MTFs in Dec 01 was $.53, which is 39% below the $.87 weighted average cost that existed prior to the contract.

According to Aventis, the 500 count bottles of both the 60 and 180 mg tablets will be added and the 60 mg capsules will be removed from the non-sedating antihistamine contract effective 28 Feb 2002. The contract price for the 60 mg and 180 mg tablets remains unchanged at $0.37 and $0.60 per tablet, respectively.

Cetirizine (Zyrtec) costs MTF pharmacies $.95 per day compared to only $.60 per day for fexofenadine 180 mg. MTFs fill almost as many prescriptions for cetirizine as for fexofenadine. The Council agreed that the PEC should publish an article in the PEC Update to encourage greater utilization of fexofenadine.

The FDA recently approved desloratadine (Clarinex). Desloratadine cannot be added to the BCF or MTF formularies while the contract for fexofenadine is in effect.

D. *Statin Contract* – MAJ Cheryl Filby stated that the contract for simvastatin (Zocor) was renewed for the final option year (until 19 Feb 03) as the Council recommended at the November meeting. Simvastatin and atorvastatin (Lipitor) account for 95% and 3.5% respectively of the total statin prescriptions filled at MTF pharmacies, but atorvastatin accounts for a much higher percentage at a few MTFs. An analysis of prescription data also revealed that the majority of atorvastatin prescriptions are filled for the 10 mg and 20 mg strengths. Higher dosages of atorvastatin (40 mg and 80 mg) would normally be needed if atorvastatin were used primarily for patients who failed to reach their LDL

goals on simvastatin. The PEC will provide statin usage data to MTFs and publish an article in the PEC Update that addresses the appropriate use of non-contracted statins.

E. *Status of contracting initiative for nasal corticosteroid inhalers* - The Council reiterated that neither flunisolide nor budesonide would be acceptable as the only nasal corticosteroid on the BCF because they too frequently require dosing more than once daily. The Council agreed that DoD could participate in a solicitation that may result in the addition of flunisolide or budesonide to the BCF, but neither of these drugs can be the sole nasal corticosteroid on the BCF.

F. *Potential contracting initiative for carbamazepine* – There is an opportunity to establish a joint VA/DoD single-source contract for an AB-rated generic carbamazepine. A recent analysis of carbamazepine purchases by DoD MTFs revealed that 85% of purchases were for branded Tegretol, at 5 times the cost of the available generics.

At the last DoD P&T Executive Council meeting, the PEC was asked to query the field and evaluate why there is high usage of brand name Tegretol when AB-rated generics are available. The Council also wanted a sense of how providers and pharmacists in the field would view a generic contract for this drug.

Responses were received from 35 primary care providers, pharmacists and neurologists. The majority of respondents (77%) were not concerned about whether the drug provided at their facility was generic or brand name. They agreed that Tegretol was prescribed because they were confident it would always be supplied by the same manufacturer. This guaranteed that the color, shape, etc. of the tablet would remain constant so as not to confuse patients or bring up questions of differences in bioavailability. Many also noted that carbamazepine is typically not the drug of choice for treating seizure disorders since safer options are now available. The drug is being used frequently for neuropathic pain control, where bioequivalence does not carry the same significance as it might for seizure control. However, since there is still some use as an antiepileptic, respondents felt a contract for an AB-rated generic would be acceptable, as long as a single manufacturer was chosen for a long-term contract to maintain consistency.

The Council learned that the proposed contract would allow facilities to use either the contracted generic or brand name Tegretol. The Council recognized that this conflicts with the desire of DoD providers to stipulate the use of a single carbamazepine product throughout the MHS. Some Council members asserted that this situation was still preferable to the current situation in the DoD, where all five generic products are currently being utilized. They also recognized the value in participating with the VA in a contracting action for this agent, and felt that it would be a first step in working toward the goal of all facilities using the contracted agent exclusively. After much discussion, the Council voted to support a joint VA/DoD solicitation for a single source of generic carbamazepine that allows MTFs to use either the contracted generic carbamazepine or brand name Tegretol (assuming that Tegretol does not in fact win the contract).

a. *Compliance with sole source contracts* - LCDR Ted Briski reported that a review of generic contract compliance revealed many instances where MTFs purchased non-contracted products. A small sampling of MTF pharmacy directors indicated that unavailability of the contracted product from the prime-vendor caused MTFs to purchase

non-contracted products. The Council views unavailability of contracted products as a patient compliance/safety issue since it may cause patients to receive different looking tablets or capsules each time they receive a prescription. LCDR Briski and Dave Bretzke will coordinate with MAJ Cheryl Filby to assess the problem and report back at the next meeting.

G. *Potential contracting initiative for fluoroquinolones* – Levofloxacin is currently on the BCF in accordance with a BPA. The Council concluded in Nov 01 that levofloxacin and gatifloxacin are therapeutically interchangeable and that either agent would be clinically acceptable as the "workhorse" oral fluoroquinolone. Ortho-McNeil has offered a modified BPA to both DoD and the VA, which removes the market share requirements and gives a uniform price of $2.00/tab system-wide. The BPA would reduce overall expenditures while avoiding the logistical and economic consequences of undergoing a product conversion that could potentially result from a contracting action. However, the Council also believes that it is still clinically acceptable to participate in a joint DoD/VA contract. Since the clinical needs of patients could be satisfied with either a contract or a BPA, the Council voted to support whichever joint action the VA/DoD contracting workgroup decides to pursue.

H. *Potential contracting initiative for triptans* – Lt Col Zastawny presented information from clinical studies and provider input regarding triptans. Clinical studies show that triptans generally will provide pain relief within 2 hours for 50-75% of patients and that 25-40% of patients will be pain free after two hours. One study showed that 45-58% of patients who did not respond to the initial triptan would respond to a different triptan. The clinical trial data suggest that patients' clinical needs would not be satisfied if a contract prohibited MTFs from having more than one triptan on their formularies. The majority of MTF providers surveyed by the PEC agreed that a contracting action would not be acceptable if it limited MTF formularies to a single triptan. The Council voted to support any contracting initiative or other pricing agreement that either allows or requires MTFs to have at least two triptans on their formularies.

I. *Potential contracting initiative for angiotensin receptor blockers (ARBs)* – LCDR Briski reported that MTF expenditures for ARBs increased from $5.7 million in FY 99 to $14.5 million in FY 01. The VA and DoD are working together on a clinical review of the ARBs. The PEC will forward the clinical review to Council members and compile additional information that will assist the Council in assessing the need for addition of an ARB to the BCF and the therapeutic interchangeability of the ARBs for a potential contracting initiative.

J. *Other contracting initiatives:* According to prime vendor data, national pharmaceutical contracts produced $16 million in cost avoidance at MTFs during the first quarter of FY 02. As for the third and fourth quarters of FY 01, prime vendor data for the first quarter of FY 02 are missing for many MTFs, so the actual cost avoidance is more than $16 million. Through Dec 01, the weighted average cost per unit for drugs covered by national pharmaceutical contracts is 33% less than the weighted average cost per unit that existed before the contracts took effect. Although MTFs are now spending much less for

proton pump inhibitors, no cost avoidance is attributed to this drug class because there is no contract in effect for proton pump inhibitors.

6. POTENTIAL IMPACT OF NEW GENERICS

A. *Fluoxetine:* CAPT Torkildson presented an update on the situation regarding generic fluoxetine. Barr Pharmaceuticals' 6-month period of exclusivity for this product expired in late January. On January 29 the FDA approved several additional generic fluoxetine products. At least two companies receiving approval have submitted the necessary paperwork to establish FSS pricing for their generic products. The prices contained in the most recent FSS pricing database for these products range from $4.49 to $5.19/100 capsules for the 10 mg and 20 mg strengths. It is uncertain at this time how soon these prices will be loaded or when they will be available to the MTFs, but they will likely be available by March 1. MTFs are advised to examine the available prices carefully before purchasing quantities of fluoxetine in the near future. If MTFs transition quickly to these significantly less expensive generic products, it is anticipated that the MHS could reduce expenditures for fluoxetine by as much as $13M over the next 12 months.

B. *Metformin:* The FDA approved generic formulations of metformin (Glucophage) on 25 Jan 01. At least six generic companies will market metformin, and five of them have approval for all three strengths (500-, 850-, and 1000 mg). The extended release metformin preparation (Glucophage XR) and combination product with glyburide (Glucovance) are still under patent.

Current FSS prices for Glucophage are $0.32 for the 500 mg tablet, $0.55 for the 850 mg tablet, and $0.58 for the 1000 mg tablet. MTFs spent approximately $20 million on Glucophage during the past 12 months. While FSS prices have not yet been established for generic metformin, a hypothetical example can illustrate the magnitude of potential cost savings. For example, MTFs could potentially save about $15 million annually if the generic metformin price is 75% less than the Glucophage price.

7. SUBCOMMITTEE REPORT: OBTAINING INPUT FROM PROVIDERS

LCDR Briski reported on the latest efforts by the PEC staff to obtain input from MTF-based providers, which is an important factor in pharmaceutical contracts and formulary management. The email groups put together by MAJ Roach have been effective, but do not reach all MTFs. Since the DoD P&T is a TMA chartered organization, using the TMA infrastructure is a logical mechanism to communicate with MTFs. The PEC initiated monthly teleconferences with lead agent medical directors and lead agent pharmacists. The PEC's goal is to tap into the already existing networks these senior Lead Agency staffers have established. Close contact with the service-specific chains of command will continue to be maintained via the Chief Pharmacy and Chief Clinical Consultants to each Surgeon General. In addition, the PEC is exploring the options for creating a Chat room/Bulletin Board section of the PEC web site to facilitate consistent and timely communication. P&T minutes will continue to be distributed through service and TMA lanes.

8. MTF REQUESTS FOR BCF CHANGES

A. *Request to add Advair (fluticasone/salmeterol) to the BCF* – An Air Force allergist provided the following rationale for the request:

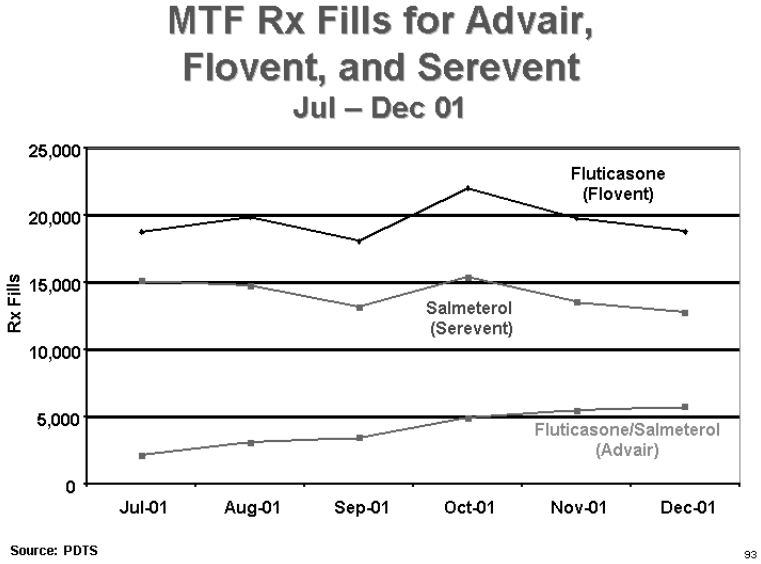
- Nine studies have proven that the addition of a long acting beta-agonist is superior to doubling the dose of inhaled corticosteroid (ICS) in the treatment of uncontrolled asthma in the patient already on an ICS.
- The evidence also suggests that long acting beta-agonists should never be used as mono-therapy and should always be used in conjunction with ICS.
- Compliance with asthma controller medication decreases when more than one inhaler is used.
- Advair offers mandatory combination therapy and a single inhaler of 1 puff twice a day (vs. 2 inhalers, 4 puffs twice a day).

Safety and tolerability of the combination product are similar to the same dosages of the products administered by separate inhalers. The FDA allowed the removal of the box warning about adrenal insufficiency surrounding the use of inhaled corticosteroids class because no cases were reported. Efficacy of the combination product is similar to the same dosages of the products administered by separate inhalers. An article by Aubier et al. comparing Advair vs. the two single agents demonstrated that the two arms were equal for morning Peak Expiratory Flow (PEF).

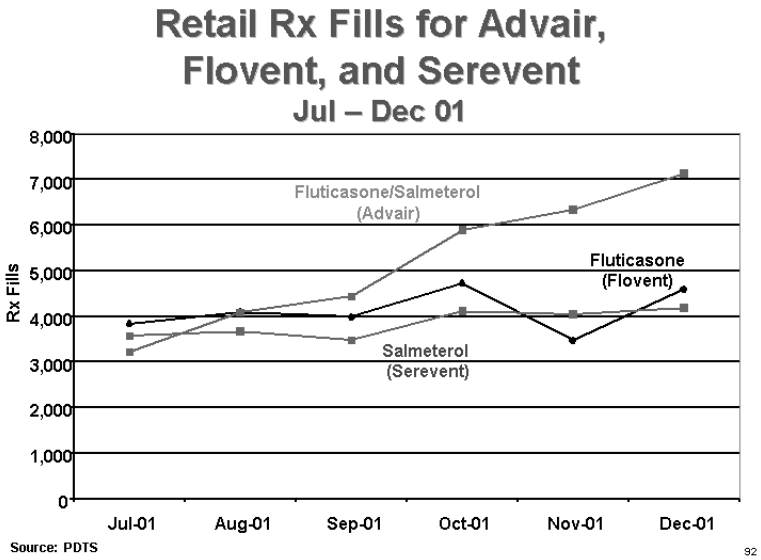
The PEC requested provider (physician and pharmacist) input on this issue and received 63 responses: 56 favoring addition to the BCF; 4 against addition to the BCF; and 3 inconclusive regarding addition of Advair to the BCF. Providers made several key points:

- Advair provides perceived symptom improvement within 30 minutes (from the Serevent). Researchers have speculated that the patient's perception of the benefit of the treatment rather than the dosage form itself may be the more critical factor. Some patients using the separate inhalers will identify Serevent as the agent that causes improvement, stop the inhaled steroid, and then end up on Serevent monotherapy. One large MTF survey showed that 200 patients were on Serevent monotherapy.
- The greatest benefit would be to our teenage population. The death rate of asthma in children has risen 150% between 1980 and 1996 – the age group with the highest mortality is 15-24 years of age. Asthma deaths today are preventable and we need to support combination therapy of inhaled corticosteroids and long-acting beta-agonists.
- Advair can be administered in 1/20 of the time it takes to use the 2 separate inhalers. How could this not improve compliance?

Fluticasone and salmeterol are on the BCF as individual agents. As shown in the following graph, prescription fills for Advair are rising steadily at MTFs (up 60% from Jul 01 to Dec 01), while usage of the individual agents is flat or declining slightly.



Prescription fills for Advair are rising even faster in the retail network pharmacies (more than doubled from Jul 01 to Dec 01)



The FSS pricing as of January 2002 for Advair and the individual products is presented in the following table:

Item Description		Doses/container	FSS Price As of Jan 2002
Advair Diskus Inhaler	fluticasone 100 mcg/salmeterol 50 mcg	60	$64.27
	fluticasone 250 mcg/salmeterol 50 mcg	60	$80.54
	fluticasone 500 mcg/salmeterol 50 mcg	60	$102.82
Serevent	salmeterol 25 mcg MDI	120	$42.72
	salmeterol 50 mcg diskus	60	$45.32
Flovent	fluticasone 110 mcg MDI	120	$39.60
	fluticasone 220 mcg MDI	120	$60.10

The cost of Advair is compared to the cost of the individual products in the following table:

Item Description	Advair cost/day Using twice daily dosing	Cost/day for equivalent dose of individual products	Additional cost per day for Advair
fluticasone 100 mcg/salmeterol 50 mcg	$2.14/day	$2.09/day	$0.05/day
fluticasone 250 mcg/salmeterol 50 mcg	$2.68/day	$2.43/day	$0.25/day
fluticasone 500 mcg/salmeterol 50 mcg	$3.43/day	$3.43/day	$0.00/day

Addition of Advair to the BCF could improve patient satisfaction and compliance. There is also a potential reduction in waste, since most fluticasone and salmeterol use is of MDI inhalers that are hard to estimate remaining doses. Advair Diskus gives number of doses remaining. The Council added all strengths of the fluticasone/salmeterol (Advair) to the BCF.

B. *Request to add Plan B (emergency contraceptive) to the BCF* – An MTF provider offered the following rationale in support of the request:

- Use of an emergency contraceptive is the only method available to prevent pregnancy after unprotected sexual intercourse or after a contraceptive "accident."

- It can provide emergency treatment for victims of sexual assault who were not protected by an effective contraceptive.
- A couple or a single female may suffer economic hardship as well as significant psychological and social costs from an unintended pregnancy.
- Although relatively higher in cost than some combination formulary contraceptives, the cost of Plan B is well within the range of the most commonly used preparations for this purpose, and the volume or frequency of use would be relatively low.
- The lower side effect profile of Plan B would decrease the use and cost of anti-emetics usually prescribed with the combination regimens, and the cost and necessity of return visits for adverse effects or therapeutic failure.
- The greater clinical efficacy, lower adverse effects, and simplified patient dosing regimen make Plan B the drug of choice for emergency contraception.
- Data indicate a rapid return of normal ovulation and fertility following discontinuation of either combined estrogen-progestin or progestin-only tablets for emergency contraception.
- Emergency contraceptives should be uniformly and immediately available in order to maximize their effectiveness in preventing unintended pregnancies and thereby reducing the number of women who seek elective abortions.

The Council considered the following information regarding emergency contraceptives in general and Plan B in particular:

- The American College of Obstetricians and Gynecologists (ACOG) and the American Academy of Family Practice (AAFP) recommend and endorse the use of emergency contraception.
- ACOG estimates that use of emergency contraceptives could prevent as many as half of the approximately 3 million unintended pregnancies that occur each year in the United States, including as many as 700,000 pregnancies that are terminated by abortion.
- Emergency contraception counseling should be provided during every annual health maintenance examination per BUMED NOTE 6320 (26 Oct 99) and Article 15-76 of the Manual of the Medical Department, Section VI; Family Planning, Contraceptive Counseling, and Sexually Transmitted Disease Prevention Counseling.
- The OB/GYN consultants for the three services support the addition of Plan B to the BCF.
- Ethics consultants for the three services concluded that there are no apparent reasons to preclude the use of Plan B at MTFs, since it is an FDA-approved contraceptive and not, as some argue, an abortifacient. Service regulations and TRICARE policy do not prohibit the coverage of emergency contraceptives. The presence of Plan B on the BCF would not "force" providers to prescribe Plan B. As with all other drugs on the BCF, the decision to prescribe Plan B would be left to the discretion of the individual provider.
- MTFs already provide emergency contraceptive therapy. Most MTFs use regular oral contraceptives in an "off label" fashion, while some MTFs use Plan B.
- The first dose of an emergency contraceptive should be taken within 72 hours of unprotected sex, preferably during the first 24 hours, followed by a second dose 12 hours later. The earlier the emergency contraceptive is given, the more likely it is to prevent pregnancy. The need for timely administration supports the argument that the emergency contraceptive should be on the MTF formulary in order to preclude delays that might

occur if the medication had to be obtained through a non-formulary or special order request.

- MTF providers and pharmacists responded to a survey regarding the proposal to add Plan B to the BCF. 38 respondents supported the addition, 15 respondents did not support the addition, and 14 respondents did not clearly express their position.
- Plan B is more efficacious than the Yupze regimen (ethinyl estradiol 100 mcg and levonorgestrel 0.5 mg taken twice, twelve hours apart). A large-scale clinical trial conducted at 21 treatment centers in 14 countries found a pregnancy rate of 1.1% (95% CI 0.6-2.0) for Plan B versus a pregnancy rate of 3.2% (95% CI 2.24.5) for the Yupze regimen.
- The incidence of nausea and vomiting associated with Plan B is less than half the incidence of nausea and vomiting associated with the Yupze regimen.
- The Plan B regimen requires the patient to ingest a total of 2 tablets, which is much more tolerable than the 20 tablets that a patient must ingest when using progestin-only tablets.
- The costs per regimen of the various emergency contraceptive alternatives are:
    - Plan B: $11.63
    - Preven: $3.91
    - Yupze regimen: $9.92
    - Progestin-only tablets (norethindrone): $9.20

The Council voted to add Plan B to the BCF. However, the Council decided that the addition of Plan B to the BCF would not be official until the Council verifies with TMA that this action is consistent with existing DoD policy.

9. REVIEW OF BCF

A. *Follow-up of anxiolytic review – potential BCF addition of venlafaxine extended release (Effexor XR)* – The Council recommended tabling this topic until the meeting in May.

B. *Analysis of midday dosing with methylphenidate dosage forms.* The following table displays the results of analyses of midday dosing associated with random samples of methylphenidate-SR prescriptions filled between Oct 99 and Sep 00 and Concerta prescriptions filled between Oct 00 and Dec 01.

Midday Dose	Methylphenidate-SR Rxs	Concerta Rxs
Yes	78 (40%)	17 (8%)
No	115 (60%)	178 (92%)
Total	193 (100%)	195 (100%)

The analyses indicate that the addition of Concerta to the BCF improved a humanistic outcome of drug therapy by decreasing the frequency of midday dosing of methylphenidate products for ADHD patients.

C. *Potential additions to BCF based on usage review*: Medications reviewed for BCF addition based usage criteria/analysis: 1) Top 200 list from PDTS; 2) High use in retail network; 3) Significant formulary status at MTFs; and 4) High dollar items.

- *Conjugated estrogens/medroxyprogesterone acetate (Prempro)* – Safety, tolerability and efficacy are similar for Prempro and the same dosages of the

drugs administered as separate tablets. Most providers think that the potential for improved compliance with Prempro may increase effectiveness. Based on prime vendor data, the average daily cost of Prempro is $0.32, while the average daily cost of providing the same dosage of medroxyprogesterone and conjugated estrogens via separate tablets is $0.39, so Prempro is actually less expensive than the individual products.

Prempro 0.625/2.5 is on the formulary at 63 (59%) of 107 MTFs. Prempro 0.625/5 is on formulary at 37 (35%) of 107 MTFs. Prempro 0.625/2.5 was ranked #5 in dollars spent, #24 in prescriptions, and #53 in unique users at retail network pharmacies.

The PEC requested provider (physician and pharmacist) input. Of 141 responses, there were 108 in favor, 17 opposed, and 16 indecisive regarding the addition of Prempro to the BCF.

The Council added all strengths of Prempro to the BCF.

- *Gabapentin (Neurontin)* – Gabapentin was evaluated for potential addition to the BCF based on the fact that gabapentin was in the top 200 in PDTS, high usage rate in retail network, and is a high dollar item. MTF expenditures for FY 01 were $12 million. Anticonvulsants rank #12 in all DoD expenditures, with ½ of that being gabapentin. Gabapentin 300mg strength ranks #17 in expenditures and #69 in unique users in the retail network.

  The PEC requested provider (physician and pharmacist) input on this issue and received 55 responses: 22 favored, 11 opposed (nearly all due to cost), and 12 were inconclusive regarding the addition of gabapentin to the BCF. One provider indicated that gabapentin quickly became a staple in their pain arsenal and usage would likely increase dramatically in the next few years. Another provider commented that the most beneficial aspects of gabapentin are its lack of significant interactions, lack of hepatic metabolism, and lack of need for blood work monitoring. A Pfizer report stated that the worldwide use for pain indication is 85% and is increasing by a 55% growth rate. Since the usage of gabapentin will likely continue to increase, and it is a safe, well-tolerated alternative to other agents for neuropathic pain control, the PEC recommended addition of gabapentin to the BCF.

  Council members were concerned that gabapentin is not FDA approved for pain control and that it may pose a large cost burden to small MTFs. They were also concerned that there is very little solid literature to back its use for pain control. The company has a supplemental new drug application pending for FDA approval for treatment of neuropathic pain.

  The Council decided not to add gabapentin to the BCF.

- *Azithromycin (Zithromax)* – Azithromycin is a widely used agent proven safe and effective in a broad range of infectious processes. FSS pricing as of Jan 2002 for the 250 mg strength of azithromycin is $4.00/tablet or $25.00/5 day course. Azithromycin 250 mg tablet strength is #2 by unique users and #9 by Rx fills in

the retail network. Azithromycin is on 94% of MTF formularies. Provider input was not obtained for this product. Due to high volume in retail pharmacy network and representation on a vast majority of MTF formularies the Council added azithromycin 250 mg tablets to BCF (does not require the Z-pak dosing form).

10. AVAILABILITY AND PRICING OF ORTHO NOVUM 7/7/7

Ortho Novum 7/7/7 is listed on the BCF and has been available for purchase by MTFs through the Depot or directly from Ortho-McNeil for approximately $7.70/cycle. This price is not available to MTFs via Prime Vendor (approximately $16.00/cycle) because of the packaging of the product ("clinic" packs vs. "commercial" packs). Ortho-McNeil stated that it would not renew the Depot contract, which expires at the end of February 2002. Ortho Novum 777 will no longer be available from the Depot when existing supplies are exhausted. There has been no determination on the long-term availability of the "clinic" packs directly from the manufacturer. The PEC will continue to monitor the situation and determine whether a change to the BCF is necessary.

11. BLEEDING RISKS IN THE CURE TRIAL

The Council evaluated the results from the CURE (Clopidogrel in Unstable Angina to Prevent Recurrent Events) trial at the Nov 01 meeting in consideration of a proposal to add clopidogrel (Plavix) to the BCF. The Council noted the higher incidence of bleeding reported with the combination of clopidogrel plus aspirin vs. the placebo plus aspirin group. The definition of major bleeding used in the CURE trial differed from the widely accepted definition used by the American College of CHEST Physicians (ACCP). Council members were concerned that the number of major bleeds in the CURE trial may have been even higher if the ACCP definition had been used. The Council asked the PEC to request additional information from Bristol Myers Squibb (BMS) about the bleeding rates in the CURE trial.

The PEC sent questions to BMS on 3 Jan 2002. BMS referred the questions to the CURE trial investigators. The PEC received a response from the investigators on the evening of 11 Feb 02. The PEC did not have enough time to analyze the response prior to the 12 Feb 02 P&T Executive Council meeting. At the 12 Feb 02 meeting the Council asked the PEC to analyze the response, estimate the number of major bleeds using the ACCP definition for major bleeds, and forward the analysis and estimates to the Council members so they could vote on the proposal to add clopidogrel to the BCF and report the results of the vote as part of the minutes for this meeting.

Based on the response from the CURE investigators, the PEC estimated that the number of major bleeds in the clopidogrel plus aspirin group would increase by 6 (from 231 to 237) and the number of bleeds in the placebo plus aspirin group would increase by 9 (from 169 to 178) using the ACCP definition for major bleeds. Using the ACCP definition for major bleeds did not produce a significant change in the number of major bleeds for either group in the CURE trial. A BMS representative stated that several articles are planned for publication based on the CURE study, including one devoted to bleeding episodes. Additionally, newly updated guidelines by the American Heart Association and the American College of Cardiology are expected to recommend that clopidogrel receive a type one recommendation (the highest quality recommendation) for use in patients with non-ST segment-elevation myocardial

infarction; however, the guidelines have not yet been published. The PEC forwarded this information to the Council members, and the Council members voted to add clopidogrel to the BCF.

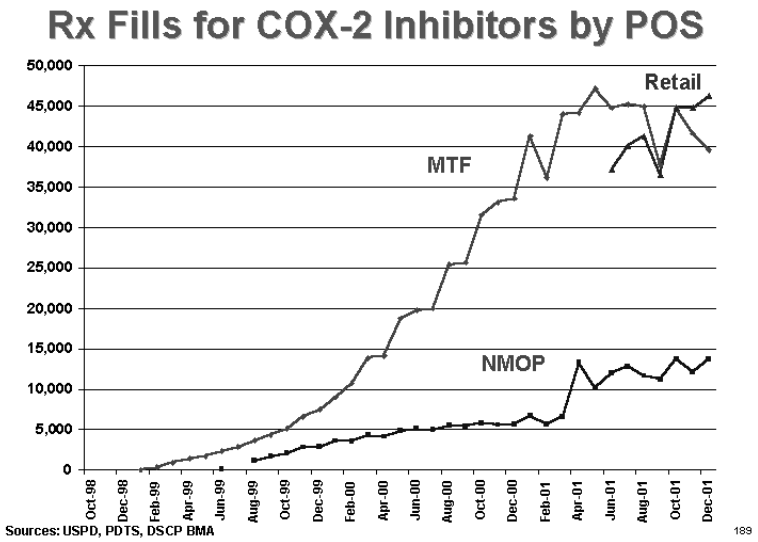
12. PROTON PUMP INHIBITORS

Rabeprazole (Aciphex) replaced omeprazole (Prilosec) on the BCF on 1 Oct 01. In Nov 01 the PEC asked MTF providers if there had been any specific problems with dosing, tolerance or patient response to Aciphex when used for common outpatient diagnoses such as GERD compared to their experience with Prilosec. Providers were also asked if the switch to Aciphex was problematic for providers, patients or pharmacists. The PEC received 41 provider responses from 32 MTFs. Most reported no problems and were very pleased with the huge decrease in the cost of proton pump inhibitor therapy. Favorable comments included the perception of a higher success rate with Aciphex and preference for the small Aciphex tablet compared to the large Prilosec capsule. A few providers reported a higher rate of treatment failures with Aciphex. One provider expressed concern about the procedure used by the MTF to convert patients from Prilosec to Aciphex.

13. COX-2 INHIBITORS

The Council considered various factors pertinent to the potential addition of a COX-2 selective inhibitor ("COX-2 inhibitor") to the BCF.

- COX-2 inhibitor usage data for the three outpatient pharmacy points of service are displayed in the graph below. After steadily increasing for 2.5 years, COX-2 prescription fills have leveled off at MTF pharmacies. COX-2 prescription fills have also leveled off somewhat in the NMOP after a sharp increase associated with the implementation of the TRICARE Senior Pharmacy Program. Limited historical data make it difficult to discern a usage trend in retail network pharmacies, but they are currently filling more COX-2 inhibitor prescriptions than MTF pharmacies.



- A survey of the COX-2 formulary status in the CHCS system at 96 MTFs revealed:
  - 41 (43%) had no COX-2 inhibitors on formulary
  - 30 (31%) had one COX-2 inhibitor on formulary
  - 25 (26%) had two COX-2 inhibitors on formulary
- Funding for MTF pharmacies in FY 02 is 15% above actual expenditures in FY 01. An objective of the increased funding is to make more drugs available at MTF pharmacies so that beneficiaries are not forced to go to a more expensive point of service (e.g. the retail network) to obtain their medications.
- Significant price reductions on certain drugs and the prospect for price reductions associated with the availability of new generic medications will substantially reduce MTF expenditures in some major drug classes, which can "free up" money for spending on other drug classes.
- A new COX-2 inhibitor, valdecoxib, is available. Approval of a fourth COX-2 inhibitor, etoricoxib, is expected in the near future. Significant price competition is unlikely at this time since the same companies that manufacture celecoxib and rofecoxib also manufacture the new agents, but more new entries in this and related drug classes are anticipated.
- The Council previously determined that celecoxib and rofecoxib are not sufficiently therapeutically interchangeable for a closed class contract.

The Council also reviewed a model constructed by the PEC that estimates the total cost to DoD of adding a COX-2 inhibitor to the BCF given assumptions about the percentage of switches from non-selective NSAIDs to COX-2 inhibitors, the absolute increase in COX-2 inhibitor prescriptions among patients not previously receiving an NSAID, the movement of COX-2 prescriptions from the retail networks to MTFs, and the anticipated percent decrease in average cost per unit for COX-2 inhibitors at MTFs and the NMOP that would result from selecting one COX-2 inhibitor for the BCF.

The Council voted that DSCP should issue a request for Blanket Purchase Agreement (BPA) price quotes to the pharmaceutical companies that market COX-2 inhibitors for the purpose of adding a COX-2 inhibitor to the BCF. The COX-2 drug class would remain "open" on the BCF. The Council will consider the price quotes, as well as the relative safety, tolerability, efficacy/effectiveness, and other relevant factors, in selecting a COX-2 inhibitor for the BCF. However, if its analysis demonstrates that it is not in the Government's best interest, the Council reserves the right to not select a COX-2 inhibitor for the BCF. The request for BPA price quotes will also ask the pharmaceutical companies to submit their plans for assisting MTFs in targeting the use of COX-2 inhibitors to the patients at greatest risk for gastrointestinal events. The Council encourages the continued use of COX-2 guidelines at MTFs in the efforts to ensure appropriate, cost-effective use of COX-2 inhibitors. The Council also requested DSCP to ask the VA if it wishes to participate in this request for BPA price quotes.

14. ADJOURNMENT

The meeting adjourned at 1600 hours on 12 Feb 2002. The next meeting will be held at the Non-Commissioned Officers Club, Fort Sam Houston, TX starting at 0800 on 8 May 2002. All agenda items should be submitted to the co-chairs no later than 8 April 2002.

MCCS-GPE **15 NOVEMBER 2001**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T committee convened at 0800 hours on 15 November 2001, at the Uniformed Services University of the Health Sciences, Bethesda, Maryland.

2. MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL John R. Downs, MC	Air Force
COL Bill Sykora, MC	Air Force
LtCol (select) George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
COL Mike Heath, MS (representing MAJ Brett Kelly)	Army
COL Rosa Stith, MC	Army
LTC (P) Joel Schmidt, MC	Army
CAPT Chuck Bruner	Coast Guard
LTC Mike Kieffer, MS	Joint Readiness Clinical Advisory Board
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
William Hudson	Humana
Ron McDonald	Sierra Military Health Services
Gene Lakey	TriWest

MEMBERS ABSENT

Dick Rooney	Department of Veterans Affairs
Ray Nan Berry	Health Net Federal Services

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TMA
CAPT Betsy Nolan	Navy Pharmacy Specialty Leader
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC	DoD Pharmacoeconomic Center
LCDR Denise Graham	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
MAJ Maria Ionescu	Pharmacy Benefits Division, TMA
Howard Altschwager	Deputy General Counsel, TMA
David Bretzke	DoD Pharmacoeconomic Center
David Chicoine	Uniformed Services Family Health Plan
Lisa Le Gette	DoD Worldwide TRICARE Information Center
Shirif Mitry	Pharmacy Student, TMA
Mark Petruzzi	Merck-Medco
David Spiler	Merck-Medco
Shana Trice	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia

3. **REVIEW MINUTES OF LAST MEETING / ADMINISTRATIVE ISSUES** – The Committee approved the minutes of the last meeting with one correction: the entry for valganciclovir (Valcyte) on Page 8 (Appendix A) was changed to list Roche as the manufacturer rather than Syntex.

4. **INTERIM DECISIONS** – In September 2001, voting members of the Committee communicated via email and telephone to make an interim decision regarding the status of PPIs on the National Mail Order Pharmacy (NMOP) Formulary subsequent to the expiration of the omeprazole contract on 1 Oct 2001. The voting members decided to retain omeprazole on the NMOP Formulary, add rabeprazole and pantoprazole to the NMOP formulary, and exclude lansoprazole and esomeprazole from the NMOP formulary. The decision was communicated to the field in early October 2001.

5. **UNIFORM FORMULARY–** COL Davies reported that the draft rule for the Uniform Formulary was sent to the Office of Management and Budget (OMB) on 29 Oct 01. [Note: It was subsequently determined that a summary notification of the draft rule was sent to OMB on 29 Oct 01. The draft rule was not sent to OMB until 30 Nov 01.]

6. **BCF AND NATIONAL MAIL ORDER PHARMACY (NMOP) FORMULARY ISSUES** – The Committee determined the NMOP formulary status, NMOP or retail network formulary restrictions (quantity limits or prior authorization), and Basic Core Formulary (BCF) status for 8 new drugs (see Appendix A).

7. **PROPOSED BPA FOR LANSOPRAZOLE FOR NMOP FORMULARY STATUS** - Lansoprazole (Prevacid) and esomeprazole (Nexium) are not on the NMOP formulary. TAP is offering a BPA with the following provisions if lansoprazole is added to the NMOP formulary:

   - For the first three months of the BPA (15 Nov 01 – 15 Feb 02), TAP will provide all eligible DoD MTF and NMOP facilities a $0.99 per tablet price for Prevacid.
   - Before the expiration of the first three-month period after pricing is in place, MTF and NMOP facilities must place Prevacid on their individual formularies in order to guarantee that they will continue to receive the BPA price for Prevacid.
   - If Prevacid has not been placed on individual MTF and NMOP formularies, TAP reserves the option to increase the price of Prevacid to the current published FSS price at MTFs where Prevacid is not on formulary.

   The Committee decided to place lansoprazole on the NMOP Formulary.

8. **PROPOSAL TO REMOVE OMEPRAZOLE FROM THE NMOP FORMULARY** – As of the first week in November 2001, the average cost per unit for proton pump inhibitors (PPIs) dispensed by the NMOP was $1.86, which is 72% higher than the $1.08 average cost per unit for PPIs dispensed by MTF pharmacies. MTFs and the NMOP pay the same prices for PPIs. The average cost per unit is higher in the NMOP because high-priced omeprazole continues to dominate PPI usage in the NMOP (72% of PPI prescription fills during the first week in November). Legal challenges continue to delay the availability of generic versions of omeprazole, so price relief is not imminent. A recent "Pink Sheet" article contained a prediction by a generic manufacturer that generic versions of omeprazole would not be available until the second half of calendar year 2002.

   The P&T Committee considered a proposal to remove omeprazole from the NMOP formulary. Patients who currently receive omeprazole from the NMOP would be "grandfathered" so that they could continue to receive omeprazole from the NMOP. Removal of omeprazole from the NMOP formulary would encourage the use of more cost-effective PPIs.

   Committee members and other attendees expressed concern that constraining availability of such a widely used drug could discourage patients from using the NMOP. Others were concerned that patients might simply get omeprazole prescriptions filled at retail pharmacies at a higher cost to the government and the patient. The Committee voted to retain omeprazole on the NMOP formulary.

9. **ANTIBIOTIC PROPHYLAXIS FOR ANTHRAX EXPOSURE** – The Committee discussed the recent memorandum from Health Affairs supporting Centers for Disease Control and Prevention (CDC) guidelines for antibiotics used for prophylaxis for anthrax exposure. They also reviewed data on the number of prescription fills for ciprofloxacin in the Managed Care Support Contractor (MCSC) retail networks, MTFs, and the NMOP. Although there were modest increases in the number of prescription fills for ciprofloxacin in early to mid October, utilization now appears to have returned to pre-September 11th levels. Increased usage was most notable in affected areas (Florida and Washington). The DoD P&T Committee, the PEC, and TMA will use Pharmacy Data Transaction Service (PDTS) data to monitor usage of ciprofloxacin and doxycycline (and other antibiotics that may be used for anthrax prophylaxis in the future) in MTFs, the NMOP, and the retail network.

10. PRIOR AUTHORIZATIONS

A. *Cost avoidance from NMOP prior authorizations (PAs)* – Cost avoidance analyses were not completed for this quarter due to lack of data for September 2001.

B. *Changes to PA criteria for COX-2 inhibitors* – In Oct 2001, celecoxib (Celebrex) 100 mg capsules received a supplemental indication from the Food and Drug Administration (FDA) for the management of acute pain in adults and treatment of primary dysmenorrhea. Existing NMOP PA criteria for COX-2 inhibitors allow use of rofecoxib for 20 days or less in patients with risk factors for GI adverse events, but not celecoxib, which previously lacked any indication for acute use. The Committee decided to table this issue until the next meeting when the following information is expected to be available: new package labeling for celecoxib; the percentage of rofecoxib prescriptions in the NMOP written for short-term use; and actions taken at the Jan 02 meeting of Merck-Medco's internal P&T committee (since the NMOP criteria were adapted from and are similar to criteria used by Merck Medco for other mail order clients).

C. *Clinical Rationale Statements on NMOP PA forms* – There are two versions of the NMOP PA request forms: (1) forms maintained on the PEC website for download by patients and providers, and (2) forms used internally by Merck-Medco to fax to providers when prior authorization is needed. A year ago the DoD P&T Committee decided that NMOP PA request forms should include a clinical rationale statement. The task of constructing the clinical rationale statements was delegated to the PEC staff.

   The PEC staff has encountered significant difficulties in constructing and updating the clinical rationale statements. Space is limited on the single-page forms, so it is difficult to construct complete, coherent clinical rationale statements that will fit on the forms. Any changes in the clinical rationale statements on the forms used by Merck Medco must go through a lengthy approval process.

   The Committee decided to remove the clinical rationale statements from the NMOP PA request forms, but make them available on the PEC website. The NMOP PA forms maintained on the PEC website will contain links to the clinical rationale on the PEC website. The Committee also decided that it would review and approve changes to the clinical rationale statements on the PEC website on an ongoing basis. The Committee reviewed and revised the clinical rationale statements for each of the drugs subject to prior authorization. The information on the PEC website will be updated to reflect these changes.

D. *Combination antifungal therapy for onychomycosis* – Prescription data from one MCSC indicated that only 9 patients received concurrent therapy with ciclopirox and a systemic antifungal during the 21-month time period from Jan 2000 to Sep 2001. The Committee concluded that the incidence of concomitant use is too low to warrant changing PA criteria for the antifungals for onychomycosis.

E. *Status of the PA for sildenafil (Viagra) in the NMOP and retail network* –MAJ Bellemin presented data from the NMOP assessing the potential impact of removing the sildenafil PA. He reported that the cost avoidance attributable to the PA for sildenafil in the NMOP over the 1-year time period April 2000 to March 2001 was about $14.00 per prescription using the same

model routinely used to monitor cost avoidance from the NMOP PA program. He recommended that the PA for sildenafil be continued.

Bill Hudson (Humana) also recommended that the sildenafil PA be continued. He presented data concerning the impact of the prior authorization for sildenafil in the TRICARE regions managed by Humana Military Healthcare Services (HMHS).

HMHS has required prior authorization for sildenafil in Regions 3/4 since mid June of 1998. Upon implementation of the PA requirement, utilization declined from over 1200 prescriptions per month to approximately 200 scripts per month. During 2000 through March 2001, utilization and prior authorization requests leveled off at approximately 500 scripts and 100 requests per month. Upon implementation of the TRICARE Senior Pharmacy program in April 2001, utilization approximately doubled, but the rate of denials remained constant at about 20%.

A distinctly different pattern is seen in Regions 2/5, which did not require prior authorization for sildenafil prior to April 2001. HMHS acquired the contract to manage these regions in June 2001. Sildenafil utilization was two to three times greater in Regions 2/5 than in Regions 3/4, even though the population of Regions 2/5 is about 20% smaller than Regions 3/4. During this time, Regions 3/4 had about 900 fewer claims per month than Regions 2/5 even though only about 30 requests for sildenafil were denied each month. The differences between Regions 3/4 and 2/5 in sildenafil utilization support the existence of a "sentinel effect" due to the presence of the PA program in Regions 3/4.

The PA may also enhance patient safety by assessing whether patients are currently receiving nitrates. The interaction between sildenafil and nitrates is one of the drug interactions most commonly detected by PDTS.

The Committee decided not to change the sildenafil PA in the NMOP or retail network.

11. **CLARIFICATION OF GROWTH HORMONE ON NMOP COVERED INJECTABLES LIST** – The Committee clarified the listing for somatropin, a human growth hormone, on the NMOP Covered Injectables list to include all of the brand names for this product. MAJ Mickey Bellemin confirmed that the NMOP is filling prescriptions for all brands of somatropin.

12. **CLARIFICATION OF HUMAN CHORIONIC GONADOTROPIN (HCG) PRODUCTS ON NMOP COVERED INJECTABLES LIST** – HCG is currently on the NMOP Covered Injectables List as "Human Chorionic Gonadotropin injection." The Committee added the recombinant HCG product Ovidrel (choriogonadotropin alfa) to the NMOP Covered Injectables List.

13. **ACCUTANE QUANTITY LIMIT** – Mark Petruzzi confirmed that the NMOP is complying with new FDA requirements for dispensing of Accutane, including limiting dispensing to a months supply and requiring a new prescription bearing a special sticker (which certifies that female patients have a negative pregnancy test and have received counseling on pregnancy prevention) prior to dispensing each months supply.

14. SUBCOMMITTEE REPORT: PROVISION OF INJECTABLE DRUGS IN THE NMOP OR RETAIL NETWORK PHARMACIES – LtCol (select) George Jones reported on the work of the subcommittee regarding provision of injectable drugs in the NMOP and retail network pharmacies. The subcommittee's goal was to optimize patient access, outcome, and satisfaction balanced with safety and cost efficiency. A guiding principle was that legislation or policy should not take the place of clinical judgment.

The subcommittee analyzed data from PDTS for MTFs, retail network pharmacies, and the NMOP to determine what injectable medications are being filled in each point of service. The subcommittee discussed the trend in the civilian sector to move high cost injectable drugs that were historically provided through provider offices into pharmacy distribution systems in an attempt to attain more control and information about injectable use and decrease costs through volume purchasing strategies.

LtCol (select) Jones commented that the subcommittee had not found any civilian plan that had a usable method of categorizing drugs into those that could be self-administered vs. those that should only be provided through provider offices. Plans differed drastically on what injectable drugs were covered as part of the pharmacy benefit, ranging from insulin and allergy kits only to an extensive list (basically everything except investigational drugs). Many plans have a positive list of drugs that are provided through the pharmacy benefit. Most plans have a system to handle exceptions and special needs. An industry report highlighted one plan that "optimized" distribution of injectables by directing patients to use mail order as their primary source for chronically used injectables.

The subcommittee made preliminary recommendations:

- Continue to provide injectables through the pharmacy benefit in the current manner. No significant misadventures or problems have been reported.
- Expand the number of injectables available through the NMOP. MAJ Bellemin and Mark Petruzzi (Merck-Medco) reported that the subcommittee would review Merck-Medco standard formulary planning list of injectable products as to what is usually covered. The subcommittee will review for next meeting and make specific recommendations. Mark Petruzzi noted that the idea of providing injectables to provider offices is something that Merck Medco is looking at for its commercial clients.
- MTFs continue to meet the needs of their patients through formulary addition or special purchases of injectable products.

15. CONTROLLED DISTRIBUTION OF DOFETILIDE (TIKOSYN) – Because of specialized educational requirements mandated by the FDA, dofetilide is only available for outpatient use through Stadtlander's Pharmacy/CVS Procare (which is a non-network pharmacy for DoD beneficiaries). LCDR Ted Briski reported that a plan has been worked out between Pfizer and DSCP to establish a centralized policy and financing procedure that should allow the drug to be obtained for DoD patients at federal pricing and prevent DoD patients from potentially having to pay the copay for a non-network pharmacy. Members commented that more drugs requiring controlled distribution systems are being approved and that similar issues are likely to continue to arise.

16. CONTROLLED DISTRIBUTION OF PEGINTERFERON ALFA 2B (PEG-INTRON; SCHERING) – Schering has instituted a special-distribution process for PEG-Intron due to concerns that unregulated distribution of the product could lead to shortages. Patients must begin the entire course of therapy again if it is interrupted.

Patients using retail network pharmacies or the NMOP will use the same process as Schering's commercial customers. Patients will call 888-437-2608 to self-enroll into the PEG-Intron Access Assurance program and receive an identification number. Patients will supply the identification number to the pharmacy along with their prescription or refill request. The pharmacy will place an order through its usual wholesaler, using the patient's ID number. The wholesaler will ship the product to the pharmacy to arrive within 5 days.

Patients using MTF pharmacies will not have to supply an identification number. MTF pharmacies will input the prescription into CHCS. The PDTS Customer Service Support Center will generate a weekly report of DoD patients newly started on PEG-Intron (using masked patient identifiers) and provide this to the PEG-Intron Access Assurance program. Schering will internally assign an ID number. No order authorization will be required. Schering is in the process of working out details of the program. Schering expects to submit a Memorandum of Understanding to DoD for approval before the end of the year.

17. ADJOURNMENT – The meeting adjourned at 1200 hours. The next meeting will be held at the Non-Commissioned Officers Club, Fort Sam Houston, TX starting at 0800 on Wednesday, 13 February 2002. All agenda items should be submitted to the co-chairs no later than 11 January 2002.

List of Appendices

APPENDIX A: NEWLY APPROVED DRUGS CONSIDERED FOR THE NATIONAL MAIL ORDER PHARMACY FORMULARY AND DOD BASIC CORE FORMULARY

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Cefditoren pivoxil tablets (Spectracef; TAP)	29 Aug 01; third generation cephalosporin for treatment of acute exacerbations of chronic bronchitis, pharyngitis, tonsillitis, and uncomplicated skin and skin structure infections	Added to the NMOP Formulary	**Quantity Limits** 10 days supply (40 tabs) per 30 days in NMOP and retail network **Rationale for Quantity Limits:** Spectracef is **only** indicated for acute therapy. Pivalate-containing compounds have caused clinical carnitine deficiency when used over a period of months. The effect of repeat short-term courses on carnitine levels is unknown. **Prior Authorization:** No	Not added to the BCF **Similar BCF Drugs:** Amoxicillin/ clavulanic acid oral; cephalexin oral (first generation cephalosporin)
Darbepoetin alfa for injection (Aranesp; Amgen)	17 Sep 01; erythropoietin analog for treating the anemia of chronic renal failure in dialysis and non-dialysis patients; administered every 1-2 weeks by IV or SQ injection	Added to the NMOP Formulary **Note**: Erythropoietin products (Epogen, Procrit) are currently on NMOP Covered Injectables List; darbepoetin alfa may be self-administered	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **Similar BCF Drugs:** none
Tramadol + acetaminophen tablets (Ultracet; Johnson & Johnson)	15 Aug 01; short-term (5 days or less) management of acute pain	Added to the NMOP Formulary **Note**: Although Ultracet is only indicated for short-term management of acute pain, both tramadol and acetaminophen are used on a longer-term basis; in addition, excluding the product from the NMOP Formulary would further delay therapy in the unlikely event that patients submit prescriptions for short-term therapy to the NMOP.	**Quantity Limits** 240 tablets per 30 days, 720 tablets per 90 days **Rationale for Quantity Limits:** Maximum daily quantity established by labeling as 8 tabs per day; consistent with existing quantity limits for tramadol **Prior Authorization** No	Not added to the BCF **Similar BCF Drugs:** multiple analgesics; tramadol is not on the BCF
Mixed salts of a single-entity amphetamine product, immediate/ delayed release (Adderall XR; Shire)	18 Oct 01; once daily treatment of attention deficit/hyperactivity disorder	Added to the NMOP Formulary	**Quantity Limits** NMOP: General rule for Schedule II controlled substances for treatment of ADHD applies (90 days supply; no refills) **Prior Authorization** No	Not added to the BCF **Similar BCF Drugs:** Methylphenidate oral (includes Concerta, but does not include Metadate CD)

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP and/or retail network formulary restrictions**	**BCF Status**
Ribavirin capsules (Rebetol; Schering-Plough)	26 July 01; anti-viral nucleoside analog capsules previously only available as a component of the combination product Rebetron, now available as a separate product indicated for combination use with interferon alfa 2b (Intron A) in chronic hepatitis C	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **Similar BCF Drugs:** none
Albuterol solution for inhalation - 0.63 mg/3 mL, 1.25 mg/3 mL (AccuNeb; Dey)	01 May 01; pre-mixed, pre-measured reduced dosages of albuterol inhalation solution for children with asthma aged 2-12	Already included on NMOP Formulary as new formulation of existing product	**Quantity Limits** 8 boxes of 25 per 30 days (200 unit doses); 22 boxes of 25 per 90 days (550 unit doses) **Rationale for Quantity Limits:** Consistent with existing quantity limits for nebulization solutions; sufficient to provide 6 treatments per day **Prior Authorization** No	Current BCF listing for albuterol solution for inhalation clarified to not include AccuNeb **Similar BCF Drugs:** albuterol solution for inhalation; albuterol oral inhaler
Comments about AccuNeb: The Council voted to exclude the new concentrations from the existing BCF listing for albuterol solution for inhalation because it seems doubtful that the incremental benefit will exceed the incremental cost. The Council also had concerns about the potential for medication errors (underdosing) if all MTFs are required to have all three strengths on their formularies. Council members noted that because the lower vital capacity of pediatric patients decreases total drug exposure, overdosing is not typically a problem with nebulized albuterol. If lower concentrations are desired, these may be easily attained with existing products.				
Amoxicillin/ Clavulanate Potassium Powder for Oral Suspension (Augmentin ES-600; Glaxo SmithKline)	22 Jun 01; Pediatric suspension of amoxicillin/clavulanate with double the previous concentration of amoxicillin, same clavulanate concentration; indicated for the treatment of pediatric patients with recurrent or persistent acute otitis media.	Already included on NMOP Formulary as new formulation of existing product	**Quantity Limits** General rule applies **Prior Authorization** No	Current BCF listing for amoxicillin/ clavulanic acid oral will include this new formulation **Similar BCF Drugs:** amoxicillin/ clavulanic acid oral
Comments about Augmentin ES-600: The Council noted that the cost per course of therapy with Augmentin ES-600 oral suspension appears to be comparable to giving standard concentration Augmentin plus an dose of amoxicillin suspension to provide the same amounts of amoxicillin and clavulanic acid. Other oral dosage forms with double concentrations of amoxicillin are already available and are also included in the BCF listing for amoxicillin clavulanic acid oral.				
Tenofovir disoproxil fumarate (Viread; Gilead Sciences)	26 Oct 01; in combination with other antiretroviral medications for the treatment of HIV infection	Already included on NMOP Formulary following precedent for HIV drugs. Confirmed by the Committee	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **Similar BCF Drugs:** None

APPENDIX B: COMBINED SUMMARY OF FORMULARY CHANGES FROM THE DOD P&T EXECUTIVE COUNCIL MEETING AND THE DOD P&T COMMITTEE MEETING

1. **BCF CHANGES**
   A. *Additions to the BCF*
      1) Tretinoin cream, 0.025% and 0.05% [excludes products only indicated for wrinkles (e.g., Renova)]
      2) Diazepam 5 mg oral tablets
      3) Clonazepam 0.5 mg oral tablets
   B. *Deletions from the BCF*
      1) Cromolyn sodium oral inhaler
      2) Cromolyn sodium solution for inhalation
      3) Haloperidol oral
   C. *Changes and clarifications to the BCF*
      1) The current BCF listing for albuterol solution for inhalation was clarified to exclude the 0.63-mg/3 mL and 1.25 mg/3 mL strengths (AccuNeb)
      2) The current BCF listing for amoxicillin/clavulanic acid oral will include Augmentin ES-600 oral suspension
2. **NMOP FORMULARY CHANGES**
   A. *Additions to the NMOP Formulary* (See Appendix A for details)
      1) Rabeprazole oral (interim decision effective 1 Oct 2001)
      2) Pantoprazole oral (interim decision effective 1 Oct 2001)
      3) Lansoprazole oral (as of 15 Nov 2001)
      4) Choriogonadotropin alfa (Ovidrel) for injection – added to NMOP Covered Injectables List
      5) Ceftidoren pivoxil tablets (Spectracef; TAP) – quantity limits apply, see below
      6) Darbepoetin alfa for injection (Aranesp; Amgen) – added to NMOP Covered Injectables List
      7) Tramadol/acetaminophen 37.5 / 325 mg tablets (Ultracet; Johnson & Johnson) – quantity limits apply, see below
      8) Mixed salts of a single-entity amphetamine product, immediate/delayed release (Adderall XR; Shire)
      9) Ribavirin capsules (Rebetol; Schering-Plough)
      10) Tenofovir disoproxil fumarate (Viread; Gilead Sciences)
   B. *Exclusions from the NMOP Formulary*
      1) Lansoprazole oral (interim decision effective 1 Oct 2001; lansoprazole was added to the NMOP Formulary as of 15 Nov 2001)
      2) Esomeprazole oral (interim decision effective 1 Oct 2001; esomeprazole remains excluded from NMOP Formulary)

C. Clarifications to the NMOP Formulary

1) Listing for somatropin (human growth hormone) on NMOP Covered Injectable List clarified to list all of the brand names for this product

3. **QUANTITY LIMIT CHANGES (NMOP AND RETAIL NETWORK)**

A. Quantity limit for cefditoren pivoxil tablets: 10 days supply (40 tablets) per 30 days in NMOP and retail network

B. Quantity limit for tramadol/acetaminophen 37.5/325 mg tablets: 240 tablets per 30 days; 720 tablets per 90 days

C. Albuterol solution for inhalation – 0.63 mg/3 mL, 1.25 mg/3 mL: 8 boxes of 25 per 30 days (200 unit doses); 22 boxes of 25 per 90 days (550 unit doses)

4. **CHANGES TO THE PRIOR AUTHORIZATION PROGRAM (NMOP AND RETAIL NETWORK)** – None

Department of Defense
Pharmacoeconomic Center

Fort Sam Houston, TX 78234-5081

MCCS-GPE **14 November 2001**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The DoD P&T Executive Council met from 0800 to 1600 hours on 14 November 2001 at the Uniformed Services University of the Health Sciences. The DoD P&T Executive Council is responsible for performing certain inherently governmental functions relevant to the DoD pharmacy benefits program. The Council focuses primarily on issues related to the Basic Core Formulary (BCF), national pharmaceutical contracts, and blanket purchase agreements. The DoD P&T Executive Council is comprised of federal employees who are members of the DoD P&T Committee.

2. MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL John R. Downs, MC	Air Force
COL Bill Sykora, MC	Air Force
LtCol (select) George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
COL Mike Heath, MS (representing MAJ Brett Kelly)	Army
COL Rosa Stith, MC	Army
LTC (P) Joel Schmidt, MC	Army
CAPT Chuck Bruner	Coast Guard
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
LTC Mike Kieffer, MS	Joint Readiness Clinical Advisory Board

MEMBERS ABSENT

Dick Rooney	Department of Veterans Affairs

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TMA
COL Ardis Meier, BSC	Air Force Pharmacy Consultant
CAPT Betsy Nolan, MSC	Navy Pharmacy Specialty Leader
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
LTC Deborah Bostock, MC	Air Force
CDR Denise Graham, MSC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
MAJ Maria Ionescu	Pharmacy Benefits Division, TMA
MAJ Barb Roach, MC (by teleconference)	DoD Pharmacoeconomic Center
Howard Altschwager	Deputy General Counsel, TMA
Dave Bretzke	DoD Pharmacoeconomic Center
Michael McGregory	Pharmacy Student, Butler University Pharm.D. Program
Shirif Mitry	Pharmacy Student, TMA
Shana Trice	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia

3. REVIEW MINUTES OF LAST MEETING / ADMINISTRATIVE ISSUES

The Council approved the minutes of the last meeting with two corrections:

- The reference to seborrheic keratoses on Page 15 of the Aug 01 DoD P&T Executive Council minutes was changed to actinic keratoses.
- The prescription data in Table 2 on Page 3 of the Aug 01 DoD P&T Executive Council minutes are incorrect. The corrected table is shown below:

Table 2: Prescription fills for COX-2 Inhibitors and Traditional NSAIDs in the MHS, July 2001

	MTF prescriptions	MCSC retail network prescriptions	NMOP prescriptions	Total
COX-2 inhibitors	45,201 (15%)	40,106 (59%)	12,824 (74%)	98,131 (26%)
Traditional NSAIDs	252,134 (85%)	27,857 (41%)	4,480 (26%)	284,471 (74%)
Total	297,335	67,963	17,304	382,602

.

4. ADVANCES IN MEDICAL PRACTICE (AMP) PROGRAM

According to prime vendor data, Military Treatment Facilities (MTFs) spent $46.5 million on AMP drugs in FY 2001. Prime vendor data are incomplete for 44 MTFs in the second half of FY 01, so MTFs actually spent more than $46.5 million on AMP drugs during FY 01.

5. SUBCOMMITTEE REPORT: OBTAINING INPUT FROM PROVIDERS

COL Downs reported how the VA uses the Medical Advisory Panel (MAP) and the regionally based formulary management process in the 22 Veterans Integrated Service Networks (VISNs) to systematically obtain input from providers on formulary and contracting issues. The Council noted that most TRICARE regions have not established a regional formulary management process. LCDR Briski reported a lack of consensus among pharmacy officers regarding methods to obtain prescriber input. Some pharmacy officers favor communicating through lead agents, while others favor military service lines of communication.

LtCol (select) George Jones noted that actions of the DoD P&T Committee are a standing agenda item for his local P&T committee, which prompts input and communication. He suggested that MTF P&T Committees should routinely include DoD P&T Committee actions on their meeting agendas. He also noted that the PEC website provides access to DoD P&T Committee documents. (The PEC website is available at www.pec.ha.osd.mil.)

The Council decided to obtain prescriber input primarily by having the PEC communicate with the chairs of MTF and/or regional P&T committees and MTF pharmacy chiefs. The Council did not reach a definitive conclusion regarding the process that will be used to accomplish this type of communication. However, there was support voiced for including lead agent pharmacists and medical directors as integral parts of the process. The PEC agreed to present various process options at the next meeting.

6. NATIONAL PHARMACEUTICAL CONTRACTS AND BLANKET PURCHASE AGREEMENTS (BPAs)

A. *Contract awards, renewals, and terminations*

- As of November 2001, 54 joint VA/DoD and 3 DoD-only contracts for drugs or pharmaceutical supplies are in effect. A joint VA/DoD returned goods contract is also in effect. Information on national pharmaceutical contracts, including NDC numbers and prices, is available on the DSCP website (www.dmmonline.com).
- Contracts for terazosin, acyclovir, hydroxyurea, pentoxifylline, rifampin, sucralfate, nortriptyline, prazosin, diltiazem XR, ranitidine, insulin, verapamil, and albuterol inhalers were renewed.
- The cimetidine contract was extended until May 02.
- Contracts for cerivastatin, amoxicillin, azathioprine, and omeprazole were cancelled.
- New contracts were awarded for cyclobenzaprine tablets, isosorbide dinitrate tablets, loperamide capsules, methocarbamol tablets, verapamil immediate release tablets, and lactulose syrup.

B. *Financial impact of contracts* – COL Remund reported on the percent reduction in cost per unit for drugs covered by national pharmaceutical contracts (see Table 1).

Table 1: Percent Reduction in Cost per Unit for Drugs Covered by National Pharmaceutical Contracts*

Drug/Drug Class	% Reduction
Diltiazem extended release	48%
Lisinopril	45%
PPIs	36%
Non-sedating antihistamines	36%
Statins	31%
All contracts	33%

*From start dates of contracts to 30 Sep 2001

C. *Status of Contracting Initiative for Leutinizing Hormone Releasing Hormone (LHRH) agonists* – CAPT Torkildson reported that the joint VA/DoD contracting action to select a LHRH agonist for the Basic Core Formulary (BCF) (for the treatment of prostate cancer only) is awaiting completion of updates to the VA clinical review. The VA extended its contract for Zoladex until early 2002 in preparation for a joint VA/DoD contracting initiative. The DoD Blanket Purchase Agreements (BPAs) for Lupron and Zoladex remain in place. The BPA for Zoladex has been modified since the last meeting to remove the market share requirement and to extend the expiration date of the BPA until 30 April 2002. The Lupron BPA has also been modified to maintain the current price until 30 April 2002.

D. *Non-sedating antihistamine contract* – The market share for fexofenadine (as a percent of all prescriptions for non-sedating antihistamines dispensed at MTF pharmacies) increased from 50% prior to the contract to approximately 89% by the end of October 2001. The prescription market shares for fexofenadine and loratadine continue to remain stable in the retail pharmacy networks and the National Mail Order Pharmacy (NMOP), indicating that MTFs are maximizing the use of fexofenadine without shifting loratadine prescriptions into the retail pharmacy network or NMOP. The average cost per non-sedating antihistamine tablet/capsule purchased by MTFs dropped by 36%, from $0.87 (pre-contract) to $0.56 (as of Sep 2001).

E. *Statin Contract* – The Council considered two options regarding the renewal of the simvastatin contract:

Option 1: Renew the simvastatin contract for the final option year (February 2002 to February 2003). The statin class remains "closed" on the BCF. Simvastatin is the only statin on MTF and NMOP formularies.

Option 2: Do not renew the simvastatin contract. The statin class would be "open" on the BCF. MTFs may have additional statins on formulary. DoD P&T Committee decides which statins are on the NMOP formulary.

The Council assessed the relative safety/tolerability of statins; effectiveness in reducing LDL-cholesterol; evidence of effect on cardiovascular morbidity and mortality; ability of simvastatin to meet the clinical needs of the DoD beneficiary population; current statin

costs; likelihood of future price reductions for simvastatin, input from providers; and potential collaboration with the VA on the statin class in the future.

The Council concluded that:

- Simvastatin has a well-established safety and tolerability profile.
- Simvastatin is proven to reduce cardiovascular morbidity and mortality.
- Simvastatin is currently used by > 95% of statin patients at MTFs.
- Non-contracted statins can be provided through the special order process for patients who need them.
- Simvastatin is more cost-effective than other statins in treating patients to LDL goal.
- The cost per dose of statin therapy has decreased by 31% at MTF pharmacies in the first two years of the statin contract. Additional reductions in the cost per dose are more likely to occur if the contract is renewed than if it is not renewed.
- The VA strategy for managing statins is linked to renewal of the DoD statin contract.
- Contract renewal will facilitate joint management of statins by DoD and VA.

The Council decided to advise DSCP to renew the contract for simvastatin.

F. *Status of contracting initiative for nasal corticosteroid inhalers* –The Council reviewed an updated analysis of aqueous nasal corticosteroid dosing frequency and input from providers to assess whether or not flunisolide should be included in a solicitation for a closed class contract.

- An analysis of MTF prescription data from Jun 00 to May 01 showed the following percentages of patients who were treated with a single daily dose of an aqueous nasal corticosteroid:

fluticasone	93.7%
mometasone	93.7%
beclomethasone 84mcg	91.9%
triamcinolone	85.5%
budesonide	60.0%
flunisolide	27.2%

- DoD providers report a higher rate of burning and stinging with flunisolide than with other nasal corticosteroid products.

The Council concluded that flunisolide should not be included in the solicitation because it is dosed more than once daily much more frequently than other products and because providers have reported tolerability problems. The Council concluded that budesonide should not be included in the solicitation because it is dosed more than once daily much more frequently than other products. The Council also recommended that:

- The contract should not apply to use of aqueous nasal steroids in patients under 6 years of age. While it is not known whether the nasal corticosteroids differ significantly in their potential to affect the growth and development of pediatric patients, the Council prefers to allow MTFs to select an alternate agent for this patient

population if they so desire. The PEC estimates that less than 4% of all aqueous nasal steroid inhaler prescriptions are for patients who are under 6 years of age, so exclusion of this patient population will not have a negative impact on the contract.

- The contract should specify that all new patient starts must use the contracted agent, but should not dictate that existing patients be switched to the contracted agent.

The Council reiterated its support for a joint VA/DoD solicitation if agreement can be reached on the products that are included in the solicitation. If agreement cannot be reached, the Council recommends that DoD pursue its own contract.

G. *Potential contracting initiative for carbamazepine* – Multiple AB-rated generic products are available for commonly used strengths of carbamazepine. MTF usage of carbamazepine has declined about 20% over the past two years to a current usage rate of 700,000 tablets/month. MTFs spent about $1.5 million on carbamazepine during FY 01 ($1.4 million for the brand name product (Tegretol) and $0.1 million for generic products). The average cost is currently $0.22/tablet for Tegretol and $0.05/tablet for generic carbamazepine.

Generic versions of carbamazepine currently account for about 20% of total carbamazepine usage at MTFs (up from 5% two years ago). In light of the large cost difference between the brand and generic versions of carbamazepine, the Council asked the PEC to investigate why the usage of the brand name drug continues to predominate at MTFs.

H. *Potential contracting initiative for triptans* – In the absence of information that negates concerns about variability in patient response, the Council is unwilling to support a closed class contract for a single oral triptan. The Council asked the PEC to continue to explore potential contracting initiatives for this drug class.

I. *Potential contracting initiative for angiotensin receptor blockers (ARBs)* – MTF utilization and expenditures for the ARBs are rising, and clinical information concerning these agents is evolving. The PEC is collaborating with the VA Pharmacy Benefits Management Strategic Healthcare Group (VA PBM) on a class review of the ARBs. The Council asked the PEC to continue to work with the VA to complete the class review and explore the feasibility of contracting initiatives in this drug class.

J. *Contracting initiative for fluoroquinolones* – Independent class reviews completed by the VA PBM and the PEC concluded that gatifloxacin (Tequin) and levofloxacin (Levaquin) offer advantages over the other fluoroquinolones in safety and tolerability (side effect and drug interaction profiles), expanded gram-positive spectrum of activity, and once daily dosing. Both reviews concluded that levofloxacin and gatifloxacin are the only two fluoroquinolones that are therapeutically interchangeable and clinically acceptable as a "workhorse" oral fluoroquinolone. Levofloxacin is currently on the BCF in accordance with a BPA.

Ciprofloxacin is dosed twice daily, has poor coverage for *S. pneumoniae*, and has several clinically significant drug interactions. The Council concluded that ciprofloxacin is not therapeutically interchangeable with gatifloxacin or levofloxacin. The Council noted that

ciprofloxacin is the only fluoroquinolone currently approved for post-exposure prophylaxis of anthrax, but the proposed contract initiative would not affect the availability of usage of ciprofloxacin for anthrax exposures.

The DoD P&T Executive Council agreed to support a contracting initiative to choose a workhorse oral fluoroquinolone for the BCF.

7. MTF REQUESTS FOR BCF CHANGES

A. *Request to remove cromolyn sodium oral inhaler and solution for inhalation from the BCF* –An Army pharmacist provided the following rationale for the request:

> Cromolyn is relatively infrequently used in clinical practice. Cromolyn is a weak anti-inflammatory agent and is rarely prescribed. Inhaled steroids are used almost exclusively for this indication and are now acceptable in patients <2years of age with use of a spacer mask.

The mast cell stabilizers (cromolyn and nedocromil) produce only minor side effects (nasal congestion, cough, sneezing, dry throat). Nedocromil has an unpleasant taste. Mild-persistent asthma can be controlled with cromolyn in approximately 60 to 75% of patients, but 4 to 6 weeks of usage four times a day may be needed to attain maximum benefit. The mast cell stabilizers are not as effective as the inhaled corticosteroids, which are the agents of choice for long-term control of persistent asthma.

The PEC requested provider input on this issue and received 129 responses: 70 favoring removal from the BCF; 42 against removal from the BCF; 13 unsure; and 4 wanted to remove the MDI, but keep the nebulizer solution. Providers made several key points:

- Keeping cromolyn on the BCF may promote less effective, outdated therapy. Removing it from the BCF may encourage providers to more appropriately treat persistent asthma with inhaled corticosteroids.
- Despite parental concerns, studies reporting growth reduction with inhaled corticosteroids do not offer sufficient justification for avoiding the use of inhaled corticosteroids in children with asthma.
- Data suggest that delays in initiating maintenance therapy with inhaled corticosteroids result in less recovery of lung function in children with asthma.
- The best evidence for use of cromolyn is for people whose asthma symptoms are solely induced by exercise and who do not tolerate a long-acting beta agonist like salmeterol.

Prescriptions for cromolyn MDIs at MTFs declined by 52% over the past year, from 3265 prescriptions in Sep 2000 to 1562 prescriptions in Sep 2001. Prescriptions for cromolyn nebulizer solution declined by 55%, from 957 Rxs in Sep 2000 to 434 in Sep 2001.

The Council removed cromolyn sodium oral inhaler and solution for inhalation from the BCF. MTFs can decide whether or not to keep either or both products on their local formularies.

B. *Request to remove oral haloperidol from the BCF* – An Army pharmacist based this request on the relatively infrequent usage of haloperidol at his MTF.

Haloperidol is a potent antipsychotic with a high propensity to cause adverse effects. MTFs currently fill about 500 haloperidol prescriptions per month. Newer agents such as risperidone, olanzapine, and quetiapine are used more frequently than haloperidol. Primary care providers in the outpatient setting do not commonly prescribe antipsychotics. The Council removed oral haloperidol from the BCF. MTFs can decide whether or not to keep oral haloperidol on their local formularies.

C. *Request to add a no to extremely low androgen oral contraceptive to the BCF* – An Army pharmacist originally requested the addition of Desogen, a monophasic oral contraceptive (OCP) to the BCF. The request was subsequently clarified to be for the addition of a "3rd generation" monophasic OCP classified as having no to low androgenic side effects and 35 mcg of ethinyl estradiol. These OCPs contain the progestin desogestrel (Desogen, Ortho-Cept, Apri) or norgestimate (Ortho-Cyclen).

The purported advantages of OCPs with no to low androgenic effects are lower incidences of weight gain, edema, bloating hirsutism and acne. MAJ Barb Roach reported that she could not find empirical evidence that OCPs differ significantly in androgenic side effects. Head-to-head trials are not available. Most reviewers acknowledge that there is no evidence of significant differences in side effects or efficacy for any of the OCPs, regardless of the progestin contained in the pill or their classification as mono-, bi-, tri-, or estro-phasic products. However, the same reviewers then go on to discuss differences in androgenic side effects with different progestins (apparently based primarily on *in vitro* characteristics of the progestins). A number of providers commented on the propensity for misconception in this therapeutic category.

All OCPs are associated with an increased risk of venous thromboembolism. Some studies suggest an increased potential for venous thromboembolism with the 3rd generation OCPs compared to other OCPs, but the evidence is inconclusive.

The 3rd generation OCPs cost from $10.20 to $15.28 per cycle—much more than most other OCPs. The Council decided not to add a 3rd generation OCP to the BCF because there is insufficient evidence that an incremental clinical benefit exists that would justify the incremental cost.

8. FORMULARY STATUS OF TRETINOIN

Tretinoin cream is indicated for the treatment of acne, and is also commonly used for the treatment of various skin cancers, precancerous conditions (e.g., actinic keratoses), and other dermatological conditions. Tretinoin products are also used for cosmetic treatment of photoaged skin (wrinkles and liver spots). One brand of tretinoin cream, Renova, is specifically indicated for mitigation of fine wrinkles, mottled hyperpigmentation and tactile skin roughness in patients who use comprehensive skin care and sunlight avoidance programs.

Topical retinoids are first line agents for acne. More than 95% of MTFs already have tretinoin cream on formulary. The Council decided to add tretinoin cream 0.025% and 0.05% to the BCF, but excluded products specifically indicated for wrinkles only (e.g., Renova). The Council noted that MTFs may adopt guidelines or retain existing guidelines designed to prevent usage of tretinoin products for cosmetic treatment of photoaged skin.

The NMOP statement of work does not allow tretinoin prescriptions to be filled for patients over the age of 35. The rule exists only in the NMOP statement of work—not in the Code of Federal Regulations or TRICARE policy. PDTS data show that tretinoin prescriptions are routinely filled in MTF and retail pharmacies for patients over the age of 35. The Council considered a proposal to remove the NMOP age restriction so that tretinoin would be more uniformly available to patients across all points of service. Some attendees expressed concern about taking an action that would require modification of the NMOP contract. After extensive discussion, the vote to remove the NMOP age restriction on tretinoin ended in a tie. The age restrictions on tretinoin remain in the NMOP. .

9. REVIEW OF ANXIOLYTICS FOR THE BCF

CAPT Torkildson reported on the PEC review of drugs for the treatment of anxiety disorders: generalized anxiety disorder (GAD), panic disorder/agoraphobia, acute/post-traumatic stress disorder (PTSD), obsessive-compulsive disorder (OCD), specific phobia, and social phobia. These six conditions share a common dimension of poor response to stress leading to frequent and intense episodes of negative affect. This dimension is shared with depressive disorders, and is primarily responsible for the observed comorbidity among the anxiety disorders and between these disorders and depression. Each disorder also contains a unique component that distinguishes it from the others, with the possible exception of GAD.

Pharmacotherapy for anxiety disorders includes serotonin reuptake inhibitors [selective serotonin reuptake inhibitors (SSRIs) and venlafaxine]; benzodiazepines; buspirone; tricyclic antidepressants (TCAs); imipramine; clomipramine; trazodone; and nefazodone. Of these, buspirone, imipramine, trazodone, and four SSRIs are on the BCF.

Serotonin Reuptake Inhibitors – This classification includes the SSRIs and venlafaxine. There is growing support for using this group of drugs as first line therapy for many of the anxiety disorders. SSRIs are now considered the treatment of choice for panic disorder and post-traumatic stress disorder, and as first choice in conjunction with psychotherapy for OCD, specific phobia, and social phobia. Usage of SSRIs for treatment of GAD is increasing. Despite differences in FDA-approved indications, the SSRIs appear similar in safety and efficacy for these conditions. There are already four SSRIs (citalopram, fluoxetine, paroxetine, sertraline) on the BCF.

Venlafaxine inhibits both serotonin and norepinephrine reuptake (similar to TCAs). It was approved by the FDA for depression in 1993, and for GAD in 1999. It has been shown to be effective for GAD with and without coexisting depression. Venlafaxine appears to have a rapid onset of action with a safety profile similar to the SSRIs. Venlafaxine appears to be less costly on a cost per day basis than fluoxetine, paroxetine, or sertraline. It is currently on approximately 88% of MTF formularies, but it is not on the BCF.

The Council decided not to change the SSRIs on the BCF, but instructed the PEC to investigate the potential for addition of venlafaxine extended-release to the BCF as a cost-effective alternative to the SSRIs for the treatment of anxiety disorders.

Benzodiazepines – Benzodiazepines are effective in treating anxiety disorders, including GAD, panic disorder, and social anxiety disorder. The long-term use of benzodiazepines for anxiety disorders is controversial. All benzodiazepines share a risk of sedation, motor vehicle accidents, industrial accidents, and dependence. Rebound anxiety occurs in approximately 15% of patients upon discontinuation. The benzodiazepines are Pregnancy Category D due to the risk of cleft lip/palate. There are currently no benzodiazepines on the BCF.

All benzodiazepines used for treatment of anxiety disorders are available as generics. All strengths of these benzodiazepines are available for less than $0.10 per tablet or capsule. As Schedule IV medications, the administrative burden associated with stocking and record keeping must be considered in adding any of them to the BCF.

Psychiatrists identified clonazepam as a drug that should be considered for the BCF because of a lower abuse potential and more utility in other conditions (e.g., some seizure disorders). Almost all MTFs (99%) are filling prescriptions for the 0.5 mg strength of clonazepam. Some MTFs appear to carry only the 0.5 mg strength.

According to the PEC Formulary database, 100% of facilities have diazepam on their local formulary. About 97% of prescriptions for oral diazepam tablets are for the 5 mg strength.

The Council decided to add clonazepam 0.5 mg and diazepam 5 mg to the BCF. MTFs may have other strengths or formulations of these medications on their formularies.

Buspirone – The utility of buspirone is limited primarily to treatment of GAD. Buspirone has a superior safety profile compared to the benzodiazepines, but a significantly slower onset of action. Many think buspirone is less efficacious than other agents, but under-dosing might be the problem. Buspirone is already on the BCF and MTF pharmacies dispensed nearly 6 million tablets in the first 9 months of FY 01. The Council agreed that buspirone should remain on the BCF.

Tricyclic Antidepressants – Imipramine is useful primarily in GAD. Clomipramine is used to treat OCD. The usefulness of these agents is limited by their side effect profile and potential for accidental or deliberate overdose. SSRIs are equally efficacious, safer, and much better tolerated. Imipramine is already on the BCF. There is no provider support for the addition of clomipramine. The Council made no changes in this drug class.

Trazodone – Trazodone is a heterocyclic antidepressant. Anxiolytic use has been confined primarily to GAD. Although trazodone has no significant safety, tolerability, or efficacy advantages over other active agents, it is relatively inexpensive. Trazodone also has some utility in treating insomnia resulting from SSRI therapy. Trazodone is already on the BCF. The Council made no change to the formulary status of trazodone.

Nefazodone – Nefazodone is an antidepressant with a unique mechanism of action. It was FDA-approved in 1994 for treatment of depression, but is used off-label to treat panic disorder, PTSD, and social phobia. The major advantage of nefazodone is its somewhat superior safety profile, but the daily cost per day of therapy is $1.06 to $3.18. Nefazodone is not on the BCF. Providers expressed no interest in the addition of nefazodone to the BCF and usage in the Military Health System (MHS) is relatively low. The Council made no change in the formulary status of nefazodone.

10. EVALUATION OF THE CLOPIDOGREL IN UNSTABLE ANGINA TO PREVENT RECURRENT EVENTS (CURE) TRIAL

The CURE trial randomized approximately 12,500 patients (500 patients in the U.S. arm) with unstable angina and non-ST-segment elevation myocardial infarction (MI) presenting within 24 hours of symptom onset to clopidogrel (300 mg load, followed by 75 mg daily, plus aspirin in doses ranging from 75 to 325 mg daily) or aspirin plus placebo. Patients were treated for 3 to 12 months (average of 9 months).

The primary composite outcome of non-fatal MI, stroke, or death due to cardiovascular causes occurred in 9.3% of patients receiving clopidogrel plus aspirin compared to 11.4% of patients receiving aspirin plus placebo. This equates to a relative risk of 0.80 (95% CI 0.72-0.90, $p<0.001$), or a 20% relative risk reduction. The absolute risk reduction was 2.1%, which yields a number needed to treat of 47. The addition of clopidogrel to aspirin appeared to provide both an early (within 2 hours) and sustained benefit.

If 100 patients analogous to those obtaining benefit in the CURE trial were treated for a 9 month period with clopidogrel plus aspirin and a similar group of 100 patients were treated with aspirin only, drug costs for the clopidogrel plus aspirin group would be about $50,220 ($1.86 per patient per day) compared to about $270 ($0.01 per patient per day) for the aspirin only group. Given outcomes of the CURE trial, 9 patients (9.3%) in the clopidogrel plus aspirin group and 11 (11.4%) in the aspirin only group would be expected to experience the primary outcome of non-fatal MI, stroke, or death. Dividing the incremental cost of clopidogrel therapy ($50,220 - $270) by the number of averted events (2) results in an incremental cost of $25,000 per averted event.

The increased risk of bleeding in the clopidogrel plus aspirin group must also be considered. During the CURE trial, a significantly higher percentage of patients receiving clopidogrel plus aspirin experienced major bleeding compared to those receiving aspirin plus placebo (3.7% vs 2.7%, $p = 0.001$), a number needed to harm of 100. Thus, for every 100 patients treated with clopidogrel plus aspirin, one additional patient would be expected to have a major bleed compared to 100 patients receiving aspirin alone (or one major bleed per two events averted). Combination therapy also resulted in a significantly higher percentage of patients experiencing non-life threatening bleeding, minor bleeding, and bleeding requiring transfusion of $\geq$ 2 units of blood. The percentage of fatal bleeding episodes was 2.2% for clopidogrel plus aspirin compared to 1.8% with aspirin plus placebo (a statistically non-significant difference).

The definitions used in the CURE trial for the various types of bleeding differ from widely accepted definitions used in the ACCP Consensus Conference on Antithrombotic Therapy guidelines published each year in CHEST (the “CHEST guidelines”) and the “Thrombolysis in Myocardial Infarction” (TIMI) trials. The variance in bleeding definitions raises the

concern that the risk of bleeding among patients receiving clopidogrel plus aspirin may have been even larger if the bleeding definitions in the CHEST guidelines and TIMI trials had been used.

The Council decided not to add clopidogrel to the BCF. The Council asked the PEC to request additional information from the manufacturer about the incidence of bleeding found in the CURE trial—ideally information about the bleeding rates using the definitions found in the CHEST guidelines and TIMI trials.

11. PROTON PUMP INHIBITORS

COL Remund reported on a significant shift in proton pump inhibitor (PPI) prescription market shares after omeprazole (Prilosec) was removed and rabeprazole (Aciphex) was added to the BCF on 1 October 2001. By the first week in November, rabeprazole accounted for 54% of MTF PPI prescription fills. The rapid switch to rabeprazole by MTF pharmacies essentially negated the effect of the huge increase in the price of omeprazole. The weighted average cost per unit for PPIs increased significantly during the first part of October, but trended back down to $1.08 per unit by the first week in November (just under the $1.09 cost per unit that existed prior to termination of the omeprazole contract).

12. COX-2 INHIBITORS

MTF prescription fills and expenditures for the COX-2 selective inhibitors (celecoxib and rofecoxib) leveled off over the past six months. Council members speculated that uncertainty about cardiovascular safety and the ability of these agents to significantly reduce the risk of GI events (especially in patients taking aspirin for cardiac prophylaxis) may have played a role.

13. ADJOURNMENT

The meeting adjourned at 1600 hours on 14 Nov 2001. The next meeting will be held at the Non-Commissioned Officers Club, Fort Sam Houston, TX starting at 0800 on 12 Feb 2002. All agenda items should be submitted to the co-chairs no later than 11 Jan 2002.

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T committee convened at 0800 hours on 16 August 2001, at the Non-Commissioned Officers Club, Ft. Sam Houston, TX.

2. MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL John R. Downs, MC	Air Force
LtCol (select) George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
LTC (P) Joel Schmidt, MC	Army
MAJ Brett Kelly, MS	Army
CAPT Robert Rist	Coast Guard
LTC Mike Kieffer, MS	Joint Readiness Clinical Advisory Board
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia (DSCP)
William Hudson	Humana, Inc
Gene Lakey	TriWest
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)

MEMBERS ABSENT

COL Rosa Stith, MC	Army
Dick Rooney	Department of Veterans Affairs
Ray Nan Berry	Health Net Federal Services
Ron McDonald	Sierra Military Health Services

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TMA
COL Mike Heath, MS	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
LtCol Gary Blamire, MSC	Lead Agent Office, Region 6
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
LTC Doreen Lounsbery, MC	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, BSC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
MAJ Barbara Roach, MC	DoD Pharmacoeconomic Center
Capt Andrew Meadows, BSC	Baylor University Resident
SFC Augustin Serrano	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
David Bretzke	DoD Pharmacoeconomic Center
David Chicoine	Uniformed Services Family Health Plan
Eugene Moore	DoD Pharmacoeconomic Center
Mark Petruzzi	Merck-Medco
Carol Scott	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia
Gina Wu	Merck-Medco

3. **REVIEW MINUTES OF LAST MEETING / ADMINISTRATIVE ISSUES** – The minutes from the last meeting erroneously listed Shannon Rogers as an employee of Merck-Medco. Ms. Rogers is an employee of Humana.

4. **UNIFORM FORMULARY**– COL Davies reported that a draft of the Uniform Formulary regulation is being staffed in TMA.

5. BCF AND NATIONAL MAIL ORDER PHARMACY (NMOP) FORMULARY ISSUES – The Committee determined the NMOP formulary status, NMOP or retail network formulary restrictions (quantity limits or prior authorization), and Basic Core Formulary (BCF) status for the 6 new drugs listed below. See Appendix A for more information.

- Almotriptan 6.25- and 12.5-mg tablets (Axert; Pharmacia & Upjohn)
- Drospirenone 0.3 mg / ethinyl estradiol 30 mcg tablets (Yasmin; Berlex);
- Desogestrel/ethinyl estradiol tablet (Cyclessa; Organon)
- Valganciclovir tablets (Valcyte; Syntex)
- Albuterol sulfate 3 mg and ipratropium bromide 0.5 mg per 3 mL (DuoNeb Solution for Inhalation; Dey Labs)
- Insulin aspart injection (NovoLog; Novo Nordisk)

6. USAGE PATTERNS OF DRUGS FORMERLY ON NMOP PREFERRED DRUG PROGRAM – On 1 April 2001, Merck-Medco (the NMOP contractor) ceased making calls to physicians concerning all non-preferred/preferred drug pairs in the NMOP Preferred Drug Program except diltiazem. The committee was interested in seeing how discontinuation of the preferred drug program affected usage patterns of these drugs. Oxybutynin immediate release and Adalat CC experienced the largest drop in market share versus the non-preferred products. The market share changes for ranitidine, acyclovir, and generic NSAIDs were much smaller. Except for the antiviral drugs (acyclovir, famciclovir, valacyclovir), all the products experienced sharp increases in prescription volume because of the implementation of the TRICARE Senior Pharmacy Program.

7. PRIOR AUTHORIZATIONS

A. *Temporary lapse in the NMOP Prior Authorization Program* – Prior authorizations in the NMOP were temporarily suspended in April and early May due to sharp increases in workload associated with the expansion of the pharmacy benefit to all beneficiaries over 65 years of age. Table 1 shows when specific PAs were "turned off" in the NMOP. Initial implementation of the PA for ciclopirox topical solution (Penlac) was delayed to 10 May 2001.

Table 1: Temporary suspension of NMOP PAs due to the Apr 01 benefit change

Drug	"Turned off"	"Turned back on"
Antifungals for onychomycosis [itraconazole (Sporanox), terbinafine (Lamisil)]	10 April 01	1 May 01
Antifungals for onychomycosis [(ciclopirox top solution (Penlac)]	NA	10 May 01
COX-2 inhibitors [celecoxib (Celebrex), rofecoxib (Vioxx)]	14 April 01	30 April 01
Etanercept (Enbrel)	14 April 01	30 April 01
Sildenafil (Viagra)	10 April 01	10 May 01

B. *Cost avoidance from NMOP prior authorizations (PAs)* – Shana Trice (PEC) reported that cost avoidance analyses were not completed for this quarter due to the temporary suspension of the NMOP PA Program. Merck-Medco is now supplying data that identifies new and refill prescriptions, which should improve the accuracy of cost avoidance analyses.

C. *Utilization of the NMOP and retail network pharmacies for drugs subject to PA* – An analysis of the potential shift of patients with prescriptions for COX-2 inhibitors from the NMOP to the retail network is underway, using data from PDTS.

D. *Revision of NMOP PA forms* – Changes to clinical rationale language for the COX-2 inhibitors were delayed by the temporary suspension of the NMOP PA program. Further discussion with Merck-Medco is required to incorporate clinical rationale language for this drug class into the fax forms used by Merck-Medco. Changes to clinical rationale language for the antifungals for onychomycosis to reflect safety announcements by the Food and Drug Administration (FDA) concerning terbinafine and itraconazole are in progress.

E. *Status of the PA for sildenafil (Viagra) in the NMOP and retail network* – MAJ Bellemin commented that the sildenafil PA is responsible for the most patient complaints of all PAs in the NMOP. He suggested that quantity limits already in effect (6 tabs per 30 days for the retail network; 18 tabs per 90 days for the NMOP) might be sufficient to control over-utilization without a PA. The PA for sildenafil was established by a Health Affairs policy, so the PA cannot be discontinued unless the policy is changed. Other drugs similar to sildenafil may be on the market soon, which may provide an impetus to change the sildenafil policy. .

COL Davies commented that the information in the current sildenafil PA regarding drug interactions and contraindications has a questionable impact on prescribing, since the second most frequently reported potential drug-drug interaction in PDTS is concomitant sildenafil and nitrate use. The committee agreed that the potential impact of removing the PA for sildenafil should be assessed more completely before recommending any policy changes to Health Affairs. Bill Hudson (Humana) will present data from the MCSCs and MAJ Bellemin will present data from the NMOP at the next meeting for assessment of the potential impact of removing the sildenafil PA.

8. **RATIONALE FOR QUANTITY LIMITS** – COL Remund reported that the PEC will add to its website an explanation of the rationale for placing quantity limits on certain drugs.

9. **PROPOSED QUANTITY LIMITS FOR OXYCONTIN** – Bill Hudson (Humana) proposed a 120 tablet per 30 days quantity limit for oxycodone extended release (Oxycontin) for the NMOP and retail network due to increasing abuse and misuse of this product.

Some committee members stated that the quantity limit would adversely affect patients who have a legitimate need for large quantities of Oxycontin, and may have little or no impact on patients who are abusing or diverting it. Person who are abusing or diverting Oxycontin will more likely submit prescriptions to multiple pharmacies than a single prescription for a large quantity. Pharmacists can use the information in patient profiles and the advisory messages provided by PDTS to identify these patients. A quantity limit on Oxycontin may set a precedent for limits on other pain medications, which would be inconsistent with the movement toward more adequate treatment of pain. The committee voted against the proposed quantity limit.

10. **REVIEW OF INJECTABLE MEDICATIONS AVAILABLE THROUGH THE NMOP** – The PEC review of the NMOP Covered Injectables list identified goserelin (Zoladex) and leuprolide (Lupron) depot as items that are not labeled for self-administration or commonly used in an outpatient setting. During the 4-month period from Mar – Jun 2001, 15 patients received prescriptions for Zoladex and 63 patients received prescriptions for Lupron Depot from the NMOP.

Lupron is available in both subcutaneous and depot dosage forms and is indicated for a variety of disease states. The subcutaneous form is commonly administered in the home setting. Lupron Depot is an intramuscular injection and is not designed for self-administration, but several facilities have programs that teach caregivers to give IM dosage forms such as Lupron Depot at home (e.g., monthly injections for precocious puberty). The committee decided that both the subcutaneous and depot formulations of Lupron should remain on the NMOP Covered Injectables List.

Goserelin (Zoladex) is an implant that requires insertion under sterile conditions and is not routinely administered outside of a hospital or clinic. The assumption is that virtually all Zoladex prescriptions are taken to physician offices or clinics for administration. The committee's understanding is that TRICARE regulations and policies do not specifically prohibit patients from getting prescriptions filled at the NMOP or retail pharmacies for subsequent administration in a physician office or clinic. The committee decided that Zoladex should remain on the NMOP Covered Injectables List.

The committee then discussed numerous issues pertaining to patients obtaining injectable products from the NMOP or retail pharmacies for subsequent administration in provider offices or clinics:

- Safety concerns about patients transporting hazardous products such as cytotoxic agents
- Quality control concerns about products that are sensitive to heat or moisture
- Payment of unnecessary copays by patients if the injectable product should have been provided as part of the physician office visit
- Payment of excess costs by the government if the expense of the injectable product should have been covered as part of the payment for the office visit
- Coverage for drugs administered in provider offices under Medicare Part B for some patients
- The fact that some providers might not stock certain injectables in their offices, making it necessary for the patient to obtain these products from the NMOP or a retail pharmacy
- The need to allow for medical necessity overrides of any general policy concerning injectable medications. For example, some injectable drugs have clinically accepted uses via non-injectable routes of administration (e.g., colistin vials used for home nebulization).

COL Davies requested that the DoD P&T Committee provide a recommendation to TMA concerning any needed policy interpretations or policy changes. A subcommittee was appointed to work on this issue. Subcommittee members are: LtCol (select) George Jones (chair), LTC (P) Joel Schmidt, MAJ Brett Kelly, MAJ Mickey Bellemin, and Bill Hudson. LTC DeGroff will provide data from the Pharmacy Data Transaction Service to the workgroup. COL Remund noted that the data needs go beyond what PDTS could provide, since the workgroup also needed to know what drugs patients were having difficulty getting. MAJ Bellemin said that the NMOP had a list of complaints, while COL Davies can supply information from congressional complaints to TMA and some of the MCSCs have records of prescription denials.

11. CONTROLLED DISTRIBUTION OF DOFETILIDE (TIKOSYN) – Because of specialized educational requirements mandated by the FDA, dofetilide is only available for outpatient use through Stadtlander's Pharmacy/CVS Procare (which is a non-network pharmacy for DoD beneficiaries). LTC DeGroff reported that a centralized policy and procedure is being worked out with Pfizer so that DoD patients are not forced to pay the copay for a non-network pharmacy. Under the procedure, all prescriptions outside the MTF would still go through Stadtlander's/CVS Procare, but would be paid through a central billing mechanism. The patient would pay only the copay, with the rest billed to a central account at FSS pricing, and the drug would be mailed from Stadtlander's/CVS Procare to the patient. COL De Groff estimated that about 220 patients in DoD might use this process. Clinical reviews for dofetilide, which has multiple drug-drug interactions, are being done out of the PDTS database.

12. ADJOURNMENT – The meeting adjourned at 1200 hours. The next meeting will be held at 0800 on 15 November 2001 in the Washington DC area (specific location to be determined). All agenda items should be submitted to the co-chairs no later than 19 October 2001.

List of Appendices

APPENDIX A: NEWLY APPROVED DRUGS CONSIDERED FOR THE NATIONAL MAIL ORDER PHARMACY FORMULARY AND DOD BASIC CORE FORMULARY

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Almotriptan 6.25- and 12.5-mg tablets (Axert; Pharmacia & Upjohn)	7 May 01; treatment of migraine with and without aura in adults. Not intended for the prophylactic therapy of migraine or in the treatment of basilar or hemiplegic migraine. Safety and effectiveness in cluster headaches not established.	Added to NMOP Formulary	**Quantity Limits** **6.25-mg tab:** NMOP: 36 tablets per 90 days; Retail Network: 12 tablets per 30 days **12.5-mg tabs:** NMOP: 36 tablets per 90 days; Retail Network: 12 tablets per 30 days **Rationale for Quantity Limits** Safety and efficacy of treating more than 4 migraines a month with this class of drugs not established. Patients experiencing more frequent migraines are likely to be candidates for routine prophylactic treatment (e.g., with beta-blockers or selective serotonin reuptake inhibitors). Recommended quantity limits for the retail network are based on the treatment of 4 headaches a month, rounding up to the next full box, if necessary. Quantity limits for the NMOP were calculated as three times the limit for the retail network to maintain consistency across points of service. **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** sumatriptan oral and sumatriptan autoinjector
Drospirenone 0.3 mg / ethinyl estradiol 30 mcg tablets (Yasmin; Berlex)	11 May 01; prevention of pregnancy	Added to NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class**: multiple oral contraceptives
Desogestrel/ ethinyl estradiol tablets (Cyclessa; Organon)	22 Dec 2000; prevention of pregnancy	Added to NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** multiple oral contraceptives
Valganciclovir tablets (Valcyte; Syntex)	29 March 2001; treatment of cytomegalovirus retinitis in AIDS patients	Added to NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** None

Generic name (Trade name; manufacturer)	**FDA approval date, drug class, FDA-approved indication**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Albuterol sulfate 3 mg and ipratropium bromide 0.5 mg per 3 mL (DuoNeb Solution for Inhalation; Dey Labs)	21 Mar 2001; bronchospasm associated with COPD in patients requiring more than one bronchodilator medication	Added to NMOP Formulary	**Quantity Limits** NMOP: 540 vials per 90 days; retail network: 180 vials per 30 days **Rationale for Quantity Limits** Based on maximum recommended doses (up to 6 treatments per day). Quantity limits for both ipratropium and albuterol vials for inhalation are currently in effect. **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** albuterol and ipratropium vials for inhalation
Insulin aspart injection (NovoLog; Novo Nordisk)	8 Jun 2000 (available Sep 2001); with an intermediate or long-acting insulin for treatment of adult patients with diabetes mellitus or those with hyperglycemia	Added to the NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** No rapid-acting insulin analogs on the BCF; insulins on the BCF are Novolin N, R, 70/30

APPENDIX B: COMBINED SUMMARY OF FORMULARY CHANGES FROM THE DOD P&T EXECUTIVE COUNCIL MEETING AND THE DOD P&T COMMITTEE MEETING

1. **BCF CHANGES** (See Minutes of the 15 August DoD P&T Executive Council Meeting)
   A. *Additions to the BCF*
      1) Rabeprazole oral – effective 1 Oct 2001
      2) Montelukast oral
      3) Amiodarone oral
      4) Clindamycin phosphate 1% topical solution
   B. *Deletions from the BCF*
      1) Cerivastatin oral – due to market withdrawal
      2) Omeprazole oral – effective 1 Oct 2001
      3) Quinidine sulfate oral
      4) Quinidine gluconate oral
      5) Primidone oral
   C. *Changes and clarifications to the BCF*
      1) The PPI class will be open effective 1 Oct 2001. As of 1 Oct 2001, MTFs must add rabeprazole (Aciphex) to their formularies (see above), but may have other PPIs on their formularies in addition to rabeprazole.
2. **NMOP FORMULARY CHANGES**
   A. *Additions to the NMOP Formulary* (See Appendix A for details)
      1) Almotriptan tablets (Axert; Pharmacia & Upjohn) - quantity limits apply
      2) Drospirenone 0.3 mg and ethinyl estradiol 30 mcg tablets (Yasmin; Berlex)
      3) Desogestrel 0.1/0.125/0.15 mg and ethinyl estradiol 25 mcg tablets (Cyclessa; Organon)
      4) Valganciclovir tablets (Valcyte; Syntex)
      5) Albuterol sulfate 3 mg and ipratropium bromide 0.5 mg per 3 mL (DuoNeb Solution for Inhalation; Dey Labs) – quantity limits apply
      6) Insulin aspart injection (NovoLog; Novo Nordisk)
   B. *Exclusions from the NMOP Formulary* – None
3. **QUANTITY LIMIT CHANGES (NMOP AND RETAIL NETWORK)**
   A. Quantity limit for almotriptan 6.25- and 12.5-mg tablets (Axert; Pharmacia & Upjohn) – NMOP: 36 tablets per 90 days; retail network: 12 tablets per 30 days
   B. Quantity limit for albuterol sulfate 3 mg and ipratropium bromide 0.5 mg per 3 mL (DuoNeb Solution for Inhalation; Dey Labs) – NMOP: 540 vials per 90 days; retail network: 180 vials per 30 days
4. **CHANGES TO THE PRIOR AUTHORIZATION PROGRAM (NMOP AND RETAIL NETWORK)** – None

Fort Sam Houston, TX 78234-6190

MCCS-GPE **15 August 2001**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The DoD P&T Executive Council met from 0800 to 1600 hours on 15 August 2001 at the Non-Commissioned Officers Club, Ft. Sam Houston, TX. The DoD P&T Executive Council is responsible for performing certain inherently governmental functions relevant to the DoD pharmacy benefits program. The Council focuses primarily on issues related to the Basic Core Formulary (BCF), national pharmaceutical contracts, and blanket purchase agreements. The DoD P&T Executive Council is comprised of federal employees who are members of the DoD P&T Committee.

2. MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL John R. Downs, MC	Air Force
LtCol (select) George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
LTC (P) Joel Schmidt, MC	Army
MAJ Brett Kelly, MS	Army
CAPT Robert Rist	Coast Guard
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
LTC Mike Kieffer, MS	Joint Readiness Clinical Advisory Board representative

MEMBERS ABSENT

COL Rosa Stith, MC	Army
Dick Rooney	Department of Veterans Affairs

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TRICARE Management Activity
COL Mike Heath, MS	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
LtCol Gary Blamire, MSC	Lead Agent Office, Region 6
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
LTC Doreen Lounsbery, MC	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, BSC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
MAJ Barbara Roach, MC	DoD Pharmacoeconomic Center
SFC Tom Bolinger	DoD Pharmacoeconomic Center
SFC Augustin Serrano	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Dave Bretzke	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Carol Scott	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia

3. REVIEW MINUTES OF LAST MEETING / ADMINISTRATIVE ISSUES –The minutes from the last meeting were accepted as written.

4. ADVANCES IN MEDICAL PRACTICE (AMP) PROGRAM

TMA recently released AMP funds for FY 2001 to the military services. Based on prime vendor data, MTFs spent $37.3 million on AMP drugs during the first nine months of FY 2001 (see Appendix A). Total AMP expenditures for FY 2001 will likely be close to the projected figure of $50 million.

5. PROGRAM BUDGET DECISION 812

Program Budget Decision (PBD) 812, approved by the Deputy Secretary of Defense on 21 June 2001, increases MTF pharmacy funding by $307.1 million in FY 2002 to recognize the cost growth experienced in FY 2001. PBD 812 also funds MTF pharmacies at a 15% annual growth rate through FY 2007. MTF pharmacy expenditures will be reviewed annually to determine the adequacy of the revised program funding, and it will be adjusted accordingly. The PBD recognizes the fact that inadequate funding of MTF pharmacies can cause beneficiaries to fill their prescriptions in the private sector at much higher cost to the government.

6. COX-2 INHIBITORS

At the last meeting, the Council agreed that management of the COX-2 inhibitors should ideally focus on two issues: accurately and efficiently targeting COX-2 therapy to those patients at greatest risk for gastrointestinal (GI) adverse events, and reducing the unit cost of COX-2 inhibitors.

A. *Formulary status of COX-2 inhibitors and the use of targeting programs at MTFs*

A PEC survey of MTFs in August 2001 found that 54% of the MTFs have no COX-2 inhibitors on formulary and 77% of the MTFs have a program to target COX-2 inhibitor therapy (see Table 1). Most MTFs use the NMOP prior authorization criteria to target therapy.

Table 1: Formulary Status and Targeting Programs for COX-2 Inhibitors at MTFs

Service	MTFs responding	COX-2s on formulary			MTFs with Targeting Program
		None	One*	Both	
Navy	**14**	12	0	2	8
Air Force	**19**	6	7	6	19
Army	**25**	13	4	8	18
Total	**58**	**31 (53%)**	**11 (19%)**	**16 (28%)**	**45 (78%)**

C. *Therapeutic interchangeability of COX-2 inhibitors*

A significant reduction in unit cost would likely be achieved by a closed class contract that selects a single COX-2 inhibitor for the BCF, but a closed class contract is feasible only if the drugs are therapeutically interchangeable. Additional safety data concerning rofecoxib and celecoxib recently became available due to the release of FDA advisory committee briefing documents and reviews of additional data from two large trials—the Vioxx Gastrointestinal Outcomes Research (VIGOR) study and the Celecoxib Long-term Arthritis Safety Study (CLASS). These data were submitted to the FDA Arthritis Advisory Committee to support manufacturers' requests to remove NSAID-class GI warnings from product labeling. (The review documents represent the opinions of reviewers and not final conclusions of the FDA, which has not yet made a final determination.) The Council assessed various concerns about the therapeutic interchangeability of celecoxib and rofecoxib, including two key issues that arose from review of this additional information.

1. *Vioxx Gastrointestinal Outcomes Research study (VIGOR)* – Data from the VIGOR trial showed an increased risk of serious thrombotic cardiovascular events for rofecoxib compared to naproxen. The rate of confirmed thrombotic cardiovascular serious adverse events was 1.67 per 100 patient-years for the rofecoxib group and 0.70 per 100 patient-years for the naproxen group (RR 2.37; 95% CI 1.39 – 4.06; p=0.0016). The difference in the composite measure was primarily due to a difference in the incidence of myocardial infarctions between the rofecoxib and the naproxen group. These results could be explained by either a prothrombotic effect of rofecoxib or an antithrombotic cardioprotective effect of naproxen. See Appendix B for a more detailed discussion of VIGOR results.
2. *Celecoxib Long-term Arthritis Safety Study (CLASS)* – Published results of the CLASS trial were limited to data obtained during the first six months of study participation, although about 35% of patients completed nine months or more of treatment. Published results did not show a significant difference in the primary endpoint of the study [annualized incidence of confirmed complicated UGI events (perforations, obstructions, and GI bleeds)] between celecoxib and the pooled group of comparator non-steroidal anti-inflammatory drugs (NSAIDs) in the overall study population. There was a significant difference in the primary endpoint in the subgroup of patients not taking low dose aspirin.

   Results from the entire study period did not show a significant difference for the primary endpoint in either the overall study population or in the subgroup of patients not taking aspirin. The differences between the six-month and entire study period data appeared to be due to the occurrence of relatively more confirmed complicated UGI events in the celecoxib group than in the NSAID group in the time period subsequent to the first six months of study participation.

   These results raise doubts about the GI protective effects of celecoxib. The additional data also suggest that the statistically significant differences in GI safety endpoints between celecoxib and the pooled NSAID group are primarily due to differences between celecoxib and ibuprofen; celecoxib was not statistically significant from diclofenac for any patient group or endpoint. This finding raises additional doubts about the generalizability of CLASS results to patients receiving "traditional" NSAIDs not tested in the CLASS trial. See Appendix B for a more detailed discussion of CLASS results.
3. *Lack of rheumatoid arthritis indication for rofecoxib* – Rofecoxib is not currently indicated for rheumatoid arthritis (RA). Merck filed an application for a supplemental NDA for an indication for RA in March 2001 and has submitted additional studies to the FDA.
4. *Edema and hypertension* – Like traditional NSAIDs, both celecoxib and rofecoxib have been shown to increase blood pressure and produce edema. It is not clear whether there is a clinically significant difference in the propensity of the two drugs to produce such effects. Studies suggest a small, dose-related increase in edema and hypertension with rofecoxib, especially at 50 mg QD. A dose-response relationship has not been clearly shown for celecoxib.

5. *MTF survey regarding therapeutic interchangeability* - A survey was sent to lead agent pharmacists to ascertain the opinions of MTFs in their regions. The survey focused on the consensus opinions of facility P&T committees, not individual provider opinions. Lead agent pharmacists had the option of reporting individual MTF responses or submitting a single consensus response from their entire region. The survey included a clinical review comparing celecoxib and rofecoxib and a fact sheet outlining possible scenarios for contracting and/or BCF status. Questions about possible contracting and/or BCF status were to be answered under the assumption that the Program Budget Decision 812 would provide MTFs with adequate funding for these agents. Responses to the survey are summarized in Table 3.

Table 3: Responses to the COX-2 Interchangeability Survey

Region			1	2	3	4	5	6	7/8	9	10	11	12	Summary

Add neither agent to BCF			5	5	1		1	4	5		4	1	3.5	3.3

* Consensus response from entire region only

D. *VA/DoD Clinical Review*

The PEC and the VA PBM are collaborating on a clinical review of the COX-2 inhibitors, but the review is not complete yet.

E. *P&T Executive Council Conclusions*

Based on the available safety and efficacy data and the lack of a RA indication for rofecoxib, the Council could not conclude that celecoxib and rofecoxib are therapeutically interchangeable. MTFs vary significantly in their support for a closed class contract. The Council does not support a closed class contract for a COX-2 inhibitor at this time.

The analysis of all the data for the CLASS study raises questions about the GI protective effects of celecoxib. The VIGOR study raises concerns about a potential increase in risk of cardiovascular events with rofecoxib. The COX-2 inhibitors are no more effective than traditional NSAIDs for treating osteoarthritis or rheumatoid arthritis. The COX-2 inhibitors cost much more than traditional NSAIDs. The Council concluded that a COX-2 inhibitor should not be added to the BCF at this time.

7. NATIONAL PHARMACEUTICAL CONTRACTS AND BLANKET PURCHASE AGREEMENTS (BPAs)

A. *Contract awards, renewals, and terminations*

- As of 1 August 2001, 47 joint VA/DoD national contracts have been awarded. Information on national pharmaceutical contracts, including NDC numbers and prices, is available on the DSCP website (www.dmmonline.com).
- Since the last meeting, DoD/VA single source contracts were awarded for the following drugs:
  - Carbidopa/levodopa 25 mg/100 mg and 50 mg/200 mg sustained action tablets, to Dupont Pharma
  - Glyburide 1.25mg, 2.5mg and 5mg tablets, to Pharmacia Corporation
  - Ointment Base (Absorbase 50% water-in-oil emulsion) 454- and 120-gram jars, to Carolina Medical Products
- The 21-count, 6-cycle package of ethinyl estradiol/ norethindrone tabs (Norinyl) was removed from the national contract effective 24 July 2001. The item may be purchased off the FSS at the same price. The 28-count packages remain on the contract.
- The albuterol inhaler contract will not be renewed due to continuing availability problems with all the chlorofluorocarbon (CFC) albuterol products.

B. *Financial impact of contracts* – Cost avoidance has been estimated by subtracting the actual expenditures for the "market basket" of products affected by a contract from the expenditures that would have occurred if the contract did not exist (based on the prices that existed before the contract took effect). This method is reasonably accurate for the first year of a contract, but changes in the "market basket" of products (e.g., new indications, generic availability, price changes for non-contracted drugs, introduction of new products, product withdrawals, etc.) make it difficult to accurately estimate "what would have been paid" if the contract did not exist in subsequent years. The Council agreed that the cost per patient-day of therapy or cost per member per month within therapeutic categories would be useful indicators of the financial impact of national pharmaceutical contracts and would avoid the ambiguities of cost avoidance estimates.

C. *Statin Contract* - The withdrawal of cerivastatin (Baycol) from the market leaves simvastatin (Zocor) as the only statin on the Basic Core Formulary (BCF) and the National Mail Order Pharmacy (NMOP) formulary. The P&T Executive Council concluded that simvastatin could meet the clinical needs of the vast majority of patients who previously took cerivastatin, so there is no need to add a second statin to the BCF or NMOP formulary at this time. Patients who previously took cerivastatin should be switched to simvastatin. Other statins should be used only when simvastatin will not meet the clinical needs of an individual patient.

The simvastatin contract requires the statin class to remain "closed" on the BCF and NMOP formulary. The simvastatin contract is in effect until February 2002, and there is an option to renew the contract to February 2003. The DoD P&T Executive Council will evaluate clinical and economic information regarding the statin class and make a

recommendation to the Defense Supply Center Philadelphia (DSCP) regarding the potential renewal of the simvastatin contract. The Council will consider the impact of new NCEP guidelines on statin usage; the potential availability of rosuvastatin (Crestor); and impending patent expirations (lovastatin - expected Dec 2001; pravastatin - expected early 2003).

The P&T Executive Council was informed that Merck would reduce the DoD contract prices for four of the five strengths of simvastatin effective 1 Sep 2001 (see Table 4).

Table 4: DoD Contract Prices for Simvastatin

Strength	Old Price	New Price (effective 1 Sep 01)
5 mg	$0.41	$0.38
10 mg	$0.62	$0.50
20 mg	$0.65	$0.60
40 mg	$0.94	$0.85
80 mg	$0.98	$0.98

D. *Proton pump inhibitor contract*

The contract for omeprazole (Prilosec) will expire on 30 September 2001 and will not be renewed because the omeprazole contract price would be much higher than the prices for other proton pump inhibitors. As a consequence, the proton pump inhibitor class will revert to an "open class" on the BCF as of 1 October 2001. The Council reviewed the safety, tolerability, efficacy, price/cost, and other factors associated with proton pump inhibitors.

Safety/Tolerability – The PPIs appear to have similar safety profiles. Early concerns about gastric enterochromaffin-cell hyperplasia and gastric cancer caused by chronic hypergastrinemia have not materialized in clinical practice.

Omeprazole may be the most likely to cause cytochrome P450 drug interactions as it interacts preferentially with CYP2C19, inhibiting the metabolism of diazepam, phenytoin, and warfarin. Rabeprazole, pantoprazole and lansoprazole do not appear to cause clinically significant P450 drug interactions. Experience with esomeprazole is limited. Omeprazole is Pregnancy Category C; the other 4 PPIs are Category B.

Efficacy – When used at appropriate doses, all the PPIs are efficacious for the treatment of a variety of acid-related disorders, including gastroesophageal reflux disease (GERD) and erosive esophagitis. More than 20 published, double-blind, randomized, head-to-head trials used omeprazole as the comparator drug. These studies showed that, in most patients, omeprazole 20 mg/day, lansoprazole 30 mg/day, pantoprazole 40 mg/day, esomeprazole 40 mg/day, and rabeprazole 20 mg/day relieve GERD symptoms within several days and heal esophageal erosions within 4 - 8 weeks of initiating therapy. Reported differences in the duration of antisecretory effect vary between patients and do not necessarily translate into improved clinical efficacy. Lansoprazole 30 mg/day and rabeprazole 20 mg/day may provide more rapid relief of GERD symptoms when compared with omeprazole 20

mg./day, but the differences are usually observed only in the first few days of treatment. Esomeprazole may have a faster onset of healing of esophageal erosions, but healing rates at 12 weeks are similar to those reported with omeprazole.

Price/Cost

Table 5: DoD Prices for Proton Pump Inhibitors

Generic	Brand	Dose	Current Price	After 1 Oct
Rabeprazole	Aciphex	20 mg	$0.22 (FSS)	$0.22 (FSS)
Lansoprazole	Prevacid	30 mg	$2.06 (FSS)	$2.06 (FSS)
Pantoprazole	Protonix	40 mg	$1.27 (FSS)	$1.27 (FSS)
Omeprazole	Prilosec	20 mg	$1.09 (contract)	$2.02 (FSS)
Esomeprazole	Nexium	20 mg	$2.35 (FSS)	$2.35 (FSS)
FSS = Federal Supply Schedule; BPA = Blanket Purchase Agreement				

Other Factors

- *Availability of generic omeprazole* – AstraZeneca has received pediatric exclusivity for Prilosec through 5 Oct 2001. The FDA has granted tentative approval for generic versions of Prilosec to two generic companies: Andrx for 10-, 20- and 40-mg delayed release capsules and GenPharm for 10- and 20-mg delayed release capsules. Due to an agreement between the two companies, Andrx would be considered the "first-to-file" and thus should be the only generic available for the most commonly used 20-mg strength of omeprazole for up to 180 days following approval. It is unknown when generic omeprazole will be available, as lawsuits involving at least 4 generic companies are underway or pending.
- *VA usage* - The VA is currently converting the majority of their patients from lansoprazole, which was previously their contract agent, to rabeprazole. Lansoprazole continues to be available to VA facilities at a BPA price of $0.55 per capsule.
- *Direct-to-consumer (DTC) advertising* - AstraZeneca is currently running an intensive DTC advertising campaign attempting to convince patients to switch from omeprazole to esomeprazole.
- *Provider survey results* – A survey was sent to GI specialists and primary care providers in all three services, who were also asked to forward the survey to other clinicians. The VA PPI class review and a supplemental fact sheet from the PEC were sent along with survey questions. A total of 28 responses were received from 15 Army, 11 Air Force, and 2 Navy providers. The majority of responses were from family medicine (10), followed by GI specialists (6); general surgery (3); internal medicine, primary care, flight medicine, unknown specialty (2 each); and pulmonary/critical care (1). Summary results are shown in Table 6 following.

  Comments from providers generally supported the therapeutic interchangeability of PPIs. Most agreed that using the least costly PPI would be appropriate to treat the majority of patients.

Several providers mentioned the need for alternate PPIs for patients with swallowing difficulties. Only lansoprazole has an oral suspension. Labeling for lansoprazole, omeprazole, and esomeprazole capsules indicates they can be opened and sprinkled on applesauce; rabeprazole and pantoprazole have no alternative dosage forms, but are relatively small tablets. Providers also mentioned the desire to have an intravenous PPI available. Only pantoprazole is available in an intravenous formulation.

Two providers commented negatively on the DTC campaign for esomeprazole. Two Air Force providers mentioned the fact that omeprazole is the only PPI specifically approved for Air Force aircrew waiver.

Table 6: PPI Provider Survey

	Strongly Agree	Agree	Neither Agree or Disagree	Disagree	Strongly Disagree
All the PPIs currently available are likely to be effective for treating the conditions for which I typically prescribe PPIs.	14	13	0	1	0
The differences in FDA-approved indications between these products have little clinical relevance when treating most patients.	8	17	0	3	0
The faster time to relief of symptoms reported by AstraZeneca for esomeprazole has little to no clinical significance.	5	16	4	2	0
The faster time to relief of symptoms reported for rabeprazole has little to no clinical significance.	4	16	5	2	0
Price should be a consideration when providers decide which of these agents to prescribe.	13	14	1	0	0
I have sufficient concerns regarding the safety, efficacy, or patient acceptability of the other available PPIs that I will continue to prescribe Prilosec after October 1st regardless of price.	0	2	0	13	12

After considering safety, tolerability, efficacy, price, and patient acceptability, which of the following PPIs, if available on formulary after October 1, would I feel comfortable using.

Drug	Definitely Use	Consider Use	Use with reservations	Never Use
Omeprazole	14	7	3	1
Rabeprazole	18	8	1	0
Lansoprazole	13	13	0	0
Pantoprazole	7	16	2	1
Esomeprazole	8	8	5	3

The Council concluded that there are no clinical or economic reasons to pursue another closed class contract in this drug class. The Council voted to remove Prilosec from the BCF and add rabeprazole (Aciphex) to the BCF. These BCF changes take effect on 1 Oct 2001. MTFs may have other PPIs on their formularies in addition to rabeprazole as of 1 Oct 2001.

E. *Status of contracting initiative for nasal corticosteroid inhalers* – The DoD P&T Executive Council concluded at the November 2000 meeting that a closed class contract could be sought for a high-potency aqueous nasal corticosteroid. The Council identified five products that could compete for the contract: budesonide 32 mcg/spray, fluticasone 50 mcg/spray, triamcinolone 55 mcg/spray, mometasone 50 mcg/spray, and beclomethasone 84 mcg/spray. The VA recently completed its class review of nasal corticosteroid inhalers. The VA wants to include flunisolide (Nasarel) in the solicitation for a closed class contract. The Council asked the PEC to update its analysis of the nasal steroid class and recommend to the Council whether or not flunisolide should be included in the solicitation.

F. *Status of potential contracting initiative for leukotriene antagonists* – The VA is currently evaluating montelukast (Singulair) and zafirlukast (Accolate) for potential contracting. The 5-lipoxygenase inhibitor Zileuton (Zyflo) is not being considered due to several clinical disadvantages, including four times daily dosing and an increased risk of drug interactions and hepatotoxicity compared to the other two agents. This drug class has been proposed as a potential joint DoD/VA contracting initiative. The BCF currently states that each MTF must have a leukotriene antagonist on formulary, but the selection of the specific product is left to the MTF.

Safety/Tolerability – Placebo-controlled trials with both agents have shown a low incidence of adverse effects. GI symptoms and headache are reported most commonly. In trials comparing leukotriene antagonists with inhaled corticosteroids, both montelukast and zafirlukast were associated with higher discontinuation rates due to adverse events than inhaled corticosteroids.

Both products have been associated with elevations in liver function tests, although confounding factors make causality difficult to assess. One serious adverse reaction, Churg Strauss syndrome, has occurred during steroid tapers with both montelukast and zafirlukast, but may have been associated with "unmasking" of a pre-existing condition. Zafirlukast has clinically significant drug interactions with theophylline and warfarin. Clinically significant drug interactions have not been reported for montelukast.

Efficacy

Adult patients

- *Comparative trials with inhaled ß-agonists*: Studies have shown that adding a leukotriene antagonist to a short acting ß-agonist reduces the occurrence of asthma symptoms and the use of ß-agonists more than placebo.
- *Comparative trials vs. inhaled corticosteroids*: Although similar asthma exacerbation rates have been reported, inhaled corticosteroids significantly improve quality of life, lung function, and symptom control compared with the leukotriene antagonists.
- *Asthma monotherapy trials*: There are no published head-to-head trials with zafirlukast and montelukast. When two individual studies with similar trial design are compared, montelukast was slightly superior to zafirlukast in terms of FEV1 (forced expiratory volume in one second), PEFR (peak expiratory flow rate), and

prn albuterol use at 12 weeks. However, low-dose fluticasone was superior to either leukotriene inhibitor.

- *Combination of leukotriene antagonists with inhaled corticosteroids*: There are no head to head comparisons, and the trial designs of the available studies are too dissimilar to make comparisons

Pediatric patients

- Head to head comparisons between montelukast and zafirlukast are not available. The trial that was the basis for montelukast's pediatric labeling is only available in the package insert and has not been published in a peer-reviewed journal. A pediatric study comparing zafirlukast with low-dose fluticasone has been published. Both montelukast and zafirlukast improve symptoms and lung function compared with placebo. Inhaled steroids show similar exacerbation rates compared to leukotriene antagonists, but result in better improvements in lung function and symptoms.

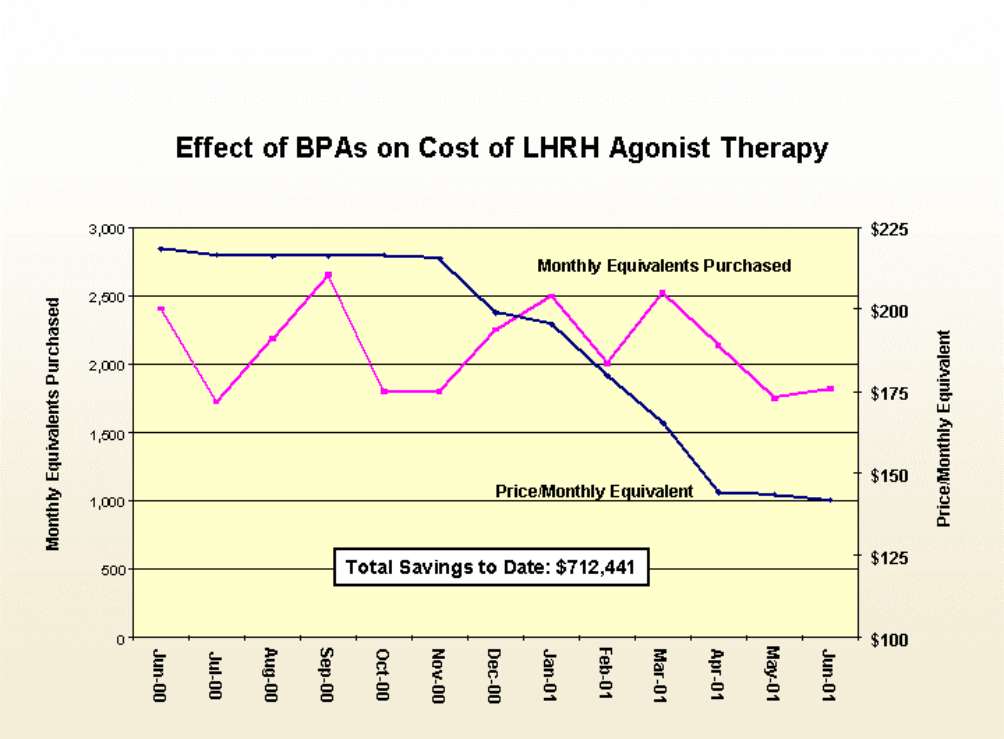
Other Factors

- Based on total tablets purchased, market shares for montelukast and zafirlukast in DoD MTFs are approximately 93% and 7%, respectively. Purchases by VA facilities are more evenly split between the two drugs—43% of leukotriene antagonist tablets purchased are montelukast; 56% are zafirlukast. Zafirlukast is typically dosed twice daily.
- Montelukast is dosed once daily and has FDA approval for patients as young as 2 years of age. A 4-mg chewable tablet formulation is available for children 2-5 years of age. Zafirlukast is dosed twice daily. It is FDA-approved for patients 7 years of age and older.

The Council concluded that montelukast and zafirlukast are not therapeutically interchangeable and that a closed class contract for a leukotriene inhibitor is not feasible for DoD. After considering the safety, tolerability, efficacy, and other factors associated with the leukotriene antagonists, the Council voted to add montelukast to the BCF.

G. *Non-sedating antihistamine contract* – Increases in prescription market share for fexofenadine (Allegra) and decreases in market share for loratadine (Claritin) indicate that MTFs are successfully implementing the non-sedating antihistamine contract. By the end of July 2001, the market share for fexofenadine (as a percent of all prescriptions for non-sedating antihistamines dispensed at MTF pharmacies) increased from 50% prior to the contract to nearly 80%. The prescription market shares for fexofenadine and loratadine remained stable in the retail pharmacy networks and the NMOP, indicating that MTFs are maximizing the use of fexofenadine without shifting loratadine prescriptions into the retail pharmacy network or NMOP. Since the contract took effect, the average cost per non-sedating antihistamine tablet/capsule purchased by MTFs has dropped by 33%, from $0.87 to $0.58. Appendix C contains market share and cost graphs for the non-sedating antihistamines.

H. *Status of BPAs and potential contracting action for Leutinizing Hormone Releasing Hormone (LHRH) agonists* – The AstraZeneca Federal Account Director has stated that the Blanket Purchase Agreement (BPA) for goserelin (Zoladex) will stay in effect even if the 80% market share requirement is not met by 1 Sep 2001. The Zoladex and leuprolide (Lupron) BPAs have reduced the weighted average cost per monthly equivalent of LHRH agonist therapy for prostate cancer by 35%, from $215 in November 2000 to $140 in June 2001. The BPAs yielded $712,000 in cost avoidance for MTFs from November 2000 to June 2001.



Lupron and Zoladex are generally considered equivalent in safety and efficacy for treatment of prostate cancer. The therapeutic interchangeability of these products hinges on tolerability and other factors that affect patient or provider acceptance of either product. CAPT Torkildson (PEC) obtained input from Urology specialty leaders and other providers:

- Several providers reported that patients had been switched from one product to the other without problems.
- Zoladex must be implanted rather than simply injected, so administration of Zoladex consumes more physician time. Some MTFs improve the efficiency of Zoladex administration by training non-physicians to administer the product.
- Lupron has a 4-month dosage form; Zoladex does not.
- Some providers expressed concern regarding lack of experience with one or the other products.
- There was general agreement that the potential for decreased cost is sufficient reason to seek a contract.

The dosage forms of Lupron and Zoladex that would compete for this contract are not used exclusively for prostate cancer. The PEC estimates that 10% of the Lupron usage and 2% of the Zoladex usage are for conditions other than prostate cancer. However, the age and sex specificity of prostate cancer allows contract compliance to be monitored relatively easily.

The Council voted to support a joint VA/DoD contract for an LHRH agonist for the treatment of prostate cancer.

8. THE CLOPIDOGREL IN UNSTABLE ANGINA TO PREVENT RECURRENT EVENTS (CURE) TRIAL

The Council reviewed preliminary summary information from the CURE trial. (Complete results of the trial were subsequently published in the 16 Aug 2001 issue of the New England Journal of Medicine.) The CURE trial enrolled approximately 12,500 patients with unstable angina and non-ST elevation MI presenting within 24 hours of the onset of symptoms. Patients were randomized into two groups: aspirin alone (75 to 325 mg QD) or aspirin plus clopidogrel (300 mg immediately, then 75 mg QD). Follow-up was for an average of 9 months. A 20% reduction in the composite endpoint of cardiovascular death, nonfatal MI, or stroke was reported for the combination of clopidogrel plus aspirin compared to aspirin alone. The combination reportedly had both an early (within 2 hours) and sustained benefit relative to aspirin alone. A significant increase in major (but not life-threatening) bleeds was reported in patients receiving both aspirin and clopidogrel, but there was insufficient information to adequately assess the severity of the incremental risk of bleeding.

Clopidogrel is currently indicated for prevention of stroke and/or MI in patients with aspirin allergy and for short-term use following cardiac stent placement. Clopidogrel is not on the BCF. The Council agreed that it would be premature to consider clopidogrel for the BCF on the basis of preliminary data, but asked the PEC to review results of the published study and make recommendations.

9. MTF REQUESTS FOR BCF CHANGES

A. *Request to remove quinidine from the BCF* – A pharmacist from an Army medical center requested removal of quinidine products from the BCF due to infrequent usage.

Meta-analyses have shown increased mortality rates in patients given quinidine during or after acute myocardial infarction and patients given quinidine after cardioversion for atrial fibrillation. Mortality rates in patients with ventricular arrhythmias were three times higher with quinidine than other Class I antiarrhythmics. In addition, the risk of torsade de pointes, a potentially fatal arrhythmia, is estimated to be 1.5% to 8% in patients treated with quinidine. (Some clinicians feel this may underestimate the true occurrence.) Current therapy recommendations relegate quinidine to second or third-line status for either atrial or ventricular arrhythmia. According to data from the Uniformed Services Prescription Database, MTF prescriptions for quinidine products have consistently decreased over the past 3 years to fewer than 200 prescriptions per month for quinidine sulfate and fewer than 1300 prescriptions per month for quinidine gluconate.

The Council voted to remove both quinidine sulfate and quinidine gluconate from the BCF. MTFs may choose to remove or retain these products on their formularies.

B. *Request to remove primidone from the BCF* – A pharmacist from an Army medical center requested removal of primidone from the BCF due to infrequent usage.

Primidone is FDA approved for treatment of partial complex seizures but is rarely used for that indication. Its primary use is off-label for the treatment of essential tremor. Safer, more tolerable alternatives are available for both seizure disorder and essential tremor. The DoD P&T Council voted to remove primidone from the BCF because it has no clinical benefit over agents already on the formulary. MTFs may choose to remove or retain primidone on their formularies.

C. *Request to add amiodarone to the BCF* – A primary care provider and a cardiologist from an Air Force teaching facility requested addition of amiodarone to the BCF based on current use of this drug in clinical practice.

Safety/Tolerability - Amiodarone carries a black box warning that lists potentially fatal toxicities, including proarrhythmic effects, pulmonary toxicity (hypersensitivity pneumonitis or interstitial/alveolar pneumonitis), and overt liver disease (in a few cases). Proarrhythmic effects appear to occur in less than 1% of patients, mostly in conjunction with electrolyte abnormalities or when used concurrently with other antiarrhythmics. This is a less frequent occurrence than seen in other antiarrhythmics. Pulmonary toxicity can be seen in 5% to 15% of patients, but has a good prognosis when the drug is discontinued.

The most common adverse effect of amiodarone is thyroid dysfunction; discontinuation of the drug is usually not necessary. Most other adverse effects are dose dependent. In general, smaller doses of amiodarone are required to treat atrial arrhythmias than ventricular arrhythmias. No other Class III antiarrhythmics are currently available.

Efficacy – Amiodarone is only FDA-indicated for the management of life-threatening recurrent ventricular fibrillation or hemodynamically unstable ventricular tachycardia, but use of the drug in clinical practice has changed significantly since its introduction in 1985. Amiodarone is now widely used to treat both atrial and ventricular arrhythmias. .

Other Factors – The VA developed a form to assist in monitoring amiodarone patients with regard to drug-drug interactions and timing of labs and other ancillary services (available at: www.vapbm.org/monitoring/amiodaron.htm). Guidelines intended for the use of primary care providers who follow patients on amiodarone have been issued by the North American Society of Pacing and Electrophysiology [Arch Intern Med 2000 (26 June); 160(12):1741-8]. Publication of guidelines for the treatment of atrial fibrillation by the American College of Cardiology and the American Heart Association are anticipated by the end of Aug 2001.

The Council added amiodarone to the BCF.

10. REVIEW OF ACNE MEDICATIONS FOR THE BCF

MAJ Barbara Roach reported on the PEC review of acne medications. The BCF currently lacks topical treatment choices for patients with acne who do not respond to over-the-counter benzoyl peroxide. The PEC evaluated the safety, tolerability, efficacy, cost, and historical MTF usage of topical acne medications and recommended the addition of clindamycin phosphate 1% solution and tretinoin cream 0.025% and 0.05% to the BCF. The PEC also recommended the removal of age restrictions for tretinoin cream in the NMOP and retail

pharmacies because it is commonly used for seborrheic keratoses (which occur in older adults).

The Council added clindamycin phosphate 1% solution to the BCF. Council members were concerned that the removal of age restrictions would allow tretinoin to be used for cosmetic treatment of photoaged skin (wrinkles and liver spots). The Council was uncertain as to whether the age restriction was specified in the Code of Federal Regulations, TRICARE policy, or the NMOP Statement of Work. Military service policies might also have age limits on tretinoin availability. The Council voted to table the decision on tretinoin until these issues are clarified.

11. OBTAINING INPUT FROM PROVIDERS

The PEC has substantially increased efforts to obtain input from physicians and pharmacists on formulary and contracting issues. A BCF request form is available for MTF personnel to recommend changes in the BCF. Teleconferences are conducted with the pharmacy consultants/specialty leaders and pharmacists representing each TRICARE region. The PEC has surveyed specialty consultants and MTF providers to obtain input on important drug classes such as COX-2 inhibitors, proton pump inhibitors, LHRH agonists, and low molecular weight heparins, but these are informal surveys instituted on a case-by-case basis. There is no formal, recognized, systematic method for MTF providers to routinely have input on formulary and contracting issues.

The Council appointed a subcommittee to explore ways to systematically obtain input from providers on formulary and contracting issues. Subcommittee member are COL Downs, LCDR Briski, and COL Davies or his designee.

12. The meeting adjourned at 1600 hours on 15 August 2001. The next meeting will be held in the Washington DC area (specific location to be determined) and is scheduled for 14 Nov 2001 at 0800. All agenda items should be submitted to the co-chairs no later than 19 October 2001.

LIST OF APPENDICES

Appendix A: MTF Expenditures for Drugs Included in the Advances in Medical Practice (AMP) Program

MTF Expenditures On Amp Drugs, First Nine Months Of FY 01

Drug Name*	Air Force	Army	Navy	Grand Total
Abciximab	$254,828	$216,886	$75,396	$547,110
Alpha-1-Proteinase Inhibitor			$18,228	$18,228
Becaplermin	$62,291	$94,926	$43,818	$201,035
Cyclosporine	$322,159	$235,474	$178,033	$735,666
Cyclosporine Microemulsion	$662,783	$632,102	$628,818	$1,923,703
Dornase Alfa	$238,605	$136,393	$154,692	$529,690
Epoetin Alfa	$3,074,457	$3,640,225	$1,957,694	$8,672,375
Eptifibatide	$66,227	$299,967	$179,640	$545,834
Etanercept	$1,165,366	$825,910	$499,619	$2,490,896
Factor VIIa,Recomb		$4,218		$4,218
Filgrastim	$1,071,525	$1,379,019	$809,235	$3,259,779
Gemcitabine Hcl	$168,885	$296,224	$225,954	$691,062
Glatiramer Acetate	$368,394	$180,715	$100,230	$649,339
Infliximab	$251,723	$258,436	$332,440	$842,598
Interferon Beta-1a	$1,211,255	$979,842	$496,651	$2,687,748
Interferon Beta-1b	$374,021	$512,901	$332,929	$1,219,851
Interferon Gamma-1b,Recomb.	$41,678	$65,455	$35,905	$143,037
Irinotecan Hcl	$183,078	$427,646	$232,438	$843,162
Leflunomide	$152,077	$285,243	$171,167	$608,488
Mycophenolate Mofetil	$412,354	$518,043	$219,776	$1,150,173
Mycophenolate Mofetil HCl	$919	$2,082		$3,002
Palivizumab	$1,316,843	$1,401,470	$943,150	$3,661,463
Ribavirin/Interferon A-2b	$539,000	$1,168,805	$423,249	$2,131,054
Rituximab	$284,989	$956,443	$407,289	$1,648,721
Sargramostim	$17,853	$105,341	$8,348	$131,542
Sirolimus	$33,545	$75,817	$31,191	$140,554
Tacrolimus Anhydrous	$409,332	$367,998	$226,014	$1,003,344
Temozolomide	$122,356	$95,662	$67,134	$285,152
Tirofib Hc M-Hyd/Na Chlor 0.9%	$2,745	$21,087		$23,832
Tirofiban HCl M-Hydrate	$87,199	$55,477	$19,159	$161,835
Trastuzumab	$121,671	$269,967	$26,662	$418,300
Grand Total	$13,018,156	$15,509,775	$8,844,859	$37,372,790

* Celecoxib and rofecoxib were removed from the AMP list for FY 01

Appendix B: COX-2 Inhibitor Trials (VIGOR and CLASS)

1. Cardiovascular Safety Data from the Vioxx Gastrointestinal Outcomes Research (VIGOR) Study

The 8076-patient VIGOR trial (NEJM 2000;343:1520-8) included patients with rheumatoid arthritis (RA) who were 50 years old (or 40 years old and receiving long-term glucocorticoids) and excluded patients on low-dose aspirin for cardiovascular prevention. Patients were randomized to rofecoxib 50 mg QD or naproxen 500 mg BID. The median follow-up was 9 months (range 0.5 – 13). Use of aspirin or non-study NSAIDs was not allowed.

A detailed analysis of VIGOR data concerning the occurrence of cardiovascular events is available from FDA briefing documents, available at *www.fda.gov/ohrms/dockets/ac/01/briefing/3677b2.htm*. Overall, the rate of adjudicated thrombotic cardiovascular serious adverse events per 100 patient-years was 1.67 for rofecoxib vs. 0.70 for naproxen [relative risk (RR) 2.37; 95% confidence interval (CI) 1.39-4.06; p=0.0016]. The difference in the composite measure was primarily due to a difference in the incidence of myocardial infarctions between the rofecoxib and the naproxen group. For patients identified as potential candidates for low-dose aspirin, the difference in event rates was marked: 14.29 for rofecoxib vs. 2.94 for naproxen (RR 4.89; 95% CI 1.41-16.88; p=0.0122). For patients not considered candidates for low dose aspirin, the difference in events was less marked but still statistically significant: 1.16 for rofecoxib vs. 0.62 for naproxen (relative risk 1.88; 95% CI 1.03-3.45; p=0.041).

It has been suggested that naproxen, which is relatively COX-1 selective, may have antiplatelet effects similar to aspirin. This may explain the relatively lower incidence of thrombotic events with naproxen compared to rofecoxib, but, as stated by the FDA Advisory Committee review, a direct prothrombotic effect of rofecoxib cannot be ruled out. Whether the putative effect of naproxen in reducing cardiovascular thrombotic effects in the VIGOR trial is reasonable compared to expected results with aspirin is subject to debate. There are no trials assessing the ability of naproxen to reduce cardiovascular events.

Since RA patients appear to have a higher baseline risk for cardiovascular disease than patients with osteoarthritis (OA), the RA population in VIGOR may have been more sensitive to any potential thrombogenic effect of selective COX-2 inhibition than a population predominated by OA patients. In addition, the effect may be dose-related; the 50-mg daily dose used in VIGOR is at least two times higher than doses recommended for chronic use.

The proposed prothrombotic mechanism is related to cyclooxygenase inhibition. COX-1 mediates production of thromboxane A2, which promotes vasoconstriction, platelet activation and aggregation. COX-2 mediates production of prostaglandins at inflammatory sites as well as prostacyclin (PGI2), a vasodilator and inhibitor of platelet aggregation. If COX-2 is selectively inhibited, unopposed production of thromboxane could result in an increase in CV thrombotic effects. Compensatory mechanisms are known to exist. Whether this theoretical effect applies to celecoxib is unknown, but appears plausible based on the proposed mechanism.

2. Additional Results Concerning GI Protective Effects of Celecoxib from the Celecoxib Long-term Arthritis Safety Study (CLASS)

The Celecoxib Long-term Arthritis Safety Study (CLASS) was an 8059-patient trial that compared celecoxib (400 mg BID) to diclofenac (75 mg BID) or ibuprofen (800 mg TID). Approximately 73% of patients had osteoarthritis; 27% had rheumatoid arthritis. Use of low-dose aspirin for cardiovascular prophylaxis was permitted.

The published report of the trial (JAMA 2000;284:1247-55) was limited to data obtained during the first six months of study participation, although about 35% of patients received nine months or more of treatment. According to published six-month data, the annualized absolute risk (AR) for the primary endpoint of confirmed complicated UGI events (GI bleeds, perforation, or gastric outlet obstruction) was 0.76% for celecoxib vs. 1.45% for the pooled NSAID group (RR 0.53; 95% CI 0.26-1.11; p=0.09), a non-significant difference. The difference in AR was significant when the subgroup of patients not taking aspirin was considered [0.44% for celecoxib vs. 1.27% for the pooled NSAID group (RR 0.35; 95% CI 0.14-0.98; p=0.04)]. However, there was neither a significant difference nor a discernible trend in patients taking aspirin [2.01% for celecoxib vs. 2.12% for the pooled NSAID group (RR 0.95; 95% CI not calculated; p=0.49)], a result that raises the possibility that COX-2 inhibitors may not provide a clinically relevant GI protective effect for patients on low dose aspirin.

When the entire study period was considered, there was no significant difference between celecoxib and the pooled NSAID group for the primary endpoint of confirmed complicated UGI events in the overall study population, the subgroup of patients not receiving aspirin, or the subgroup of patients receiving aspirin. The differences in statistical significance between six-month data and data from the entire study period appeared to be due to the occurrence of relatively more confirmed complicated UGI events in the celecoxib group than in NSAID groups subsequent to the first six months (see table below).

Number of confirmed complicated UGI events in the CLASS trial
(uncensored intent-to-treat data)

	Celecoxib (n=3987)	Diclofenac (n=1996)	Ibuprofen (n=1985)
First 6 months	11	9	11
Entire Study Period	17	10	11

Adapted from Tables 13 and 14, Medical Officer Review for Celebrex®, available at:
www.fda.gov/ohrms/dockets/ac/01/briefing/3677b1_03_med.doc

The manufacturer has suggested that this is primarily due to disproportionate dropouts secondary to GI symptoms (e.g., dyspepsia) among patients receiving comparator NSAIDs, artificially decreasing the number of patients in the NSAID group susceptible to GI adverse events. FDA reviewers raise a number of questions concerning the validity of this explanation.

FDA briefing documents and reviews also provide separate data for the two comparator NSAIDs. All differences that were statistically significant between celecoxib and pooled NSAIDs were significant for celecoxib versus ibuprofen. The differences between celecoxib and diclofenac were not statistically significant for any of the endpoints.

FDA briefing documents and reviews are available at *www.fda.gov/ohrms/dockets/ac/01/briefing/3677b1.htm*.

MCCS-GPE **7 JUNE 2001**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T committee convened at 0900 hours on 7 June 2001, at the Uniformed Services University of the Health Sciences, Bethesda, Maryland.

2. MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL Bill Sykora, MC	Air Force
LtCol (select) George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
COL Rosa Stith, MC	Army
LTC (P) Joel Schmidt, MC	Army
MAJ Brett Kelly, MS	Army
CAPT Chuck Bruner	Coast Guard
Dick Rooney	Department of Veterans Affairs
LtCol Greg Russie, BSC	Joint Readiness Clinical Advisory Board
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia (DSCP)
Ray Nan Berry	Health Net Federal Services
William Hudson	Humana, Inc
Gene Lakey	TriWest
Ron McDonald	Sierra Military Health Services
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)

MEMBERS ABSENT

COL John R. Downs, MC	Air Force

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TMA
COL Ardis Meier, BSC	Air Force Pharmacy Consultant
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
CAPT Pat Welter, MSC	Navy Bureau of Medicine & Surgery
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
David Chicoine	Uniformed Services Family Health Plan
Bill Chamberlain	Defense Supply Center Philadelphia
Mark Petruzzi	Merck-Medco
Shannon Rogers	Merck-Medco
Elizabeth Scaturro	Merck-Medco
Shana Trice	DoD Pharmacoeconomic Center
Vinnie Valinotti	Defense Supply Center Philadelphia
Paul Vasquez	Defense Supply Center Philadelphia
Gina Wu	Merck-Medco

3. **ADMINISTRATIVE ISSUES** – The minutes from the last meeting were accepted as written.

4. **REPORT FROM THE DOD EXECUTIVE COUNCIL MEETING** – COL Remund reviewed materials presented at the Executive Council Meeting concerning utilization and cost trends for drugs in the top six classes (by dollar expenditure) in DoD Military Treatment Facilities (MTFs) and the National Mail Order Pharmacy Program (NMOP). COL Remund also informed the committee about the award, contract provisions, and implementation of the joint VA/DoD national pharmaceutical contract for non-sedating antihistamines.

5. **IMPLEMENTATION OF FY 00 AND FY 01 NATIONAL DEFENSE AUTHORIZATION ACTS** – COL Davies briefed the Committee on the ongoing efforts to implement the pharmacy benefit provisions of the FY 00 and FY 01 National Defense Authorization Acts.

6. **BCF AND NATIONAL MAIL ORDER PHARMACY (NMOP) FORMULARY ISSUES** – The Committee determined the NMOP formulary status; NMOP or retail network formulary restrictions (quantity limits or prior authorization); and the Basic Core Formulary (BCF) status for 11 new drugs (see Appendix A). Additional discussion concerning the following drugs is also summarized in Appendix A: insulin glargine (Lantus; Aventis), PEG-interferon alfa 2b (PEG Intron; Schering), fluticasone/salmeterol powder for inhalation (Advair Diskus; Glaxo SmithKline), fluoxetine 90-mg capsules (Prozac Weekly; Lilly), and imatinib mesylate (Gleevec; Novartis).

7. **NON-PREFERRED/PREFERRED DRUG PAIRS IN THE NMOP** – MAJ Mickey Bellemin and Paul Vasquez (DSCP) reported that on 1 April the NMOP contractor, Merck-Medco, ceased making calls to physicians concerning all non-preferred/preferred drug pairs in the NMOP Preferred Drug Program except diltiazem. DSCP and Merck-Medco agreed to this change in order to accommodate the increased NMOP workload from the expansion of the pharmacy benefit to all beneficiaries over 65 years of age. Phone calls for diltiazem will continue because of the national contract for diltiazem extended release (Tiazac) and the high cost avoidance per attempted provider contact associated with this non-preferred/preferred drug pair.

CAPT Joe Torkildson reported a $2.8 million cumulative cost avoidance over the 22-month duration of the NMOP Preferred Drug Program (see Appendix B). COL Remund commented that the committee should continue to monitor market shares in classes in which a non-preferred/preferred drug pair existed in order to assess the true effect of these interventions and the potential effect of similar interventions in the future.

8. PRIOR AUTHORIZATIONS

A. *Cost avoidance from NMOP prior authorizations (PAs)* – Shana Trice (PEC) reported on the estimated cost avoidance due to PAs in the NMOP. The cost avoidance per prescription is based on the cost avoidance model that was outlined in the Aug 00 DoD P&T Committee minutes.

PA Cost Avoidance per New Prescription Submitted to the NMOP*

Drug	3rd Quarter FY 00	4th Quarter FY 00	1st Quarter FY 01	2nd Quarter FY 01
Sildenafil	$13.60	$26.46	Not calculated**	Not calculated**
COX-2 inhibitors	$11.66	$18.56	$10.95	$8.74
Etanercept	$327.20	$111.86	$7.89	$76.96

* Cost avoidance due to the PA for antifungals for onychomycosis (ciclopirox, itraconazole, terbinafine) is not calculated using this model because the PA differs substantially from the other PAs. Unlike the other PAs, which authorize dispensing of new and refill prescriptions for a year, each course of therapy with antifungal medications for the treatment of onychomycosis goes through the PA process.

** The PEC is working with Merck Medco and DSCP to revise the PA cost avoidance model to account for prior authorization of refill prescriptions.

- *Etanercept* – The progressive decline in the cost avoidance for the etanercept PA in the NMOP noted at the last meeting appears to have reversed (see table). However, considering the high cost of etanercept, the low number of prescriptions, and the even lower number of prescriptions that go through the PA process, the analysis is likely to be extremely sensitive to small changes in the number of prescriptions that are not filled because they do not meet PA criteria. The analysis of cost avoidance due to the etanercept PA in the retail network discussed at the last meeting has not yet been completed. The committee did not take any action concerning the etanercept PA.

B. *Temporary lapse in the NMOP PA program* – Paul Vasquez (DSCP) reported that the NMOP PA program was suspended from mid April 01 to early May 01 to accommodate large increases in NMOP workload due to the expansion of the pharmacy benefit to all beneficiaries over 65 years of age.

C. *Utilization of the NMOP and retail network pharmacies for drugs subject to PA* – The committee discussed the possibility of using data from the Pharmacy Data Transaction Service (PDTS) to analyze the extent to which patients who are denied prescriptions for COX-2 inhibitors in the NMOP subsequently fill these prescriptions at retail network pharmacies. The COX-2 inhibitor PA was withdrawn in the retail network in Aug 00 because federal regulations governing TRICARE currently allow prior authorizations to be applied in the retail pharmacy

networks only for clinical considerations (appropriateness of therapy), and not for cost-effectiveness considerations.

Bill Hudson (Humana) presented longitudinal data concerning utilization and costs of COX-2 inhibitors, brand name nonsteroidal anti-inflammatory drugs (NSAIDs) and generic NSAIDs in Regions 3 and 4. He reported that utilization of COX-2 inhibitors, which had decreased when the COX-2 inhibitor PA had been put into place, essentially doubled when the COX-2 inhibitor PA was discontinued.

The number of patients who opt to fill COX-2 inhibitor prescriptions in retail network pharmacies instead of the NMOP due to the presence of the COX-2 inhibitor PA is unknown. Prescriptions filled at the NMOP are less costly to DoD than those filled in the retail network. In addition, it is likely that some patients who opt to fill one prescription in the retail network rather than the NMOP will decide to fill all their prescriptions in the retail network. The committee requested that the PEC utilize data from PDTS to analyze the shift of patients from NMOP to the retail network.

C. *Antifungals for onychomycosis* – Ciclopirox topical solution (Penlac Nail Lacquer) was added to the existing NMOP PA for antifungals for onychomycosis as of 10 May 01. No problems with NMOP implementation were reported.

Bill Hudson (Humana) expressed concern about combination therapy with oral antifungals and ciclopirox being prescribed by a small number of providers. It is doubtful that this combination increases the effectiveness of onychomycosis treatment by any clinically significant degree. Product labeling for ciclopirox recommends against concurrent therapy with oral antifungals since it is not known whether ciclopirox interferes with the action of the oral antifungals. Because ciclopirox requires regular visits to remove infected nail material, use of the combination not only increases medication cost but may also increase the total cost of therapy. The committee requested more information about the incidence of combination therapy.

D. *Revision of PA forms* – Changes to clinical rationale language for the COX-2 inhibitors due to the CLASS study are in progress. The committee requested that clinical rationale language for the antifungals for onychomycosis to be changed to reflect recent safety announcements by the Food and Drug Administration (FDA) concerning terbinafine and itraconazole.

9. STATUS OF LOW MOLECULAR WEIGHT HEPARINS (LMWHs) IN THE NMOP AND RETAIL NETWORK – CAPT Torkildson reported on the PEC's survey of providers concerning the necessity to have the LMWHs available through the NMOP. While most providers did not feel this to be necessary, the obstetricians surveyed agreed that their patients were prescribed LMWH therapy for a long enough period of time to make acquiring the drug from the NMOP a viable option. While the volume of prescriptions is expected to be low, the committee agreed that there is no reason to not have low molecular heparins designed for self-administration available through the NMOP for those patients who might benefit. The committee added LMWHs (dalteparin, enoxaparin, and tinzaparin) to the NMOP formulary. The low molecular weight heparinoid, danaparoid, was not added because it is indicated for intravenous administration only and is unlikely to be administered as an outpatient medication.

10. REVIEW OF INJECTABLE MEDICATIONS AVAILABLE THROUGH THE NMOP - The committee clarified that the potential for self-administration is only one of the factors for considering drugs for the NMOP Covered Injectables List. Other factors include the feasibility of

dispensing the medications through mail order (Merck-Medco's mail order facilities are not set up to handle sterile compounding of parenteral products) and the relative likelihood that the medications will be needed on an outpatient basis.

One of the MCSC pharmacy directors requested removal of Zoladex from the NMOP Covered Injectables list, since it is an implant that requires an office visit and insertion under sterile conditions. It was pointed out that Lupron, although administered as an intramuscular injection rather than implanted subcutaneously, is in most cases also not suitable for self-administration. The committee requested the PEC to review the NMOP Covered Injectables list to identify items not designed for self-administration or commonly used in an outpatient setting and review the current utilization of these medications through the NMOP. The committee did not change the availability of Zoladex through the NMOP at this time, pending results of the review.

11. **CONTROLLED DISTRIBUTION OF ETANERCEPT (ENBREL) –** Since MTF pharmacies, unlike retail pharmacies, are not required to submit patient enrollment numbers to obtain etanercept, DoD beneficiaries can obtain etanercept from MTF pharmacies even if they did not enroll with Immunex. However, unenrolled patients may experience problems if they need to obtain etanercept from a source other than an MTF pharmacy. A process has been established for patients not enrolled with the manufacturer who have been receiving etanercept from a MTF and who wish to obtain their medication through the retail network, or who have separated from the military, to obtain enrollment numbers and receive etanercept through the NMOP or a retail network pharmacy. Patients who have not previously received etanercept (new starts) are subject to the same waiting list procedures as civilian patients. LTC De Groff reported that a letter addressing these procedures has been sent to the field by the pharmacy consultants/specialty leaders. A copy of the letter is available as Appendix D.

12. **CONTROLLED DISTRIBUTION OF DOFETILIDE (TIKOSYN) –** Because of specialized educational requirements mandated by the FDA, dofetilide is only available for outpatient use through Stadtlander's Pharmacy/CVS Procare (which is a non-network pharmacy for DoD beneficiaries). COL Davies reported that the biggest problem is that prime patients are being forced to pay the copay for a non-network pharmacy. He reported that there is a potential for developing a new payment mechanism to handle not just dofetilide, but also the increasing number of drugs with unique distribution systems. Efforts to establish such a payment mechanism are in progress.

13. **ADJOURNMENT –** The meeting adjourned at 1400 hours. The next meeting will be held at Ft Sam Houston, TX and is tentatively scheduled for 16 Aug 01 at 0800. All agenda items should be submitted to the co-chairs no later than 20 Jul 01.

List of Appendices

APPENDIX A: NEWLY APPROVED DRUGS CONSIDERED FOR THE NATIONAL MAIL ORDER PHARMACY FORMULARY AND DOD BASIC CORE FORMULARY

Generic name (Trade name; manufacturer)	FDA approval date, drug class, FDA-approved indication	NMOP Formulary Status	NMOP or retail network formulary restrictions	BCF Status
Ziprasidone capsules (Geodon; Pfizer)	5 Feb 01; atypical antipsychotic for the treatment of schizophrenia. Labeling for ziprasidone specifically notes that: "When deciding among the alternative treatments available for this condition, the prescriber should consider the finding of ziprasidone's greater capacity to prolong the QT/QTc interval compared to several other antipsychotic drugs." It is not known whether ziprasidone will cause torsade de pointes.	Added to NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** antipsychotics: haloperidol oral; no atypical antipsychotics
Galantamine tablets (Reminyl; Johnson & Johnson)	23 Feb 01; acetylcholinesterase inhibitor; indicated for the treatment of mild to moderate dementia of Alzheimer's disease	Added to NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class**: None
Bimatoprost ophthalmic solution, 0.03% (Lumigan; Allergan)	16 Mar 01; synthetic prostamide (prostaglandin analog); indicated for reduction of intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension; should be used in patients who cannot tolerate or have failed treatment with other IOP-lowering medications	Added to NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** Ophthalmic agents for glaucoma: timolol, brimonidine, and pilocarpine ophthalmic solutions; no prostaglandin analogs
Travoprost ophthalmic solution, 0.004% (Travatan; Alcon)	16 Mar 01; synthetic prostaglandin analog; indicated for reduction of intraocular pressure (IOP) in patients with open-angle glaucoma or ocular hypertension; should be used in patients who cannot tolerate or have failed treatment with other IOP-lowering medications	Added to NMOP Formulary	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** Ophthalmic agents for glaucoma: timolol, brimonidine, and pilocarpine ophthalmic solutions; no prostaglandin analogs

Generic name (Trade name; manufacturer)	FDA approval date, drug class, FDA-approved indication	NMOP Formulary Status	NMOP or retail network formulary restrictions	BCF Status
Insulin glargine [rDNA origin] injection (Lantus; Aventis)	20 Apr 00 (launched 21 May 01); long-acting (basal) insulin; indicated for once daily SQ administration at bedtime for treating adult and pediatric patients with type 1 diabetes mellitus, or adult patients with type 2 diabetes mellitus who require basal (long-acting) insulin for the control of hyperglycemia. **Note:** Insulin glargine is a clear solution that should not be mixed with other insulin products; use of insulin glargine does not eliminate the need for mealtime coverage.	Added to NMOP Formulary **Note**: The NMOP Covered Injectables list includes all forms of insulin and insulin analog products (i.e., Humalog)	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** Human insulin [rDNA origin} NPH, regular, 70/30 (Novolin brand only). There is a DoD/VA single source contract for the 10 mL bottles of these products (the contract also includes human lente insulin). The contract does not affect formulary status of other insulin products.
Comments about insulin glargine: The committee agreed that, while insulin glargine represents an advance in diabetes therapy and may be rapidly adopted by clinicians, it is too early to add it to the BCF. The PEC will monitor usage and will bring the item back to the committee for reconsideration if usage and demand for the product increase markedly and when clinicians have had a chance to become familiar with the product. The true potential advantage of basal insulin may only be realized when intranasal insulin becomes available, since this combination may allow even insulin dependent diabetics to limit subcutaneous injections to one daily.				
PEG-interferon alfa-2b powder for SC injection (PEG-Intron; Schering)	19 Jan 01; interferon product; indicated as once-weekly monotherapy of chronic hepatitis C in patients not previously treated with interferon alpha who have compensated liver disease, and who are at least 18 years old	Added to the NMOP Formulary **Note**: Interferon alfa products (Infergen, Roferon-A, Intron A) and combination interferon alfa/ribavirin (Rebetron) are on NMOP Covered Injectables list	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** None
Comments about Hepatitis C treatment: The VA representative, Mr. Dick Rooney, reported on the VA Chicago Health System's protocol for treatment of hepatitis C with ribavirin/interferon alfa 2b (Rebetron). Approximately 70% of patient with hepatitis C in North America are infected with genotype 1, which is less likely to respond to interferon treatment than genotypes 2 or 3. The VA performs a genotype test (which costs approximately $70) after the patient and provider have reached intention to treat. Patients with genotype 1 are then treated for one year, compared to six months for other genotypes. This both prevents unnecessary exposure to treatment that is unlikely to result in benefit and is cost-effective (cost savings of approximately $15,800 per 10 patients tested, not including avoidance of drug side effects and reduced provider visits and laboratory monitoring).				

Generic name (Trade name; manufacturer)	FDA approval date, drug class, FDA-approved indication	NMOP Formulary Status	NMOP or retail network formulary restrictions	BCF Status
Fluticasone / salmeterol powder for inhalation **100/50, 250/50, and 500/50 mcg per inhalation** (Advair Diskus; Glaxo SmithKline)	18 Aug 00; combination product containing an oral inhaled corticosteroid and a long-acting beta agonist; indicated for the long-term, twice-daily, maintenance treatment of asthma in patients 12 years of age and older. Advair is not indicated for the relief of acute bronchospasm.	Added to NMOP Formulary	**Quantity Limits** 1 inhaler (60 blisters) per 30 days (retail), 3 inhalers (180 blisters) per 90 days (NMOP) **Prior Authorization** No	Not added to BCF **BCF drugs in this class:** No other oral inhaled corticosteroid/beta agonist combination products exist; both fluticasone and salmeterol oral inhalers are on the BCF
Comments about fluticasone/salmeterol oral inhaler: The committee agreed that there is no evidence to support a clinically significant advantage (in terms of improved safety or efficacy) for the combination product compared to the two component products given separately. The combination product may be more convenient than two individual inhalers and may result in better compliance with therapy. On the other hand, the fixed dose combinations may make titration (including temporary increases in fluticasone dose during peak seasons, respiratory infections, etc.) more difficult. Advair is a dry powder Diskus device, which is substantially different from metered dose inhaler devices. Most use of fluticasone products in DoD is for the metered dose inhaled product, with minimal use of the currently available Flovent Diskus device. There is no price advantage to Advair compared to fluticasone and salmeterol given separately, although there may be cost efficiencies to MTF pharmacies (fewer prescriptions to fill) and patients (one less copay at NMOP or retail). Patent protection on fluticasone, the oral inhaled corticosteroid with the largest market share in DoD, is expected to expire in the latter part of 2003, although an "A-rated" generically substitutable product is unlikely due to environmental restrictions on production of chlorofluorocarbons (CFCs). The committee decided not to add this combination product to the BCF. The PEC will continue to monitor usage in this rapidly changing drug class.				
Formoterol fumarate powder for inhalation (Foradil; Novartis)	16 Feb 01; long-acting beta agonist; indicated for long-term, twice daily (morning and evening) administration in the maintenance treatment of asthma and in the prevention of bronchospasm in adults and children 5 years of age and older with reversible obstructive airways disease, including patients with symptoms of nocturnal asthma, who require regular treatment with inhaled, short-acting, beta2-agonists. It is not indicated for patients whose asthma can be managed by occasional use of a short-acting beta2-agonist. **Note:** formoterol has a more rapid onset of action than salmeterol (2-3 minutes vs. 10-15 minutes), previously the only available long-acting oral inhaled beta agonist. However, it is NOT a substitute for albuterol as a quick-relief medication.	Added to NMOP Formulary	**Quantity Limits** 1 inhaler (60 capsules) per 30 days (retail), 3 inhalers (180 capsules) per 90 days (NMOP) **Prior Authorization** No	Not added to the BCF **BCF drugs in this class:** salmeterol oral inhaler

Generic name (Trade name; manufacturer)	FDA approval date, drug class, FDA-approved indication	NMOP Formulary Status	NMOP or retail network formulary restrictions	BCF Status
Fluoxetine HCl 90-mg capsule (Prozac Weekly; Lilly)	26 Feb 01; selective serotonin reuptake inhibitor; indicated for the maintenance treatment of depression after an initial antidepressant response is obtained with once daily fluoxetine	Added to NMOP Formulary	**Quantity Limits** 4 capsules (one blister pack) per 30 days (retail); 12 capsules (3 blister packs) per 90 days (NMOP) **Prior Authorization** No	Excluded from BCF listing for fluoxetine. MTFs are not required to add Prozac Weekly to their formularies, but may do so if they so desire. **BCF drugs in this class:** citalopram, fluoxetine (excludes Sarafem), paroxetine, sertraline
Comments about fluoxetine 90-mg once-weekly capsule: Weekly administration of fluoxetine may represent a convenience advantage over once daily dosing, although this remains to be proven. The implications of once weekly dosing of medications for patient adherence to therapy are unknown. Plasma concentrations fluctuate to a much greater degree with once weekly dosing; the effect of patients missing once weekly doses or taking them a few days late may effectively equate to interruptions in therapy, even with the long half-life of fluoxetine. The pharmacokinetic effects, clinical consequences, and adverse effects associated with once weekly doses greater than 90 mg are unknown. The 90-mg capsule appears to be associated with more diarrhea than the 20-mg capsule, despite its delayed release formulation. The weekly formulation does not appear to be any more effective, and may be less effective, than once daily dosing. It is indicated only for maintenance treatment of depression. Prozac Weekly 90 mg once weekly costs less per month than Prozac 20 mg once daily. However, impending generic availability of fluoxetine (expected in Aug 01) and anticipated price decreases render this cost difference irrelevant, even without considering the uncertain clinical utility of this formulation of fluoxetine.				
Esomepra-zole (Nexium; AstraZeneca)	20 Feb 01; proton pump inhibitor (PPI); indicated for 1) short-term healing of confirmed erosive esophagits; 2) maintenance of healing of erosive esophagitis; 3) treatment of symptomatic gastroesophageal reflux disease (GERD); and 4) combination therapy with clarithromycin and amoxicillin for the eradication of Helicobacter pylori in patients with duodenal ulcer disease or a history of duodenal ulcer disease	Excluded from the NMOP Formulary as a non-contract drug. Prescriptions for esome-prazole may be filled through the NMOP only if documented medical necessity is established.	**Quantity Limits** General rule applies **Prior Authorization** No	Not added to the BCF. The PPI drug class is closed on the BCF. MTFs are required to have the contract agent (omeprazole) on their formularies and may not have any non-contract PPIs, including esomeprazole, on their formularies. Prescriptions for esomeprazole may be filled at MTFs only if documented medical necessity is established. **BCF drugs in this class:** omeprazole

Generic name (Trade name; manufacturer)	FDA approval date, drug class, FDA-approved indication	NMOP Formulary Status	NMOP or retail network formulary restrictions	BCF Status
Imatinib mesylate (Gleevec; Novartis)	10 May 01 (accelerated approval); protein-tyrosine kinase inhibitor (new drug class); oral once daily medication with a relatively favorable adverse effect profile; indicated for the treatment of patients with chronic myeloid leukemia (CML) in blast crisis, accelerated phase, or in chronic phase after failure of interferon-alpha therapy	Added to the NMOP Formulary	**Quantity Limits** Limited to 45 days supply in the NMOP; general rule applies in the retail network **Prior Authorization** No, monitor usage	Not added to the BCF **BCF drugs in this class:** None (there are no other drugs in this class). The only antineoplastic agents on the BCF are tamoxifen and methotrexate.

Comments about imatinib mesylate: This drug is an entirely novel antineoplastic agent. Imatinib inhibits the abnormal protein-tyrosine kinase that results from the Bcr-Abl gene rearrangement characteristic of chronic myelogenous leukemia (CML). This mechanism of action suggests that it would only be active against tumors that express this abnormal protein; however, it also has some activity against other protein-tyrosine kinases, some of which are constitutively expressed by other tumor types. It is currently approved only for use in CML; its use should be confined to those patients who are Philadelphia chromosome positive, since this indicates the presence of the Bcr-Abl gene.

Imatinib also has activity against the c-kit protein-tyrosine kinase that is constitutively expressed in at least 70% of small cell lung cancers and in virtually all gastrointestinal stromal tumors. *In vitro* studies have suggested that imatinib may have activity against small cell lung cancer, while a recent case report described a patient with a gastrointestinal stromal tumor who experienced a good partial response to therapy following treatment with imatinib that was maintained for at least 11 months. Imatinib has also demonstrated activity against the protein-tyrosine kinase activated by platelet-derived growth factor (PDGF) receptor that is activated abnormally in many brain tumors, No data are currently available that suggest efficacy in treating this condition. Animal studies suggest that imatinib may decrease the rate of restenosis of coronary arteries following angioplasty due to its inhibition of the protein-tyrosine kinase that is normally activated by PDGF following this procedure. There are therefore several additional conditions for which there are very limited data suggesting the possibility of benefit.

Imatinib capsules are dosed once daily, and are relatively well tolerated in comparison to other chemotherapeutic regimens. The monthly cost of therapy based on FSS prices ranges from approximately $1,500 (chronic CML) to $2,200 (treatment of CML in accelerated phase or blast crisis). Because of the limited scope of the available published clinical trials, the optimal duration of treatment remains undefined.

Members of the committee expressed concern over several factors that increase the potential for this product to be used for other than FDA approved indications. These include: the publicity in the lay press surrounding imatinib's release, the possibility that this drug may have efficacy in other malignancies, and the pressure from patients with other malignancies who have failed conventional therapy and have few or no remaining alternatives for treatment. 32 CFR 199.4(g)(15) states in part: "CHAMPUS can also consider coverage of unlabeled or off-label uses of drugs that are Food and Drug Administration (FDA) approved drugs that are used for indications or treatments not included in the approved labeling. Approval for reimbursement of unlabeled or off-label uses requires review for medical necessity, and also requires demonstrations from medical literature, national organizations, or technology assessment bodies that the unlabeled or off-label used of the drug is safe, effective and in accordance with nationally accepted standards of practice in the medical community."

Concern was also expressed that unmonitored use of imatinib might result in a delay in appreciating its value in treating other conditions. The committee discussed the possibility of instituting a prior authorization for this medication in the NMOP and retail network in order to minimize inappropriate use while allowing identification of additional indications. The proposed wording of the requirement for authorization was stated as, "treatment of an FDA-approved indication, or enrollment in an NCI-approved clinical trial". However, the committee was then reminded that 32 CFR 199.4 also excludes coverage for "services and supplies provided as a part of or under a scientific or medical study, grant, or research program." It was pointed out that the lack of a prior authorization does not prevent MCSC Utilization Management Programs from ensuring that prescribed therapy complies with TRICARE rules. The Committee appreciated that strict application of TRICARE rules will likely engender strong objections from patients and prescribers in this situation. Also, with over 350 new oncology drugs currently undergoing clinical trials, it was understood that this question would likely surface repeatedly in the future. The Committee felt that input from a higher level within TMA would be valuable in assisting them in determining how best to deal with this issue.

The committee approved placing imatinib on the NMOP formulary without a requirement for prior authorization. A quantity limit of a 45-day supply was established to minimize waste without overly burdening patients. Without a PA, the NMOP will not collect data on diagnoses of patients prescribed the drug. The PEC will monitor usage and report at the next meeting.

APPENDIX B: CUMULATIVE SUMMARY OF COST AVOIDANCE ASSOCIATED WITH THE NATIONAL MAIL ORDER PHARMACY (NMOP) PREFERRED DRUG PROGRAM

Program Summary

- Program started in June 1999 with 8 preferred/non-preferred groups and ended 31 Mar 01 as a result of increased prescription volume related to expansion of the DoD pharmacy benefit to allow all DoD beneficiaries 65 years of age or older access to the NMOP and retail network. Calls will continue for diltiazem due to the existence of the national contract for Adalat CC.
- During these 22 months, the program resulted in a total cost-avoidance of $2,841,647. A total of 31,574 attempted prescriber contacts were made to request switches from non-preferred drugs to preferred alternatives. The estimated cost-avoidance per attempted provider contact was $90.

Cumulative Table: Summary of Switch Rates and Estimated Cost Avoidances Jun 99 – Mar 01*

Non-Preferred Drug	Preferred Drug	Switch Rate	Estimated Cost Avoidance	Total Number of Attempted Provider Contacts*	Estimated Cost Avoidance per Attempted Provider Contact**	Annualized Estimated Cost Avoidance
Cardizem CD Dilacor XR, Diltia XT, Diltiazem XR	Tiazac	69%	$905,784	6392	$142	$494,064
Procardia XL[1]	Adalat CC	51%	$417,508	2097	$199	$227,732
Lodine XL, Relafen, Voltaren XR, DayPro, Naprelan	Generic NSAIDs	30%	$724,985	7791	$93	$395,446
H2 Blockers[2]	Generic Ranitidine	40%	$437,715	3749	$117	$238,754
Enalapril (Vasotec)[3]	Zestril	48%	$141,304	2741	$52	$77,075
Famvir, Valtrex[4]	Acyclovir	23%	$11,081	1670	$7	$6,044
Pletal[5]	Pentoxifylline	12%	$3,424	280	$12	$1,868
Ditropan XL, Detrol	Generic oxybutynin	29%	$199,846	6854	$29	$109,007
		Total	$2,841,647	31,574	$90	$1,549,990

* Assumes that each new prescription received for a non-preferred drug resulted in one attempted provider contact.

** Calculated as the total cost avoidance Oct 00 – Mar 01 divided by the total number of attempted provider contacts made for non-preferred drugs in this class during the same period.

1. Calls for Procardia XL diminished significantly (from 135 per month in Jun 00 to 7 per month in Dec 00), due to the introduction of generic equivalents for some strengths of Procardia XL. Calls for Procardia XL were discontinued as generic equivalents became available.
2. Implemented Dec 99
3 Implemented Feb 00. Vasotec was removed from the list of non-preferred drugs when a generic equivalent became available at a competitive price in Oct 00.
4. At the May 00 meeting, the committee changed the criteria for Famvir and Valtrex so that calls would be made only for prescriptions written for chronic use (> 30 day supply). This change took effect 1 July 00.
5. Implemented Feb 00. Removed from the list of non-preferred drugs at the Aug 00 meeting (effective Sep 00), due to a low switch rate.

APPENDIX C: COMBINED SUMMARY OF FORMULARY CHANGES FROM THE DOD P&T EXECUTIVE COUNCIL MEETING AND THE DOD P&T COMMITTEE MEETING

1. **BCF CHANGES**

   A. *Additions to the BCF*

      1) Fluocinonide 0.05% cream

   B. *Changes and clarifications to the BCF*

      1) The BCF listing for digoxin oral was changed to remove the specific brand designation for brand name Lanoxin.
      2) The BCF listing for doxycycline oral was clarified to exclude doxycycline 20-mg capsules (Periostat).
      3) The BCF listing for methylphenidate oral was clarified to exclude Metadate CD.
      4) The BCF listing for triamcinolone acetonide 0.1% topical was clarified to specify triamcinolone 0.1% cream.

2. **NMOP FORMULARY CHANGES**

   A. *Additions to the NMOP Formulary* (See Appendix A)

      1) Low Molecular Weight Heparins (dalteparin, enoxaparin, tinzaparin)
      2) Ziprasidone (Geodon; Pfizer)
      3) Galantamine (Reminyl; Johnson & Johnson)
      4) Bimatoprost ophthalmic solution, 0.03% (Lumigan; Allergan)
      5) Travoprost ophthalmic solution, 0.004% (Travatan; Alcon)
      6) Insulin glargine [rDNA origin] injection (Lantus; Aventis)
      7) PEG-interferon alfa-2b powder for SC injection (PEG-Intron; Schering)
      8) Fluticasone/salmeterol powder for inhalation (Advair Diskus; Glaxo SmithKline)
      9) Formoterol fumarate powder for inhalation (Foradil; Novartis)
      10) Fluoxetine hydrochloride 90-mg capsule (Prozac Weekly; Lilly)
      11) Imatinib mesylate (STI-571) (Gleevec; Novartis)

   B. *Exclusions from the NMOP Formulary*

      1) Esomeprazole (Nexium; Astra Zeneca)

   C. *Changes to the NMOP Preferred Drug Program*

      1) The NMOP Preferred Drug Program was discontinued 31 Mar 01. Calls requesting switches for non-contracted brands of diltiazem extended release (e.g., Cardizem CD, Dilacor XR, Diltia XT, Cartia XT, and generics) to the contract agent (Tiazac) will continue.

3. **QUANTITY LIMIT CHANGES (NMOP AND RETAIL NETWORK)**

   A. Fluticasone/salmeterol powder for inhalation (Advair Diskus; Glaxo SmithKline) - 1 inhaler (60 blisters) per 30 days (retail), 3 inhalers (180 blisters) per 90 days (NMOP)
   B. Formoterol fumarate powder for inhalation (Foradil; Novartis) - 1 inhaler (60 capsules) per 30 days (retail), 3 inhalers (180 capsules) per 90 days (NMOP)
   C. Fluoxetine hydrochloride 90-mg capsule (Prozac Weekly; Lilly) - 4 capsules (one blister pack) per 30 days (retail); 12 capsules (3 blister packs) per 90 days (NMOP)
   D. Imatinib mesylate (STI-571) (Gleevec; Novartis) - Limited to 45 days supply in the NMOP; general rule applies in the retail network

4. **CHANGES TO THE PRIOR AUTHORIZATION PROGRAM (NMOP AND RETAIL NETWORK) –** None

APPENDIX D: ENBREL ENROLLMENT LETTER

ENBREL ENROLLMENT PROCESS

The following procedures should be used when dealing with patients on Enbrel (etanercept) in the Department of Defense medical treatment system. These procedures will remain in place until the DOD is notified by Immunex and/or Wyeth that they have changed. These procedures are based on current inventories of product.

1. Patients who were on Enbrel therapy before January 1, 2001 who enrolled in the Enbrel Enrollment Program and received a registration number will keep this number in the Immunex system. These patients will not be disenrolled by Immunex, although their number will remain "inactive" if they are receiving product through an MTF pharmacy or the NMOP mail order system. In some instances the NMOP system may require this number. If this is the case, Immunex will activate the number. This number will be used if the patient is receiving product through the retail pharmacy network program.

2. Patients who are receiving Enbrel therapy from a MTF pharmacy who are required to move for military or personal reasons (i.e. PCS, TDY assignments, relocations) and who prefer to continue to receive product from either an MTF pharmacy or the NMOP mail order system should notify the pharmacy from where they are moving. This pharmacy should contact Warren H. Yeager, R.Ph., National Account Manager-Federal Government, Wyeth-Ayerst Labs @ 1-888-685-5961 ext. 76924 and notify him of the new location of the patient. This will keep track of product at the different delivery systems throughout the DOD.

3. DOD patients who choose the retail pharmacy network option for obtaining Enbrel.

    - If these patients have already enrolled in the program and have a registration number and have been receiving product there will be no change in the process.

    - Because of the portability of the prescription in the DOD, if an Enbrel patient chooses to change from an MTF or NMOP to the retail option to have their script filled and does not have an enrollment number, the dispensing pharmacist will have to "opt out" of the confirmation process. The term "opt out" is recognized by the retail pharmacy network and is put in place to have the retail pharmacy contact HDS McKesson (1-888-436-2735) when this situation presents itself. HDS McKesson personnel are aware of this scenario. If the patient has an "inactive" number, this number will be activated by HDS McKesson and the patient will receive the medication. If the patient does not have a number, HDS McKesson will assign a number and the patient will receive the medication.

4. Patients who transfer from the DoD to the private sector due to separation.

    - Because these patients are already "accounted for" in the overall enrollment process they will be given an active enrollment number at the time of separation. The patient will need to call HDS McKesson @ 1-888-436-2735 and identify themselves as an existing patient transferring from DoD to the private sector due to release from Active military service. HDS McKesson will verify DoD eligibility and assign an enrollment number that will allow the patient to continue to receive the medication. HDS McKesson can verify the patient's DoD eligibility and medication history by calling the PDTS CSSC @ 1-800-600-9332, press #1, then select option #1 a second time.

5. Wait list procedures for adding new patients to the DOD program.

    - Patients will follow the same procedures as patients in the civilian community. They will need to call 1-888-436-2735(1-888-4ENBREL). They will be placed on the waiting list and given a "inactive" registration number.

Department of Defense
Pharmacoeconomic Center

1750 Greeley Rd., Bldg. 4011, Rm. 217
Fort Sam Houston, TX 78234-6190

MCCS-GPE **6 June 2001**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The DoD P&T Executive Council met from 0800 to 1215 hours on 6 June 2001 and from 0800 to 0900 hours on 7 Jun 2001, at the Uniformed Services University of the Health Sciences, Bethesda, MD. The DoD P&T Executive Council is responsible for performing certain inherently governmental functions relevant to the DoD pharmacy benefits program. The Council focuses primarily on issues related to the Basic Core Formulary (BCF), national pharmaceutical contracts, and blanket purchase agreements. The DoD P&T Executive Council is comprised of federal employees who are members of the DoD P&T Committee.

2. MEMBERS PRESENT

CDR Terrance Egland, MC	DoD P& T Committee Co-chair
COL Daniel D. Remund, MS	DoD P& T Committee Co-chair
COL John R. Downs, MC	Air Force
LtCol (select) George Jones, BSC	Air Force
CAPT (select) Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
LTC (P) Joel Schmidt, MC	Army
MAJ Brett Kelly, MS	Army
CAPT Chuck Bruner	Coast Guard
Dick Rooney	Department of Veterans Affairs
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia
LtCol Greg Russie, BSC	Joint Readiness Clinical Advisory Board representative

MEMBERS ABSENT

COL Bill Sykora, MC	Air Force
COL Rosa Stith, MC	Army

OTHERS PRESENT

COL William Davies, MS	DoD Pharmacy Program Director, TRICARE Management Activity
COL Mike Heath, MS	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
COL Ardis Meier, BSC	Air Force Pharmacy Consultant
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
CAPT Pat Welter, MSC	Navy Bureau of Medicine & Surgery
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
MAJ Barbara Roach, MC (by teleconference)	DoD Pharmacoeconomic Center
LT David Hardy, MSC	TRICARE Management Activity
Angela Allerman (by teleconference)	DoD Pharmacoeconomic Center
Howard Altschwager	Deputy General Counsel, TRICARE Management Activity
Jonathan Blaker	TRICARE Management Activity
Bill Chamberlain	Defense Supply Center Philadelphia
Shana Trice	DoD Pharmacoeconomic Center
Vincent Valinotti	Defense Supply Center Philadelphia
Paul Vasquez	Defense Supply Center Philadelphia

3. REVIEW MINUTES OF LAST MEETING

The minutes were approved as written.

4. ADVANCES IN MEDICAL PRACTICE (AMP) PROGRAM

All AMP funds remain "on hold" at TMA due to funding shortfalls in the Defense Health Program. If AMP funds are released, the PEC is prepared to provide usage and cost data to facilitate reimbursement of MTFs for expenditures on AMP drugs. Based on prime vendor data, MTFs spent $25,831,626 on AMP drugs during the first six months of FY 01 (see Appendix A).

5. REVIEW OF COX-2 INHIBITORS

The committee reviewed usage and cost data for COX-2 selective nonsteroidal anti-inflammatory drugs ("COX-2 inhibitors") and other nonsteroidal anti-inflammatory drugs (NSAIDs):

- Data from the Pharmacy Data Transaction Service from 1 Apr 01 to 25 May 01 indicated that market share for COX-2 inhibitors in MTFs has increased to 14% of all prescriptions for NSAIDs. Market shares for COX-2 inhibitors in the retail networks and the NMOP were 58% and 74% respectively (see table following).

	MTFs	MCSC retail network	NMOP
Number of prescriptions and percent of prescriptions for NSAIDs			
COX-2 inhibitors	56,822 (14%)	72,654 (58%)	25,525 (74%)
Traditional NSAIDs	345,621 (86%)	53,245 (42%)	8,853 (26%)
Total number of prescriptions for NSAIDs	402,443	125,899	34,378
Number of patients and percent of patients using NSAIDs			
COX-2 inhibitors	44,963 (13%)	54,151 (58%)	23,454 (75%)
Traditional NSAIDs	289,313 (87%)	39,946 (42%)	7,907 (25%)
Total number of patients using NSAIDs	334,276	94,097	31,361

Note: time period is 4/1/01 through 5/25/01; data from the Pharmacy Data Transaction Service Customer Service Support Center

- The PDTS data are consistent with data from the Uniformed Services Prescription Database (USPD), which indicated a 14% market share (by prescription volume) for COX-2 inhibitors at MTFs as of March 2001. TRICARE region market shares for COX-2 inhibitors ranged from less than 5% to more than 20%.
- According to prime vendor data, MTFs spent $19.1 million on NSAIDs during the first 6 months of FY 01, which is 84% more than the $10.4 million spent during the first 6 months of FY 00. The average unit cost of NSAIDs purchased by MTFs rose from $0.06 in October 98 to $0.22 in March 01.

The Council agreed that management of the COX-2 inhibitors should ideally focus on two issues:

- COX-2 inhibitor therapy should be targeted accurately and efficiently to those patients at greatest risk for GI adverse events
- DoD should reduce the unit cost of COX-2 inhibitors

DoD faces difficulty in trying to address these two issues simultaneously. A closed class contract that offers BCF status for a COX-2 inhibitor could possibly achieve a significant price reduction, but many MTFs do not want COX-2 inhibitors to be added to the BCF. These MTFs do not have a COX-2 inhibitor on their formularies because they do not have sufficient funding and/or they want to target therapy by using the non-formulary special order process to provide COX-2 inhibitors only to patients who are at greatest risk for GI adverse events. The Council agreed that:

- The PEC should continue data analysis and provide feedback to MTFs to assist them in targeting therapy
- MTFs should analyze utilization and cost of COX-2s at the local level
- The PEC should obtain feedback from MTFs concerning methods they use to target COX-2 therapy and the accuracy and efficiency of those methods.
- A contract for COX-2 inhibitors should be pursued only if there is a mechanism to target therapy to patients who are at greatest risk for GI adverse events.

6. NATIONAL PHARMACEUTICAL CONTRACTS AND BLANKET PURCHASE AGREEMENTS (BPAs)

A. *Contract awards and renewals*

- The first joint DoD/VA closed class contract was awarded to Aventis Pharmaceuticals for the non-sedating antihistamine fexofenadine (Allegra) 60- and 180-mg tablets. The PEC previously issued implementation guidance for the non-sedating antihistamine contract (see Appendix B).
- DoD/VA single source contracts were awarded for the following drugs.
  - Ethinyl estradiol 35-mcg/norethindrone 1-mg tablets (Norinyl 1/35), 21s and 28s, to Watson Pharma
  - Norethindrone 35-mcg tablets (Nor-Q-D), 28s, to Watson Pharma
  - Ethinyl estradiol 35-mcg/1-mg ethynodiol diacetate (Demulen 1/35), 28s, to Pharmacia Corp.
  - Etodolac 200-, 300-mg capsules and 400-mg tablets, to Taro Pharmaceuticals
  - Hydrochlorothiazide 25-mg/50-mg tablets, to IVAX Pharmaceuticals (formerly Zenith-Goldline)
  - Prednisone 2.5-, 5-, 10-, 20-, and 50-mg tablets, to Pharmacia Corp.
  - Isosorbide mononitrate SA 30-, 60-, and 120-mg tablets, to Schwarz Pharma
  - Valproic Acid 250-mg capsules, to Sidmak Labs
  - Capsaicin 0.025% and 0.075% cream, to Qualitest Pharmaceuticals
  - Ticlopidine 250-mg tablets, to Par Pharmaceuticals
- As of 1 Jun 01, 44 joint VA/DoD national contracts have been awarded. Information on national pharmaceutical contracts, including NDC numbers and prices, is available on the DSCP website (www.dmmonline.com).

B. *Financial impact of contracts* – The estimated MTF cost avoidance due to national pharmaceutical contracts was $43.3 million for the first six months of FY 01. The $43.3 million in cost avoidance equals 7.9% of the $547.2 million that MTFs spent on pharmaceuticals through prime vendors during the first six months of FY 01. A summary of cost avoidance from national pharmaceutical contracts for FY 01 is provided in Appendix C.

C. *Report on Returned Goods Contract* – MAJ Cheryl Filby (DSCP) reported that, as of 5 June 01, 89 DoD facilities have signed up for the joint VA/DoD returned goods contract, which was awarded to Guaranteed Returns in Jan 01. More information on the Pharmaceutical Returns Management Program is available on the DSCP website at: http://dscp305.dscp.dla.mil/ dmmonline/pharm/return_program.asp

D. *Proton pump inhibitor contract* – Significant price reductions recently occurred in the proton pump inhibitor (PPI) market. Janssen lowered the FSS price of rabeprazole (Aciphex) to $0.22 per dose. In response to the market changes, the VA and TAP Pharmaceuticals have mutually agreed to cancel the VA's national contract for

lansoprazole (Prevacid) in favor of a BPA that sets the price for both strengths of lansoprazole at $0.55. Lansoprazole will remain on the VA National formulary, but the PPI class is now "open," so VA facilities may use other PPIs.

The DoD national contract price for omeprazole (Prilosec) is $1.09 per dose. The current option year expires on 30 Sep 01. The DoD P&T Executive Council strongly urges DSCP to negotiate a termination of the DoD national contract for omeprazole in a manner similar to what the VA negotiated.

E. *Potential contract for nasal corticosteroid inhalers* – The Council reiterated its support for establishing a joint VA/DoD closed class contract for a high potency aqueous nasal corticosteroid inhaler. Usage of nasal corticosteroid inhalers by pediatric patients should be taken into account in the contracting initiative.

F. *Potential contract for low molecular weight heparins/heparinoids (LMWHs)* — A closed class contract for a single LMWH for the outpatient treatment and prophylaxis of deep venous thrombosis (DVT) has been proposed. The Council assessed the therapeutic interchangeability of enoxaparin (Lovenox) and dalteparin (Fragmin) for outpatient treatment of DVT and prophylaxis of DVT and/or pulmonary embolism (PE) following hip or knee replacement surgery.

1) *Safety/Tolerability*

- Potential tolerability differences between the products are typically related to issues of administration (e.g., available syringe sizes) and are expected to be of relatively minor importance.
- The most important complication of anticoagulant therapy is bleeding. In a single head-to-head trial for prophylaxis of DVT following surgical repair of hip fracture, the incidence of major bleeding was 1/66 (1.5%) for dalteparin and 2/66 (3.0%) for enoxaparin. This was a small pilot study and may not represent the true incidence of major bleeding with either drug.
- Meta-analyses have found no significant difference between major bleeding rates with LMWHs and UFH, although differences have been reported in individual trials. In large clinical trials, major bleeding rates with UFH ranged from 0 to 7%, compared to 0 to 3% for LMWHs. It is difficult to draw any conclusion about the relative propensities of enoxaparin versus dalteparin to cause bleeding because of the lack of head-to-head data, differences in patient populations, dosing and regimen differences, and differences in how bleeding was defined across clinical trials.
- Enoxaparin and dalteparin are Pregnancy Category B and, unlike warfarin, are generally considered to be safe in pregnant patients requiring anticoagulation. According to case reports, patients with contraindications to warfarin have tolerated long-term use of dalteparin (2 months to 10 years) and enoxaparin (3 to 6 months).

2) *Efficacy for Outpatient Treatment of DVT*

- Enoxaparin is approved by the FDA for outpatient and inpatient treatment of DVT. Dalteparin is not approved by the FDA for treatment of either outpatient or inpatient treatment of DVT.
- There are no head-to-head trials comparing enoxaparin with dalteparin for treatment of DVT in either the inpatient or outpatient setting.
- *Enoxaparin vs. UFH* – Three large, well-conducted trials (two in the inpatient and one in the outpatient setting) compared enoxaparin with UFH for the treatment of DVT in a total of 917 patients. One trial also included patients with PE. No significant difference was noted in recurrent DVT/PE in the outpatient trial: enoxaparin 13/247 (5.3%); UFH, 17/254 (6.7%). However, only 33% of screened patients were considered eligible for study enrollment, and the studied population was generally at low risk for bleeding and did not have co-morbidities.
- *Dalteparin vs. UFH* – There are 11 published trials with dalteparin (seven in the inpatient and four in the outpatient setting) in a total of 1538 patients. However, while inpatient trials compared dalteparin with UFH, outpatient trials with dalteparin have not included an UFH comparison group. In a large (n=434), nonrandomized trial of dalteparin for the outpatient treatment of DVT, there were 7 cases of recurrent DVT (1.6%). These patients were considered to be at relatively low risk for bleeding and recurrent DVT/PE.
- Although most trials compared either dalteparin or enoxaparin to UFH, dalteparin trials were generally smaller and sometimes included patients with distal (calf vein) as well as proximal DVT (proximal DVT has a higher complication rate). Trials with enoxaparin primarily enrolled patients with proximal DVT. In addition, some of the dalteparin trials used surrogate efficacy measures (such as changes in thrombus size pre- and post-treatment) instead of clinical endpoints (such as incidence of recurrent DVT/PE). Comparison of the efficacy of the two drugs for outpatient treatment is further complicated by differences in patient populations (e.g., inclusion of patients with co-morbidities such as cancer, who are at increased risk for DVT/PE) resulting from differences in how patients were considered eligible for outpatient treatment.

3) *Efficacy for Prophylaxis of DVT Following Hip Replacement Surgery*

- Both enoxaparin and dalteparin are FDA-approved for DVT prophylaxis following hip replacement surgery.
- There are no head-to-head trials comparing enoxaparin with dalteparin in hip replacement surgery. Two trials compared dalteparin with warfarin and one trial compared enoxaparin with warfarin following hip replacement surgery. The incidence of symptomatic DVT/PE was lower with the LMWH than with warfarin in all three trials. There is insufficient evidence to conclude that enoxaparin and dalteparin differ significantly in efficacy for DVT prophylaxis following hip replacement surgery.

4) *Efficacy for Prophylaxis of DVT Following Knee Replacement Surgery*

- Of the two drugs, only enoxaparin is FDA-approved for DVT prophylaxis following knee replacement surgery.
- There are no head-to-head trials of enoxaparin and dalteparin for DVT prophylaxis. One double-blinded trial comparing enoxaparin and warfarin for DVT/PE prophylaxis following total knee replacement showed significantly fewer recurrent DVTs with enoxaparin compared to warfarin. There are no published trials that assess the efficacy of dalteparin for this indication.

5) *Other Factors*

- Enoxaparin is available as prefilled syringes in a wide range of dosages, which is an advantage for outpatient use. Dalteparin has only been available in pre-filled syringes in two dosages (2500- and 5000-U per 0.2 mL) and in a 10,000 U/mL multidose vial. Neither the prefilled syringes nor the multidose vial are optimal for the higher doses used for DVT treatment, which may require multiple injections. The manufacturer of dalteparin anticipates introduction of a higher concentration multidose vial and 7500- and 10,000-U prefilled syringes.
- Articles in the pharmacy literature report on at least two health systems that have changed from enoxaparin to dalteparin using a therapeutic interchange program. The program at one institution includes only DVT treatment and prophylaxis. Patients receiving enoxaparin for knee replacement surgery and cardiology indications are excluded. A preliminary drug usage evaluation comparing rates of recurrent DVT/PE and major bleeding between dalteparin and enoxaparin supported the feasibility of the therapeutic interchange program, but no outcome data are available. Another institution replaced enoxaparin with dalteparin in 1996 as the sole LMWH on the formulary for prophylaxis of DVT/PE following orthopedic and abdominal surgery. Rates of recurrent DVT/PE and major bleeding seen with dalteparin were comparable to those that would have been expected with enoxaparin.
- A total of 8298 LMWH prescriptions were filled at MTFs in FY 2000. Approximately 96% of these were for enoxaparin.
- *Input from MTF providers* – Because of the morbidity and mortality associated with DVT and PE, the PEC sent its clinical review of LMWHs and a survey requesting input regarding the therapeutic interchangeability of the LMWHs to 30 providers in Internal Medicine, Cardiology, Hematology/Oncology, Ob/Gyn, Emergency Medicine, Orthopedics, and Family Practice. A total of 12 surveys (40%) were returned. Three other physicians also provided comments. Survey results are summarized in the following table:

	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree
There are at least 2 LMWH products they would feel comfortable prescribing for DVT prevention/ treatment.	0	8	0	3	1
Providers would accept a contract for dalteparin for DVT prevention/treatment.	1	4	2	3	2
Providers would accept a contract for tinzaparin for DVT prevention/treatment.	0	4	1	5	2
Enoxaparin is used more because of familiarity than superiority.	1	4	0	5	0
Dalteparin is equal to enoxaparin for VTE treatment despite the lack of FDA approval.	0	6	0	3	2
Respondents would be more likely to be sued if a bad outcome occurred after prescribing dalteparin.	3	4	2	2	0

Given the morbidity and mortality associated with DVT/PE, the Council requires a high degree of certainty about the interchangeability of the drugs for these indications. The Council found insufficient data to confidently conclude that enoxaparin and dalteparin are equally efficacious for the outpatient treatment and prophylaxis of DVT. Although the survey of MTF providers revealed some support for a closed class contract, the responses showed insufficient support to pursue such a contract. The Council concluded that enoxaparin and dalteparin are not sufficiently interchangeable for a closed class contract for the outpatient treatment and prophylaxis of DVT.

G. *Role of the DoD P&T Executive Council in BPA development* –MAJ Cheryl Filby reported the recommendations of the subcommittee regarding the role of the DoD P&T Executive Council in the BPA development process. The Council voted to accept the subcommittee's recommendations:

- DSCP will coordinate all proposed DoD and DoD/VA blanket purchase agreements with the DoD P&T Executive Council (or the PEC acting on behalf of the Council) to ascertain whether the terms and conditions are in accord with the Council's strategy for managing the pertinent drug class. The DoD P&T Executive Council will accept or reject the terms of the agreement.
- If the P&T Executive Council accepts the agreement, DSCP will then be responsible for the content of the agreement in regard to legal and contractual sufficiency.
- Individual MTFs and TRICARE regions may continue to negotiate facility-specific incentive agreements. However, MTFs and TRICARE regions are encouraged to forward any agreements to DSCP for a review of legal sufficiency.

H. *Levofloxacin BPA* – At the Feb 01 meeting the Council asked DSCP to eliminate unacceptable provisions from the levofloxacin (Levaquin) BPA. The Council reviewed a revised BPA for levofloxacin and found that the unacceptable provisions had been eliminated. The BPA offers levofloxacin 250 mg and 500 mg to all MTFs for $2.00 per tablet. Continuation of the $2.00 price is contingent upon levofloxacin achieving either (1) an 80% aggregate DoD market share by 1 Aug 01, or (2) a 50% market share at individual MTFs. Market share will be based on patient days of therapy calculated from

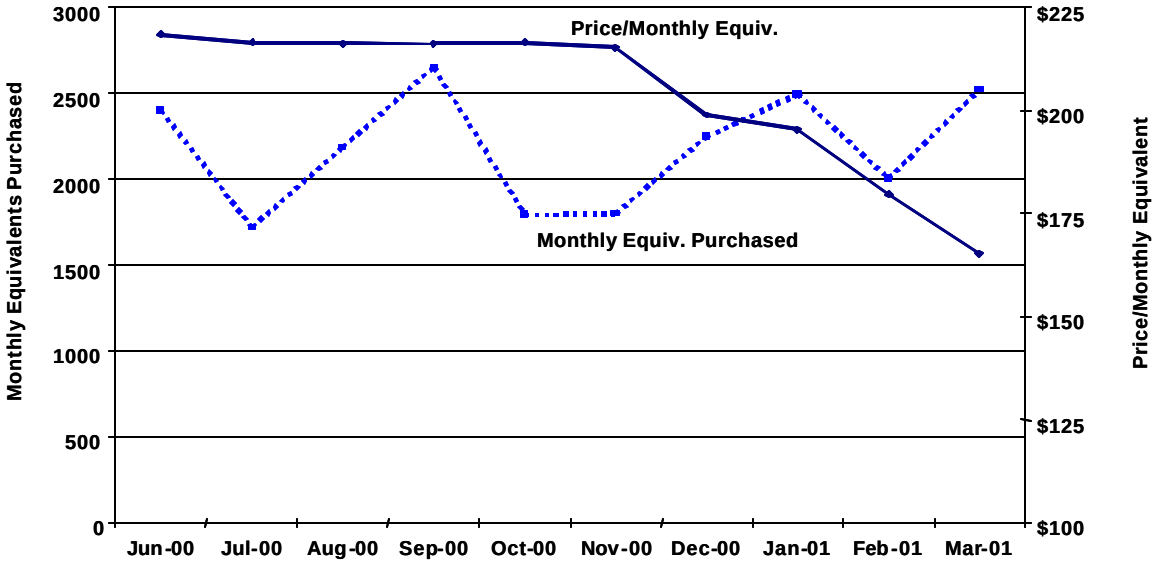
Uniformed Services Prescription Database (USPD) data. Levofloxacin is the only fluoroquinolone on the BCF, but the drug class remains "open," so MTFs may have additional fluoroquinolones on their formularies. As of April 2001, the aggregate market share for levofloxacin was approximately 77%.

I. *Status of BPAs for leutinizing hormone releasing hormone (LHRH) agonists* – A BPA makes goserelin (Zoladex) available to MTFs at the VA national contract price in exchange for attainment of an 80% overall share of the MTF prescriptions for LHRH agonists for prostate cancer by 1 Sep 2001.

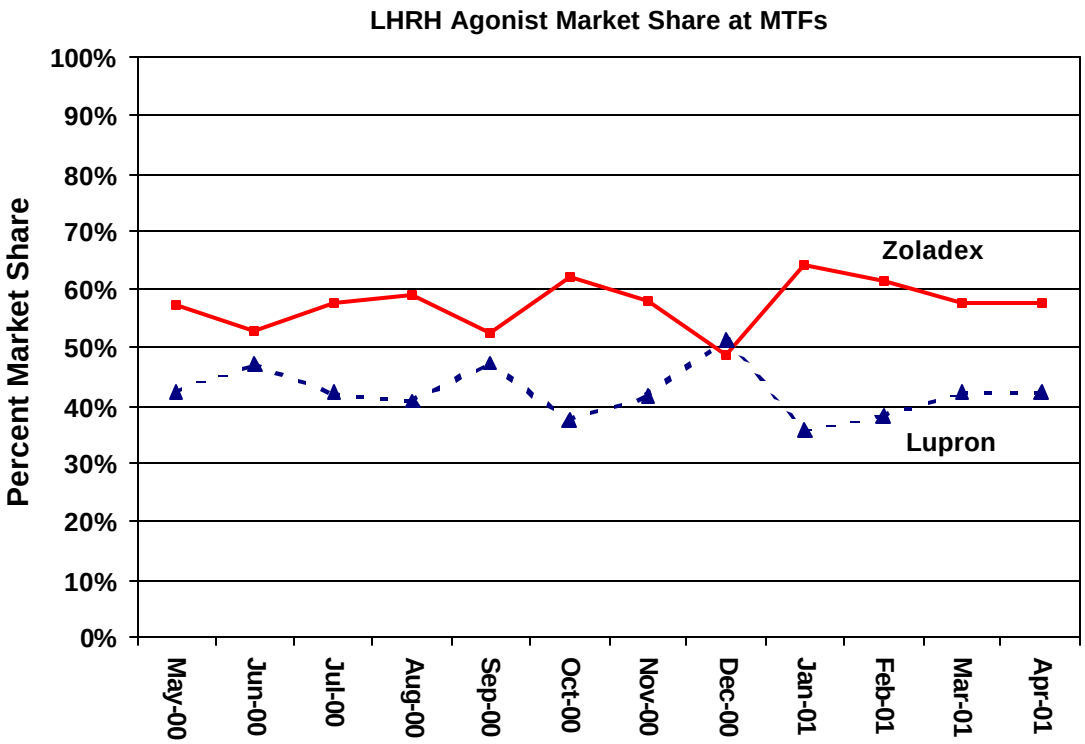
A BPA from TAP Pharmaceuticals makes leuprolide (Lupron) 1, 3, and 4-month depots available at a cost per dose just slightly higher than Zoladex. TAP modified the BPA in May 2001 so that the BPA price is available without any market share requirements (the original BPA required that Lupron attain an 80% market share within 6 months).

The Zoladex and Lupron BPAs have reduced the weighted average cost per monthly equivalent of LHRH agonist therapy for prostate cancer by 23% from $215 in Nov 00 to $165 in Mar 01. The BPAs yielded $294,000 in cost avoidance for MTFs from Nov 00 to Mar 01.

LHRH Agonist Price per Monthly Equivalent and Purchases at MTFs



Market share trends suggest that the 80% market share goal for Zoladex will probably not be achieved (see graph below). The Council asked DSCP and the PEC to talk with Astra Zeneca about the potential extension of the BPA price beyond August 2001 even if the 80% market share goal is not achieved.



The VA contract for Zoladex expires in February 2002. The Council asked the PEC to assess the potential for a contracting action for LHRH agonists for prostate cancer and present a recommendation at the August 2001 P&T Executive Council meeting.

J. *Proposed BPA for metformin/glyburide (Glucovance; BMS) and glyburide extended release (Glucophage XR; BMS)* – Bristol Myers Squibb (BMS) proposed a BPA that would reduce the price of Glucovance and Glucophage XR if they were added to the Basic Core Formulary. BMS also promised to further reduce the price of Glucovance and Glucophage XR to meet or beat any price offered on generic metformin until which point the generic metformin price falls below a price at which BMS can no longer compete. The proposed BPA did not specify the price at which BMS can no longer compete.

The Council concluded that there is insufficient evidence to prove conclusively that the extended release and combination dosage forms offer a clinically significant advantage regarding safety, tolerability, or efficacy over immediate release metformin or immediate release metformin plus generically available glyburide. While the proposed BPA would provide an economic benefit to DoD in the short run, it might be costly in the long run. DoD would benefit economically from the BPA until generic versions of metformin become available at a price below the BMS price protection point. If and when the price of generic metformin falls below the BMS price protection point, DoD would forgo the savings that could have been accrued through the use of the lower priced generic metformin because patients taking Glucovance or Glucophage XR would not likely switch back to generic metformin.

The current market share for various metformin products in MTF pharmacies, retail network pharmacies, and the NMOP are shown in the following table:

Number and percent of patient obtaining Rxs for various metformin products	MTFs	MCSC retail network	NMOP
Metformin (Glucophage)	42,756 (94%)	9,917 (72%)	4,912 (78%)
Extended release metformin (Glucophage XR)	2,401 (5%)	1872 (14%)	673 (11%)
Metformin/glyburide (Glucovance)	389 (1%)	1925 (14%)	722 (11%)
Totals	45,546	13,714	6,307

Note: time period is 4/1/01 through 5/25/01; data from the Pharmacy Data Transaction Service Customer Service Support Center

Since 94% of MTF patients using metformin products are currently using immediate release metformin (Glucophage), DoD has the potential to realize significant cost savings if these patients are treated with inexpensive generic versions of metformin in the future. The Council advised DSCP to reject the proposed BPA. The Council's rejection of the proposed BPA does not preclude an MTF from adding Glucovance or Glucophage XR to its formulary. MTFs should consider the local usage patterns and the degree to which their patients are getting prescriptions for Glucovance or Glucophage XR filled in retail pharmacies where the cost to DoD is much higher.

7. BCF ISSUES

A. *Proposal to add lancets to the BCF* – The Council decided not to add lancets to the BCF.

- Some MTFs provide lancets through central supply or other places in the MTF besides the pharmacy. There is no compelling reason to require all MTFs to provide lancets through the pharmacy.
- Standardization of medical and surgical supplies is being worked on a regional basis. Lancets and other items related to diabetic care might be more appropriately handled on a regional basis.

B. *Status of digoxin on the BCF* – The BCF listing for digoxin oral currently specifies Lanoxin brand (Glaxo Wellcome) only. The Council removed the specific brand designation from the listing because there is now an "A-rated" generic equivalent (Digitek; Bertek).

C. *Clarification of BCF listing for doxycycline oral* – Periostat (CollaGenex Pharmaceuticals) is a 20-mg capsule formulation of doxycycline hyclate with FDA approval as an adjunct to scaling and root planning to promote attachment level gain and pocket depth in patients with adult periodontitis. The mechanism of action is not antimicrobial, but is related to doxycycline's ability to inhibit collagenase.

The Council excluded Periostat from the BCF listing for doxycycline oral due to its low usage across the system (503 bottles of 100 purchased in the last 12 months, 65% of these by two large medical centers), its high cost relative to generic doxycycline, and the absence of a compelling reason to require all MTFs to have it on their formularies.

D. *Clarification of methylphenidate listing on the BCF* – The Council excluded Metadate CD from the BCF listing for methylphenidate oral.

- Metadate CD offers no safety or tolerability advantage compared to other dosage forms of methylphenidate already on the BCF.

- Metadate CD has an 8-hour duration of action. Concerta has a 12-hour duration of action and is on the BCF. With a shorter duration of action, Metadate CD is less likely than Concerta to eliminate the need for repetitive dosing.
- An FSS price is not yet available for Metadate CD and actual dose distributions for Metadate CD and Concerta are unknown, so a precise cost comparison is impossible. Assuming "standard" FSS pricing and a dosage distribution similar to that seen in clinical trials, the estimated weighted average daily cost of Metadate CD is $1.27. Concerta would be only slightly more expensive. The estimated weighted average daily cost for Concerta (based on manufacturer-supplied daily consumption data) is $1.42, $1.52 and $1.70 for the 54 mg, 36 mg and 18 mg strengths respectively.
- Metadate CD is a controlled substance, so all MTFs would experience the administrative burden associated with accounting for an additional controlled drug if Metadate CD were added to the BCF.
- The Council does not want to add another dosage form of methylphenidate to the BCF until it assesses how well Concerta reduces the frequency of midday dosing.

E. *Status of nifedipine extended release on the BCF* – The BCF listing for nifedipine extended release currently specifies Adalat CC as the BCF selection. At the last meeting, the DoD P&T committee requested that the PEC report back on whether the availability and pricing of generic nifedipine extended release products necessitated a change in the BCF listing. After reviewing the current availability and prices for generic versions of both Procardia XL and Adalat CC, the Council concluded that it is not necessary to make changes in the Basic Core Formulary until a generic manufacturer offers prices that are competitive with Adalat CC. The PEC will continue to monitor pricing for nifedipine extended release products.

8. MTF REQUESTS FOR BCF CHANGES

A. *Request to remove micronized glyburide from the BCF* – Glyburide oral and micronized glyburide are both listed on the BCF. An Air Force pharmacist requested that micronized glyburide be removed from the BCF because it is seldom used and more costly than other glyburide formulations. Alternately, he requested that a DoD or VA/DoD contracting initiative be considered to reduce the unit cost of the drug.

The safety, tolerability, and efficacy of glyburide and micronized glyburide appear to be similar. The primary difference between the formulations is improved and more consistent bioavailability with the micronized product, resulting in a less variable half-life and a lower propensity for food to interfere with absorption. The duration of action is similar with both drugs (16-24 hours), due to intracellular accumulation of glyburide. It is unclear whether the pharmacokinetic differences result in any improvement in glycemic control.

Generic micronized glyburide is at least 2 to 3 times more costly than generic glyburide. Of the 15.2 million sulfonylurea tablets or capsules purchased by MTFs through the Prime Vendor program during the first quarter of FY 01, 44% were glyburide; 43% glipizide, 10% micronized glyburide, 2% glimepiride, and essentially 0% tolazamide, tolbutamide, or chlorpropamide. A joint VA/DoD contracting initiative that includes micronized glyburide is already in progress.

The Council did not make any changes to the BCF pending results of the contracting initiative for micronized glyburide.

B. *Request to add gatifloxacin (Tequin) and remove levofloxacin (Levaquin) from the BCF* – A Director of Pharmacy Services at an Air Force MTF cited a price advantage for gatifloxacin in a request to replace levofloxacin with gatifloxacin on the BCF. Gatifloxacin is available to MTFs through an incentive price agreement at a price of $1.90 for the 200 mg and 400 mg tablets. The incentive price is contingent on gatifloxacin having a preferred or co-preferred formulary position at an individual MTF, but there are no market share requirements.

   The Council voted to keep levofloxacin on the BCF. Removal of levofloxacin from the BCF would nullify the BPA that makes levofloxacin available to all MTFs at a price of $2.00 per dose. MTFs are reminded that the fluoroquinolone class is open on the BCF, so MTFs may add gatifloxacin to their formularies if they wish to take advantage of the lower price for gatifloxacin.

C. *Requests to add tolterodine extended release capsules (Detrol LA) to the BCF* – MAJ Roach reported that the PEC received 10 requests for addition of Detrol LA to the BCF in a single week. With the exception of one request from an obstetrician-gynecologist, the requests came from specialty providers (urogynecology or urology). Four requestors noted that tolterodine extended release should be considered a second line agent after the patient has failed oxybutynin; two of the four specifically mentioned tolerability and compliance benefits in elderly patients who could not tolerate oxybutynin. Three requestors cited comparable costs for the tolterodine immediate release and extended release preparations. One requestor felt that tolterodine had become standard of care in community and academic practice for treatment of Overactive Bladder (OAB). The Council considered these requests as part of the overall review of OAB drugs (see Paragraph 9C).

D. *Review of form for requesting BCF changes on PEC website* – MAJ Roach reported that requestors provided little information about how the requested drug compared to other drugs regarding safety, tolerability, efficacy and price. The Council agreed with the PEC recommendation to change the wording on the form to more clearly ask MTF providers to compare the requested agents to other drugs on the BCF or in the same drug class.

9. BASIC CORE FORMULARY REVIEW

A. *Ongoing review* – The PEC is reviewing topical medications for acne and benzodiazepines for anxiety disorders. Information on these drugs will be presented at the next meeting of the P&T Executive Council.

B. *Review of topical corticosteroids for the BCF* – MAJ Barbara Roach reported on the PEC review of topical corticosteroids (see Appendix D for a table of topical corticosteroid agents). Topical corticosteroids were grouped by potency category, ranging from Class I (Very High Potency Agents) to Class IV (Low Potency Agents). According to input from dermatologists, primary care providers, and others, there is little or no difference within potency categories except for the difference between fluorinated and nonfluorinated agents and availability in the desired vehicle (e.g., ointment, cream). The Council considered each potency category for potential changes to the BCF:

Class I Agents (Very High Potency) – There is currently no Class I agent on the BCF. These agents are not generally considered to be primary care drugs. No agent from this class was added to the BCF.

Class II Agents (High Potency) – There are currently no Class II agents on the BCF. After considering the opinions of dermatologists and primary care providers and the relative usage and cost per gram for specific agents within this category, the Council decided to add fluocinonide 0.05% cream to the BCF.

Fluocinonide represents 58% of all MTF purchases of Class II agents (by number of tubes) and is available under a VA/DoD national contract at approximately $0.10 per gram. (Costs per gram in this category range as high as $1.17 per gram). Fluocinonide 0.05% cream represents the great majority of all purchases of fluocinonide products. MTFs may decide whether or not to add fluocinonide 0.05% ointment or solution to their formularies according to local usage patterns.

Class III Agents (Medium Potency) – Triamcinolone 0.1% is currently listed on the BCF as "triamcinolone acetonide 0.1% topical." The Council did not add another Class III agent to the BCF.

The Council agreed that listings for topical agents on the BCF should specify formulation (e.g., cream, ointment) and concentration. After considering the relative usage of the various formulations, the Council clarified the listing to "triamcinolone acetonide 0.1% cream." To avoid confusion, the Council instructed the PEC to clarify the definitions section on the BCF page of the PEC website to note that formulary requirements for topical agents include only the specified formulation(s) and strength(s). The PEC will review the BCF to see if further clarifications are necessary for individual topical agents.

Class IV Agents (Low Potency) – The only low potency topical corticosteroid on the BCF is hydrocortisone 2.5% rectal cream. The Council discussed addition of a Class IV nonfluorinated topical corticosteroid agent for general use. Nonfluorinated agents cause less skin atrophy than fluorinated agents, which is particularly important for pediatric patients and for administration to the face.

The majority of MTFs already have hydrocortisone cream on their individual formularies and many also have desonide (both are nonfluorinated). Hydrocortisone cream and ointment are available in both OTC and prescription formulations. The BCF generally does not include OTC medications, so the Council did not add hydrocortisone cream or ointment to the BCF. The Council also did not add desonide to the BCF because it costs approximately eight times more per gram than hydrocortisone, and the Council did not wish to mandate that facilities using hydrocortisone cream must also add desonide to their formularies.

C. *Review of medications for overactive bladder (OAB) for the BCF* – Oxybutynin immediate release is the only medication for overactive bladder currently on the BCF. Tolterodine (Detrol, Detrol LA) and oxybutynin extended release (Ditropan XL) have a lower incidence of anticholinergic side effects (e.g. dry mouth) than oxybutynin immediate release. The clinical significance of the lower incidence of side effects is uncertain because the percentage of patients who discontinued these drugs due to side effects in clinical trials is small and not clinically or statistically different between the

drugs. Ditropan XL, Detrol, and Detrol LA all cost more than 10 times as much as oxybutynin immediate release. The Council concluded that Ditropan XL, Detrol, and Detrol LA should not be added to the BCF because they do not offer sufficient clinical benefit to justify their significantly higher cost compared to oxybutynin immediate release.

D. *Review of sedative/hypnotic medications for the BCF* – Temazepam and zolpidem currently account for over 90% of sedative/hypnotic medications dispensed from MTF pharmacies. One or more of these drugs are present on 90% of MTF formularies, and 55% of MTFs have both drugs on formulary. The Council considered only these two sedative/hypnotic medications for addition to the BCF.

   Eighty percent of MTFs have temazepam on formulary, but prime vendor data show that usage is declining. Council members speculated that usage is shifting toward newer agents that might have a lower propensity to cause tolerance and dependence in long term use). The Council concluded that temazepam should not be added to the BCF because there is no clinical reason to require 20% of the MTFs to add it to their formularies.

   Sixty-five percent of MTFs have zolpidem on formulary. Anecdotal reports suggest continued efficacy of zolpidem in long-term use without the development of tolerance or dependence; however, clinical trial evidence is limited to trials of 35 days or less. Zolpidem costs more than 40 times as much as temazepam. The Council concluded that zolpidem should not be added to the BCF because the magnitude of the incremental clinical benefit is uncertain and the incremental cost is too large to require every MTF to have it on their formularies.

   No changes were made to the BCF. The sedative/hypnotic class will not be represented on the BCF at this time.

10. The meeting adjourned at 0900 hours on 7 June 2001. The next meeting will be held at Ft Sam Houston, TX and is scheduled for 15 Aug 01 at 0800. All agenda items should be submitted to the co-chairs no later than 20 Jul 01.

LIST OF APPENDICES

Appendix A: MTF Expenditures for Drugs Included in the Advances in Medical Practice (AMP) Program

MTF Expenditures on AMP Drugs, First Six Months of FY 01

Drug Name*	Air Force	Army	Navy	Grand Total
Abciximab	$153,356	$135,960	$61,384	$350,699
Alpha-1-Proteinase Inhibitor			$5,676	$5,676
Becaplermin	$42,589	$55,966	$28,194	$126,749
Cyclosporine	$229,898	$157,445	$119,904	$507,247
Cyclosporine Microemulsion	$465,749	$425,208	$436,010	$1,326,967
Dornase Alfa	$160,855	$92,255	$112,092	$365,203
Epoetin Alfa	$2,083,361	$2,444,833	$1,197,215	$5,725,408
Eptifibatide	$38,665	$198,383	$124,977	$362,025
Etanercept	$804,539	$529,045	$300,484	$1,634,069
Factor VIIa,Recomb				
Filgrastim	$713,677	$880,520	$499,944	$2,094,141
Gemcitabine Hcl	$107,075	$205,731	$123,202	$436,008
Glatiramer Acetate	$258,059	$116,704	$64,836	$439,600
Infliximab	$153,880	$153,784	$187,743	$495,407
Interferon Beta-1a	$851,257	$632,273	$322,213	$1,805,742
Interferon Beta-1b	$280,715	$361,135	$237,275	$879,125
Interferon Gamma-1b,Recomb.	$30,794	$25,793	$20,854	$77,441
Irinotecan Hcl	$114,396	$303,743	$126,862	$545,001
Leflunomide	$105,700	$189,325	$103,047	$398,072
Mycophenolate Mofetil	$282,012	$333,083	$151,995	$767,090
Mycophenolate Mofetil HCl	$460	$1,681		$2,141
Palivizumab	$1,261,189	$1,294,001	$851,639	$3,406,830
Ribavirin/Interferon A-2b	$398,410	$899,484	$297,228	$1,595,122
Rituximab	$143,969	$660,609	$203,242	$1,007,820
Sargramostim	$14,918	$75,739	$7,850	$98,507
Sirolimus	$20,452	$43,216	$22,488	$86,155
Tacrolimus Anhydrous	$293,731	$241,897	$167,910	$703,538
Temozolomide	$83,072	$72,879	$51,571	$207,522
Tirofib Hc M-Hyd/Na Chlor 0.9%	$2,023	$21,087		$23,109
Tirofiban HCl M-Hydrate	$62,628	$47,964	$15,166	$125,759
Trastuzumab	$69,227	$153,578	$10,647	$233,452
Grand Total	**$9,226,657**	**$10,753,321**	**$5,851,648**	**$25,831,626**

* Celecoxib and rofecoxib were removed from the AMP list for FY 01

Appendix B: Implementation Guidance for the Non-Sedating Antihistamine Contract

Note: The following implementation plan was distributed to the field via e-mail the last week of April 2001.

Implementation Plan for the Non-Sedating Antihistamine Contract

Department of Defense Pharmacoeconomic Center

Effective Date: 1 May 2001 (Contract will be in effect for one year with an option to extend the terms of the contract for 4 additional one-year periods).

Selected Product: Fexofenadine (Allegra®) 60 mg tablets and 180 mg tablets; Aventis Pharmaceuticals Inc.

Contract Prices

Table 1

Strength	Dosage Form	NDC	Price per tablet/capsule	QTY per Package
60 mg	Tablet	00088-1107-47	$0.37	100
60 mg	Capsule*	00088-1102-55	$0.37	500
180 mg	Tablet	00088-1109-47	$0.60	100

* Aventis Pharmaceuticals informed the Pharmacoeconomic Center that production of the Allegra® 60mg capsule product will be phased out over the next 12 months. The contract price of $0.37 for the 60mg capsule only applies to the 500-count package size. The contract price for the 60mg capsule will only apply until such time that the 500-count package size of the Allegra 60mg tablet is available. We suggest that MTFs **not** add the 60 mg capsule to their formularies, as it will necessitate switching patients to the tablet formulation in the near future.

Formulary guidance

- This contract closes the non-sedating antihistamine (NSA) class on the Basic Core Formulary (BCF) and therefore:
  1) Allegra® 60 mg tablets and Allegra® 180 mg tablets must be on all Military Treatment Facility (MTF) formularies.
  2) Claritin® 10 mg tablets and Claritin Reditabs® must not be on any MTF formularies.
- Table 2 delineates formulary status requirements for all Allegra® and Claritin® products. While MTFs are not precluded from having the products in column 3 on formulary, MTFs should only include these products on formulary if the needs of their specific patient population require their availability. This decision requires critical evaluation of the relative costs of all products that can meet the clinical needs of patients.

Table 2

MTFs must have on formulary:	MTFs cannot have on formulary:	MTFs may have on formulary:
Allegra 180 mg tablets	Claritin Reditabs	Allegra 60 mg capsules
Allegra 60 mg tablets	Claritin 10 mg tablets	Allegra 30 mg tablets
		Allegra D
		Claritin Syrup
		Claritin D 12 Hour
		Claritin D 24 Hour

- Other NSAs that may be approved by the FDA after the date of this announcement may not be added to MTF formularies during the term of this contract.
- Cetirizine (Zyrtec®) is classified as a second-generation antihistamine but is not classified as an NSA. Therefore, this contract does not affect the current or future BCF or MTF formulary status of Zyrtec® products.
- This contract does **not** affect the current or future status of any Allegra®, Claritin®, or Zyrtec® product on the National Mail Order Pharmacy (NMOP) formulary. All Allegra®, Claritin® and Zyrtec® products remain available through the NMOP. Please note that the contract price for the Allegra® products as presented in Table 1 *will* apply to the NMOP.
- This contract does **not** apply to Managed Care Support Contractor retail network pharmacies.

Prescribing guidance for prescriptions filled at MTFs

- **New patient starts (patients who have not previously been prescribed a Claritin â or Allegra â product):** The contract requires that all new patients who have a clinical need for an NSA be prescribed either Allegra® 60 mg tablets or Allegra®180 mg tablets. If the patient fails to achieve adequate symptom relief or experiences unacceptable side effects with Allegra®, it is permissible to prescribe Claritin® under the provisions of medical necessity. Other examples of medical necessity include:
  - documented allergy to Allegra® products
  - pregnant patients with a clinical need for an NSA (Claritin® is assigned a pregnancy risk category B. Allegra® is assigned a pregnancy risk category C)
- **Patient who were previously treated successfully with Claritin 10mg or Claritin Reditabs:** Unlike the contracts currently in place for the proton pump inhibitor and statin drug classes, this contract does not mandate the conversion of NSA patients currently receiving Claritin® 10 mg tablets or Claritin Reditabs® to Allegra® 60 mg tablets or Allegra® 180 mg tablets. It is therefore **permissible** for patients who were successfully treated with Claritin® 10 mg tablets or Claritin Reditabs® to continue to receive these products. However, it is important to note that while the contract does not mandate patients be switched, **MTFs may decide to encourage their providers to switch patients.** This decision will be made at the MTF level.
- This contract does not preclude providers from prescribing alternate agents to patients for whom the contracted dosage forms and strengths are clinic ally inappropriate (i.e., pediatric patients).
- Both Allegra® 180 mg tablets and Allegra® 60 mg tablets are included in the NSA contract. This gives providers greater flexibility by allowing them to prescribe either Allegra® 60 mg in the morning and a generic sedating antihistamine in the evening at a cost of approximately $0.40 per day, Allegra® 180 mg once daily at a cost of $0.60 per day, or Allegra® 60 mg twice daily at a cost of $0.74 per day.

Acetaminophen	1-Jan-01		NA	NA	NA	NA
TOTAL			**$131,819,804**	**$93,776,570**	**$43,352,575**	**32.89%**

Explanation of Cost Avoidance Calculations: Cost avoidance equals the difference between (1) the theoretical cost that would have occurred in FY 00 if a contract had not existed, and (2) the actual cost that was incurred in FY 01 for the "market basket" of drugs that pertains to each contract. The theoretical cost that would have occurred in FY 01 if a contract had not existed was estimated by multiplying the weighted average price/unit that existed before the contract took effect by the quantity purchased in FY 01. The "market basket" of drugs includes both the contracted and the non-contracted drugs that pertain to a given contract. For example, the cost avoidance for statins takes into account the expenditures for all six statins, not just the two contracted statins.

Appendix D –Topical Corticosteroid Table

After receiving input from dermatology consultants, providers, and pharmacists, topical corticosteroids were divided into four categories depending on potency. The potency of a topical corticosteroid is standardized according to its ability to induce vasoconstriction. This is partially determined by the concentration of the drug and the vehicle used. The categories range from Class I (Very High Potency Agents) to Class IV (Low Potency Agents).

Ranking the topical corticosteroids in this manner may present some discordance among different classification schemes when attempting to categorize a specific drug into a particular level of potency; overall, however, disagreements are minor. Disease severity, age, body location and concomitant medical conditions usually determine the potency of topical corticosteroid treatment, while characteristics of the dermatologic condition usually determine the vehicle chosen. There appears to be little clinical reason to prefer one drug to another within a given category except for availability in the desired vehicle and a preference for nonfluorinated products for pediatric use or use on the face. Nonfluorinated products appear to cause less skin thinning (atrophy).

Topical Corticosteroids Categorized by Potency

Class I – Very High Potency			
Brand Name	**Generic Name**	**Vehicle**	**(%)***
Diprolene	Augmented betamethasone dipropionate □	Ointment	0.05
Temovate, Cormax, Temovate E	Clobetasol propionate □	Cream, Ointment, Gel, Solution	0.05
Psorcon	Diflorasone diacetate □	Ointment	0.05
Ultravate	Halobetasol propionate □	Cream, Ointment	0.05

Class II – High potency			
Brand Name	**Generic Name**	**Vehicle**	**(%)***
Cyclocort	Amcinonide □ □	Cream, Ointment, Lotion	0.1
Diprolene AF	Augmented betamethasone dipropionate □ □	Cream	0.05
Alphatrex, Del-Beta, Diprosone, Maxivate	Betamethasone dipropionate □ □	Cream, Ointment, Lotion	0.05
Betatrex	Betamethasone valerate □ □	Ointment	0.1
Topicort	Desoximetasone □	Cream, Ointment Gel	0.25 0.05
Florone, Florene-E emollient, Maxiflor	Diflorasone diacetate □	Cream, Ointment (emollient base)	0.05
Synalar-HP	Fluocinolone acetonide □	Cream	0.2
Lidex, Lidex-E, Lidex soln.	Fluocinonide □	Cream, Ointment, Solution, Gel	0.05
Halog (water soln cream), Halog solution, Halog-E	Halcinonide □	Cream, Ointment, Solution	0.1
Aristocort, Aristocort A Kenalog, Trymex	Triamcinolone acetonide □ □	Cream, Ointment	0.5

Topical Corticosteroids Categorized by Potency (continued)

Class III – Medium potency			
Brand Name	**Generic Name**	**Vehicle**	**(%)***
Benisone, Uticort	Betamethasone benzoate □	Cream, Gel, Lotion	0.025
Alphatrex, Diprosone	Betamethasone dipropionate □	Lotion	0.05
Valisone, Beta-Val, Betatrex	Betamethasone valerate □	Cream, Lotion	0.1
Cloderm	Clocortolone pivalate □	Cream	0.1
Topicort LP	Desoximetasone □	Cream, Gel	0.05
Fluonide, Synalar, Synemol	Fluocinolone acetonide □	Cream, Ointment	0.025
Cordran	Fluandrenolide □	Cream, Ointment Lotion	0.025, 0.05 0.05
Cutivate	Fluticasone propionate □	Cream Ointment	0.05 0.005
Locoid	Hydrocortisone butyrate □	Cream, Ointment, Solution	0.1
Westcort	Hydrocortisone valerate □	Cream, Ointment	0.2
Elocon	Mometasone furoate □ □	Cream, Ointment Lotion	0.1
Aristocort A, Kenalog, Trymex,	Triamcinolone acetonide □ □	Cream, Ointment Lotion	0.025 0.025, 0.1

Class IV – Low potency			
Brand Name	**Generic Name**	**Vehicle**	**(%)***
Aclovate	Alclometasone dipropionate □	Cream, Ointment	0.05
Valisone, Celestone	Betamethasone valerate □	Cream	0.01, 0.2
DesOwen, Tridesilon	Desonide □	Cream, Ointment, Lotion	0.05
Decaderm	Dexamethasone □	Gel	0.1
Synalar, Fluonid	Fluocinolone acetonide □	Cream, Solution	0.01
Hytone, Lacticare, Synacort	Hydrocortisone □	Lotion Cream, Oint, Lotion Cream, Oint, Lotion, Solution Cream, Oint, Lotion	0.25 0.5 1 2.5
Numerous	Hydrocortisone acetate □	Cream, Ointment	0.5, 1
Medrol	Methylprednisolone □	Cream	0.25
Oxylone	Fluoromethalone □	Cream	0.025
Numerous OTCs			

□ fluorinated agent; □ nonfluorinated agent; □ disagreement among references concerning potency class
* Not all brands or concentrations are available in all vehicles or formulations; specialized formulations such as aerosols or tapes are not included in this table

MCCS-GPE **8 FEB 2001**

MEMORANDUM FOR: Executive Director of Tricare Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T committee convened at 0800 hours on 8 February 2001, at Ft Sam Houston, TX.

2. **MEMBERS PRESENT**:

CDR Terrance Egland, MC	Co-chair
COL Daniel D. Remund, MS	Co-chair
COL Mark Nadeau, MC	Air Force (alternate)
COL (select) John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Matt Nutaitis, MC	Navy
MAJ Brett Kelly, MS	Army
CDR Robert Rist	Coast Guard
Ronald L. Mosier	Department of Veterans Affairs
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia (DSCP)
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)
Ray Nan Berry	Health Net Federal Services
Kirby Davis	Anthem Alliance
William Hudson	Humana, Inc
Gene Lakey	TriWest

MEMBERS ABSENT:

COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
CDR Kevin Cook, MSC	Navy
Ron McDonald	Sierra Military Health Services
Joint Readiness Clinical Advisory Board Representative	

OTHERS PRESENT:

CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
COL Mike Heath, MS	Army Pharmacy Consultant, DoD Pharmacy Board of Directors
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center
COL William Davies, MS	DoD Pharmacy Program Director, Tricare Management Activity (TMA)
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
LTC Ed Zastawny, BSC	DoD Pharmacoeconomic Center
LCDR Ted Briski, MSC	Lead Agent Office, Region 9
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
CAPT Krissa Crawford, BSC	Pharmacy Practice Resident, Wilford Hall Medical Center
HM3 Cory Beckner	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
David Chicoine	Uniformed Services Family Health Plan
Eugene Moore	DoD Pharmacoeconomic Center
Mark Petruzzi	Merck-Medco
Elizabeth Scaturro	Merck-Medco
Carol Scott	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Dana Dallas	Defense Supply Center Philadelphia
Paul Vasquez	Defense Supply Center Philadelphia

3. **ADMINISTRATIVE ISSUES**

   The minutes from the last meeting were accepted as written.

4. **REPORT FROM THE DOD EXECUTIVE COUNCIL MEETING** – COL Remund reported that the DoD P&T Executive Council added 12 drugs to the Basic Core Formulary (BCF) at the 7 Feb 01 meeting. Budget shortfalls in the Defense Health Program for FY 01 forced the Council to be very conservative in adding drugs to the BCF.

5. **IMPLEMENTATION OF FY 00 AND FY 01 NATIONAL DEFENSE AUTHORIZATION ACTS** – COL Davies briefed the Committee on the ongoing efforts to implement the pharmacy benefit provisions of the FY 00 and FY 01 National Defense Authorization Acts.

6. **BCF AND NATIONAL MAIL ORDER PHARMACY (NMOP) FORMULARY ISSUES** – The Committee determined the NMOP formulary status; NMOP or retail network formulary restrictions (NMOP Preferred Drug Program, quantity limits, or prior authorization); and the BCF status for six new drugs listed in Appendix A.

7. **NON-PREFERRED/PREFERRED DRUG PAIRS IN THE NMOP** – Eugene Moore (PEC) reported cost avoidance associated with the NMOP Preferred Drug Program (see Appendix B).

8. PRIOR AUTHORIZATIONS

A. *Cost avoidance from NMOP prior authorizations (PAs)* – Shana Trice (PEC) reported on the estimated cost avoidance due to NMOP prior authorizations. The cost avoidance per prescription is based on the cost avoidance model that was outlined in the Aug 00 DoD P&T Committee minutes.

PA Cost Avoidance per New Prescription Submitted to the NMOP

Drug	3rd Quarter FY 00	4th Quarter FY 00	1st Quarter FY 01
Sildenafil	$13.60	$26.46	Not calculated
COX-2 inhibitors	$11.66	$18.56	$10.95
Etanercept	$327.20	$111.86	$7.89

1) *Sildenafil* – Data reported by Merck Medco and DSCP suggest that a large number of the PAs performed during the first quarter FY 01 were for sildenafil refills. PA cost avoidance was not calculated for the first quarter of FY 01 because the cost avoidance model was not designed to account for prior authorization of refill prescriptions. The PEC will work with Merck Medco and DSCP to revise the model.

2) *Etanercept* – The large drop in the PA cost avoidance for etanercept is due to fewer prescription denials through the PA process (see following table).

NMOP PA Data for Etanercept

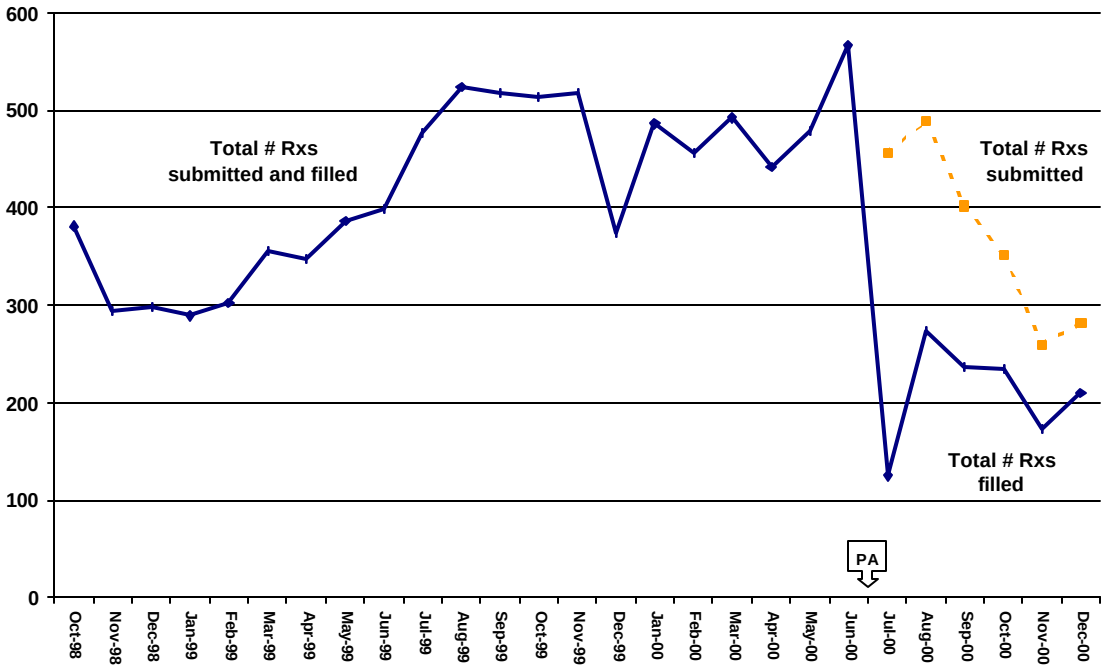
	3rd Quarter FY 00	4th Quarter FY 00	1st Quarter FY 01
Total number of Rxs filled (new and refill)	441	495	612
Total number of Rxs that went through the PA process	41	64	58
Total number of Rxs denied as a result of the PA process	11	5	1
Estimated cost avoidance per new Rx submitted	$327.20	$111.86	$7.89

The Committee discussed the possibility of modifying or discontinuing the PA for etanercept since the cost avoidance is so minimal. The Committee refrained from changing the etanercept PA because this analysis does not assess the PA cost avoidance in the retail pharmacy networks (which probably fill many more prescriptions for etanercept than the NMOP). The Committee encouraged the MCSC pharmacy directors to voluntarily provide data to the PEC for analysis of the etanercept PA cost avoidance in the retail networks (the MCSC pharmacy directors are not contractually required to submit the data). The PEC will furnish a list of data elements in the cost avoidance model to the MCSC pharmacy directors.

B. *Antifungals for onychomycosis* – The PA for onychomycosis began on 1 Jul 00 in the NMOP. Comparing the six-month time periods before and after the PA took effect, prescription fills for terbinafine and itraconazole dropped from an average of 491 per month (range 444-569) to an average of 211 per month (range 129-239). Prescription fills for terbinafine and itraconazole dropped because (1) prescriptions submitted to the NMOP were denied when they did not meet

the PA criteria, and (2) fewer prescriptions for terbinafine and itraconazole were submitted to the NMOP due to the "sentinel" effect of the PA. The sentinel effect occurs because providers prescribe the drug less frequently when they know the drug is subject to prior authorization. The following graph illustrates the reduction in the number of prescriptions submitted and the number of prescriptions filled for terbinafine and itraconazole after the PA began.

Total Number of NMOP Rxs for Terbinafine or Itraconazole



C. *Revision of PA forms* – Merck-Medco added clinical rationale language to the PA forms it faxes to prescribers for sildenafil and etanercept. The clinical rationale language is not yet in place on the Merck-Medco PA fax forms for COX-2 inhibitors or antifungals for onychomycosis.

D. *Changes to COX-2 inhibitor criteria to include Familial Adenomatous Polyposis (FAP)* – At the Aug 00 meeting, the Committee approved a change in the criteria for the COX-2 inhibitors to allow use of celecoxib for familial adenomatous polyposis. Merck-Medco has revised their fax form. The PEC will reflect the changes on its website.

E. *Proposal to change the COX-2 inhibitor PA to reflect findings of the Celecoxib Long-term Arthritis Safety Study (CLASS)* – The annualized incidence rates of upper GI ulcer complications alone and combined with symptomatic ulcers were not significantly different for celecoxib versus NSAIDS for patients in the CLASS study who were also receiving low dose aspirin. The data, however, were limited: the number of patient-years of therapy for patients also receiving low dose aspirin was relatively low, results were based on a maximum of 6 months of therapy, and the dropout rates in both the celecoxib and NSAID group were high (40-45%).

The CLASS study suggests that the use of even low doses of aspirin may reduce or eliminate the GI protective effect of COX-2 selective NSAIDs compared to conventional NSAIDS. However, the Committee agreed that the data are insufficient to change the PA criteria to preclude usage of COX-2 inhibitors by patients taking low dose aspirin. The Committee requested that the PEC revise the clinical rationale language on the PA forms to include information on the results of the CLASS study in regard to the use of COX-2 inhibitors in patients currently receiving low dose aspirin.

F. *Prior authorization of ciclopirox topical solution (Penlac Nail Lacquer) in the NMOP and retail network* – LTC Ed Zastawny (PEC) reported on a request from one of the MCSCs to add ciclopirox topical solution to the existing PA for antifungals for onychomycosis. Since other drugs for onychomycosis require prior authorization to ensure that they are used only when clinically appropriate (when a fungal infection is present), the Committee agreed that the same standard should be applied to ciclopirox. The committee voted to institute a PA for ciclopirox topical solution that requires confirmation of a fungal infection.

9. **STATUS OF LOW MOLECULAR WEIGHT HEPARINS (LMWHs) IN THE NMOP AND RETAIL NETWORK**

The Committee discussed the potential need to have LMWHs available through the NMOP. LMWHs are increasingly used in the outpatient sector and in some cases may be appropriately used for extended time periods (e.g., for pregnant women requiring anticoagulation). Dr. Rabie pointed out that there is now solid literature for 30 days of anticoagulation after joint replacement. While most clinicians switch patients from LMWHs to warfarin as soon as warfarin levels are therapeutic, some may opt to keep patients on enoxaparin or dalteparin for 30 days. The Committee asked the PEC to assess the opinions of providers about the necessity to have the LMWHs available through the NMOP.

10. **CONTROLLED DISTRIBUTION OF ALENDRONATE (FOSAMAX) 40 MG (FOR PAGET'S DISEASE)** – Alendronate 40 mg is no longer available through MTF pharmacies or retail network pharmacies, but is available through the NMOP. Most DoD beneficiaries who are age 65 and over cannot use the NMOP until 1 April 01. MAJ Bellemin reported that DSCP has worked out a procedure with Merck-Medco to honor prescriptions submitted by these DoD beneficiaries through their MTF pharmacies until they are eligible to use the NMOP on 1 April 01. Information about the interim procedure has been provided to the pharmacy consultants/specialty leaders for dissemination to MTF pharmacies.

11. **CONTROLLED DISTRIBUTION OF DOFETILIDE (TIKOSYN)** – Because of specialized educational requirements mandated by the FDA, dofetilide is only available for outpatient use through Stadtlander's Pharmacy/CVS Procare (which is a non-network pharmacy for DoD beneficiaries). COL Davies reported that the 50% copay penalty for using a non-network pharmacy can be waived retroactively, but the process is cumbersome. Attempts to establish a centrally funded process for supplying dofetilide to patients have thus far been unsuccessful.

12. **CONTROLLED DISTRIBUTION OF ETANERCEPT (ENBREL)**

Although a plan to supply etanercept only through the NMOP had been contemplated, LTC De Groff reported that etanercept would continue to be available through MTF pharmacies, retail network pharmacies, and the NMOP. Immunex and Wyeth/Ayerst have allotted supplies to MTF pharmacies based on historical usage data, so MTF pharmacies (unlike retail pharmacies) are not required to submit patient enrollment numbers to obtain etanercept. DoD beneficiaries can therefore obtain etanercept from MTF pharmacies even if they did not enroll with Immunex. However, unregistered patients may experience problems if they need to obtain etanercept from a source other than an MTF pharmacy.

13. **ADJOURNMENT –** The meeting adjourned at 1200 hours. The date and location for the next meeting have not been determined. All agenda items should be submitted to the co-chairs no later than 15 April 01.

List of Appendices

APPENDIX A: NEWLY APPROVED DRUGS CONSIDERED FOR THE NMOP FORMULARY AND BCF

Generic name (Trade name; manufacturer)	**Indication, FDA approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Abacavir / lamivudine / zidovudine (Trizivir; Glaxo)	Approved 14 Nov 00 for use alone or in combination with other antiretroviral agents for treating HIV. Trizivir is intended only for patients whose regimen would otherwise include all three individual medications.	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added
Sodium phosphate, dibasic, anhydrous / sodium phosphate monobasic, monohydrate (Visicol; Inkine)	Approved 21 September 2000 for cleansing of the bowel as a preparation for colonoscopy in adults 18 years of age or older.	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added
Balsalazide disodium (Colazal; Salix)	Approved 18 Jul 00 for the treatment of mildly to moderately active ulcerative colitis. Oral prodrug of 5-aminosalicylic acid (5-ASA) in which the sulfapyridine moiety of sulfasalazine has been replaced with an inert carrier molecule.	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added
Telmisartan/ HCTZ (Micardis HCT; Boehringer-Ingelheim)	Approved 11 Nov 00 for treatment of hypertension. As a fixed-dose combination, telmisartan/HCTZ is not indicated for initial therapy.	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added
Tacrolimus ointment (Protopic; Fujisawa)	Approved 8 Dec 00 for short-term and intermittent long-term therapy in the treatment of patients with moderate to severe atopic dermatitis (AD) in whom the use of alternative conventional therapies is deemed inadvisable because of potential risks or in the treatment of patients who are not adequately responsive to or are intolerant of alternative conventional therapies. Indicated as 0.03% and 0.1% ointment for adults and only 0.03% ointment for children aged 2 to 15 years.	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies; monitor quantities dispensed **Prior Authorization** No	Not added

APPENDIX A (CONTINUED): CONSIDERATION OF NEWLY APPROVED DRUGS FOR THE NMOP FORMULARY AND BCF

Generic name (Trade name; manufacturer)	**Indication, FDA approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Nateglinide (Starlix; Novartis)	Approved 22 Dec 00 as monotherapy in patients with type 2 diabetes mellitus whose hyperglycemia cannot be adequately controlled by diet and physical exercise, and who have not been chronically treated with other anti-diabetic agents (treatment-naïve patients). Nateglinide is also indicated for use in combination with metformin. Nateglinide may be added to but not substituted for metformin in patients already receiving metformin who still have inadequately controlled hyperglycemia. Patients receiving glyburide or sulfonylureas who have inadequately controlled hyperglycemia should not be switched to nateglinide, nor should nateglinide be added to their treatment regimen.	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added

APPENDIX B: SUMMARY OF COST AVOIDANCE ASSOCIATED WITH THE NATIONAL MAIL ORDER PHARMACY (NMOP) PREFERRED DRUG PROGRAM

Summary of Switch Rates and Estimated Cost Avoidances FY 00

Non Preferred Drug	Preferred Drug	Switch Rate	Estimated Cost Avoidance	Total Attempted Provider Contacts	Estimated Cost Avoidance per Attempted Provider Contact
Cardizem CD, Dilacor XR, Cartia XT, Diltiazem XR	**Tiazac**	68%	$535,437	2904	$184
Procardia XL[1]	**Adalat CC**	53%	$313,918	1137	$276
Lodine XL, Relafen, Voltaren XR, Daypro, Naprelan	**Generic NSAIDs**	33%	$396,134	4118	$96
H2 Blockers	**Generic Ranitidine**	38%	$273,739	2485	$110
Vasotec[2]	**Zestril**	45%	$141,394	2741	$51
Famvir, Valtrex[3]	**Acyclovir**	24%	$6,783	1018	$7
Pletal[4]	**Pentoxifylline**	12%	$3424	280	$12
Ditropan XL, Detrol	**Generic Oxybutynin**	29%	$115,346	4003	$29
	Summary		**$1,779,392**	**17,668**	**$101**

Notes:

1. Calls for Procardia XL have diminished significantly (from 135 per month in Jun 00 to 7 per month in Dec 00), due to the introduction of generic equivalents for some strengths of Procardia XL. Procardia XL will be removed from the list of non-preferred drugs when generic equivalents are available for all strengths of Procardia XL.
2. Vasotec was removed from the list of non-preferred drugs when a generic equivalent became available at a competitive price in Dec 00.
3. At the May 00 meeting, the committee changed the criteria for Famvir and Valtrex so that calls would be made only for prescriptions written for chronic use (> 30 day supply). This change took effect 1 July 00.
4. Pletal was removed from the list of non-preferred drugs at the Aug 00 meeting (effective Sep 00), due to a low switch rate.

APPENDIX C: COMBINED SUMMARY OF FORMULARY CHANGES FROM THE DOD P&T EXECUTIVE COUNCIL MEETING AND THE DOD P&T COMMITTEE MEETING

1. **BCF CHANGES**

   A. *Additions to the BCF* (See the 7 Feb 01 P&T Executive Council Minutes, Paragraph 10B and Appendix C)

      1) Clindamycin 150-mg capsules
      2) Loperamide 2-mg capsules
      3) Chlorhexidine gluconate 0.12% oral rinse (e.g., Peridex®, Periogard®, generics)
      4) Amoxicillin/clavulanic acid oral (tablets and suspension)
      5) Fluconazole oral, 150-mg tablets only. Includes only the single-dose regimen for treatment of vaginal candidiasis.
      6) Metoclopramide oral
      7) Mupirocin 1% ointment
      8) Metoprolol 50- and 100-mg oral. Does not include Toprol XL.
      9) Fluticasone oral inhaler
      10) Lactulose syrup
      11) Methotrexate oral
      12) Nitrofurantoin macrocrystals (generic equivalents to Macrodantin). Does not include Macrobid.

   B. *Changes and clarifications to the BCF* - None

2. **NMOP FORMULARY CHANGES**

   A. *Additions to the NMOP Formulary* (See Appendix A)

      1) Abacavir / lamivudine / zidovudine (Trizivir; Glaxo)
      2) Sodium phosphate, dibasic, anhydrous / sodium phosphate monobasic, monohydrate (Visicol; Inkine)
      3) Balsalazide disodium (Colazal; Salix)
      4) Telmisartan/HCTZ (Micardis HCT; Boehringer-Ingelheim)
      5) Tacrolimus ointment (Protopic; Fujisawa)
      6) Nateglinide (Starlix; Novartis)

   B. *Exclusions from the NMOP Formulary* – None

   C. *Changes to the NMOP Preferred Drug Program* (See Appendix B)

      1) Procardia XL will be removed from the list of non-preferred drugs when generic equivalents are available for all strengths of Procardia XL.

      2) Vasotec was removed from the list of non-preferred drugs when a generic equivalent became available at a competitive price in Dec 00.

3. **QUANTITY LIMIT CHANGES (NMOP AND RETAIL NETWORK) -** None

4. **CHANGES TO THE PRIOR AUTHORIZATION PROGRAM (NMOP AND RETAIL NETWORK)**

   A. A prior authorization that requires diagnostic verification of a fungal infection will be instituted for ciclopirox topical solution (Penlac Nail Lacquer) (See Paragraph 8F).

APPENDIX D: ITEMS TO BE ADDRESSED AT THE NEXT MEETING

1. *NMOP Preferred Drug Program Report* – See Paragraph 7 and Appendix B
2. *NMOP Prior Authorization Program Report* – See Paragraph 8
3. *Status of the Prior Authorization for Etanercept* – See Paragraph 8A3
4. *Status of Low Molecular Weight Heparins in the NMOP* – See Paragraph 9
5. *Controlled Distribution of Dofetilide (Tikosyn)* – See Paragraph 11
6. *Controlled Distribution of Etanercept (Enbrel)* – See Paragraph 12

Department of Defense
Pharmacoeconomic Center

1750 Greeley Rd., Bldg. 4011, Rm. 217
Fort Sam Houston, TX 78234-6190

MCCS-GPE **7 Feb 2001**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The DoD P&T Executive Council convened at 0800 hours on 7 Feb 2001, at Ft Sam Houston, TX. The DoD P&T Executive Council is responsible for performing certain inherently governmental functions relevant to the DoD pharmacy benefits program. The Council focuses primarily on issues related to the Basic Core Formulary (BCF), national pharmaceutical contracts, and blanket purchase agreements. The DoD P&T Executive Council is comprised of federal employees who are members of the DoD P&T Committee.

2. **MEMBERS PRESENT:**

CDR Terrance Egland, MC	P& T Committee Co-chair
COL Daniel D. Remund, MS	P& T Committee Co-chair
COL Mark Nadeau, MC	Air Force (alternate)
COL (select) John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Matt Nutaitis, MC	Navy
MAJ Brett Kelly, MS	Army
CDR Robert Rist	Coast Guard
Ronald L. Mosier	Department of Veterans Affairs
LtCol Steven Humburg, MC	Health Affairs
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia

MEMBERS ABSENT:

COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
CDR Kevin Cook, MSC	Navy
Joint Readiness Clinical Advisory Board Representative	

OTHERS PRESENT:

COL William Davies, MC	DoD Pharmacy Program Director, TMA
COL Mike Heath, MS	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
CAPT Pat Welter	Navy Bureau of Medicine & Surgery
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
LtCol Ed Zastawny, BSC	DoD Pharmacoeconomic Center
LCDR Ted Briski	TRICARE Region 9 Lead Agent Office
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
MAJ Barbara Roach, MC	DoD Pharmacoeconomic Center
Capt Krissa Crawford, BSC	Pharmacy Practice Resident, Wilford Hall Medical Center
HM3 Cory Beckner	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia
Dana Dallas	Defense Supply Center Philadelphia

3. REVIEW MINUTES OF LAST MEETING

The minutes were approved as written.

4. ADVANCES IN MEDICAL PRACTICE (AMP) PROGRAM

Large budget shortfalls in the Defense Health Program jeopardize funding of the AMP program for FY 01. All AMP funds are currently "on hold" at TMA. Pharmacy will probably receive about $50 million if and when AMP funds are released. MTF pharmacies spent $12.1 million on AMP drugs in the first quarter of FY 01 (based on prime vendor data). Since expenditures for pharmaceuticals typically occur at the lowest rate during the first quarter of the fiscal year, total expenditures for AMP drugs will likely exceed $50 million in FY 01.

The Council considered a request from an MTF to add fluorodeoxyglucose (a radioactive fluoride used in positron emission tomography and single photon emission tomography) to the list of drugs covered by the AMP program. The Council denied the request because MTF expenditures for drugs currently covered by the AMP program will likely exceed the funds available for pharmacy in the AMP program.

5. NATIONAL PHARMACEUTICAL CONTRACTS

A. *Contract awards and renewals* – A joint VA/DoD single-source contract for clotrimazole 1% topical cream was awarded to Taro Pharmaceuticals with an effective date of 1 Feb 01. The joint VA/DoD single-source contract for acetaminophen 325 mg and 500 mg tablets announced at the last meeting became effective 1 Jan 01. MAJ Filby reported that the joint VA/DoD returned goods contract was awarded on 21 Jan 01 to Guaranteed Returns. LTC De Groff noted that 32 joint VA/DoD national contracts have been awarded, and approximately 25 more contracts are in various stages of development.

Information on national pharmaceutical contracts is available on the DSCP website (www.dmmonline.com).

B. *Financial impact of contracts* – COL Remund reported that the final estimate of MTF cost avoidance due to national pharmaceutical contracts was $65.2 million in FY 00, which equals 6.3% of the $1.03 billion that MTFs spent on pharmaceuticals. The weighted average percent reduction in cost for the drugs and drug classes affected by national pharmaceutical contracts was 25.3%. A summary of cost avoidance from national pharmaceutical contracts is provided in Appendix A.

C. *Status of solicitation for non-sedating antihistamine (NSA) contract* – The General Accounting Office (GAO) recently denied the only remaining protest of the solicitation for a joint VA/DoD "closed class" contract for a non-sedating antihistamine. The GAO denial of the protest opens the way for a contract to be awarded by the VA National Acquisition Center (NAC).

D. *Status of solicitation for oral contraceptive contracts* – The solicitation for joint VA/DoD single source contracts for four oral contraceptive products is scheduled to close on 23 Feb 01. The solicitation is for single sources of the following oral contraceptive products: 35 mcg ethinyl estradiol (EE) / 1 mg norethindrone; 35 mcg EE / 1 mg ethynodiol diacetate; 30/40/30 mcg EE / 0.05/0.075/0.125 mcg levonorgestrel; and 0.35 mg norethindrone.

E. *Status of potential contracting initiative for nasal corticosteroid inhalers* – DoD and VA officials will evaluate the potential for soliciting for a joint VA/DoD closed class contract for a high potency aqueous nasal corticosteroid inhaler after the VA has finished its clinical review of the drug class.

F. *Blanket purchase (BPA) agreements* – The Council wants to be more involved in the process of establishing BPAs in order to ensure that the provisions of a BPA support the Council's strategy for managing a given drug class. The Council also advocates the development of a more clearly defined process for establishing joint VA/DoD BPAs. The Council appointed a subcommittee to work on these issues. Subcommittee members are LTC De Groff, MAJ Filby, and LCDR Briski.

G. *Hepatitis A vaccine contract* – The United States Army Medical Materiel Center Europe (USAMMCE) reports that some facilities are buying Havrix instead of Vaqta, which is the contracted brand of hepatitis A vaccine. USAMMCE did not provide any information about why facilities are purchasing the non-contracted brand. The Council is unaware of any clinical reason for the facilities to use Havrix instead of Vaqta. The Council referred the issue back to DSCP for further investigation.

H. *Low molecular weight heparins* – The Council discussed the suitability of the low molecular weight heparin drug class for a contracting initiative. Additional information, including input from MTF providers, is needed to determine suitability for contracting.

6. **APPLICATIONS FOR DEA NUMBERS** – COL Humburg provided an update on online applications for DEA numbers.

7. **LEUTINIZING HORMONE RELEASING HORMONE (LHRH) AGONISTS** – A BPA makes goserelin available to MTFs at the VA national contract price in exchange for attainment of

an 80% overall share of the MTF prescriptions for LHRH agonists for prostate cancer. At the Nov 00 meeting the Council asked DSCP and the PEC to initiate an education/marketing campaign to ensure that goserelin achieves the market share required by the BPA. CAPT Torkildson reported that the following actions were taken since that meeting:

- Information regarding the Council's decision and the BPA was published in the P&T Executive Council minutes.
- Specialty leaders for Urology in each service were notified of the BPA and informed of the opportunity for cost savings. Information was forwarded to urologists.
- An article was published in the Dec 00 edition of the *PEC Update.*
- Information about the goserelin BPA was provided to the pharmacy and/or urology departments at MTFs with high leuprolide usage.

The Council reviewed MTF prescription data for LHRH agonists, but concluded that it was too early to accurately discern the effect of the BPA on LHRH agonist usage and whether MTFs are on track to achieve the 80% market share for goserelin by 1 Aug 00.

The Council was informed that DSCP recently accepted a BPA from TAP Pharmaceuticals that lowered the price of leuprolide, but still leaves leuprolide with a higher price per dose than goserelin. The Council concluded that the goserelin BPA offers the best value for the MHS. The Council reaffirmed its desire to have goserelin reach an 80% market share by 1 Aug 00 and advised the PEC to continue educational efforts to attain that goal.

8. **DRUG USAGE NOT CAPTURED IN CHCS** – As part of its analysis of LHRH agonist usage, the PEC compared the quantity of LHRH agonists purchased through the prime vendor to the quantity dispensed on outpatient prescriptions. The quantity purchased significantly exceeded the quantity dispensed at 10 MTFs. The discrepancy between the purchase data and the dispensing data is most likely due to the fact that LHRH agonists are dispensed to outpatient clinics through bulk drug orders at some MTFs. Because the agent is administered to the patient in the clinic, the drug usage is not recorded in CHCS. Outpatient drug usage that is not recorded in CHCS is omitted from clinical screening within CHCS and through the Pharmacy Data Transaction Service (PDTS). The ability of the CHCS and PDTS clinical screening processes to improve patient safety is diminished when outpatient drug usage is not recorded in CHCS. This issue was referred to LTC DeGroff, PDTS Functional Program Manager, and COL Heath, chairman of the DoD Pharmacy Board of Directors.

9. **MTF REQUESTS FOR BCF CHANGES**

   A. *Request to remove methylphenidate extended-release (Concerta) from the BCF* – An MTF requested that methylphenidate extended-release (Concerta) be removed from the BCF because:

   - They could find no literature to indicate that Concerta is a superior product to those already available.
   - Concerta is not the only agent that can be dosed prior to the child leaving for school without requiring a noon dose.
   - Having another Schedule II item is always an issue.

According to a recent New Product Bulletin from the American Pharmaceutical Association (APhA), the duration of action is about 12 hours for Concerta, compared to 3 to 6 hours for methylphenidate immediate-release tablets and about 8 hours for the sustained release tablets. To the extent that a longer duration of action is desirable, Concerta might be considered superior to other currently available methylphenidate products.

A PEC analysis of MTF prescriptions for a random sample of patients under the age of 18 who received more than one prescription for sustained-release methylphenidate during FY 00 revealed the following:

- 60% (116/193) of the patients received another medication for ADHD in addition to sustained-release methylphenidate.
- 40% (78/193) of the patients were prescribed a midday dose of either sustained-release methylphenidate or another medication for ADHD.

Although methylphenidate sustained release tablets should theoretically obviate the need for a midday dose, MTF prescription data show that midday doses are frequently prescribed for patients taking methylphenidate sustained release tablets. The Council voted to keep Concerta on the BCF.

B. *Request to add gatifloxacin (Tequin) and remove levofloxacin (Levaquin) from the BCF* – An MTF pharmacy chief suggested that the addition of levofloxacin to the BCF may have been based on (1) an incorrect price for gatifloxacin, and (2) inadequate consideration of *S. pneumoniae* MICs and use in sexually transmitted diseases.

The Council was aware at the Nov 00 meeting that both levofloxacin and gatifloxacin were available for $2.00 per daily dose through BPAs. The Council also considered levofloxacin and gatifloxacin to be very similar in safety, tolerability and efficacy. Levofloxacin accounted for nearly 70% of all fluoroquinolone prescriptions dispensed at MTFs, while gatifloxacin accounted for less than 1% of fluoroquinolone prescriptions.

As requested by the Council, DSCP obtained a revised BPA that makes it easier for MTFs to obtain levofloxacin at the BPA price. The revised BPA offers levofloxacin 250 mg and 500 mg to all MTFs at an upfront price of $2.00 per tablet. Continuation of the BPA price is contingent upon levofloxacin achieving either (1) an 80% aggregate DoD market share within 6 months, or (2) a 50% market share at individual MTFs. Market share will be based on patient days of therapy and will be calculated from USPD prescription data.

The revised BPA achieves the objective of making it easier for MTFs to obtain levofloxacin at the BPA price, since MTFs are no longer responsible for individually monitoring drug usage to meet market share requirements. In addition, use of prescription data eliminates the problem of prime vendor purchases of ciprofloxacin being included in the denominator for calculating levofloxacin market share. However, some of the provisions in the BPA were unacceptable to the Council. The Council asked DSCP to revise the BPA to eliminate the unacceptable provisions.

The Council was also informed that a new incentive price agreement offers gatifloxacin to MTFs at a price of $1.90 per daily dose. The incentive price is contingent on gatifloxacin having a preferred or co-preferred formulary position at an individual MTF.

The Council voted to keep levofloxacin on the BCF. The fluoroquinolone class remains open on the BCF, so MTFs may have other fluoroquinolones on their formulary in addition to levofloxacin.

C. *Request to remove divalproex ER (Depakote ER) from BCF* – An MTF pharmacist asserted that Depakote ER (which is dosed once daily) offers no advantages over Depakote (which is dosed twice daily) because there are no data to prove better compliance.

All oral dosage forms and strengths are generally included for a drug listed on the BCF. The DoD P&T Committee may specifically omit a dosage form or strength from the BCF if it is excessively expensive compared to the other dosage forms/strengths, or if impending availability of a generic equivalent makes it inadvisable to include a given dosage form. Depakote ER is priced essentially the same as Depakote. The Council voted to keep Depakote ER on the BCF.

10. **BASIC CORE FORMULARY REVIEW**

A. *BCF overview and analysis* – The Council reviewed the objective of the BCF and factors that are considered in selecting drugs for the BCF (see Appendix B). The PEC recommended drugs for addition to the BCF based on the following information and analyses:

1) An analysis of USPD data showed that 72.6% of the prescriptions filled at MTF pharmacies in FY 00 were filled with drugs that were on the BCF at the end of FY 00. Prescriptions for most over-the-counter drugs were excluded from the analysis because they generally are not eligible for inclusion on the BCF. The analysis did not characterize second-generation antihistamines, low molecular weight heparins, leukotriene antagonists, and estrogenic vaginal creams as BCF drugs—even though the BCF requires MTFs to have at least one agent from each of those drug classes on the MTF formulary.

2) A frequency distribution of prescriptions filled at MTFs for BCF and non-BCF drugs that was generated from USPD data.

3) A survey of MTFs to determine the MTF formulary status for 98 drugs that are not currently included on the BCF.

4) Input from MTF providers.

5) Drug usage and cost trends from prime vendor and USPD data.

B. *Addition of drugs to the BCF* – The Council was forced to take a conservative approach in adding drugs to the BCF because of the uncertain funding situation for the Defense Health Program in FY 01. The Council added 12 drugs to the BCF, which are listed in Appendix C. [NOTE: A comprehensive list of all BCF and NMOP formulary changes is provided in an appendix to the 8 Feb 01 DoD P&T Committee minutes.]

C. *Drugs not added to the BCF* – The Council considered clinical information and usage data regarding gabapentin, COX-2 inhibitors, and dihydropyridine calcium channel blockers. The Council did not add any of these drugs to the BCF.

D. *Ongoing review* – The PEC is reviewing topical corticosteroids, benzodiazepines, and medications for acne and overactive bladder. Information on these drugs will be presented at the next meeting of the P&T Executive Council.

E. *Status of lancets on the BCF* – A Council member asked why lancets are not included on the BCF. The Council tabled this issue until the next meeting.

11. The meeting adjourned at 1230 hours. The date and location of the next meeting are to be determined.

Appendix A: Cost Avoidance in DoD MTFs Due to National Pharmaceutical Contracts, FY 00

Estimated Cost Avoidance in DoD MTFs Due to National Pharmaceutical Contracts, Fiscal Year 2000

Drug/Drug Class	Contract Start Date	Weighted Average Price/Unit Before Contracted	Theoretical FY 00 Cost If Not Contracted	FY 00 Actual Cost	Cost Avoidance	Percent Reduction in Cost
Statins	1-Oct-99	$0.961874	$94,988,500	$72,672,448	$22,316,052	23.49%
PPIs	1-Oct-99	$1.681407	$97,608,455	$78,179,686	$19,428,769	19.90%
Lisinopril	1-Aug-99	$0.284396	$22,410,939	$12,338,214	$10,072,726	44.95%
Diltiazem	15-Dec-98	$0.631469	$13,077,589	$6,118,739	$6,958,850	53.21%
Ranitidine	16-Nov-98	$0.066602	$3,819,158	$1,956,040	$1,863,118	48.78%
Hepatitis A	18-Sep-99	$16.981597	$8,221,080	$6,546,563	$1,674,517	20.37%
Albuterol	16-Nov-98	$3.297032	$2,882,500	$1,932,971	$949,529	32.94%
Timolol Gel	14-Jan-00	$14.598153	$952,836	$417,571	$535,265	56.18%
Verapamil	20-Aug-99	$0.125912	$2,358,022	$1,804,406	$553,616	23.48%
Cimetidine	16-Nov-98	$0.072763	$833,304	$540,391	$292,913	35.15%
Terazosin	5-Sep-00	$0.459093	$726,193	$539,565	$186,628	25.70%
Captopril	18-Oct-99	$0.036173	$313,233	$171,569	$141,664	45.23%
Nortriptyline	15-Oct-99	$0.049281	$311,276	$227,111	$84,165	27.04%
Gemfibrozil	1-Jan-00	$0.077935	$995,172	$914,650	$80,522	8.09%
Naproxen	3-Jul-00	$0.069829	$752,114	$673,203	$78,911	10.49%
Amoxicillin	7-Aug-99	$0.040549	$560,140	$499,419	$60,721	10.84%
Insulin Syringes	1-May-00	$0.098121	$430,084	$408,406	$21,678	5.04%
Timolol Drops	14-Jan-00	$2.795264	$195,968	$162,419	$33,548	17.12%
Nicotine Patches	1-Jun-00	$2.567746	$518,454	$460,290	$58,163	11.22%
Levobunolol	14-Jan-00	$4.641527	$54,385	$37,522	$16,863	31.01%
Fluocinonide	1-Sep-99	Cream $1.816402 Oint $6.210282 Sol $6.422653	$370,547	$355,800	$14,747	3.98%
Prazosin	1-Nov-99	$0.032916	$132,685	$118,531	$14,153	10.67%
Amantadine	28-Aug-99	$0.063871	$61,008	$53,950	$7,058	11.57%
Naproxen Sodium	3-Jul-00	$0.073176	$47,017	$48,695	($1,678)	-3.57%
Salsalate	15-Mar-00	$0.026462	$79,751	$87,525	($7,774)	-9.75%
Insulin	1-Nov-99	$5.292812	$4,818,894	$5,071,036	($252,142)	-5.23%
Acyclovir	1-Oct-00	$0.121623			NA	NA
Azathioprine	1-Oct-00	$0.477152			NA	NA
Hydroxyurea	1-Oct-00	$0.295324			NA	NA
Pentoxifylline	1-Oct-00	$0.182262			NA	NA
Rifampin	1-Oct-00	$0.566776			NA	NA
Sucralfate	1-Oct-00	$0.198476			NA	NA
Acetaminophen	1-Jan-01				NA	NA
TOTAL FY00			**$257,519,303**	**$192,336,719**	**$65,182,584**	**25.31%**

Explanation of Cost Avoidance Calculations: Cost avoidance equals the difference between (1) the theoretical cost that would have occurred in FY 00 if a contract had not existed, and (2) the actual cost that was incurred in FY 00 for the "market basket" of drugs that pertains to each contract. The theoretical cost that would have occurred in FY 00 if a contract had not existed was estimated by multiplying the weighted average price/unit that existed before the contract took effect by the quantity purchased in FY 00 after the contract was in effect. The "market basket" of drugs includes both the contracted and the non-contracted drugs that pertain to a given contract. For example, the cost avoidance for statins takes into account the expenditures for all six statins, not just the two contracted statins.

Appendix B: Objective of the Basic Core Formulary and Factors Considered in Drug Selection

A. *Objective of the Basic Core Formulary (BCF)*

Ensure uniform availability of cost-effective pharmaceuticals at MTF pharmacies to meet the majority of patients' primary care needs

B. *Selecting drugs for the BCF*

Compare the drug to other agents in the class or other agents that are used for a given disease/condition, based on the following factors:

Safety

Tolerability

Efficacy / Effectiveness

Price / Cost

Other factors, including but not limited to:

- Place in therapy / clinical niche
- Interchangeability of drugs in the class
- Variability in patient response to drugs in the class
- MTF provider opinions/preferences
- Market share trends within the drug class
- Percentage of MTFs that have the drug on formulary
- Potential for inappropriate use
- Patent expirations and impending availability of generic equivalents

Appendix C: Drugs Added to the BCF

Drug	Factors Considered Safety, tolerability, efficacy, price, and other factors (STEPO) relative to other drugs in the same class and/or current BCF items, if any	Percentage of MTFs reporting drug on formulary
Clindamycin 150-mg capsules	S/T/E: Safe and effective for treatment of commonly encountered acute infections. P: Generics available. Capsule prices range from $0.28 to $1.15 (branded 300-mg capsule) O: Class not represented on current BCF. Alternative for skin, soft-tissue, and respiratory tract infections in PCN allergic patients. Needed for treatment of polymicrobial infections where anaerobes are suspected.	Unknown
Loperamide 2-mg capsules	S/T: Safer than diphenoxylate/atropine (e.g., Lomotil). Does not interact with MAO inhibitors or CNS depressants. Does not cause physical dependence. Less drowsiness and sedation compared to diphenoxylate/atropine. E: Efficacy similar to diphenoxylate/atropine. P: DAPA price = $0.046 per capsule, compared to $0.017 per tablet for diphenoxylate/atropine O: Available on a high number of local formularies. A non-scheduled alternative to diphenoxylate/atropine (will not add to administrative burden).	98.7% (155/157)
Chlorhexidine gluconate 0.12% oral rinse (Peridex®, Periogard®, generics) – used for treating gingivitis	S/T: No systemic effects (topical application). Potential cosmetic concerns include staining of the tooth surfaces, restorations, and dorsum of the tongue. Occasional alterations in taste perception. E: No available published literature that treating gingivitis decreases tooth loss. There are conflicting reports on the relationship between periodontal disease and coronary heart disease in men. P: Price ranges from $2.44 to $3.00 for 473 mL bottles O: No similar agents are available on the BCF Satisfies an unique therapeutic niche Dental consultants agreed that this product belongs on the BCF Space limitations may be a concern in smaller MTFs	96.8% (152/157)
Amox/clav (Augmentin) tablets and suspension	S/T/E: Widely used agent proven safe and effective in broad range of infectious processes. P: Already available at nearly all MTFs, so minimal cost impact. O: Class not represented on BCF. Widely used to treat respiratory tract infections and otitis media where penicillinase-producing organism is known or suspected.	Tablets - 96.8% (152/157) Susp – 97.5% (153/157)
Fluconazole oral, 150-mg tablets only	S/T/E: Proven safe and effective for treatment of vaginal candidiasis. P: $6.63 to $6.89 per treatment. OTC cream DAPA price range from $3.35 to $4.42 per 45gm tube. O: No alternatives currently listed on the BCF. As effective as OTC vaginal creams. Offers advantage of single dose therapy and ease of administration.	96.8% (152/157)

Drug	Factors Considered Safety, tolerability, efficacy, price, and other factors (STEPO) relative to other drugs in the same class and/or current BCF items, if any	Percentage of MTFs reporting drug on formulary
Metoclo-pramide oral	S/T: Metoclopramide is well tolerated with CNS side effects of drowsiness, fatigue and lassitude occurring in roughly 10% of patients at normal doses. Extrapyramidal and/or dystonic reactions are rare, occurring in about 0.2% of patients. E: Effective in the treatment of diabetic gastroparesis for which there is no other treatment. P: Price is less than $0.01 per tablet. O: No similar product on the BCF	Metoclopramide 95.5% (150/157)
Mupirocin 1% ointment	ST: Only safety issue would be in patients with renal failure who need to use it on a large open wound area; otherwise mupirocin is not absorbed systemically. No significant tolerability issues. E: Bacitracin nearly 100% failure rate for impetigo. Oral erythromycin now > 50% failure rate due to resistance. Nearly 100% successful treatment of impetigo with mupirocin or cephalexin. Using mupirocin avoids problems related to systemic therapy. Studies were done at Tripler. P: DAPA prices: ointment $22.03 per 22gm tube; cream $16.24 per 15 gm tube, $27.56 per 30 gm tube; nasal ointment $29.57 (box of 10, 1gm tube) O: Nothing similar in this category of therapy on BCF. On the VA formulary with restrictions. Many schools and day care centers will not allow children with impetigo to return until they have been treated.	Mupirocin oint. – 143/157 – 91.1%
Metoprolol 50mg, 100mg oral (Toprol XL is not included in this listing for metoprolol)*	S: Safe when used as directed. Avoid in patients with severe reactive airway disease, concurrent negative inotropic agents, severe or unstable heart failure. T: Well tolerated. β-1 selective agent may minimize β2 blockade related adverse effects (bronchospasm). Selectivity is lost with higher doses. E: Effective in treating HTN, angina, post-MI, selected CHF patients (stable NYHA II and NYHA III). Proven mortality benefit in all these conditions. Usually dosed BID. Can be used QD for HTN in some patients. P: Inexpensive. Metoprolol 50mg generic - $0.02-0.06, Metoprolol 100mg generic - $0.03-0.05, Toprol XL® 50mg - $0.46, Toprol XL® 100mg - $0.92 (Dec 2000 DAPA prices). Toprol XL® 25mg scored tablet – submitted for FDA approval for stable NYHA II-III CHF patients – release date unknown. O: Proven mortality benefit in several indications. Want to encourage use, esp in post-MI patients (decreases mortality and is a HEDIS measure). **Toprol XL® was excluded because there are insufficient clinical advantages to justify the incremental cost compared to immediate release metoprolol.*	Metoprolol – 142/157 – 90.4% Toprol XL – 7/157 – 4.5%

Drug	Factors Considered Safety, tolerability, efficacy, price, and other factors (STEPO) relative to other drugs in the same class and/or current BCF items, if any	Percentage of MTFs reporting drug on formulary
Fluticasone oral inhaler (For complete analysis and clinical information, see Review of Orally Inhaled Corticosteroids, Nov 00 DOD P & T Committee Meeting)	S/T: Fluticasone is equal in safety to other inhaled corticosteroids (ICS) on the market. Adverse reactions appear to be similar to the other available ICS. E: When given in equipotent doses, all the ICS appear to have equal efficacy. Fluticasone, like budesonide, is a high potency ICS that may require fewer puffs per day to achieve control of asthma. P: DAPA prices - 44 mcg MDI $19.88 110 mcg MDI $29.03, 220 mcg MDI $50.65, 50 mcg DPI $21.32, 100 mcg DPI $27.95, 250 mcg DPI $35.98 O: There are no high potency ICS on the BCF. Of the two high potency ICS, fluticasone has a significant share of the market compared to budesonide (39% versus 3.5%). The two high potency ICS are not interchangeable. Budesonide is a dry powder inhaler (DPI); fluticasone is available as both a DPI and a metered dose inhaler (MDI). Given the difference in dosage forms, significant and costly patient education would be required to switch patients currently on fluticasone to budesonide. Budesonide is less desirable than fluticasone because providers report that patients have difficulty in administering the correct dose because of the lack of tactile feedback. Breath actuation with budesonide may be particularly difficult for children.	135/157 (86.0%)
Lactulose syrup	ST: No significant safety issues. Better tolerated than other 2 maintenance therapies recommended for children (mineral oil, magnesium salts). Common side effects (flatulence, belching, abdominal distension, abdominal pain) generally mild. E: Several clinical trials have demonstrated significant increase in stool frequency, weight, volume, and water content compared to placebo. P: DAPA price $3.97/480 ml vs. $17.92 approximate retail price O: Constipation prevalent in pediatric population. Adult therapies not generally used in children	Unknown
Methotrexate oral	ST: Substantial toxicity, low therapeutic index. Not possible to logically compare to other agents. E: No equivalent antineoplastic agent on BCF. No other DMARDs on BCF. Efficacy as antineoplastic agent and immunosuppressive agent clearly demonstrated. P: Generic product available. DAPA price $0.12/tablet; 2.5-10 fold lower than approximate retail price O: Availability of best alternative DMARD (etanercept) greatly limited. Rheumatrex dose packs significantly more expensive than bulk tablets.	80.9% (127/157)

Drug	Factors Considered Safety, tolerability, efficacy, price, and other factors (STEPO) relative to other drugs in the same class and/or current BCF items, if any	Percentage of MTFs reporting drug on formulary
Nitrofurantoin macrocrystals (generic equivalents to Macrodantin) Macrobid is not included*	S/T/E: Specifically for the treatment and suppression of UTI. P: Generics available Price range from $0.07 to $0.87/dose. O: Recommended as one of primary agents in DOD Acute Dysuria or Urgency in Women Guideline. **MacroBid â was excluded because it offers no significant clinical advantage over available generic products.*	Capsules – 72.6% (114/157) Macrocrystals – 79% (124/157) Susp - Unknown

MEMORANDUM FOR: Executive Director of Tricare Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. A meeting of the DoD P&T committee convened at 0800 hours on 16 November 2000, at Ft Sam Houston, TX.

2. **MEMBERS PRESENT:**

CDR Terrance Egland, MC	Co-chair
COL Daniel D. Remund, MS	Co-chair
LTC Judith O'Connor, MC	Army
MAJ Brett Kelly, MS	Army
CDR Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
COL (select) John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Robert Rist	Coast Guard
LTC Greg Russie	Joint Readiness Clinical Advisory Board
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia (DSCP)
Ron Mosier	Department of Veterans Affairs
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)
Ray Nan Berry	Foundation Health
Kirby Davis	Anthem Alliance
William Hudson	Humana, Inc
Gene Lakey	TriWest
Ron McDonald	Sierra Military Health Services

MEMBERS ABSENT:

COL Rosa Stith, MC	Army

OTHERS PRESENT:

CAPT Joe Torkildson	DoD Pharmacoeconomic Center
COL Mike Heath, MS	Army Pharmacy Consultant, DoD Pharmacy Board of Directors
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center
LTC (P) William Davies	DoD Pharmacy Program Director, Tricare Management Activity (TMA)
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
LTC Steven Humburg	Health Affairs
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
LCDR Mark Richerson	DoD Pharmacoeconomic Center
MAJ Barbara Roach, MS	DoD Pharmacoeconomic Center
MAJ Ed Zastawny	DoD Pharmacoeconomic Center
HM3 Cory Beckner	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Howard Altschwager	Deputy General Counsel, TMA
David Chicoine	Uniformed Services Family Health Plan
Eugene Moore	DoD Pharmacoeconomic Center
Jeremy Johnson	Family Practice Pharmacy Resident, University of Texas Pharmacy Program
Mark Petruzzi	Merck-Medco
Elizabeth Scaturro	Merck-Medco
Carol Scott	DoD Pharmacoeconomic Center
David Spiler	Merck-Medco
Shana Trice	DoD Pharmacoeconomic Center
Vincent Valinotti	Defense Supply Center Philadelphia
Paul Vasquez	Defense Supply Center Philadelphia
Eric Vetter	Pharm.D. Student, Ferris State University

ADMINISTRATIVE ISSUES

The minutes from the last meeting were corrected as below:

- The heading for Paragraph 11G was changed to "General Accounting Office (GAO) Report—Review of Drug Classes for Contracting Potential."

- Paragraph 16 (Formulary Controls in the Retail Pharmacy Network) was revised to delete the sentence "MCSCs can not currently impose prior authorizations beyond those approved by the DoD P&T committee."

3. **REVIEW OF INTERIM DECISIONS –** The co-chairs reported on the following interim decisions, which were confirmed by the committee:

- Quantity limit for testosterone gel (Androgel) – The normal quantity limit for a Schedule III drug would be a 30-day supply. An exception was made to allow prescriptions for Androgel to be filled for up to a 90-day supply, based on its chronic use and the lower potential for overuse compared to other testosterone formulations.

- Coverage of perindopril (Aceon; Solvay) through the National Mail Order Pharmacy (NMOP) program – Perindopril was approved in 1993, but only recently marketed. Perindopril was added to the NMOP Formulary.

- The co-chairs decided to establish and have the first meeting of the DoD Executive Council as a separate committee composed solely of federal employees. The DoD P&T Executive Council is responsible for performing certain inherently governmental functions relevant to a pharmacy benefits program and providing other direction and assistance to the P&T committee. The first meeting of the DoD Executive Council was held 15 Nov 00. Minutes of the meeting will be posted on the PEC website.

4. **PROCEDURE FOR REQUESTING BCF CHANGES** – At the last meeting, the committee appointed a subcommittee to develop standard procedures for MTFs to request changes to the Basic Core Formulary (BCF) and to propose agenda items for the DoD P&T Committee. MAJ George Jones presented findings of the subcommittee, including a proposed form to be placed on the PEC website to facilitate requests from MTF providers and other DoD personnel for additions, deletions, or changes to the BCF.

   Some committee members said that requests for BCF changes should be routed through the MTF or regional P&T committee rather than being submitted directly to the DoD P&T committee by an individual provider. Other committee members said that providers would view that as a "roadblock" to submitting requests. The committee voted not to require submission through the MTF or regional P&T committees. The committee asked the PEC to revise the draft form as necessary and place it on the PEC website. Use of the form will be reviewed in 3 to 6 months.

5. **IMPLEMENTATION OF FY00 AND FY01 NATIONAL DEFENSE AUTHORIZATION ACTS** – LTC Davies briefed the committee on the ongoing efforts to implement the provisions of the FY00 and FY01 National Defense Authorization Acts pertaining to the Uniform Formulary and the DoD P&T Committee.

6. **LINEZOLID USAGE IN THE RETAIL NETWORK** – The managed care support contractors (MCSCs) reported that linezolid usage had been minimal and appears appropriate. The committee agreed that a prior authorization is not necessary and closed the issue.

7. BCF AND NMOP FORMULARY ISSUES

A. The committee considered the eighteen newly approved drugs listed in Appendix A. For each drug, the committee determined status on the NMOP Formulary; the necessity for NMOP or retail network formulary restrictions (NMOP Preferred Drug Program, quantity limits, or prior authorization); and status on the BCF.

B. *Mifepristone (Mifeprex, RU-486; Danco Labs)*, approved 28 Sep 00 for medical termination of intrauterine pregnancy, through day 49 of pregnancy. Because the drug will only be available via direct shipment to qualified providers and because of existing DoD policies regarding termination of pregnancy, mifepristone was excluded from the NMOP and will not be a covered benefit through network providers. COL Davies addressed the issue of how mifepristone will be incorporated into existing medical care directives in the MTFs. He stated that TMA and Health Affairs is working on a policy to clarify the distribution of mifepristone and the processes that will need to be followed to obtain the drug. He stated that although there are potential uses for mifepristone other than termination of pregnancy, availability of the drug is likely to be limited by the FDA-approved indication and distribution process.

8. **NON-PREFERRED/PREFERRED DRUG PAIRS IN THE NMOP** – CDR Mark Brouker reported that the report could not be prepared because the data were not available.

9. PRIOR AUTHORIZATIONS

A. *Cost analysis of NMOP prior authorizations (PAs)* – Shana Trice (PEC) reported on the cost analysis of prior authorizations in the NMOP, using the same model presented at the Aug 00 meeting. For each drug, the costs that would be incurred for 1000 new prescriptions submitted to the NMOP that are subject to the PA process were compared to the costs that would be incurred if the prescriptions were not subject to the PA process. The analysis takes into account the cost of drug therapy, the charge from Merck-Medco for performing the PA, the estimated number of refills associated with each new prescription and the estimated cost of alternative therapy for prescriptions not filled as a result of the PA process. The analysis does not quantify the "sentinel effect" of PAs (i.e., the possibility that providers prescribe the drug less frequently because they know the drug is subject to prior authorization).

The analysis showed that total costs for each drug would be higher without PA than they are with PA. The cost avoidance resulting from the PA process is shown in the following table:

Drug	Cost avoidance per new Rx submitted
Etanercept (Enbrel)	$111.86
Sildenafil (Viagra)	$26.46
COX-2 inhibitors	$18.56

Although preliminary information on the PA for antifungals for onychomycosis (terbinafine and itraconazole) was presented, the committee agreed that it is too soon to draw any meaningful conclusions.

B. *Status of changes in prior authorization criteria for etanercept and COX-2s* – The changes in criteria for etanercept and COX-2s discussed at the February and August meetings have been completed, with the exception of the revision of the COX-2 PA to reflect approval of celecoxib for familial adenomatous polyposis (FAP). This change is in progress.

C. *Revision of prior authorization forms to reflect the rationale for the prior authorization* – The PA forms on the PEC website, which are mailed in by beneficiaries with their prescriptions after being completed by prescribers, have been changed to include the clinical rationale for the prior authorization. Merck-Medco is in the process of adding the clinical rationale language to the forms it faxes to prescribers.

D. *Proposal to increase the length of time for which etanercept is approved* – The committee considered a proposal to increase the length of time for which etanercept PAs are approved from one year to five years, which is Merck-Medco's current standard for etanercept in other health plans. Reports of rare cases of demyelinating disorders and pancytopenia in patients receiving etanercept engendered concern on the part of committee members about lengthening the approval period. The committee decided not to make any changes to the etanercept PA at this time.

E. *Proposal to change the COX-2 PA to reflect findings of the Celecoxib Long-term Arthritis Safety Study (CLASS)* – For patients taking aspirin in the CLASS study, the annualized incidence rates of upper GI ulcer complications alone and combined with symptomatic ulcers were not significantly different for celecoxib versus NSAIDS. These results indicate that celecoxib confers no GI safety benefit over NSAIDs for patients who take aspirin for cardioprotection. The PA criteria for COX-2 inhibitors may need to be revised so that usage of COX-2 inhibitors is not approved for patients who take aspirin for cardioprotection. The committee asked the PEC to further evaluate the consequences and costs of making such a change in the COX-2 PA criteria.

10. NMOP AND RETAIL NETWORK QUANTITY LIMITS

A. *Report of the subcommittee on quantity limits for proton pump inhibitors (PPIs)* – Bill Hudson (Humana) reported that the subcommittee considered two clinical questions 1) is there undetected disease that is being masked by chronic PPI therapy, and 2) do people really need long-term therapy with these drugs? With the assistance of expert opinion, the subcommittee concluded that there is probably very little undetected disease masked by PPI use. They also concluded that a substantial number of patients do need some type of long-term therapy, although many of these patients could be managed with a H2 blocker such as ranitidine instead of a PPI. The committee decided not to institute specific quantity limits for the PPIs in the NMOP and retail network.

B. *Quantity limits for isometheptene 65 / dichloralphenazone 100 / acetaminophen 325 mg oral (Midrin, generics)* – Because the status of this combination drug is being changed to

Schedule IV and because it is used for migraine treatment, the question arose as to whether quantity limits for the NMOP and retail network should be specified. However, the drug has different limits for different indications—5 capsules per day for migraines and 8 capsules per day for tension headaches—and it is difficult to determine how many capsules patients are likely to use on a monthly basis. The committee concluded that there is no need to have a specific quantity limit for this drug, since no specific limits are set for other scheduled medications. A clinical maximum for all drugs set by First Data Bank will apply across the MHS as the Prescription Data Transaction Service (PDTS) is implemented. Like other Schedule III - V drugs, isometheptene/dichloralphenazone/acetaminophen will be limited to a 30-day supply with 5 refills in the NMOP.

C. *Quantity limits for sumatriptan (Imitrex) 100 mg* – This is a newly approved dosage form of sumatriptan. The committee agreed with the proposed quantity limits of 27 tablets per 90 days in the NMOP and 9 tablets per 30 days in the retail network, which are consistent with quantity limits for other strengths of sumatriptan. Sumatriptan 100 mg tablets are packaged in 9's.

11. **CONTROLLED DISTRIBUTION OF ALENDRONATE (FOSAMAX) 40 MG (FOR PAGET'S DISEASE)** – Nationally, this dosage strength of alendronate will only be available from one specialty pharmacy (CVS ProCare). LTC Don De Groff reported on efforts to work out distribution within DoD. He reported that the manufacturer (Merck), DSCP, Merck-Medco, and the NMOP wholesaler have worked out the payment issues to allow DoD beneficiaries to go through the NMOP to process their prescriptions rather than dealing with CVS ProCare. DoD patients will receive a business reply card for Merck's Paget's Patient Support Program, giving them access to this program if they wish to participate. The PDTS Customer Service Support Center (CCSC) will assist in redirecting DoD beneficiaries receiving prescriptions through the retail pharmacy network to the NMOP in order to centralize the program. LTC De Groff emphasized that it is important that all MTF prescriptions for alendronate 40 mg, including new prescriptions, be filled at the NMOP because alendronate 40 mg will no longer be available to MTFs as of 15 Dec 00. More information will be supplied by DSCP and/or the PEC as soon as possible, and will be posted on the DSCP website. This program is expected to affect approximately 300 patients DoD-wide.

    The committee agreed that the BCF requirement for alendronate should be clarified to exclude the 40-mg tablet, since it will not be available at MTFs. The 40-mg tablet will remain on the NMOP Formulary, since the NMOP will be providing the drug.

12. **CONTROLLED DISTRIBUTION OF DOFETILIDE (TIKOSYN)** – Because of specialized educational requirements mandated by the FDA, this drug is only available for outpatient use through a single specialty pharmacy in the U.S. (Statlander's Pharmacy/CVS Procare). LTC Don De Groff reported that while the issue of payment for the medication is not yet entirely worked out, the communication procedures to support clinical monitoring have been defined. All prescriptions for dofetilide for DoD beneficiaries received by CVS Procare will be reported to the PDTS Customer Service Support Center (CCSC) (using a flat file in NCPDP compliant format) on a daily basis and a paper claim will be entered by the CSSC so that any positive prospective DURs (e.g., drug interactions) can be reported to CVS Procare. More information

concerning distribution and payment will be supplied by DSCP as soon as the issues are resolved.

13. **CONTROLLED DISTRIBUTION OF ETANERCEPT (ENBREL) –** The manufacturer of etanercept (Immunex) very recently reported that production of etanercept is at maximum capacity and that demand will likely exceed supply until new production facilities are constructed. In order to ensure that patients currently receiving etanercept are able to continue therapy, Immunex is setting up an process requiring existing patients to enroll by 1 Jan 01. Further details are available from Immunex at *www.enbrelenrollment.com*.

    The etanercept enrollment and distribution process is likely to be very difficult in DoD facilities because of the multiple chains of distribution through which MTF pharmacies obtain products. LTC Don De Groff reported on discussions with Immunex and Wyeth-Ayerst (co-marketer of Enbrel) to attempt to establish a process for DoD patients to use the NMOP only to obtain supplies of etanercept. The program start of 1 Jan 00 will not be enforced for DoD beneficiaries obtaining etanercept through the NMOP or MTFs, pending resolution of this issue.

14. **PUBLIC HEALTH ADVISORY FROM THE FDA REGARDING PHENYLPROPANOLAMINE (PPA) –** The committee discussed the recent advisory from the FDA stating that the agency is taking steps to remove PPA from all drug products and requesting that drug companies discontinue marketing products containing PPA, based on the evidence of an association between PPA and hemorrhagic stroke. Although the risk of hemorrhagic stroke is very low, the FDA is advising patients to stop taking products containing PPA. USAMMA has sent out two medical material quality control messages informing MTFs of the FDA advisory and advising pharmacies to stop dispensing the drug.

    The committee removed guaifenesin /PPA (e.g., Entex LA) from the BCF. The committee did not select an alternative agent for the BCF at this meeting because of anticipated reformulation of products by manufacturers and because the selection will be addressed as part of the BCF review to be addressed at the Feb 01 meeting.

15. **ADJOURNMENT –** The meeting adjourned at 1415 hours. The next meeting will be held in February 01 at a date and location to be determined. All agenda items should be submitted to the co-chairs no later than 15 Jan 01.

List of Appendices

APPENDIX A: CONSIDERATION OF NEWLY APPROVED DRUGS FOR THE NMOP FORMULARY AND BCF

Generic name (Trade name; manufacturer)	**Indication, approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Metformin/ glyburide tablets (Glucovance; Bristol-Myers Squibb)	Approved 31 July 00 for initial therapy, as an adjunct to diet and exercise, to improve glycemic control in patients with type 2 diabetes whose hyperglycemia can not be satisfactorily managed with diet and exercise alone; and second-line therapy when diet, exercise and initial treatment with a sulfonylurea or metformin do not result in adequate glycemic control in patients with type 2 diabetes	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added. While Glucovance is slightly less costly than Glucophage at the moment, generic metformin is expected to become available sometime around July 2001, presumably at a greatly decreased cost. The committee agreed that the combination therapy did not appear to offer enough additional benefit to offset the potential for higher costs compared to generic metformin and generic glyburide, as well as the loss of dosing and titration flexibility compared to the individual components.
Metformin extended release tablets (Glucophage XR; Bristol-Myers Squibb)	Approved 13 Oct 00 as monotherapy as an adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes; may be used concomitantly with a sulfonylurea or insulin to improve glycemic control (same indication as immediate release metformin).	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Excluded from the BCF listing for metformin. MTFs are not required to have Glucophage XR on their formularies, but may add it if they so desire. While Glucophage XR 500 mg is slightly less costly than Glucophage 500 mg at the moment, generic metformin is expected to become available sometime around July 2001, presumably at a greatly decreased cost. The committee agreed that extended release preparation did not appear to offer enough additional benefit to offset the potential for higher costs compared to generic metformin, when available.
Alendronate 35- and 70-mg (once weekly) tablets (Fosamax; Merck)	Approved 20 Oct 00 for prevention (35-mg tablet) or treatment (70-mg tablet) of osteoporosis in postmenopausal women	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Listing for alendronate on the BCF will include the once-weekly formulations. Once weekly administration appears to be as effective as once daily and may have tolerability/safety advantages. The cost per week for the once-weekly and once-daily tablets is the same. The earliest patent expiration listed in the FDA Orange Book for alendronate is 2007.

Generic name (Trade name; manufacturer)	**Indication, approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Divalproex sodium ER tablets (Depakote ER; Abbott)	Approved 13 Oct 00 for prophylaxis of migraines in adults	Added	**NMOP Preferred Drug Program** No	Listing for divalproex sodium on the BCF will include Depakote ER. Depakote ER is only indicated for prophylaxis of migraine headaches, while delayed release divalproex sodium (Depakote) is indicated for seizure disorder, bipolar disorder, and prophylaxis of migraine headaches. Depakote ER may have some convenience advantages (two 500-mg tablets once daily as opposed to one 500-mg Depakote tablet twice daily) and is cost-neutral. The earliest patent expiration listed in the FDA Orange Book for Depakote is 2008.
			Quantity Limits General rule applies	
			Prior Authorization No	
Methyl-phenidate HCl extended release tablet (Concerta; Alza)	Approved 1 Aug 00 for the treatment of attention deficit disorder	Added	**NMOP Preferred Drug Program** No	The BCF listing for methylphenidate will include Concerta. Concerta is given once daily. It consists of an immediate release component and an extended release component, which provides for initial morning efficacy followed by extended release of medication over an approximately 12-hour period. At $1.30 - $1.38 per day, Concerta is approximately 57% more costly than a typical regimen of extended-release plus immediate release methylphenidate. However, once daily dosing of Concerta has the potential to obviate the need for children to take doses during the school day. The committee pointed out that this is a quality of life issue that has a direct impact on active duty dependents and active duty personnel.
			Quantity Limits NMOP: 90 day supply Retail: 30 day supply or 90 day supply with 3 co-pays	
			Prior Authorization No	

Generic name (Trade name; manufacturer)	**Indication, approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Tinzaparin injection (Innohep; Dupont)	Approved 18 Jul 00 for treatment of acute symptomatic deep vein thrombosis with or without pulmonary embolism when administered in conjunction with warfarin sodium. Safety and effectiveness were established in hospitalized patients.	Not added. The low molecular weight heparins (LMWHs) are not currently available through the NMOP.	Non-applicable	The BCF listing for LMWHs specifies that "all MTFs must have at least one of the following products on the MTF formulary: ardeparin (Normiflo®); dalteparin (Fragmin®); danaparoid (Orgaran®); or enoxaparin (Lovenox®). MTFs will select the specific brand." The listing was amended to include tinzaparin as an option and to remove ardeparin, which is no longer available. The committee agreed that the class should be reviewed to assess the need for having the LMWHs available through the NMOP, the need for a prior authorization process at the NMOP/retail network to control inappropriately extended use, and the potential for contracting/incentive price agreements to reduce the unit cost of LMWH therapy. The VA is currently completing a LMWH clinical review, with a target date of Dec 00. The committee agreed that such an action could be done in conjunction with the VA.
Cande-sartan/ HCTZ tablets (Atacand HCT; AstraZeneca)	Approved 5 Sep 00 for treatment of hypertension	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added. The committee noted that there are currently no angiotensin receptor blockers (ARBs) on the BCF. While the clinical usefulness of the ARBs appears to be limited to patients who cannot tolerate ACE inhibitors due to cough, the comment was made that in light of increasing utilization it might be reasonable to review this class. The VA does not have a clinical review scheduled in the near future.

Generic name (Trade name; manufacturer)	**Indication, approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Cole-sevelam HCl (Welchol; GelTex Pharma/ Sankyo Parke Davis)	Approved 30 May 00 as adjunctive therapy to diet and exercise for the reduction of elevated LDL cholesterol in patients with primary hypercholesterolemia, administered alone or in combination with an HMG-CoA reductase inhibitor (non-absorbed agent)	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added. Colestipol, a bile acid sequestrant, is on the BCF. The committee asked the PEC to obtain more information to establish if a bile acid sequestrant continues to be required on the BCF and if colesevelam's apparent advantages of reduced constipation and fewer drug interactions make it a better choice for the BCF. The committee agreed that the PEC should wait until the Adult Treatment Panel III Guidelines are out and bring the issue back to the committee for consideration.
Beclo-methasone dipro-pionate HFA inhalation aerosol (QVar; 3M Pharma)	Approved 15 Sep 00 for the maintenance treatment of asthma as prophylactic therapy; and for asthma patients who require systemic corticosteroid administration, where adding QVar may reduce or eliminate the need for the systemic corticosteroids	Added	**NMOP Preferred Drug Program** No **Quantity Limits** **40-mcg strength:** 4 inhalers per 30 days, 12 inhalers per 90 days **80-mcg strength:** 2 inhalers per 30 days, 6 inhalers per 90 days. **Prior Authorization** No	Not added

Generic name (Trade name; manufacturer)	**Indication, approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Budesonide inhalation suspension (Pulmicort Respules; AstraZeneca)	Approved 8 Aug 00 for the maintenance treatment of asthma and as prophylactic therapy in children 12 months to 8 years of age	Added	**NMOP Preferred Drug Program** No **Quantity Limits 0.25-mg strength:** 4 boxes of 30 per 30 days, 12 boxes of 30 per 90 days **0.5mg strength:** 2 boxes of 30 per 30 days, 6 boxes of 30 per 90 days **Prior Authorization** No	Not added
Unoprostone isopropyl ophthalmic solution, 0.15% (Rescula; Ciba Vision/ Novartis)	Approved 3 Aug 00 for lowering of intraocular pressure in patients with open-angle glaucoma or ocular hypertension who are intolerant of other intraocular pressure lowering medications or insufficiently responsive (failed to achieve target IOP determined after multiple measurements over time) to another intraocular pressure lowering medication	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added
Azelastine HCl ophthalmic solution, 0.05% (Optivar; ASTA Medica)	Approved 22 May 00 for treatment of itching of the eye associated with allergic conjunctivitis	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added

Generic name (Trade name; manufacturer)	**Indication, approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Levo-floxacin ophthalmic solution, 0.5%, (Quixin; Santen)	Approved 21 Aug 00 for the treatment of bacterial conjunctivitis	Added The committee noted that although there is little reason for prescriptions for the 7-day regimen of Quixin to be filled through the NMOP, other acute use antibiotics are available through the NMOP.	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added
Estradiol/ norethin-drone acetate tablets (Activella; Pharmacia & Upjohn)	Approved 11 Apr 00 for women with an intact uterus for the prevention of postmenopausal osteoporosis	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added
Atova-quone/ proguanil (Malarone; Glaxo Wellcome)	Approved 14 July 00 for the prevention and treatment of acute, uncomplicated Plasmodium falciparum malaria. Dosing recommendations in labeling for pediatric patients > 11 kg.	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added The committee noted that this drug has more application for readiness applications than for managed care. Special note was made of the pediatric indications for Malarone. LTC Greg Russie from the Joint Readiness Clinical Advisory Board commented that it is likely that facilities that need the agent for deployment purposes will have it, while active duty dependents traveling overseas will have access to the drug through the NMOP.

Generic name (Trade name; manufacturer)	**Indication, approval date**	**NMOP Formulary Status**	**NMOP or retail network formulary restrictions**	**BCF Status**
Lopinavir/ ritonavir solution (Kaletra; Abbott)	Approved 15 Sep 00 for the treatment of HIV-1 infection in adults and pediatric patients age six months and older	Added	**NMOP Preferred Drug Program** No **Quantity Limits** General rule applies **Prior Authorization** No	Not added
Eflornithine HCl 13.9% cream (Vaniqa; Bristol-Myers Squibb)	Approved 28 Jul 00 for the reduction of unwanted facial hair in women	Excluded Drugs intended for purely cosmetic purposes are not covered under the TRICARE benefit.	Non-applicable	Not added
Bexarotene gel (Targretin gel; Ligand)	Approved 29 Jun 00 for the topical treatment of cutaneous lesions in patients with early-stage (TNM Stage IA and IB) cutaneous T-cell lymphoma (CTCL) who have refractory or persistent disease after other therapies or who have not tolerated other therapies	Excluded It does not appear feasible to meet strict requirements for avoiding pregnancy (including limiting to a one month supply, monthly pregnancy tests, and frequent counseling) in a mail-order program. Oral bexarotene was excluded from the NMOP Formulary in Feb 00.	Non-applicable	Not added

APPENDIX B: ITEMS TO BE ADDRESSED AT THE NEXT MEETING

1. Report of the subcommittee to develop standard procedures for MTFs to request BCF changes and propose agenda items for the DoD P&T Committee and follow-up on placement of a form on the PEC website for MTF providers and other DoD personnel involved in the prescribing process to propose additions, deletions, or changes to the BCF. Subcommittee members include: MAJ George Jones (chair), MAJ Barbara Roach (PEC), MAJ Brett Kelly, CDR Matt Nutaitis, MAJ Mickey Bellemin, LTC Judith O'Connor.

2. NMOP preferred drug program standing report – CDR Mark Brouker (PEC)

3. NMOP prior authorization program standing report – MAJ Mickey Bellemin, Shana Trice (PEC)

4. Controlled distribution of alendronate (Fosamax) 40 mg (for Paget's Disease)

5. Controlled distribution of dofetilide (Tikosyn)

6. Controlled distribution of etanercept (Enbrel)

Department of Defense

Fort Sam Houston, TX 78234-6190

MCCS-GPE **15 Nov 00**

MEMORANDUM FOR: Executive Director, TRICARE Management Activity (TMA)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Executive Council Meeting

1. The inaugural meeting of the DoD P&T Executive Council convened at 0800 hours on 15 November 2000, at Ft Sam Houston, TX. The DoD P&T Executive Council is responsible for performing certain inherently governmental functions relevant to the DoD pharmacy benefits program. The council focuses primarily on issues related to the Basic Core Formulary (BCF), national pharmaceutical contracts, and blanket purchase agreements. The DoD P&T Executive Council is comprised of federal employees who are members of the DoD P&T Committee.

2. **MEMBERS PRESENT:**

CDR Terrance Egland, MC	P& T Committee Co-chair
COL Daniel D. Remund, MS	P& T Committee Co-chair
MAJ Brett Kelly, MS	Army
LTC Judith O'Connor, MC	Army
CDR Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
COL (select) John R. Downs, MC	Air Force
COL Bill Sykora, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Robert Rist	Coast Guard
Ronald L. Mosier	Department of Veterans Affairs
LTC Greg Russie, BSC	Joint Readiness Clinical Advisory Board
LTC Steven Humburg, MC	Health Affairs
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia

MEMBERS ABSENT:

COL Rosa Stith, MC	Army

OTHERS PRESENT:

COL Mike Heath, MS	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
CAPT Joe Torkildson, MC	DoD Pharmacoeconomic Center
LTC (P) William Davies, MC	DoD Pharmacy Program Director, TMA
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
LCDR Fred Beale, MSC	Defense Supply Center Philadelphia
LCDR Mark Richerson, MSC	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
MAJ Barbara Roach, MC	DoD Pharmacoeconomic Center
HM3 Cory Beckner	DoD Pharmacoeconomic Center
Angela Allerman	DoD Pharmacoeconomic Center
Howard Altschwager	Deputy General Counsel, TMA
Shana Trice	DoD Pharmacoeconomic Center
Vincent Valinotti	Defense Supply Center Philadelphia
Paul Vasquez	Defense Supply Center Philadelphia

3. **IMPLICATIONS OF THE FY00 AND FY01 DEFENSE AUTHORIZATION ACTS** – COL Remund and LTC (P) Davies briefed the committee on implications of the FY00 and FY01 Defense Authorization Acts for the BCF. The BCF should be expanded to ensure uniform availability of cost-effective pharmaceuticals that will satisfy the primary care needs of the vast majority of patients served by MTF pharmacies. The DoD Pharmacoeconomic Center (PEC) will analyze drug usage data from MTF pharmacies, the NMOP and retail pharmacy networks to assist the committee in selecting additional pharmaceuticals for inclusion on the BCF at the next P&T meeting.

4. **NATIONAL PHARMACEUTICAL CONTRACTS**

A *Contract awards and renewals*

- The proton pump inhibitor (PPI) contract for omeprazole (Prilosec; Zeneca) was renewed. The price decreased from $1.40 to $1.10 per capsule.

- The FDA approved the marketing of the 0.8 mg dosage of cerivastatin (Baycol; Bayer). The 0.8 mg tablet is not being added to the statin contract, but is available at a DAPA price of $0.50 per tablet. According to package labeling, 0.8 mg/day of cerivastatin reduces LDL cholesterol by 42% and raises HDL cholesterol by 9% after 8 weeks of therapy. A 0.8 mg daily dose of cerivastatin costs $183 per year and provides approximately the same percent reduction in LDL-C as simvastatin 40 mg/day, which costs $361 per year.

- Joint VA/DoD single source contracts were awarded for acetaminophen, acyclovir, azathioprine, hydroxyurea, pentoxifylline, rifampin, sucralfate, and terazosin.

- Joint VA/DoD single source contracts were renewed for ranitidine, insulin, prazosin, and cimetidine.

- Prices and effective dates for contracts are available on the DSCP website.

B. *Financial impact of contracts* – Incomplete prime vendor data impaired the accuracy of previous estimates of the financial impact of national pharmaceutical contracts. The Defense Supply Center Philadelphia (DSCP) recently provided more complete prime vendor data to the PEC. Analysis of the more complete data revealed that MTFs spent approximately $1.03 billion on pharmaceuticals through the prime vendor system in FY 00. MTF cost avoidance from national pharmaceutical contracts was approximately $62.8 million in FY 00. A summary of MTF cost avoidance from national pharmaceutical contracts is provided in Appendix A. Market share and cost avoidance data associated with national pharmaceutical contracts are also available on the PEC website.

C. *Status of joint VA/DoD solicitation for non-sedating antihistamine contract* – Pharmaceutical companies have submitted multiple GAO protests to the solicitation. The PEC is working with the VA Pharmacy Benefit Management (PBM) Strategic Healthcare Group, the VA National Acquisition Center (NAC), and DSCP to resolve the protests.

D. *Status of contracting initiatives for oral contraceptives* – LCDR Beale reported that DSCP received no bids by the closing date of the solicitation for a joint VA/DoD single source contract for 35 mcg ethinyl estradiol (EE) / 1 mg norethindrone. DSCP plans to reissue the solicitation. DSCP also plans to issue solicitations for joint VA/DoD single source contracts for 35 mcg EE / 1 mg ethynodiol diacetate; EE 30/40/30 mcg / levonorgestrel 0.05/0.075/0.125 mcg; and 0.35 mg norethindrone.

E. *Returned goods contract* – LCDR Beale reported on DSCP's efforts to establish a returned goods contract.

F. *Potential future contract initiatives* – Potential candidates for future joint VA/DoD single source contracts include spironolactone, ticlopidine, isosorbide, diclofenac, ketoconazole cream, capsaicin cream, valproic acid, and hydrochlorothiazide.

5. **FLUOROQUINOLONES** – The committee considered safety, tolerability, efficacy and other pertinent factors and concluded that fluoroquinolones are not sufficiently interchangeable for a closed class contract. Fluoroquinolones differ significantly in adverse event profiles, spectrum of activity, and FDA-approved indications. The committee was also concerned that a closed class contract would preclude the use of new fluoroquinolones that may be approved by the FDA in the near future. The new fluoroquinolones may offer significant clinical advantages over existing agents.

   The committee selected levofloxacin for the BCF. The safety, tolerability and efficacy of levofloxacin are equivalent to or better than other fluoroquinolones. MTF fluoroquinolone usage has shifted away from ciprofloxacin in favor of levofloxacin over the past two years. Levofloxacin now accounts for nearly 70% of all fluoroquinolone prescriptions dispensed at

MTFs. The shift in market share was likely spurred by a blanket purchase agreement (BPA) that offered levofloxacin at a price of $2.00 per daily dose if levofloxacin attained a 60% market share at an MTF. Levofloxacin cost $2.50 per daily dose if the 60% market share was not achieved. A recent modification of the levofloxacin BPA lowers the market share requirement to 50%, but MTFs that do not meet the market share requirement will now pay the federal ceiling price of $3.25 per day for levofloxacin.

Some MTFs report that they are unable to obtain levofloxacin at the BPA price because purchases of ciprofloxacin for readiness requirements have artificially depressed the levofloxacin market share at their facilities. This problem is more prevalent at Air Force and Coast Guard pharmacies. The committee encouraged DSCP to modify the terms of the BPA so that MTFs can more easily obtain levofloxacin at the BPA price.

The fluoroquinolone class remains open on the BCF, so MTFs may have fluoroquinolones on their formulary in addition to levofloxacin. The committee is aware that ciprofloxacin is the only fluoroquinolone approved for the treatment of anthrax. The committee stressed that the selection of levofloxacin for the BCF has no bearing on the purchase of ciprofloxacin for readiness requirements.

6. **LEUTINIZING HORMONE RELEASING HORMONE (LHRH) AGONISTS** – The committee considered the PEC clinical review (available on the PEC website) and concluded that it is not possible to establish a closed class contract for a single agent to cover all nine clinical conditions that are treated with LHRH agonists. Seven of the clinical conditions affect only woman or children and two conditions affect only men. None of the four LHRH agonists is indicated for all the clinical conditions. The PEC estimates that 58% of MTF prescriptions for LHRH agonists are for prostate cancer and this usage is fairly evenly split between goserelin and leuprolide. Leuprolide accounts for nearly all the MTF usage for conditions other than prostate cancer.

   The committee concluded that goserelin and leuprolide are equivalent in regard to safety, tolerability, efficacy and other pertinent factors in the treatment of prostate cancer, so it is theoretically possible to establish a closed class contract for the specific indication of prostate cancer. The committee decided not to seek a closed class contract at this time. Since the VA already has a closed class contract for goserelin for treatment of prostate cancer, a joint VA/DoD contract should not be pursued until the VA is ready to rebid the contract. If DoD were to establish its own closed class contract now, it would likely hinder the ability to solicit for a joint VA/DoD contract in the future. The committee also has concerns about the potential complexity of administering a closed class contract for a specific indication within the military health system.

   The committee was informed of a recent voluntary price reduction for leuprolide and an offer of a blanket purchase agreement (BPA) for goserelin (see Appendix B for price information and BPA terms). The BPA prices for goserelin are equal to the VA national contract prices and are substantially lower than the prices for equivalent doses of leuprolide for prostate cancer. The committee advised DSCP to accept the BPA for goserelin. The committee asked DSCP and the PEC to initiate an education/marketing campaign to ensure that goserelin

achieves at least an 80% overall share of the MTF prescriptions for LHRH agonists for prostate cancer as required by the BPA. The PEC will use the Uniformed Services Prescription Database (USPD) to track the market shares for LHRH agonists for prostate cancer.

7. **NASAL INHALED CORTICOSTEROIDS** – The committee reviewed a draft of the VA clinical review and MTF usage and cost data for intranasal corticosteroids. The committee made the following observations and conclusions:

   - Nasal corticosteroids are widely used as first line agents in treating nasal symptoms of seasonal and perennial allergic rhinitis.

   - Nasal corticosteroids do not differ significantly in their safety profiles. All nasal corticosteroids carry the same warning regarding potential suppression of growth in children.

   - Patients generally tolerate the aqueous formulations better than the non-aqueous formulations.

   - All nasal corticosteroids can be considered equally effective for seasonal and perennial allergic rhinitis when used in equipotent doses. Agents that are normally dosed once or twice daily are commonly classified as "high potency" agents. These agents are budesonide 32mcg/spray, fluticasone 50mcg/spray, triamcinolone 55mcg/spray, mometasone 50mcg/spray, and beclomethasone 84mcg/spray.

   - Annual MTF usage of nasal corticosteroids has remained relatively constant, but annual expenditures have nearly doubled over the past three years due to large price increases for some of the agents. Significant shifts in market share have occurred over the past two years—probably in response to the large price increases. Two years ago, beclomethasone inhalers accounted for 80% of all nasal corticosteroid prescriptions filled at MTFs—now they account for only 20% of the prescriptions. Fluticasone 50mcg/spray (the only nasal corticosteroid inhaler currently on the BCF) and mometasone 50mcg/spray now account for 60% and 20% respectively of all nasal steroid prescriptions filled at MTF pharmacies.

   The committee agreed that the nasal corticosteroid inhaler class can be divided into two categories: aqueous and non-aqueous formulations. The aqueous formulations can be further subdivided into high potency and low potency categories. The committee concluded that the BCF must contain, at a minimum, a high potency aqueous nasal corticosteroid. The committee agreed that a closed class contract could be established for a high potency aqueous corticosteroid inhaler. The committee recommended that this should be a joint VA/DoD contract if the requirements of the two agencies are conducive to such a contract. The committee also supports a closed class contract for a non-aqueous corticosteroid inhaler if those involved in the contracting process conclude that it would be beneficial to seek such a contract.

8. **ORAL INHALED CORTICOSTEROIDS** – The committee considered the PEC clinical review (available on the PEC website) and made the following observations and conclusions.

- High potency agents (budesonide and fluticasone) are not interchangeable with low potency agents (beclomethasone, triamcinolone, and flunisolide). Patients with moderate to severe asthma often prefer a high potency agent because they can obtain the necessary dosage with fewer puffs per day than with low potency agents.

- Budesonide and fluticasone are not sufficiently interchangeable because fluticasone is available as a metered dose inhaler (MDI) and a dry powder inhaler (DPI) and budesonide is available only as a DPI. Some patients do not like using the breath-actuated DPI because it lacks the tactile feedback associated with an MDI that uses a propellant to deliver the drug. Breath actuation may be particularly difficult for pediatric patients. Patients who need to use a spacer with a face mask cannot use a budesonide DPI.

- The bitter taste of flunisolide limits its interchangeability with other low potency agents.

- The triamcinolone inhaler comes with a built-in spacer. While this ensures the use of a spacer, the spacer is relatively low volume and does not work well with a face mask.

The committee concluded that oral corticosteroid inhalers are not sufficiently interchangeable for a closed class contract for the overall class or the high potency or low potency categories. The committee discussed the possibility of adding a high potency oral corticosteroid inhaler to the BCF, but concluded that the issue should be addressed in the process of selecting additional agents for the BCF at the next P&T meeting.

9. **POTENTIAL ADDITION OF A THIAZOLIDINEDIONE ("GLITAZONE") TO THE BCF**
The thiazolidinediones currently on the market are rosiglitazone and pioglitazone. Troglitazone was withdrawn in March 2000 due to cases of hepatotoxicity and liver failure, some fatal. The committee agreed that post marketing surveillance has not yet proven conclusively that rosiglitazone and pioglitazone are free from similar safety problems. The committee also discussed the side effect of edema and weight gain known to occur with the glitazones and the related contraindication in patients with New York Heart Association Class III and IV heart failure. Although the glitazones are approved for monotherapy, clinical practice guidelines (including the DoD/VA Clinical Practice Guideline for diabetes) and expert opinion currently support use of glitazones only as add-on medications following sulfonylureas, metformin, and possibly other antidiabetic agents. The committee concluded that a thiazolidinedione should not be added to the BCF at this time.

10. **SELECTION OF A TRIPTAN FOR THE BCF (EVALUATION OF BPA PRICE QUOTES)**

The committee considered the PEC class review (available on the PEC website) of oral 5-HT_1 receptor agonists (triptans) and concluded the following:

- There are no clinically significant differences in the overall safety profiles of the individual triptans.

- Patients probably tolerate naratriptan better than the other triptans (the incidence of adverse events experienced by patients in phase III trials was similar to placebo). No significant differences in tolerability can be discerned between the other agents

- The efficacy of triptans can be measured by how fast they relieve headaches, to what degree they relieve headaches, and how frequently the headaches reoccur. Some studies suggest that rizatriptan may be slightly more efficacious than sumatriptan and zolmitriptan, but the available evidence is insufficient to conclude that there is any clinically significant difference in efficacy between rizatriptan, sumatriptan and zolmitriptan. Naratriptan should not be considered a first line agent because of its slower onset of action.

    - Head-to-head trials suggest that rizatriptan may provide earlier and/or more complete headache relief than either sumatriptan or zolmitriptan.

    - Two published meta-analyses of several studies found no significant differences in the "number needed to treat (NNT)" for sumatriptan, rizatriptan, and zolmitriptan. The NNT for naratriptan was significantly higher.

    - The PEC tried to compare the data from various clinical trials that measured efficacy in terms of the percentage of patients who obtained headache relief at two hours after the first dose of a triptan. In an effort to control for factors that may have varied between the trials, the PEC calculated the incremental efficacy of the triptan compared to placebo by subtracting the percentage of patients who obtained relief on placebo from the percentage of people who obtained relief on the triptan. This analysis showed a slightly higher incremental efficacy for rizatriptan. A formal statistical analysis was not performed, but it is likely that the difference between rizatriptan and the other triptans was not statistically significant.

The committee then considered the weighted average cost per prescribed dose for each triptan, which was derived from a frequency distribution of the prescribed doses and the price per tablet for each strength of each triptan. The frequency distributions of prescribed doses were obtained from the USPD. The price per tablet reflected the prices offered by pharmaceutical companies in response to a Blanket Purchase Agreement (BPA) request for price quotes issued by DSCP. The DAPA price was used if a company did not submit a price quote.

The committee concluded that sumatriptan offered the greatest value to DoD. Sumatriptan is similar in safety, tolerability and efficacy to rizatriptan and zolmitriptan. The price quote of $6.95 for sumatriptan 50 mg and 100 mg tablets reflects a 5% price reduction from the existing DAPA prices. Given the fact the sumatriptan accounts for 93% of the triptan usage at MTFs, acceptance of the sumatriptan price quote will yield the greatest cost avoidance for DoD.

The committee voted to add sumatriptan to the BCF. The triptan class remains open on the BCF. The committee emphasized that the addition of sumatriptan to the BCF is not intended to cause MTFs to delete other triptans from their formularies or to switch patients who are already using other triptans to sumatriptan.

11. **UPDATE AND REVISION OF THE ADVANCES IN MEDICAL PRACTICE (AMP) PROGRAM** – Total MTF expenditures and reimbursements in FY 00 for drugs covered by the AMP Program are given in the table below. Total expenditures were just slightly more than the $48.8 million that was programmed for pharmacy in the FY 00 AMP program.

	MTF Expenditures	AMP Reimbursement
All AMP drugs other than COX-2 inhibitors	$43,377,976	$43,377,976
COX-2 inhibitors*	$13,862,741	$6,931,370
Total	**$57,240,717**	**$50,309,346**

* reimbursed at 50%

Only $50.7 million in AMP funds are projected to be available for pharmacy in FY 01, which will be insufficient to cover the drugs currently included in the AMP program. During the last 3 months of FY 00, MTFs spent an average of $4 million per month on AMP drugs other than COX-2 inhibitors. It would be reasonable to project that expenditures for AMP drugs other than COX-2 inhibitors could easily exceed the $50.7 million in AMP funds programmed for pharmacy in FY 01. Expenditures for COX-2 inhibitors averaged nearly $2 million per month during the last 3 months of FY 00. Even if expenditures for COX-2 inhibitors in FY 01 leveled off at the expenditure rate observed in the last three months of FY 00, pharmacy would still require $12 million above the projected AMP program to reimburse MTFs for COX-2 inhibitors in FY 01. The committee concluded that COX-2 inhibitors should be removed from coverage under the AMP program because funds available to pharmacy are insufficient to support their reimbursement under the AMP program.

12. **CONSIDERATION OF COMBINATION DRUGS FOR THE BCF** – The committee discussed pros and cons of having combination drugs on the BCF. Combination drugs might offer the advantages of greater convenience and improved compliance for patients. They also could possibly reduce workload for pharmacies if a prescription for one combination product actually replaces two prescriptions for individual products. Combination products pose the disadvantages of fixed dosages that preclude adjustment in the dosage of the component drugs and the potential for unnecessary exposure to drugs if a combination product is used when a single drug would have sufficed.

The committee considered Glucovance, a newly-approved combination of metformin and glyburide. Even though Glucovance is priced slightly lower than the combined cost of the individual drugs, the committee decided not to add Glucovance to the BCF. Generic versions of metformin are expected to be available in less than a year, so the cost advantage offered by Glucovance will likely be a short-term phenomenon. The committee expects that cost of

generic versions of the individual drugs will likely be significantly less than the cost of Glucovance.

The committee considered Combivent inhaler, a combination of ipratropium and albuterol. While patients may find Combivent more convenient to use than separate inhalers, there is no conclusive evidence that patient compliance is improved significantly. Combivent costs slightly more than individual ipratropium and albuterol inhalers. The higher cost might be offset by reduced usage of albuterol inhalers, but conclusive data are not available. The committee decided not to add Combivent to the BCF.

Appendix A: Estimated Cost Avoidance in DoD MTFs Due to National Pharmaceutical Contracts, Fiscal Year 2000

Total FY00 prime vendor purchases in DoD MTFs were $1,024,591,068. The total cost avoidance of $62,804,712 for FY00 was equal to 6.13% of the total FY00 prime vendor purchases.

Drug/Drug Class	Cost Avoidance
Statins	$22,340,377
PPIs	$19,297,055
Lisinopril	$10,072,755
Diltiazem	$6,967,368
Ranitidine	$1,862,449
Albuterol	$923,293
Timolol Gel	$540,882
Verapamil	$413,898
Cimetidine	$292,913
Captopril	$135,558
Nortriptyline	$83,643
Amoxicillin	$60,492
Timolol Drops	$31,473
Fluocinonide	$14,749
Prazosin	$14,153
Amantadine	$5,796
Insulin	($252,142)
TOTAL FY00	**$62,804,712**

Appendix B: Cost Considerations – Goserelin and Leuprolide Depot for Prostate Cancer

MAGNITUDE OF DOD EXPENDITURE: DoD can expect to spend approximately $5 million for 17,500 LHRH agonist prescriptions in FY01. Approximately 58% of these, or 10,000 prescriptions, will be for strengths used for prostate cancer. These 10,000 prescriptions are currently split almost evenly between goserelin and leuprolide. Over 97% of the remaining LHRH agonist prescriptions are for leuprolide.

DOD PRICING FOR GOSERELIN AND LEUPROLIDE DEPOT FORMULATIONS

	Goserelin				**Leuprolide**		
	Dosage Form	**Nov 00 DAPA price**	**BPA Price*** (equals VA contract price)		**Dosage Form**	**Oct 00 DAPA Price**	**Nov 00 DAPA Price** (resulting from voluntary price reduction)
1-month depot	3.6 mg implant	$213.80	$140.67		7.5 mg depot	$257.00	$227.21
3-month depot	10.8 mg implant	$611.62	$418.70		22.5 mg depot	$770.99	$681.63
4-month depot	Not available				30 mg depot	$976.58	$908.84

*The BPA for goserelin provides for a direct, immediate modification of the prime vendor price, not a rebate. The requirement is that goserelin achieve >80% market share of the prostate cancer market within 9 months (by August 2001).

MCCS-GPE 17 Aug 2000

MEMORANDUM FOR: Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with Health Affairs policy 98-025, a meeting of the DoD P&T committee convened at 0800 hours on 17 August 2000, at the Uniformed Services School of the Health Science, Bethesda, MD.

2. MEMBERS PRESENT:

CDR Terrance Egland, MC	Co-chair
COL Daniel D. Remund, MS	Co-chair
COL Mike Heath, MS	Army
LTC Judith O'Connor, MC	Army
CDR Matt Nutaitis, MC	Navy
CDR Kevin Cook, MSC	Navy
COL (select) John R. Downs, MC	Air Force
LTC Deborah Bostock	Air Force (alternate)
MAJ George Jones, BSC	Air Force
LCDR Pam Stewart-Kuhn	Coast Guard
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia (DSCP)
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)
Ray Nan Berry	Foundation Health
Kirby Davis	Anthem Alliance
William Hudson	Humana, Inc
Gene Lakey	TriWest
Ron McDonald	Sierra Military Health Services

MEMBERS ABSENT:

COL Rosa Stith, MC	Army

Joint Readiness Clinical Advisory Board representative
Department of Veterans Affairs representative

OTHERS PRESENT

LTC (P) William Davies	DoD Pharmacy Program Director, Tricare Management Activity (TMA)
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center
LTC Don De Groff, MS	DoD Pharmacoeconomic Center
MAJ Cheryl Filby, MS	Defense Supply Center Philadelphia
MAJ Brett Kelly, MS	TRICARE Lead Agent Office (Region 1)
Howard Altschwager	Deputy General Counsel, TMA
David Chicoine	Uniformed Services Family Health Plan
Linda Magazu	Defense Supply Center Philadelphia
Mark Petruzzi	Merck-Medco
Elizabeth Scaturro	Merck-Medco
Shana Trice	DoD Pharmacoeconomic Center
Paul Vasquez	Defense Supply Center Philadelphia

3. ADMINISTRATIVE ISSUES

   The minutes from the last meeting were accepted as written. COL Mike Heath replaced Danielle Doyle as the Army pharmacy representative.

4. REVIEW OF INTERIM DECISIONS – The co-chairs made an interim decision to institute the same quantity limits in the National Mail Order Pharmacy (NMOP) program and the retail network for ondansetron oral dissolving tablets (Zofran ODT) as those currently in place for ondansetron tablets (Zofran). The committee agreed with the interim decision.

5. UPDATE ON THE ADVANCES IN MEDICAL PRACTICE (AMP) PROGRAM – COL Remund presented military treatment facility (MTF) prime vendor expenditure data through May 00 for drugs covered under the AMP program. Accurate prediction of the total AMP expenditures for FY 00 is impossible because prime vendor data are missing for numerous military treatment facilities (MTFs). The "best guess" is that total MTF expenditures for AMP drugs will be around $47 million in FY 00, which will use up all the AMP funds available for pharmacy. The committee decided to make no changes in the drugs covered by the AMP program until we are more certain about expenditures for AMP drugs in FY 00 and we know how much AMP funding will be available for pharmacy for FY 01.

6. UPDATE ON BCF ADDITIONS RESULTING FROM PROGRAM BUDGET DECISION (PBD) 041 – COL Remund presented prescription data from the Uniformed Services Prescription Database (USPD) for the drugs added to the Basic Core Formulary (BCF) in Jan 00 as a result of PBD 041. A marked increase in the number of prescriptions filled for these drugs indicates that MTFs have generally complied with BCF policy by adding these drugs to their formularies.

7. SELECTION OF AN ADDITIONAL ACE INHIBITOR FOR THE BCF

The primary purpose of adding another long-acting ACE inhibitor to the BCF is to ensure uniform availability at all MTFs of an additional agent within a class of drugs that is known to provide significant clinical benefits at a reasonable cost. The ACE inhibitor clinical review prepared by the PEC will be posted on the PEC website. The committee first considered the relative safety, tolerability, efficacy, and other factors pertaining to ACE inhibitors and agreed that:

- Fosinopril may offer a slight safety/convenience advantage in patients with renal or hepatic failure due to its lack of dose adjustment requirements.
- There is insufficient evidence to conclude that ACE inhibitors differ significantly in their propensity to cause cough.
- All long-acting ACE inhibitors appear to be similar in efficacy for hypertension.
- Benazepril, enalapril and ramipril have the most evidence of a beneficial effect on renal disease/diabetic nephropathy.
- Enalapril and ramipril have the most extensive evidence of reduction in morbidity and mortality in patients with congestive heart failure (CHF), post-myocardial infarction (MI), or asymptomatic left ventricular (LV) dysfunction. Trandolapril has evidence of reduction in morbidity and mortality in a subset of these patients (LV dysfunction post MI). Fosinopril, quinapril, and perindopril have evidence of a beneficial effect on signs and symptoms of CHF and on disease progression, but lack mortality data. Moexipril and benazepril have little or no evidence supporting use in these patient populations.
- Ramipril appears to be the only ACE inhibitor with evidence of a reduction in the risk of stroke in patients at high cardiovascular risk.

The committee then considered the weighted average daily cost per patient for each ACE inhibitor, which was derived from the frequency distribution of prescribed daily doses and the price per tablet for each strength of each ACE inhibitor. The frequency distributions of prescribed daily doses were obtained from the USPD. The price per tablet reflected the prices offered by pharmaceutical companies in response to a Blanket Purchase Agreement (BPA) request for price quotes issued by Defense Supply Center Philadelphia. The DAPA price was used if a company did not submit a price quote.

Ramipril had the second lowest weighted average daily cost per patient, which was only $0.008 more than the lowest cost ACE inhibitor (a difference of $2.92 per patient per year). The committee concluded that ramipril offered the greatest value to DoD because its extensive evidence of proven clinical benefits for a variety of conditions outweighed its slightly higher cost. The committee decided (by a vote of 8 to 1) to add ramipril to the BCF.

The ACE inhibitor class remains open on the BCF. The committee emphasized that the addition of ramipril to the BCF is not intended to cause MTFs to delete other ACE inhibitors from their formularies or to switch patients who are already using other ACE inhibitors to ramipril.

8. STATUS OF ORTHO NOVUM 7/7/7 ON THE BCF – Ethinyl estradiol 35 mcg/norethindrone 0.5/0.75/1 mg (Ortho-Novum 7/7/7) is one of two oral contraceptive products still available

through the DSCP Centrally Managed Inventory Program (the depot). The price of Ortho-Novum 7/7/7 through the depot is approximately $5.56 per cycle, including surcharge, compared to $15.78 per cycle through the prime vendor program (DAPA price as of May 00). The Ortho-Novum 7/7/7 packages stocked in the depot are clinic packs, which cannot be included under the prime vendor program. About 64% of the estimated 274,000 cycles of Ortho-Novum 7/7/7 purchased by MTFs from Apr 99 to Mar 00 were obtained from the depot. The DSCP product manager expects that the product will continue to be available through the depot until at least 2002. The committee agreed that Ortho-Novum 7/7/7 should remain on the BCF, but strongly encouraged MTFs to order the product through the depot.

9. STATUS OF OXYCODONE/ACETAMINOPHEN ON THE BCF – The BCF currently requires MTFs to have both the 5/325 and 5/500 mg strengths of oxycodone/acetaminophen on their formularies. MTF pharmacists contend that both strength combinations are not needed at all MTFs. The committee agreed to change the BCF to state: "oxycodone/acetaminophen 5/325 mg *and/or* 5/500mg." MTFs may decide to have one or both combinations on their formularies.

10. PROCEDURE FOR REQUESTING BCF CHANGES – The committee appointed a subcommittee to develop standard procedures for MTFs to request changes to the BCF and to propose agenda items for the DoD P&T Committee. The subcommittee will present its recommendations at the next meeting. Subcommittee members include: MAJ George Jones (chair), MAJ Barbara Roach (PEC), MAJ Brett Kelly, CDR Matt Nutaitis, MAJ Mickey Bellemin, LTC Judith O'Connor.

11. NATIONAL PHARMACEUTICAL CONTRACTS, BLANKET PURCHASE AGREEMENTS, AND INCENTIVE PRICE AGREEMENTS

    A. *Contracts Awarded Since Last Meeting* – LTC De Groff reported that a joint DoD/VA single source contract for terazosin tablets and capsules was awarded with a start date of 5 Sep 00. Contract prices are approximately 70% less than the pre-contract prices. DoD MTFs purchased at least $6.1 million of terazosin tablets and capsules through the prime vendor program during FY99.

    B. *Financial Impact of Contracts* – COL Remund reported cumulative cost avoidance for national pharmaceutical contracts based on prime vendor data through May 00. Cost avoidance information is maintained on the PEC website. Accurate calculation of cost avoidance is impossible because prime vendor data are missing for numerous MTFs. The "best guess" is that cost avoidance from national pharmaceutical contracts will total approximately $52 million for MTFs in FY 00. To put this in context, total expenditures at MTF pharmacies in FY99 were $878 million.

    COL Remund also reported that efforts by the PEC and DSCP to monitor the financial impact of national pharmaceutical contracts have yielded additional benefits. SFC (P) Tom Bolinger, NCOIC at the PEC, discovered that a prime vendor had charged an MTF the wrong price for three drugs. Correction of the pricing errors resulted in a $236,500 credit for that MTF.

C. *Potential contract for Extended Release Morphine* – The committee considered the possibility of competing MS Contin, "A-rated" generic equivalents to MS Contin, Oramorph SR, and Kadian against each other for a closed class contract. MTF providers contend that MS Contin has a longer duration of action than Oramorph SR, and two published studies support that contention. Kadian is dosed once daily, while the other products typically require multiple daily doses. The committee concluded that these drugs are not sufficiently interchangeable for a closed class contract.

D. *Potential Contracts for Oral Contraceptives* – The committee reiterated that single source contracts should be sought for each of the following oral contraceptive agents:

1) ethinyl estradiol (EE) 35 mcg / norethindrone 1 mg
2) EE 35 mcg / ethynodiol diacetate 1 mg
3) EE 30/40/30 mcg / levonorgestrel 0.05/0.075/0.125 mcg
4) norethindrone 0.35 mcg

E. *Returned Goods Contract* – Linda Magazu updated the committee on the status of the returned goods contract.

F. *Generic 2000 and 2000B packages (VA lead)* – LTC De Groff reported on the progress of joint DoD/VA single source contracts for multi-source drugs included in the Generic 2000 and 2000B packages. The Generic 2000 package includes acyclovir, azathioprine, etodolac, furosemide, glipizide, hydroxyurea, pentoxifylline, rifampin, selegiline, and sucralfate. The Generic 2000B package includes albuterol immediate release, amitriptyline, bupropion, buspirone, carbidopa/levodopa sustained action, carisoprodol, capsicum, diclofenac, hydrochlorothiazide, imipramine, isosorbide, ketoconazole cream, meclizine, methocarbamol, prednisone, sotalol, spironolactone 50- and 100-mg, sulindac, ticlopidine, verapamil immediate release, and valproic acid. An extensive 2000C package may be developed as drugs come off VA contracts in the next six months.

The committee reiterated that contracts for single sources of "A-rated" multi-source products do not normally require prior review by the DoD P&T Committee.

G. *General Accounting Office (GAO) Report – Review of Drug Classes for Contracting Potential* – The committee reviewed the GAO recommendations regarding drug classes that may be suitable for joint DoD/VA committed use contracts. The committee supports developing joint DoD/VA contracts whenever possible. The committee came to the following conclusions regarding the potential for contracts in seven drug classes as described below:

1) *$5HT_1$ receptor agonists for migraine ("triptans")* – The committee concluded that the oral triptans are not sufficiently interchangeable for a closed class contract because of variability in patient response to these agents. The committee decided that an oral triptan should be selected for the BCF in an open class to ensure uniform availability of one oral triptan while allowing MTFs to have additional oral triptans on their formularies. The PEC will do a clinical review and DSCP will obtain pricing

information by issuing a BPA request for price quotes to companies that market oral triptans. The committee is hopeful that its evaluation of the clinical and pricing information will lead to the selection of an oral triptan for the BCF at the next meeting.

2) *Thiazolidinediones ("glitazones")* – This drug class cannot be closed because the class is too new to accurately assess the interchangeability of the drugs. The PEC will do a clinical review to assess the need for adding one of these agents to the BCF. If an agent should be added to the BCF, the committee will likely advise DSCP to issue a BPA request for price quote.

3) *Oral inhaled corticosteroids* – The PEC will do a clinical review to assess the interchangeability of these agents for a closed class contract. Members commented that separate contracts might be needed for low-potency and high-potency agents.

4) *Nasal inhaled corticosteroids* – The PEC will do a clinical review to assess the interchangeability of these agents for a closed class contract.

5) *Fluoroquinolones* – The committee discussed a number of factors that could complicate contracting efforts in this drug class, including readiness requirements for ciprofloxacin (approved for anthrax) and regional variations in antibiotic resistance. The committee decided not to rule out the possibility of a closed class contract until the PEC completes a clinical review.

6) *Leutinizing hormone releasing hormones (LHRHs; leuprolide (Lupron) and goserelin (Zoladex))* – The VA has a closed class contract for goserelin (Zoladex) for prostate cancer, but a closed class contract may not be appropriate for DoD because these drugs are less interchangeable in a patient population that includes more women and children. Lupron is indicated for prostate cancer, endometriosis, uterine fibroids and precocious puberty. Zoladex is indicated for prostate cancer, endometriosis and breast cancer. The PEC will do a clinical review to assess the interchangeability of these agents for a closed class contract.

7) *Non-sedating antihistamines* – LTC De Groff reported that the market share requirements in the current incentive price agreements for the non-sedating antihistamines are difficult for MTFs to achieve. The committee concluded that the incentive price agreements probably would not yield substantial cost savings for MTFs. In light of the large increase in MHS expenditures for these agents, the committee reconsidered the possibility of a closed class contract for a non-sedating antihistamine. The committee decided that its previous objections to a closed class contract for a non-sedating antihistamine would be obviated under the following conditions:

    - Loratadine and fexofenadine are classified as non-sedating antihistamines and cetirizine is classified as a low-sedating antihistamine. Loratadine and fexofenadine are the only two drugs that compete for the contract.

- The contracted drug is the only non-sedating antihistamine on the BCF. The non-sedating antihistamine class would be closed on the BCF, so the contracted drug would be the only non-sedating antihistamine permitted on MTF formularies.
- The contract does not affect the current status or future status of loratadine or fexofenadine in regard to the NMOP formulary.
- The contract does not affect the current status or future status of cetirizine in regard to the BCF, MTF formularies, or NMOP formulary (cetirizine is not a non-sedating antihistamine).
- The contract does NOT require DoD beneficiaries who are currently taking the non-contracted drug to switch to the contracted drug.

The committee recommended that a joint DoD/VA closed class contract should be pursued if the VA is willing to amend its contract solicitation to include the DoD requirements.

12. AVAILABILITY OF INFORMATION ON INCENTIVE PRICE AGREEMENTS AND NATIONAL PHARMACEUTICAL CONTRACTS – MAJ Cheryl Filby (DSCP) reminded the committee that the DSCP website contains information on all national contracts and a list of all incentive agreements that have come through DSCP for review. Copies of the incentive agreements are available from DSCP. She also noted that MTFs were encouraged to submit incentive price agreements to DSCP for review by DSCP legal staff and posting on the DSCP website in order to expand availability to other MTFs. In addition, the website contains a tool that may assist MTFs in verifying that they are complying with (and realizing the cost avoidance associated with) all the national contracts.

13. IMPLEMENTATION OF FY00 NATIONAL DEFENSE AUTHORIZATION ACT – LTC Davies briefed the committee on the ongoing efforts to implement the provisions of the FY00 National Defense Authorization Act pertaining to the Uniform Formulary and the DoD P&T Committee.

14. BCF AND NMOP FORMULARY ISSUES

A. The following recently approved drugs were added to the NMOP formulary. None of these drugs were added to the BCF.

1. *Triamcinolone acetonide nasal spray (Tri-Nasal; Muro Pharma)*, approved 4 Feb 00 for treatment of nasal symptoms of seasonal and perennial allergic rhinitis in adults and children 12 years and older. Tri-Nasal will have a quantity limit of 6 bottles (45 gm) per 90 days in the NMOP and 2 bottles (15 gm) per 30 days in the retail network, which is consistent with the established quantity limits for other nasal corticosteroids.

2. *Zonisamide capsules (Zonegran; Elan)*, approved 31 Mar 00 for adjunctive treatment of partial seizures in adults 16 years and older with epilepsy.

3. *Meloxicam tablets (Mobic; Boehringer-Ingelheim/Abbott)*, approved 13 Apr 00 for relief of the signs and symptoms of osteoarthritis. Meloxicam is a nonsteroidal anti-inflammatory drug (NSAID) that is preferential but not completely selective for

cyclooxygenase-2 (COX-2). If COX enzyme selectivity is conceptualized as a spectrum, meloxicam, like nabumetone and etodolac, tends to bind more to COX-2 than cyclooxygenase-1 (COX-1), while drugs such as naproxen tend to bind more to COX-1 than COX-2. Unlike celecoxib and rofecoxib, meloxicam retains some activity at COX-1 receptors. Bill Hudson noted that Humana had opted to require prior authorization of meloxicam on the same terms as rofecoxib for its commercial (non-DoD) clients. The committee noted that managed care support contractors (MCSCs) can not currently impose prior authorizations for DoD beneficiaries beyond those approved by the DoD P&T Committee (see paragraph 16 below). The committee decided that meloxicam will be identified as a non-preferred drug (like other brand name NSAIDs) on the NMOP formulary.

4. *Pemirolast potassium ophthalmic solution (Alamast; Santen),* approved 24 Sept 99 for prevention of itching of the eye due to allergic conjunctivitis.

5. *Testosterone 1% gel (Androgel; Unimed Pharma),* approved 28 Feb 00 for primary hypogonadism secondary to testicular failure and hypogonadotropic hypogonadism secondary to gonadotropin deficiency.

.

B. *Linezolid injection, tablets, and oral suspension (Zyvox; Pharmacia & Upjohn)* were excluded from the NMOP and were not added to the BCF. Linezolid was approved 24 Apr 00 for nosocomial and community acquired pneumonia and complicated/uncomplicated skin/skin structure infections caused by susceptible organisms, primarily aerobic gram-positive organisms, including *Enterococcus faecium* (vancomycin-resistant only), *Staphylococcus aureus* (including methicillin-resistant strains), *Streptococcus pneumoniae* (penicillin sensitive strains only), *Streptococcus galactiae*, and *Streptococcus pyogenes*. Because of the potential that bacterial resistance will develop if this drug is used indiscriminately, as well as the need for dispensing the drug on a more timely basis than is possible in a mail order program, the committee excluded linezolid from the NMOP formulary.

The committee discussed the possibility of instituting a prior authorization program in the retail network to ensure that linezolid is used only when truly indicated, thus minimizing the potential for development of bacterial resistance. The committee decided not to establish a prior authorization process because a delay in therapy due to the prior authorization process would pose a greater threat than the inappropriate use that might occur in the absence of a prior authorization process. The committee requested that the MCSCs monitor usage of linezolid in their systems and report back to the committee at the next meeting.

C. *Fluoxetine (Sarafem; Lilly*) – Sarafem is supplied with special packaging/labeling for Premenstrual Dysphoric Disorder (PMDD). The committee added Sarafem to the NMOP formulary. The committee decided that the BCF listing for fluoxetine should specify that MTFs are not required to have the Sarafem brand of fluoxetine on their formularies because:

- There are no chemical or formulation differences between Sarafem and Prozac. Prozac is on the BCF.
- While Sarafem and Prozac may be the same price now, a generic form of fluoxetine may be available as soon as 2001 and will probably be much less expensive than Prozac. The generic form will probably not be substitutable for Sarafem.
- The committee is skeptical that the specialized labeling for Sarafem offers any significant incremental value over the Prozac brand of fluoxetine.

15. NON-PREFERRED/PREFERRED DRUG PAIRS IN THE NMOP – CDR Mark Brouker reported the switch rates and estimated cost avoidance for the preferred drug program in the NMOP (see Appendix C). The NMOP preferred drug program yields approximately $1.8 million in annual cost avoidance for DoD.

    The committee removed cilostazol (Pletal) from the list of non-preferred drugs due to a low switch rate (see Appendix A). No report was made on the herpes antivirals, since the new strategy of calling only on prescriptions for valacyclovir and famciclovir written for chronic use (> 30-day supply) was not implemented until 1 Jul 00.

    The committee asked the PEC to instruct Merck-Medco to remove enalapril (Vasotec) from the list of non-preferred drugs as soon as generic enalapril is available at a price that is competitive with other ACE inhibitors.

16. FORMULARY CONTROLS IN THE RETAIL PHARMACY NETWORK – LTC Bill Davies and Howard Altschwager informed the committee that clarifications have been issued to the MCSCs concerning formulary controls in the retail pharmacy networks.

- The NMOP formulary does not apply to the retail pharmacy network.
- The federal regulations that implement the law governing TRICARE currently allow prior authorizations to be applied in the retail pharmacy networks only for clinical considerations (appropriateness of therapy). Terbinafine, itraconazole, sildenafil, and etanercept will continue to be subject to prior authorization in the retail network. The prior authorization for COX-2 inhibitors will be withdrawn in the retail pharmacy networks because it is based primarily on cost-effectiveness considerations rather than clinical appropriateness. The PEC will make all required changes to its website. ~~MCSCs can not currently impose prior authorizations beyond those approved by the DoD P&T committee.~~ *(This sentence was deleted as a correction to the minutes at the Nov 00 meeting of the DoD P&T Committee.)*
- Quantity limits continue to apply both to the NMOP and the retail pharmacy network.

- Active duty personnel may fill prescriptions at retail network pharmacies—including prescriptions for controlled substances.

- DoD closed class pharmaceutical contracts (i.e. contracts for statins and proton pump inhibitors) do not apply to the retail network pharmacies. Closed class contracts that apply only to MTF pharmacies and the NMOP cannot serve as the basis for denying prescriptions in the retail pharmacy networks.

17. PRIOR AUTHORIZATIONS

A. *Cost analysis of NMOP prior authorizations* – Shana Trice (PEC) presented the subcommittee's extensive cost analysis of prior authorizations (PAs) in the NMOP. Subcommittee members included MAJ Mickey Bellemin (DPSC), MAJ Brett Kelly (TRICARE Region 1 Lead Agent Office), Shana Trice (PEC), and Dave Beshara (Merck-Medco).

For each drug, the costs that would be incurred for 1000 new prescriptions submitted to the NMOP that are subject to the PA process were compared to the costs that would be incurred if the prescriptions were not subject to the PA process. The analysis takes into account the cost of drug therapy, the charge from Merck-Medco for performing the PA, the estimated number of refills associated with each new prescription and the estimated cost of alternative therapy for prescriptions not filled as a result of the PA process. The analysis does not quantify the "sentinel effect" of PAs (i.e., the possibility that providers prescribe the drug less frequently because they know the drug is subject to prior authorization).

The analysis showed that total costs for each drug would be higher without PA than they are with PA. The cost avoidance resulting from the PA process is shown in the following table:

Drug	Cost avoidance per new Rx submitted
Etanercept (Enbrel)	$327.20
Sildenafil (Viagra)	$13.60
COX-2 inhibitors	$11.66

B. *COX-2 inhibitors* – As addressed previously, the clarification of TRICARE policy caused discontinuation of the COX-2 inhibitor PA in the retail pharmacy networks. The committee decided to continue the PA for COX-2 inhibitors in the NMOP because TRICARE policy allows prior authorizations to be based on cost-effectiveness considerations in the NMOP and because the cost analysis showed that prior authorization yielded cost avoidance in the NMOP. The committee is also concerned that usage of COX-2 inhibitors would increase even more rapidly if they were not subject to the PA process. Much of the incremental COX-2 inhibitor usage would occur among patients who are at relatively low risk for gastrointestinal problems and therefore would offer negligible incremental benefit compared to using the much less expensive generic NSAIDs.

Celecoxib is indicated for familial adenomatous polyposis (FAP), which is not addressed in the current PA criteria for COX-2 inhibitors. Patients with FAP have obtained celecoxib from the NMOP through the PA appeal process. The committee agreed that the PA criteria should be revised to address FAP. The PEC will collaborate with DSCP and Merck-Medco to revise the PA criteria.

C. *Etanercept* – As a result of the "ERA" study, etanercept is now indicated for reducing signs and symptoms and delaying structural damage in adult patients with moderately to severely active rheumatoid arthritis (RA). The PEC will collaborate with DSCP and Merck-Medco to revise the PA criteria for etanercept to properly address the expanded indication.

D. *Antifungals for onychomycosis (terbinafine, itraconazole)* – The PA for terbinafine and itraconazole for onychomycosis started 1 Jul 00 in the NMOP.

E. *Prior authorization portability process* – LTC Don De Groff reported that when the Prescription Data Transaction Service (PDTS) service is completely implemented, it will provide the capability to communicate prior authorization approvals across drug distribution channels (MTF pharmacies, NMOP, and retail pharmacies).

18. BENEFIT DETERMINATION FOR FERTILITY AGENTS – According to the Code of Federal Regulations and TRICARE policy, fertility drugs are not a covered benefit when used to assist in non-coital reproduction methods. The committee agreed with CDR Terry Egland's recommendation that prescriptions for the injectable gonadotropins (follitropin alfa, follitropin beta, urofollitropin, and menotropins) should be reviewed to determine benefit coverage.

19. PROTON PUMP INHIBITORS – Bill Hudson (Humana) initially proposed that a 90-day quantity limit be established for proton pump inhibitors (PPIs) to curb inappropriate long-term use. Committee members pointed out that extended use of PPIs does not necessarily indicate inappropriate care, so a 90-day quantity limit might impede access to appropriate care. The committee agreed with Mr. Hudson's suggestion to appoint a subcommittee to study this issue and offer recommendations at the next meeting. Subcommittee members are Bill Hudson, MAJ George Jones, LTC Judith O'Connor, MAJ Mickey Bellemin, and MAJ Ed Zastawny (PEC).

20. REPORT OF THE SUBCOMMITTEE ON QUANTITY LIMITS FOR TOPICALS – Bill Hudson reported frequency distributions of quantities dispensed per prescription for the topicals and a number of other high-volume drugs that are subject to quantity limits. Committee found that the current quantity limits appear to be appropriate.

21. CONTROLLED DISTRIBUTION OF ALENDRONATE (FOSAMAX) 40 MG (FOR PAGET'S DISEASE) – The committee was informed that Merck intends to implement a Paget's Disease Patient Support Program that includes enrollment of patients and exclusive distribution of alendronate (Fosamax) 40 mg through the specialty services pharmacy, CVS ProCare. Numerous issues regarding payment for prescriptions, patient enrollment, privacy concerns, etc., will have to be worked out in order for this program to be implemented for DoD patients.

22. CONTROLLED DISTRIBUTION OF DOFETILIDE (TIKOSYN) – Because of specialized educational requirements mandated by the FDA, this drug is only available for outpatient use through a single specialty pharmacy in the U.S. (Statlander's Pharmacy in Pittsburgh). LTC Bill Davies agreed to work with TMA contracting and policy officials and the MCSCs to address the issue of payment for dofetilide for patients in the retail network. Establishment of procedures for supplying and paying for dofetilide for MTF patients will likely require coordination between the pharmacy consultants/specialty leaders and resource management officials for each service. Dofetilide was excluded from the NMOP formulary at the last meeting.

23. CONSIDERATION OF COMBINATION DRUGS FOR THE NMOP – The committee agreed that newly marketed combination products should not be automatically added to the NMOP formulary, but should go through the normal evaluation process for addition to the formulary. If an acute need requires immediate attention, the issue should be referred to the co-chairs for an interim decision. COL Remund commented that the committee should evaluate the status of combination products with regard to the BCF at the next meeting.

24. ADJOURNMENT – The meeting adjourned at 1630 hours. The next meeting will be held 15 Nov 00 at a location to be determined. All agenda items should be submitted to the co-chairs no later than 15 Oct 00.

List Of Appendices

Appendix A: Formulary Changes

1. BCF Changes
   A. Additions to the BCF
      1) Ramipril (Altace; Monarch) (See Paragraph 7.)
   B. Changes and Clarifications to the BCF
      1) The BCF listing for "oxycodone 5 mg /acetaminophen 325 and 500 mg" was changed to "oxycodone/acetaminophen 5/325 mg ***and/or*** 5/500 mg." MTFs may decide to have one or both combinations on their formularies. (See Paragraph 9.)
      2) The BCF listing for fluoxetine was changed to specify that MTFs are not required to have the Sarafem brand of fluoxetine on their formularies. (See Paragraph 14C.)

2. NMOP Formulary Changes
   A. *Additions to the NMOP Formulary* (See Paragraph 14A.)
      1) Triamcinolone acetonide nasal spray (Tri-Nasal; Muro Pharma)
      2) Zonisamide capsules (Zonegran; Elan)
      3) Meloxicam tablets (Mobic; Boehringer-Ingelheim/Abbott).
      4) Pemirolast potassium ophthalmic solution (Alamast; Santen)
      5) Testosterone gel (Androgel; Unimed Pharma)
   B. *Exclusions from the NMOP Formulary* (See Paragraph 14B.)
      1) Linezolid injection, tablets, and oral suspension (Zyvox; Pharmacia & Upjohn),
   C. *Changes to the NMOP Preferred Drug Program*
      1) Deletion of non-preferred/preferred pair for cilostazol/pentoxifylline (See Paragraph 15.)
      2) Addition of meloxicam to NMOP Preferred Drug Program as a brand name NSAID (See Paragraph 14A3.)
      3) Discontinuation of the non-preferred/preferred drug pair for enalapril/lisinopril as soon as generic enalapril is available at a price that is competitive with other ACE inhibitors. (See Paragraph 15.)

3. Quantity Limit Changes (NMOP and retail network)
   A. Quantity limits for triamcinolone acetonide nasal spray (Tri-Nasal; Muro Pharma) were established: 6 bottles (45 gm) per 90 days in the NMOP and 2 bottles (15 gm) per 30 days in the retail network. (See Paragraph 14A1.)
   B. Quantity limits for ondansetron oral dissolving tablets (Zofran ODT) were clarified to be the same as quantity limits for ondansetron tablets (Zofran): 45 tablets per 90 days in the NMOP and 15 tablets per 30 days in the retail network for both the 4- and 8-mg tablets. (See Paragraph 4.)

Appendix A continued: Formulary Changes

4. Changes to the Prior Authorization Program (NMOP and retail network)
   A. Clarification of TRICARE policy caused discontinuation of the PA for COX-2 inhibitors in the retail pharmacy network. The COX-2 inhibitor PA will continue in the NMOP. (See Paragraphs 16 and 17B.)
   B. The COX-2 inhibitor PA in the NMOP will be revised to address the use of celecoxib for familial adenomatous polyposis. (See Paragraph 17B.)
   C. The etanercept PA in the NMOP and retail network will be revised to address the newly expanded indication of etanercept for reducing signs and symptoms and delaying structural damage in adult patients with moderately to severely active rheumatoid arthritis (RA). (See Paragraph 17C.)

Appendix B: Items to Be Addressed at the Next Meeting

1. Report of the subcommittee to develop standard procedures for MTFs to request BCF changes and propose agenda items for the DoD P&T Committee. Subcommittee members include: MAJ George Jones (chair), MAJ Barbara Roach (PEC), MAJ Brett Kelly, CDR Matt Nutaitis, MAJ Mickey Bellemin, LTC Judith O'Connor.

2. Clinical review for $5HT_1$ receptor agonists for migraine ("triptans") – PEC

3. Price quotes for oral triptans obtained through a blanket purchase agreement request for quote – DSCP

4. Clinical review for thiazolidinediones ("glitazones") – PEC

5. Clinical review for oral inhaled corticosteroids – PEC

6. Clinical review for nasal inhaled corticosteroids – PEC

7. Clinical review for leutinizing hormone releasing hormones (LHRHs) - PEC

8. Report from the managed care support contractors regarding usage of linezolid in the retail network

9. Report of the subcommittee to study quantity limits for proton pump inhibitors. Subcommittee members include: Bill Hudson, MAJ George Jones, LTC Judith O'Connor, MAJ Mickey Bellemin, MAJ Ed Zastawny (PEC).

10. Controlled distribution of alendronate (Fosamax) 40 mg (for Paget's Disease)

11. Controlled distribution of dofetilide (Tikosyn)

12. Combination drugs on the BCF and NMOP Formulary

13. NMOP preferred drug program standing report – CDR Mark Brouker (PEC)

14. NMOP prior authorization program standing report – MAJ Mickey Bellemin, Shana Trice (PEC)

Appendix C: National Mail Order Pharmacy (NMOP) Preferred Drug Program Summary

Summary of Switch Rates and Estimated Cost Avoidance, Jun 99 – Jun 00*

Non-Preferred Drug	Preferred Drug	Switch Rate	Estimated Cost Avoidance	Total Number of Attempted Provider Contacts	Estimated Cost Avoidance per Attempted Provider Contact	Annualized Estimated Cost Avoidance
Cardizem CD Dilacor XR Diltia XT Diltiazem XR	**Tiazac**	68%	$466,128	4751	$98	$430,272
Procardia XL	**Adalat CC**	53%	$358,233	1963	$182	$330,722
Lodine XL Relafen Voltaren XR Daypro Naprelan	**Generic NSAIDs**	33%	$461,867	5502	$84	$426,338
H2 Blockers	**Generic ranitidine**	38%	$164,996**	1740	$95	$282,679
Enalapril	**Zestril**	45%	$92,854**	1704	$54	$222,850
Pletal	**Generic pentoxifylline**	11%	$1682	169	$10	$4036
Ditropan XL Detrol	**Generic oxybutynin**	29%	$112,269	3912	$30	$103,633
		Total	**$1,658,031**	**19741**	**$87**	**$1,800,530**

* The anti-herpes data are not presented because the new anti-herpes strategy of calling only on prescriptions for valacyclovir and famciclovir for chronic use (>30-day supply) was not implemented until 1 July 00.

** H2 blockers and enalapril→lisinopril implemented Dec 99 and Feb 00, respectively. Data and cost avoidance estimate in table is from date of implementation through Jun 00.

Appendix C continued: National Mail Order Pharmacy (NMOP) Preferred Drug Program Summary

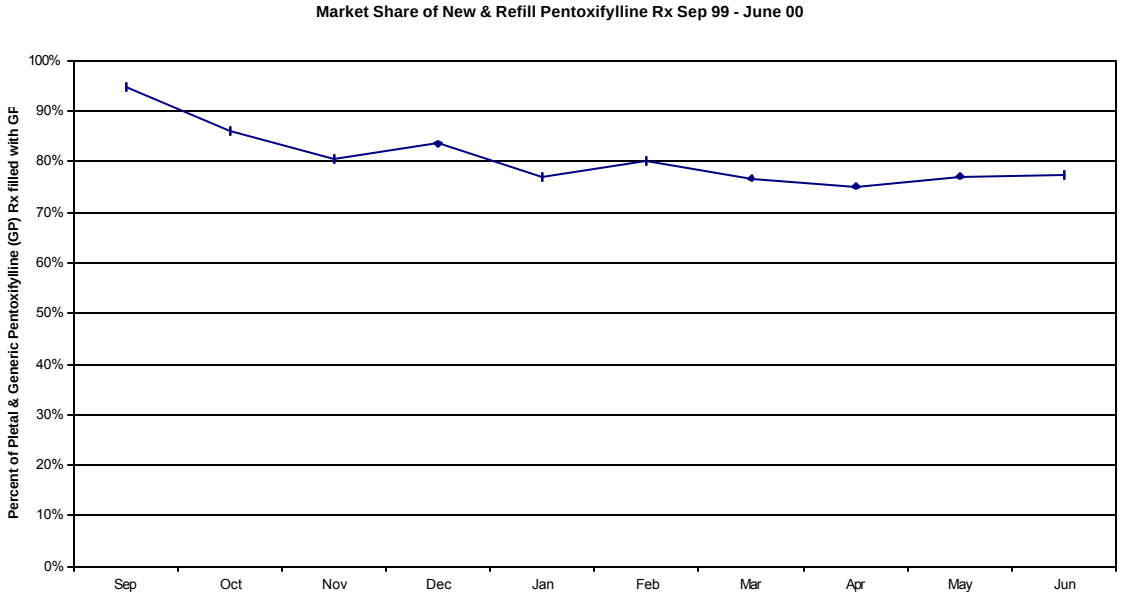
Summary of Switch Rates & Estimated Cost Avoidance for Pentoxifylline/Cilostazol, Feb 00 – Jun 00

Generic pentoxifylline was designated as a preferred drug in NMOP in August 99. Pletal (cilostazol) was designated as a non-preferred drug. Implementation began in February 2000.

Prescriptions for Non-Preferred Anti-Claudication Drugs in NMOP, Feb 00 – June 00[1]						
Month	**Feb 00**	**Mar 00**	**Apr 00**	**May 00**	**Jun 00**	**Feb 00- Jun 00**
New Rxs Received	23	33	32	41	40	169
Prescriber Contacts	21	28	26	37	38	150
Switches	5	0	3	4	6	18
Switch rate[2]	21%	0%	9%	10%	15%	11%

1 From Merck-Medco reports "NMOP Switch Report," "DoD Target Drug Report," and "DoD Prescription Volume Report" covering February through 30 June 00.
2. Percentage of new prescriptions received for non-preferred drugs that were switched to generic pentoxifylline.

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	Feb 00	Mar 00	Apr 00	May 00	Jun 00	**Feb 00 – Jun 00**
Monthly Cost avoidance	$466	$0	$280	$457	$679	$1682

***** Monthly cost avoidance calculated by subtracting current expenditures from expenditures that would have occurred if the stated prescriptions had not been switched. Derived by multiplying the number of reported prescriptions switched for each target drug times the difference in average cost per prescription (target drug – pentoxifylline). [Note: this is a different methodology than used for other drugs and is due to difficulties in establishing a baseline percentage of market share for each of these drugs and uncertainty as to the validity of carrying percentages through to subsequent months.]

Department of Defense
Pharmacoeconomic Center

Fort Sam Houston, TX 78234-6190

MCCS-GPE 11 May 2000

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with Health Affairs policy 98-025, a meeting of the DoD P&T committee convened at 0800 hours on 11 May 2000, at Fort Sam Houston, TX.

2. MEMBERS PRESENT:

CDR Terrance Egland, MC	Co-chair
COL Daniel D. Remund, MS	Co-chair
COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
Daniele Doyle, DAC	Army
CDR Matt Nutaitis, MC	Navy
LCDR Kevin Cook, MSC	Navy
COL (select) Bill Sykora, MC	Air Force
COL (select) John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Robert W. Rist	Coast Guard
Ronald L. Mosier	Department of Veterans Affairs (alternate)
LTC Greg Russie, BSC	Joint Readiness Clinical Advisory Board (alternate)
LTC Steven Humburg, MC	Health Affairs
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia (DSCP)
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)
Ray Nan Berry	Foundation Health
Kirby Davis	Anthem Alliance
William Hudson	Humana, Inc
Gene Lakey	TriWest

OTHERS PRESENT:

CAPT Charlie Hostettler, MSC	DoD Pharmacy Program Director, TMA
COL Mike Heath, MS	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
LTC Gary Blamire, BSC	TRICARE Lead Agent Office (Region 6)
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center (PEC)
MAJ Barbara Roach, MS	DoD Pharmacoeconomic Center (PEC)
MAJ Jennifer Styles, MS	Pharmacy Practice Resident, BAMC
MAJ Brett Kelly, MS	TRICARE Lead Agent Office (Region 1)
LCDR Mark Richerson, MSC	DoD Pharmacoeconomic Center (PEC)
SFC Tom Bolinger	DoD Pharmacoeconomic Center (PEC)
Paul Vasquez	Defense Supply Center Philadelphia (DSCP)
Vinny Valinotti	Defense Supply Center Philadelphia (DSCP)
Shana Trice, DAC	DoD Pharmacoeconomic Center (PEC)
Eugene Moore, DAC	DoD Pharmacoeconomic Center (PEC)
Mark Petruzzi	Merck-Medco
Liz Scaturro	Merck-Medco

3. ADMINISTRATIVE ISSUES:

The minutes from the last meeting were accepted as written.

4. OLD BUSINESS

A. Review of Interim Decisions

1) The committee co-chairs revised the National Mail Order Pharmacy (NMOP) and retail pharmacy network quantity limits on an interim basis to meet timelines for the alpha test of the Pharmacy Data Transaction Service (PDTS). The committee agreed with the revised quantity limits. The revised quantity limits will be posted on the PEC website. Although the quantity limits do not currently apply to military treatment facility (MTF) pharmacies, it is likely that the NMOP quantity limits will apply to MTF pharmacies sometime in the future.

2) The committee co-chairs made an interim decision to suspend the designation of Nitro-Dur as the preferred brand of nitroglycerin patch in the NMOP when it was discovered that the Nitro-Dur patches do not cost less than other brands of nitroglycerin patches. Nitro-Dur packages designated for institutional use have low DAPA prices, but Merck-Medco cannot legally dispense these patches through the NMOP. The committee agreed with the co-chairs' interim decision. A preferred brand of nitroglycerin patch is no longer designated in the NMOP.

B. *Update on the Pharmacy Data Transaction Service (PDTS)*—COL Remund updated the committee on deployment and progress of the PDTS project. The alpha deployment at Wright-Patterson AFB successfully tested the PDTS process. Enhancements are required to the CHCS software prior to additional deployments of PDTS within the direct care system.

CAPT Hostettler commented that PDTS represents a major DoD initiative for medication error prevention and patient safety.

C. National Mail Order Pharmacy (NMOP) Preferred Drug Program

1) CDR Brouker reported the switch rates and estimated cost avoidance for the preferred drug program in the NMOP (see Appendix A). The NMOP Preferred Drug Program is estimated to result in $1.56 million in annual cost avoidance for DoD.

2) *Antiviral Drugs for Herpes (acyclovir, valacyclovir, famciclovir)*—The preferred drug program for this class currently has an estimated cost avoidance per attempted provider contact of only $8, compared to an average of $76 for the entire NMOP preferred drug program. However, if the switch program for this drug class were to be targeted to chronic suppression of herpes, the estimated cost avoidance per attempted provider contact would increase to approximately $86. The cost to DoD for a 90-day regimen of acyclovir is approximately $7, compared to $403 for famciclovir and $183 for valacyclovir. Acyclovir is given twice daily for chronic suppression, compared to once daily for valacyclovir and twice daily for famciclovir. The committee approved the proposal to request switches to acyclovir only on famciclovir and valacyclovir prescriptions that are written for more than a 30-day supply (chronic therapy).

The committee discussed the following additional proposal: *When prescriptions for chronic therapy with famciclovir or valacyclovir are received by the NMOP, Merck-Medco would call the prescriber to offer a switch to acyclovir. If the prescriber declined to switch from famciclovir to acyclovir, Merck-Medco would then suggest the famciclovir be switched to valacyclovir.* Mark Petruzzi (Merck-Medco) will report to the co-chairs by July 17th regarding the feasibility of the additional proposal. In the interim, Merck-Medco will ask prescribers to switch prescriptions for chronic therapy with famciclovir or valacyclovir to acyclovir.

D. *Report of the Subcommittee on Quantity Limits for Topicals*—The committee approved the quantity limits presented by the subcommittee for the five high-cost topicals identified at the last meeting: imiquimod (Aldara); calcipotriene (Dovonex); altitretinoin (Panretin); becaplermin (Regranex); and tazarotene (Tazorac) (See Appendix B). The subcommittee will report on the frequency distribution of quantities dispensed per prescription for these drugs at the next meeting. An interim report is due to the co-chairs by 17 Jul 00.

E. *Report of the Growth Hormone Subcommittee*—The committee reviewed the data presented by Bill Hudson (Humana) to justify a prior authorization program for growth hormone in the NMOP and the retail network. Mr. Hudson estimated a 1% denial rate for growth hormone prescriptions. The committee decided not to institute a prior authorization program because the inconvenience to prescribers and patients outweighs the relatively small potential for cost avoidance.

F. *Update on the Advances in Medical Practice (AMP) Program*—COL Remund reported that AMP funds have been distributed to the service level. The pharmacy consultants/specialty

leaders are working with the service resource management officers to devise procedures for reimbursing MTFs for expenditures on drugs covered by the AMP program.

G. *Update on Program Budget Decision 041*—The DOD P&T Committee added several drugs to the BCF at the Jan 00 interim meeting. Per DoD Health Affairs Policy 98-034 (Policy for Basic Core Formulary and Committed Use Requirements Contracts), all BCF drugs must be included on all MTF formularies.

H. *Cost-efficiency of prior authorizations in the NMOP*—MAJ Bellemin provided a verbal report to the committee. The committee directed the co-chairs to appoint a subcommittee to 1) develop a standard written report for prior authorization data, and 2) explore methods to quantify the clinical, economic, and humanistic outcomes associated with the prior authorization program. The subcommittee will include members from DSCP, PEC, Merck-Medco, and the Managed Care Support Contractors. A report is due to the co-chairs by 17 Jul 00.

I. *Prior authorization for oral antifungals for onychomycosis*—The co-chairs presented prior authorization criteria for terbinafine for the treatment of onychomycosis. The criteria require the confirmation of an active fungal infection to ensure the clinical appropriateness of therapy for onychomycosis.

Bill Hudson reported that the vast majority of use of itraconazole in Region 3 and 5 is for onychomycosis and proposed that the prior authorization also apply to itraconazole for the treatment of onychomycosis. The committee agreed that the prior authorization program should apply to itraconazole as well as terbinafine in the treatment of onychomycosis.

J. *Determining benefit coverage of fertility agents*—According to the Code of Federal Regulations and TRICARE policy, fertility drugs are not a covered benefit when used to assist in non-coital reproduction methods. Paul Vasquez (DSCP) reported that a recent contract modification to the NMOP Statement of Work (SOW) reiterated the original SOW requirement for the contractor to fill prescriptions in accordance with TRICARE policy. Merck-Medco will develop a process to ensure that prescriptions for fertility agents are dispensed to DoD beneficiaries in accordance with TRICARE policy. Since this was an original requirement of the contract, there will be no additional payment by DoD for this process.

K. *Revising prior authorization forms to include education for providers*—The committee endorsed the recommendation by LTC Judith O'Connor that the prior authorization program should include an educational component. The committee decided that the prior authorization request forms should briefly explain why the drug requires prior authorization. The PEC will revise the prior authorization request forms accordingly.

L. *Portability of Prior Authorizations*—MAJ Mickey Bellemin reported that portability of prior authorization approvals across the retail network and NMOP will eventually be accomplished through PDTS. CAPT Hostettler commented that the managed care support contractors are still exploring other options to achieve portability of prior authorization approvals.

5. NEW BUSINESS

A. National Pharmaceutical Contracts

1) *Contracts awarded since last meeting*:

a. The VA National Acquisition Center (NAC) awarded DoD/VA joint contracts to Able Laboratories for salsalate 500 and 750 mg tablets (effective date 15 Mar 00) and to Becton Dickinson for insulin syringes with needles (effective date 1 May 00). All DoD MTFs and all VA facilities that use these products are required to purchase the contract brands. The contract for insulin syringes with needles also applies to the NMOP.

b. Defense Supply Center Philadelphia (DSCP) awarded a DoD/VA contract to Novartis Consumer Health for nicotine patches (effective date 1 Jun 00). All DoD MTFs and VA facilities that use a 3-step nicotine patch are required to purchase the contract brand of this product. **Please note:** The contract does not mandate inclusion of nicotine patches on the BCF. MTFs are not required to add nicotine patches to their formularies.

2) *Financial Impact of National Pharmaceutical Contracts*— The PEC uses prime vendor purchase data to quantify the financial impact of national pharmaceutical contracts. COL Remund presented slides showing the cost avoidance associated with major DoD and DoD/VA contracts for FY99 and the first 5 months of FY00. These slides will be published on the PEC website at **www.pec.osd.ha.mil**.

COL Remund also reported on recent voluntary price reductions by Merck for simvastatin (decrease from $0.66 to 0.62 for the 10 mg tablet, $1.07 to $0.75 for the 20 mg tablet, and from $1.07 to $1.00 for the 40 mg tablet). The price reduction will yield approximately $10 million annually in additional cost avoidance for MTFs.

3) *Returned Goods Contract* – DSCP has the lead on developing the solicitation for a joint DoD/VA contract for processing returned goods.

4) *Second Generation Antihistamines*—The committee (on a vote of ten in favor with two abstentions) decided that DoD should not seek a joint DoD/VA closed class contract for a single once-daily, non-sedating antihistamine because:

a. The provisions of a closed class contract are not compatible with clinical practice regarding this drug class. A relatively large percentage of patients will not respond adequately to a given antihistamine. If a patient does not respond adequately to an antihistamine, it is common clinical practice to try a different antihistamine. Under a closed class contract, non-contracted drugs can be used only after a prior authorization or non-formulary request process is completed. Implementation of a

closed class contract for a single agent in this class would place an unacceptably large administrative burden on DoD beneficiaries, prescribers, and pharmacies.

b. A closed class contract requires patients to be switched from non-contracted drugs to the contracted drug. Converting patients from non-contracted drugs to contracted drugs is much more difficult to accomplish in the Military Health Care System than in the VA because of major differences in pharmacy benefit designs and drug distribution systems.

B. *FY00 National Defense Authorization Act*—CAPT Hostettler briefed the committee on the ongoing efforts to implement the provisions pertaining to the Uniform Formulary and the DoD P&T Committee.

C. *BCF and NMOP formulary issues:*

1) *Added to the NMOP Formulary*—The following drugs were added to the NMOP Formulary. None of these drugs were added to the BCF.

a. Levetiracetam tablets (Keppra; UCB Pharma) approved 30 Nov 99 as adjunctive therapy for partial onset seizures in adults

b. Ciclopirox topical solution (Penlac Nail Lacquer; Dermik/Aventis) approved 17 Dec 99 for mild to moderate onychomycosis

c. Nedocromil sodium ophthalmic solution, 2% (Alocril; Allergan) approved 8 Dec 99 for itch associated with allergic conjunctivitis

d. Cevimeline HCl capsules (Evoxac; Snowbrand Pharma) approved 11 Jan 00 for dry mouth in Sjögrens Syndrome

e. Alosetron tablets (Lotronex; Glaxo) approved 9 Feb 00 for women with diarrhea-predominant irritable bowel syndrome (IBS). Alosetron has been tested largely in women, who make up the majority of patients complaining of IBS in the U.S. In addition, plasma concentrations of alosetron appear to be influenced by gender (27% lower in men). Because there is currently no evidence of efficacy in male patients, coverage of this drug in the NMOP will be limited to female patients. Alosetron will be excluded from the NMOP formulary when prescribed for male patients.

f. Rivastigmine capsules (Exelon; Novartis) approved 24 Apr 00 for mild to moderate Alzheimers disease

g. Sotalol (BetapaceAF; Berlex) approved 22 Feb 00 for maintenance of normal sinus rhythm [delay in time to recurrence of atrial fibrillation/atrial flutter (AFIB/AFL)] in patients with symptomatic AFIB/AFL who are currently in sinus rhythm. Sotalol was previously marketed (as Betapace) for ventricular arrhythmias only. Betapace AF is chemically identical to Betapace but is supplied in unit-of-use packages containing specialized labeling for patients with atrial fibrillation (analogous to dual packaging of bupropion as Zyban and Wellbutrin). The FDA recommends that patients

currently receiving Betapace for atrial arrhythmias be converted to BetapaceAF in order to receive appropriate patient information. The NMOP will fill prescriptions for these products as written, e.g., BetapaceAF for "BetapaceAF" and Betapace (or the soon-to-be-available AB-rated generic) for "Betapace."

2) *Excluded from the NMOP Formulary*—Dofetilide (Tikosyn; Pfizer), approved 1 Oct 99 for maintenance of normal sinus rhythm in atrial fibrillation/flutter, was excluded from the NMOP formulary and will not be available through the NMOP. Dofetilide was NOT added to the BCF. Because of the potential for dofetilide to cause torsade de pointes, a serious and potentially lethal ventricular arrhythmia, the drug is subject to a restricted distribution process. The FDA requires documentation that prescribers and inpatient pharmacies have received education concerning the algorithm for initiating the drug, which must be started in a monitored inpatient setting. Maintenance supplies for outpatient use are currently dispensed only through Statlander's Pharmacy in Pittsburgh. The NMOP has no mechanism to refer prescriptions to Statlander's and turnaround time is a major concern. Mark Petruzzi (Merck-Medco) stated that a joint venture might occur between Merck-Medco and a specialty pharmacy company, which may be able to provide this type of medication in the future. Merck-Medco will report back to the committee if it becomes possible to provide dofetilide through the NMOP.

3) *Clarification of Antihemophilic Factors on the NMOP Formulary Covered Injectables List*—The committee intends that all antihemophilic factors be available through the NMOP. The committee clarified the current listing on the NMOP Covered Injectables List to read " *Antihemophilic Factors (including Factor VII, Factor VIII, Factor IX, Factor IX Complex, and Anti-Inhibitor Factor Complex).*"

4) *Catastrophic Drug Accounts*—The preceding discussion of antihemophilic factors led to a discussion of catastrophic drug accounts for MTFs. Extremely high cost specialty medications, such as the antihemophilic factors, cause extreme strain on the budgets of smaller MTFs. The issue of catastrophic drug accounts is beyond the purview of the committee, so it was referred to COL Mike Heath as chairman of the Pharmacy Board of Directors.

5) *Nasal Corticosteroids (BCF)*—LCDR Mark Richerson (PEC) presented an analysis of MTF prescription data that showed weighted averages of 3.57 sprays per day for fluticasone nasal spray and 3.95 sprays per day for mometasone nasal spray. Based on DAPA prices of $11.12 per fluticasone inhaler and $10.49 per mometasone inhaler, fluticasone is slightly more cost-effective than mometasone. Since mometasone does not offer any advantage in cost-effectiveness, the committee decided that fluticasone should remain as the only nasal corticosteroid inhaler on the BCF.

6) *Consideration of Niaspan (niacin extended release; Kos Pharma) for the BCF*—The committee decided not to add Niaspan to the BCF because it does not offer sufficient clinical advantage over immediate release niacin to justify the large increase in cost.

The committee made its decision based on the following comparison of Niaspan and immediate release niacin.

a. Niaspan and immediate release niacin have similar safety profiles. During clinical trials, increases in liver enzymes with Niaspan were comparable to those occurring with immediate release niacin. Required monitoring of liver function tests is the same for Niaspan and immediate release niacin.

b. It is unclear whether Niaspan offers a clinically meaningful advantage in patient tolerability over immediate release niacin. In a comparative study, 42% of patients on Niaspan and 39% of patients on immediate release niacin experienced flushing. However, the Niaspan group averaged only 1.9 episodes per month compared to 8.6 episodes per month for the immediate release niacin group. In a study comparing Niaspan to placebo, 88% of patients taking Niaspan 1000 mg per day and 83% of patients taking Niaspan 2000 mg per day experienced flushing, compared to 20% of placebo patients. In a 96-week open label study, 75% of Niaspan patients experienced flushing and 47% of Niaspan patients dropped out of the study for reasons related to the drug (although the specific reasons were not identified in the study).

c. At equivalent doses, Niaspan and immediate release niacin have a similar effect on lipid levels.

d. Depending on dosage, Niaspan costs about 20 to 30 times more than immediate release niacin.

7) Review of ophthalmic glaucoma agents for the BCF—CDR Matt Nutaitis, an ophthalmologist and glaucoma specialist, presented recommendations based on his own experience; input from glaucoma specialists from all three services; current usage in DoD; and the relative safety, tolerability, efficacy, and cost of available ophthalmic agents for the treatment of glaucoma. (See Appendix C.) The committee adopted the following recommendations:

Remove the following agents from the BCF:

- Betaxolol Ophthalmic Suspension
- Dorzolamide Ophthalmic Solution
- Pilocarpine Ophthalmic Gel

Add the following agent to the BCF:

- Brimonidine Ophthalmic Solution (Alphagan; Allergan)

8) *Consideration of metronidazole vaginal gel for the BCF*—The committee added metronidazole vaginal gel to the BCF to provide an alternative to clindamycin vaginal cream in pregnant women with symptomatic bacterial vaginosis who are at low risk for premature birth. The Centers for Disease Control and Prevention (CDC) 1998

Guidelines for Treatment of Sexually Transmitted Diseases state that for treatment of pregnant women, "the use of clindamycin vaginal cream during pregnancy is not recommended, because two randomized trials indicated an increase in the number of preterm deliveries among pregnant women who were treated with this medication." Clindamycin vaginal cream and metronidazole vaginal gel are similar in cost. Clindamycin vaginal cream remains on the BCF.

9) *Clarification of oxycodone/acetaminophen listing on BCF*— The approval in mid-99 of three new strengths for oxycodone/acetaminophen (Percocet 2.5/325, 7.5/500, 10/650; Endo) has led to questions by MTFs about which strengths of Percocet they are required to carry. The committee decided that the incremental clinical value of the new strengths was likely to be minimal. Because including the new strengths on the BCF would increase accounting and storage requirements for these controlled drugs, the committee did not opt to add them to the BCF. The committee decided that the BCF should specify that MTFs must have oxycodone/acetaminophen in the 5/325 and 5/500 mg strengths on their formularies but are not required to have the 2.5/325, 7.5/500, and 10/650 mg strengths on their formularies.

10) *Status of angiotensin-converting enzyme inhibitors (ACEIs) on the BCF*—The committee discussed at length a proposal to add ramipril (Altace; Monarch) to the BCF as a second long-acting ACEI. ACEIs already on the BCF are the short-acting agent captopril and the long-acting agent lisinopril.

Arguments in favor of the proposal to add ramipril to the BCF included:

- ACEIs tend to be underutilized. Addition of another ACEI to the BCF would ensure uniform availability of another agent within a class of drugs that is known to provide significant clinical benefits at a reasonable cost.
- Significant clinical benefits were demonstrated in a recent study where patients at high risk of cardiovascular events but without existing heart failure were treated with ramipril. The Heart Outcomes Prevention Evaluation (HOPE) study (*NEJM* 342(3):145-53; 20 Jan 00) and the MICRO-HOPE diabetic substudy (*Lancet* 355(9200):253-9; 22 Jan 00)] demonstrated significant decreases in the rate of death, myocardial infarction, and stroke in patients receiving ramipril; as well as significant decreases in the risk of overt nephropathy in diabetic patients.
- The addition of ramipril might encourage price competition within the ACEI drug class because the DAPA price of $.12 per tablet for all strengths of ramipril is $.02 less than the $.14 price per tablet for all strengths of lisinopril.

Arguments against the proposal to add ramipril to the BCF included:

- Many MTFs already have more than one long-acting ACEI on their formularies, so the addition of ramipril to the BCF might not have any effect on the overall utilization of ACEIs. Ramipril currently has very little market share in DoD MTFs.
- It is not known if other ACEIs would achieve the same clinical benefits as ramipril achieved in the HOPE study. These results could possibly represent a class effect of ACEIs.

- Greater price competition could probably be achieved by selecting a second long-acting ACEI through a contracting initiative or incentive price agreement.

COL Remund informed the committee that contracting officials have not yet delineated a method for contracting for a BCF selection among different chemical entities in an open drug class. All the open class contracts established to date have involved the selection of a specific brand of a single chemical entity that is marketed by more than one company. The selection of a second long-acting ACEI for the BCF would involve competition between different chemical entities. The committee does not want to close the ACEI drug class on the BCF, so a closed class contract is not a suitable method for selecting a second long-acting ACEI.

A motion to table the proposal to add ramipril to the BCF was defeated by a vote of 5 in favor, 6 against, and one abstention. The committee subsequently approved the addition of ramipril to the BCF by a vote of 7 in favor and 5 against.

Following the meeting and prior to the preparation of the meeting minutes, committee members contacted the co-chairs to express their concerns about the committee's decision to add ramipril to the BCF:

- A committee member pointed out that the $.02 per tablet price advantage for ramipril over lisinopril might be at least partially negated if twice a day dosing is more common for ramipril than for lisinopril. A subsequent analysis of the frequency distributions of dosages observed by a large national PBM revealed that twice a day dosing is more common for ramipril than for lisinopril. Based on the dosage distribution, the DAPA price for ramipril, and the contract price for lisinopril; the average weighted daily costs differ by only $.009 ($0.147 for ramipril and $0.156 for lisinopril).
- A committee member expressed concern that the committee did not consider the possibility that the incidence of cough as an adverse effect may be higher for ramipril than for other ACEIs. The table of adverse effects for ACEIs in *Facts and Comparisons* shows a higher incidence of cough for ramipril than for all but one other ACEI. However, the data are pooled from separate studies and are not necessarily comparable.

In light of these concerns, the P&T Committee members approved a motion to rescind the addition of ramipril to the BCF by a vote of 9 in favor and 0 against (three committee members were on leave or temporary duty and could not be contacted).

11) *Status of oral contraceptive products (OCPs) on the BCF* (see Appendix D for a list of OCPs)—(Note: costs quoted in the following discussion are based on DAPA prices as of May 00; prices are for the 28-day packs if both 21- and 28-day packs are available)

a. Monophasic OCPs with 20 mcg ethinyl estradiol (EE): There is no BCF agent in this category. The committee made no selection or recommendation in this category.

b. *Monophasic OCPs with 30 mcg EE:* EE 30 mcg/0.3 mg norgestrel (e.g., Lo/Ovral, Low-Orgestrel) remains on the BCF. The current cost per cycle for both Lo/Ovral and Low-Ogestrel is $8.00. The committee added EE 30 mcg/1.5 mg norethindrone (Loestrin FE 1.5/30) to the BCF as an alternative that offers a significant economic advantage. The current cost per cycle for Loestrin FE 1.5/30 is $2.00.

c. *Monophasic OCPs with 35 mcg EE:* The 35 mcg EE/1 mg norethindrone combination (e.g., Necon, Norinyl, Ortho-Novum) remains on the BCF. Any brand containing this combination of ingredients may be used by MTFs to fulfill the BCF requirement. The committee recommended selection of a specific brand of 35 mcg EE/1 mg norethindrone for the BCF as a potential item for a contract or incentive price agreement.

The committee added EE 35 mcg/1 mg ethynodiol diacetate (e.g., Demulen, Zovia) to the BCF. Any brand containing this combination of ingredients may be used by MTFs to fulfill the BCF requirement. This agent was added because military providers said that the combination was clinically useful for patients with acne, and because it is less expensive than other oral contraceptives touted for use in patients with acne. The committee recommended selection of a specific brand of EE 35 mcg/1 mg ethynodiol diacetate for the BCF as a potential item for a contract or incentive price agreement.

d. *Biphasic OCPs*–There is no BCF agent in this category. There is very little use of biphasic products in DoD. The committee made no selection or recommendation in this category.

e. *Triphasic OCPs*—EE 30/40/30mcg/levonorgestrel 0.05/0.075/0.125 mcg remains on the BCF. Any brand containing this combination of ingredients may be used by MTFs to fulfill the BCF requirement (e.g., Tri-levlen, Triphasil, Trivora). The committee recommended selection of a specific brand of EE 30/40/30mcg / levonorgestrel 0.05/0.075/0.125 mcg for the BCF as a potential item for a contract or incentive price agreement.

The committee initially decided to remove EE 35 mcg/norethindrone 0.5/0.75/1 mg (Ortho-Novum 7/7/7) from the BCF based on a comparison of the DAPA price for Ortho-Novum 7/7/7 to the DAPA prices of other triphasic OCPs. Subsequent to the meeting, additional information concerning the availability and pricing of Ortho-Novum 7/7/7 through the DSCP Centrally Managed Inventory Program (Depot) was brought to the attention of the co-chairs. The co-chairs made an interim decision to leave Ortho-Novum 7/7/7 on the BCF. The BCF status of Ortho-Novum 7/7/7 will be reconsidered when more definitive information is available concerning the pricing, usage volume, and prospective status of Ortho-Novum 7/7/7 as a depot stock item.

f. *Progestin-only OCPs ("mini-pills"):* The committee added 0.35 mg norethindrone (e.g., Micronor, Nor-Q.D) to the BCF to meet the needs of women who require a

progestin-only product. There were previously no progestin-only products on the BCF. The committee recommended selection of a specific brand of 0.35 mg norethindrone for the BCF as a potential item for a contract or incentive price agreement.

g. *Other OCPs:* Due to their infrequent use, OCPs with 50 mcg EE or mestranol as the estrogen component were not considered.

The committee requested that the PEC amend BCF listings on the PEC website to make it clear that the BCF does not currently specify any drug by trade name in this class. For example, the listing for 35 mcg EE/1 mg norethindrone means that any product containing this combination of ingredients is acceptable. The committee agreed that 28-day packages of oral contraceptives are preferable to 21-day packages because patients are more likely to remember to take the tablets on a daily basis.

12) *Status of narcotic pain medications on the BCF*—The committee was asked by an MTF to consider the addition of a long-acting oral narcotic analgesic to the BCF. The committee added extended release morphine tablets (MS Contin or its AB-rated generic equivalent) in the following strengths: 15-, 30-, and 60-mg. MS Contin is also currently available in 100- and 200-mg tablets, which are not included in the BCF listing. MTFs may add the 100- and 200-mg strengths to their local formularies if they so desire. The BCF listing does not include Oramorph SR, Kadian, or any other extended release morphine product other than MS Contin or AB-rated generic equivalents.

13) *Withdrawal of troglitazone and cisapride:* The committee discussed the withdrawal of troglitazone (Rezulin) and cisapride (Propulsid) from the market. Troglitazone is no longer available. Cisapride will continue to be available only through an investigational drug/limited access program once the manufacturer discontinues marketing (Jul 00) and existing stocks are exhausted. MTFs should be in the process of switching patients to alternative medications and identifying patients whose need for treatment with cisapride justifies pursuing approval through the limited access program.

7. ADJOURNMENT: The meeting adjourned at 1530 hours. The next meeting will be held on Thursday, 17 Aug 00 at a site to be determined. All agenda items should be submitted to the co-chairs no later than 17 Jul 00.

List Of Appendices

APPENDIX A: NMOP Preferred Drug Program Report

May 00 NMOP Preferred Drug Program Report

1. Extended Release Diltiazem

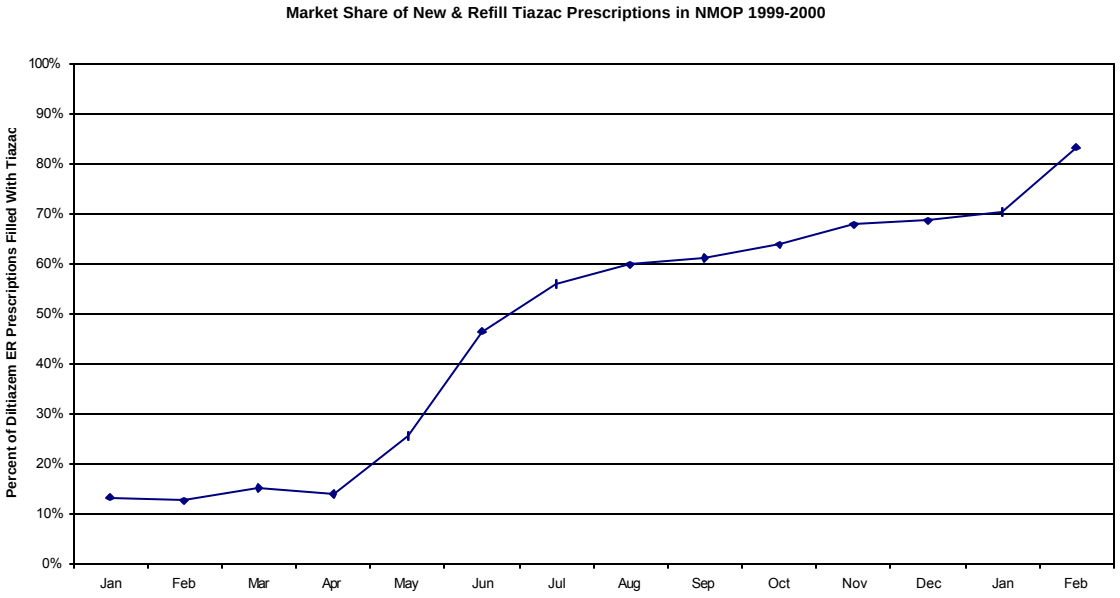
Tiazac was designated as the preferred diltiazem ER product in NMOP in May 99. Non-preferred diltiazems include Cardizem CD, Diltia XT, Dilacor XR, and generic diltiazem ER.

Table 1: Prescriptions for Non-Preferred Diltiazem ER products in NMOP, Jun 99 – Feb 00[1]

Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	**Jun 99-Feb 00**
New Rxs Received	720	661	573	395	328	291	346	155	178	**3647**
Prescriber Contacts	653	616	540	352	301	263	311	134	156	**3326**
Switches	514	495	434	255	215	189	217	97	116	**2532**
Switch rate[2]	71%	75%	76%	65%	66%	65%	63%	63%	65%	**69%**

1 From Merck-Medco reports "NMOP Switch Report", "DoD Target Drug Report", and "DoD Prescription Volume Report" covering period from 29 May 1999 through 29 February 2000.
2. Percentage of new prescriptions received for non-preferred drugs that were switched to Tiazac

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	Jun 99	Jul 99	Aug 99	Sep 99	Oct 99	Nov 99	Dec 99	Jan 00	Feb 00	**Jun 99-Feb 00**
Monthly Cost avoidance	$21,796	$27,287	$31,098	$29,017	$28,112	$34,592	$30,123	$33,877	$37,697	**$273,599**

*Monthly cost avoidance calculated by subtracting current expenditures from expenditures that would have occurred if the prescriptions had not been switched. The figure for "would-have-been" expenditures is derived by multiplying the mean percentage of market share (by prescription; both new and refill) during Jan-Apr 99 for each drug by the total number of new and refill prescriptions in each month for all non-preferred and preferred drugs, and then multiplying this figure by the average cost per prescription for each drug, and summing for all non-preferred and preferred drugs.

2. Extended Release Nifedipine

In Nov 98 the DOD P & T Committee selected Adalat CC as the preferred nifedipine ER product. Procardia XL is non-preferred.

Table 2: Prescriptions for Non-Preferred Nifedipine ER in NMOP, Jun 99 – Feb 2000[1]

Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Jun 99 – Feb 00
New Rxs Received	379	142	125	139	124	127	153	111	115	**1415**

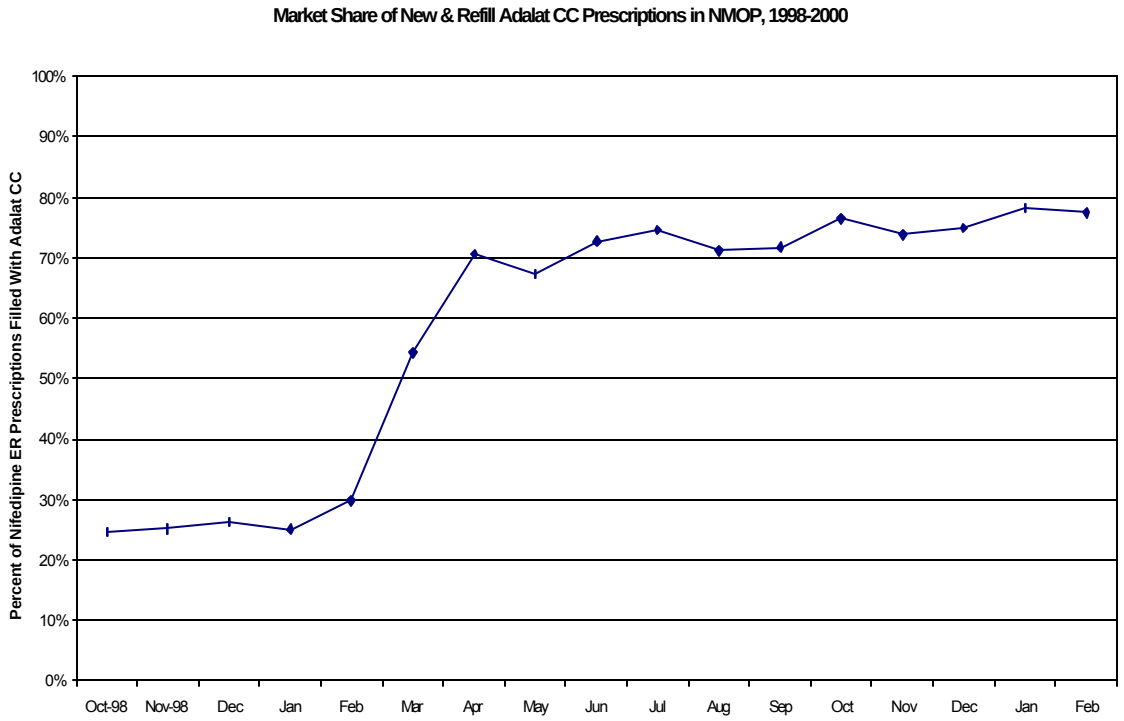
1. From Merck-Medco reports "NMOP Switch Report", "DoD Target Drug Report", and "DoD Prescription Volume Report" covering period from 29 May 1999 through 29 February.
2. Percentage of new prescriptions received for non-preferred drugs that were switched to Adalat CC.

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	Jun 99	Jul 99	Aug 99	Sep 99	Oct 99	Nov 99	Dec 99	Jan 00	Feb 00	Jun 99 – Feb 00
Cost Avoidance	$27,494	$26,624	$24,962	$24,510	$27,938	$26,122	$24,173	$32,785	$27,030	**$241,638**

*Monthly cost avoidance calculated by subtracting current expenditures from expenditures that would have occurred if the prescriptions had not been switched. The figure for "would-have-been" expenditures is derived by multiplying the mean percentage of market share (by prescription; both new and refill) during Oct – Nov 98 for each drug by the total number of new and refill prescriptions in each month for all non-preferred and preferred drugs, and then multiplying this figure by the average cost per prescription for each drug, and summing for all non-preferred and preferred drugs.

3. NSAIDS

Generic NSAIDs are preferred. Daypro, Relafen, Voltaren XR, Lodine XL, and Naprelan are non-preferred. Program started mid-May, 99

Table 3: Prescriptions For Non-Preferred NSAIDs in NMOP, Jun 99 – Feb 00[1]										
Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	**Jun 99 – Feb 00**

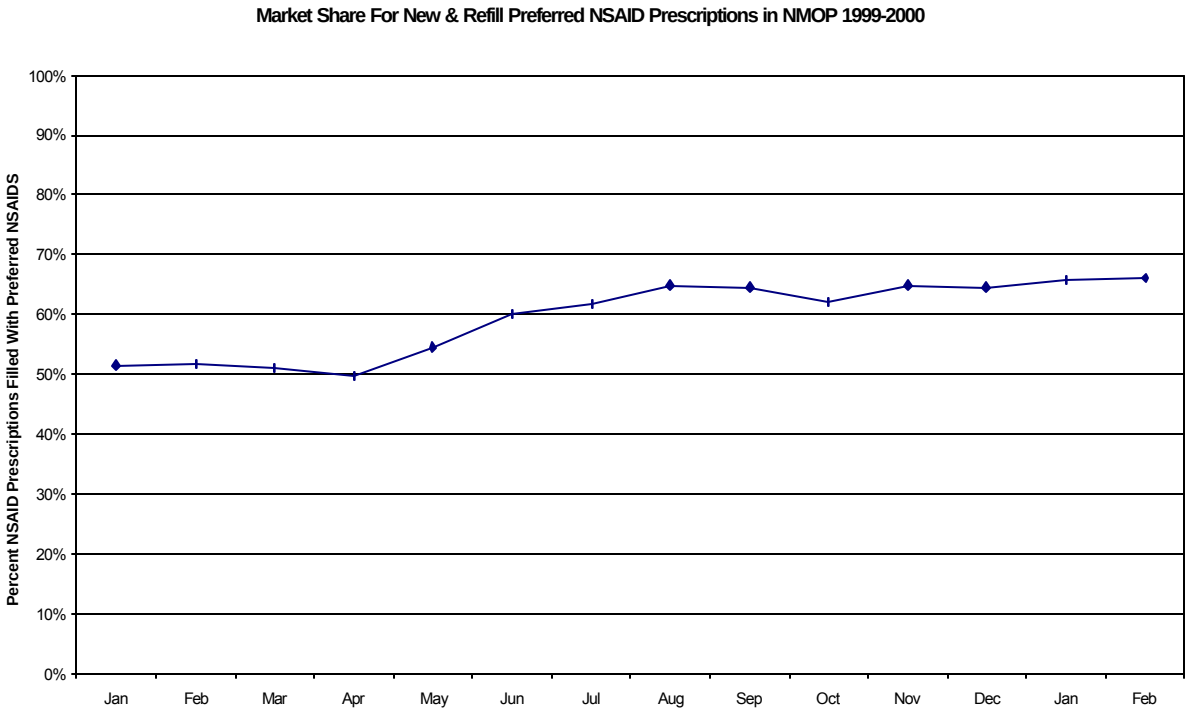
2. Percentage of new prescriptions received for non-preferred drugs that were switched to generic NSAIDs.

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	Jun 99	Jul 99	Aug 99	Sep 99	Oct 99	Nov 99	Dec 99	Jan 00	Feb 00	**Jun 99 – Feb 00**
Cost Avoidance	$21,771	$19,929	$27,670	$29,294	$25,052	$36,465	$29,364	$41,151	$35,260	**$342,206**

*Monthly cost avoidance calculated by subtracting current expenditures from expenditures that would have occurred if the prescriptions had not been switched. The figure for "would-have-been" expenditures is derived by multiplying the mean percentage of market share (by prescription; both new and refill) during Jan – Apr 99 for each drug by the total number of new and refill prescriptions in each month for all non-preferred and preferred drugs, and then multiplying this figure by the average cost per prescription for each drug, and summing for all non-preferred and preferred drugs.

4. H2 Blockers

Generic ranitidine was designated as preferred in NMOP in August 99. Axid (nizatidine) and Pepcid (famotidine) are non-preferred. Implementation began in December, 1999.

Table 4: Prescriptions for Non-Preferred H2 Blockers in NMOP, Dec 99 – Feb 00[1]				
Month	Dec	Jan	Feb	**Dec 99-Feb 00**
New Rxs Received	213	240	234	**687**

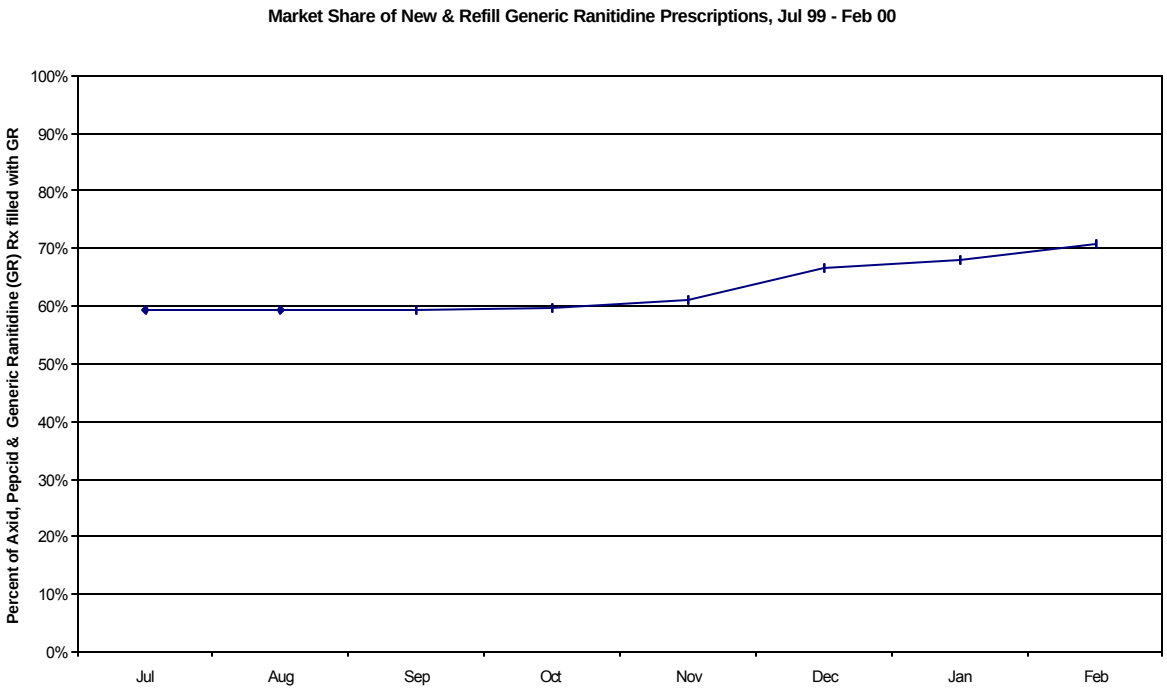
2. Percentage of new prescriptions received for non-preferred drugs that were switched to generic ranitidine.

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	Dec 99	Jan 00	Feb 00	**Dec 99-Feb 00**
Monthly Cost avoidance	$10,167	$15,285	$16,907	**$42,359**

*Monthly cost avoidance calculated by subtracting current expenditures from expenditures that would have occurred if the prescriptions had not been switched. The figure for "would-have-been" expenditures is derived by multiplying the mean percentage of market share (by prescription; both new and refill) during Jul 99-Nov 99 for each drug by the total number of new and refill prescriptions in each month for all non-preferred and preferred drugs, and then multiplying this figure by the average cost per prescription for each drug, and summing for all non-preferred and preferred drugs.

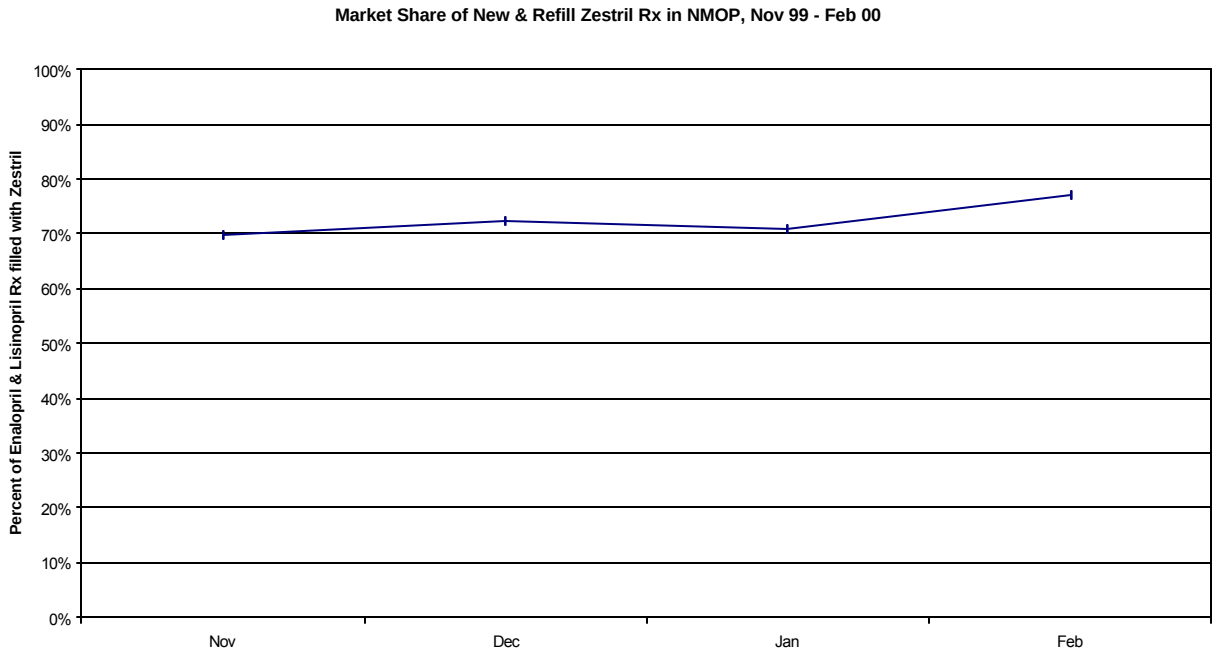
5. Enalapril

Zestril (lisinopril) generic was designated as preferred in NMOP in August 99. Vasotec (enalopril) was designated non-preferred. Implementation began in February 2000.

Table 5: Prescriptions for enalapril in NMOP, Feb 00[1]	
Month	Feb 00
New Rxs Received	265
Prescriber Contacts	239
Switches	146
Switch rate[2]	55%

1 From Merck-Medco reports "NMOP Switch Report", "DoD Target Drug Report", and "DoD Prescription Volume Report" covering February 2000.
2. Percentage of new prescriptions received for non-preferred drugs that were switched to Zestril

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	Feb 00
Monthly Cost avoidance	$12,069

*Monthly cost avoidance calculated by subtracting current expenditures from expenditures that would have occurred if the prescriptions had not been switched. The figure for "would-have-been" expenditures is derived by multiplying the mean percentage of market share (by prescription; both new and refill) during Nov 99 – Jan 00 for each drug by the total number of new and refill prescriptions in each month for all non-preferred and preferred drugs, and then multiplying this figure by the average cost per prescription for each drug, and summing for all non-preferred and preferred drugs.

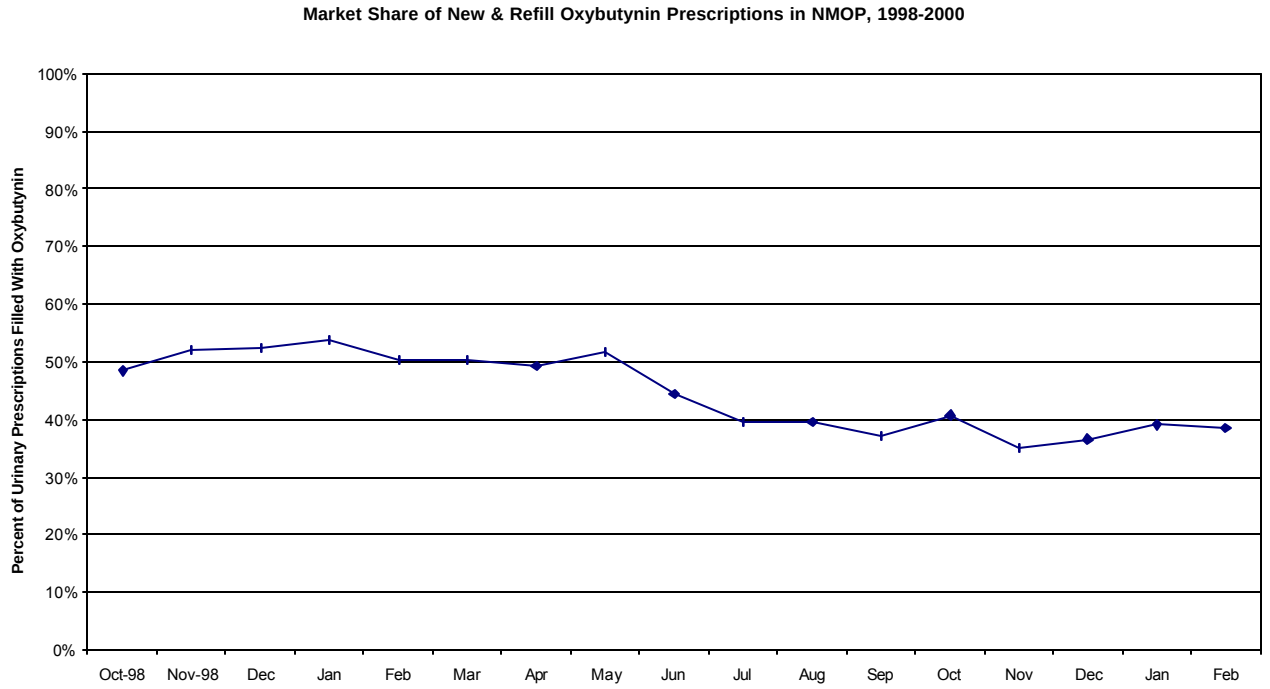
6. Urinary Agents

In November 1998, the DOD P & T Committee selected oxybutynin generic as the preferred urinary agent. Detrol and Ditropan XL are non-preferred.

Table 6: Prescriptions for Non-Preferred Urinary Drugs in NMOP, Jun 99 – Feb 00[1]										
Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	**Jun 99 – Feb 00**
New Rxs Received	224	183	270	271	308	325	363	270	272	**2486**
Prescriber Contacts	195	158	233	236	270	256	331	248	247	**2174**
Switches	80	40	76	69	95	88	105	83	100	**736**
Switch rate[2]	36%	22%	28%	25%	31%	27%	29%	31%	37%	**30%**

1. From Merck-Medco reports "NMOP Switch Report", "DoD Target Drug Report", and "DoD Prescription Volume Report" covering period from 29 May 1999 through 29 February 2000.
2. Percentage of new prescriptions received for non-preferred drugs that were switched to generic oxybutynin

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	Jun 99	Jul 99	Aug 99	Sep 99	Oct 99	Nov 99	Dec 99	Jan 00	Feb 00	**Jun 99 – Feb 00**
Monthly Cost Avoidance	$7,735	$4,355	$6,823	$6,575	$8,769	$8,414	$10,271	$7,953	$10,075	**$70,970**

Monthly cost avoidance calculated by subtracting current expenditures from expenditures that would have occurred if the stated prescriptions had not been switched. Derived by multiplying the number of reported prescriptions switched for each target drug times the difference in average cost per prescription (target drug – oxybutynin). [Note: this is a different methodology than used for other drugs and is due to difficulties in establishing a baseline percentage of market share for each of these drugs and uncertainty as to the validity of carrying percentages through to subsequent months.]

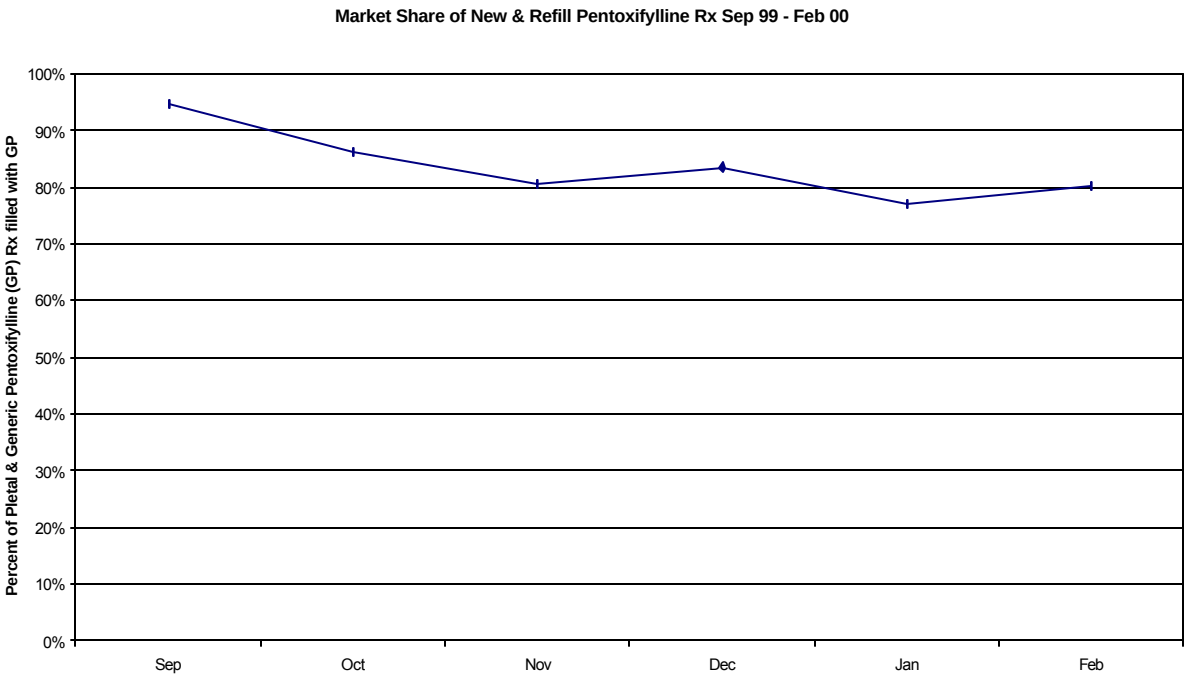
7. Cilostazol

Pentoxifylline generic was designated as preferred in NMOP in August 99. Pletal (cilostazol) was designated non-preferred. Implementation began in February 2000.

Table 7: Prescriptions for Non-Preferred Claudication Agents in NMOP, Feb 00[1]	
Month	Feb 00
New Rxs Received	23
Prescriber Contacts	21
Switches	5
Switch rate[2]	21%

1 From Merck-Medco reports "NMOP Switch Report", "DoD Target Drug Report", and "DoD Prescription Volume Report" covering February 2000.
2. Percentage of new prescriptions received for non-preferred drugs that were switched to generic pentoxifylline

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	**Sep 99-Feb 00**
Monthly Cost avoidance	$466

***** Monthly cost avoidance calculated by subtracting current expenditures from expenditures that would have occurred if the stated prescriptions had not been switched. Derived by multiplying the number of reported prescriptions switched for each target drug times the difference in average cost per prescription (target drug – pentoxifylline). [Note: this is a different methodology than used for other drugs and is due to difficulties in establishing a baseline percentage of market share for each of these drugs and uncertainty as to the validity of carrying percentages through to subsequent months.]

8. Herpes Antivirals

Generic acyclovir is the preferred herpes antiviral. Famciclovir (Famvir; SmithKline Beecham) and valacyclovir (Valtrex; Glaxo) are non-preferred agents. Famciclovir was selected as a non-preferred agent in Nov 98 and valacyclovir in Feb 99.

Table 5: Prescriptions For Non-Preferred Herpes Antivirals in NMOP, Jun 99 – Feb 00[1]

Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Jun 99 –Feb 00

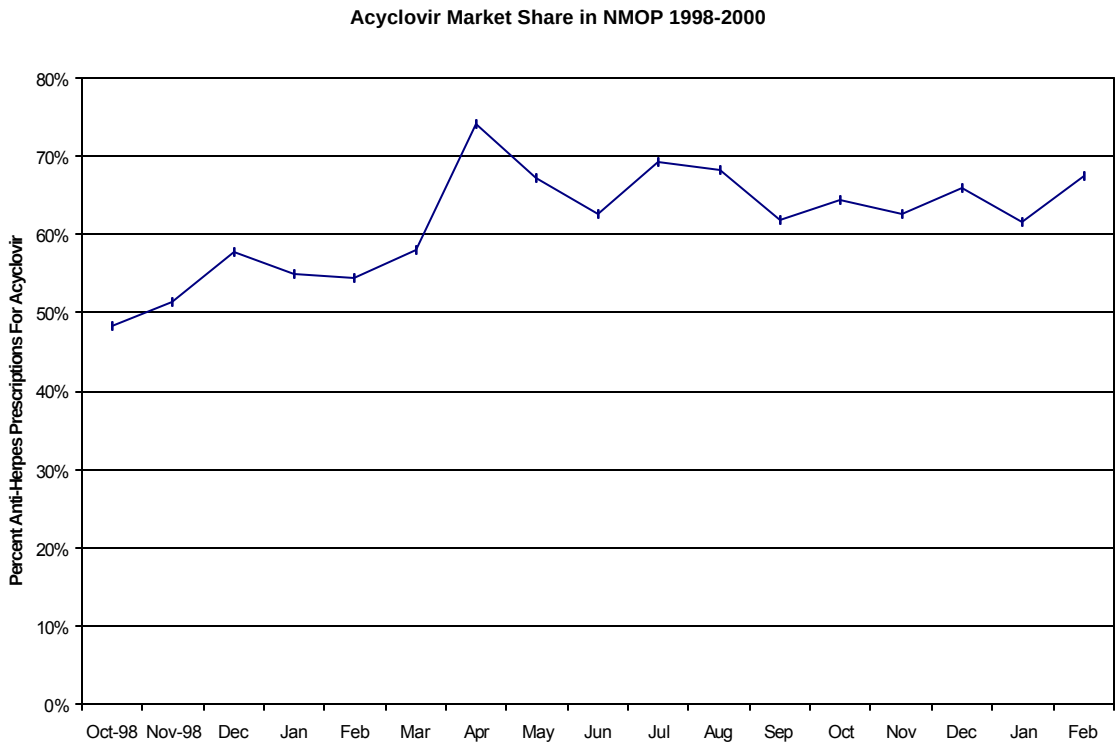
1. From Merck-Medco reports "NMOP Switch Report", "DoD Target Drug Report", and "DoD Prescription Volume Report" covering period from 29 May 1999 through 29 February 2000.
2. Percentage of new prescriptions received for non-preferred drugs that were switched to generic acyclovir.

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



Monthly Cost Avoidance*

Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Jan	Feb	Jun99 –Feb00
Monthly Cost Avoidance	$666	$302	$635	$410	$409	$406	$406	$679	$608	**$4521**

* See section following for an explanation of the assumptions underlying this estimate

Explanation of Methodology: Cost Avoidance Estimate for Herpes Antivirals

Assumptions needed to be made in order to estimate cost avoidance with this set of drugs given the level of available data. This is because dosing regimens and quantities dispensed per prescription vary widely for herpes antivirals according to 1) the disease being treated (*h. zoster*, *h simplex*) and 2) the reason for use (treatment, chronic suppression). Treatment of *h. simplex* costs less than treatment of *h. zoster*. There is also a difference in cost between famciclovir and valacyclovir for each regimen.

Regimen Costs of Herpes Antivirals in Switch Program		
Drug	**Dose**	**Cost**
Famciclovir	125 mg bid x 5 days (simplex) 500 mg q8h x 7 days (zoster)	$11.20 (simplex) $47.04 (zoster)
Valacyclovir	500 mg bid x 5 days (simplex) 1 gm tid x 7 days (zoster)	$20.30 (simplex) $30.03 (zoster)
Generic acyclovir	200 mg 5xd for 10 days (simplex) 800 mg 5xd for 7-10 days (zoster)	$1.00 (simplex) $12.00 (zoster)

Comparison of Cost Avoidance

Drug switched to acyclovir	**Cost avoidance if prescription written to treat *h. zoster***	**Cost avoidance if prescription written to treat *h. simplex***
Famciclovir	$35.04	$10.20
Valacyclovir	$18.03	$19.30

To estimate cost avoidance, we made the following assumptions:

- All prescriptions switched from valacyclovir to generic acyclovir were for the treatment of h. *simplex* (resulted in a cost avoidance of $19.30 per switch)
- All prescriptions switched from famciclovir to generic acyclovir were for the treatment of h. *zoster* (resulted in a cost avoidance of $35.04 per switch)
- Refills were not authorized on any famciclovir or valacyclovir prescriptions

For example, in the month of June, 8 of the 28 switches were for famciclovir prescriptions and 20 of the 28 were for valacyclovir prescriptions. To maximize estimated cost avoidance, it was assumed that all famciclovir switches were prescriptions written to treat h. *zoster* (8 switches @ $35.04 each = $280) and all Valrex switches were prescriptions written to treat h. *simplex* (20 switches @ $19.30 each = $386). Total cost avoidance in June is estimated at $666 ($280 + $386).

This estimate of monthly cost avoidance assumes maximal cost savings in the treatment of h. *simplex* and h. *zoster*.

May 00 NMOP Preferred/Non-Preferred Pairs Program Report:
Summary of Switch Rates and Estimated Cost Avoidances Jun 99 – Feb 00

Non-Preferred Drug	Preferred Drug	Switch Rate[1]	Estimated Cost Avoidance[1]	Total Number of Attempted Provider Contacts[2]	Estimated Cost Avoidance per Attempted Provider Contact[3]	Annualized Estimated Cost Avoidance
Cardizem CD Dilacor XR, Diltia XT, Diltiazem XR	**Tiazac**	69%	$273,599	3647	$75	$364,799
Procardia XL	**Adalat CC**	56%	$241,638	1415	$171	$322,184
Lodine XL, Relafen, Voltaren XR, DayPro, Naprelan	**Generic NSAIDs**	34%	$342,206	4128	$83	$456,275
Axid, Pepcid	**Generic ranitidine**	59%	$42,359	687	$62	$169,436
Vasotec	**Zestril**	55%	$12,069	265	$46	$144,828
Ditropan XL, Detrol	**Generic oxybutynin**	30%	$70,970	2486	$29	$94,627
Pletal	**Generic pentoxi-fylline**	21%	$466	23	$20	$5592
Valacyclovir, Famciclovir	**Generic acyclovir**	33%	$4521	562	$8	$6028
	Total	**$987,362**	**13,187**	**$75**	**$1,563,769**	

1. From May 2000 NMOP Preferred/Non-Preferred Pairs Program Report (Tables 1-8)
2. Assumes that each new prescription received for a non-preferred drug results in one attempted provider contact
3. Calculated as the total cost avoidance Jun 99 – Feb 00 divided by the total number of attempted provider contacts made for non-preferred drugs in this class during the same period

Appendix B: Quantity Limits for Selected High-Cost Topicals in the NMOP and Retail Pharmacy Network

Drug	Previous NMOP Limit	New Quantity Limits	Rationale
Imiquimod (Aldara)	**none**	**Retail:** 1 box of 12 single-use packets per 30 days (12 units) **Mail order:** 3 boxes of 12 single-use packets per 90 days (36 units)	Immune response modifier with an unknown mechanism of action, used to treat external genital and peri-anal warts. The manufacturer recommends dosing three times weekly, prior to sleep, to be left on for 6-10 hours, until total clearance or for maximum of 16 weeks. The product is supplied in boxes containing 12 single-use packets. AWP Cost: $10.40 per packet
Calcipotriene (Dovonex)		**Retail:** 300 gm or mL per 30 days* **Mail order:** 900 gm or mL per 90 days*	Synthetic vitamin D3 derivative used to treat moderate plaque psoriasis. The product is supplied as 0.005% ointment, cream, and solution in 30-, 60-, and 100-gm tubes and 60-mL bottle. AWP Cost: $1.55 per gm or mL.
Alitretinoin (Panretin)		**Retail:** 60 gm (1 tube) per 30 days **Mail order:** 180 gm (3 tubes) per 90 days	Retinoic acid derivative used to treat cutaneous lesions in patients with AIDs-related Kaposi's sarcoma. Directions are to apply sufficient gel to lesions twice daily and may gradually increase to 3-4 times daily, depending on tolerance. There is no established maximum dose. The product is supplied as a 0.1% 60-gm tube. According to the manufacturer, Ligand Pharmaceuticals, a 60-gm tube would be considered a 1 to 2-month supply based on surface area. AWP cost: $40.00 per gm
Becaplermin (Regranex)		**Retail:** 15 gm per 30 days* **Mail order:** 45 gm per 90 days*	Recombinant platelet-derived growth factor (rhPDGF) used to treat diabetic ulcers with an adequate blood supply. The amount applied once daily varies depending on the size of the ulcer area. The package labeling has a detailed calculation table. Dosage should be recalculated weekly or biweekly as the ulcer area changes. The product is supplied as a 0.01% gel in 2-, 7.5-, and 15-gm tubs. A 15-gm tube will express 60 cm of gel, which is adequate to treat one 7 cm^2 ulcer for 34 days. AWP cost: $27.50 per gm
Tazarotene (Tazorac)		**Retail:** 100 gm per 30 days* **Mail order:** 300 gm per 90 days*	Retinoid prodrug indicated for treatment of facial acne vulgaris of mild to moderate severity. It is also used to treat stable plaque psoriasis of up to 20% body surface area involvement. The product is supplied as 0.1% or 0.05% gel in 30- and 100-gm tubes. When treating facial acne, one 30-gm tube would last approximately 2 to 3 months. In treating psoriasis, one 100-gm tube would last approximately 1 month. There is no established maximum dose. AWP cost: $2.12 per gm

***Any combination of package sizes up to the maximum amount listed.**

Appendix C: Review of Ophthalmic Glaucoma Agents and BCF Recommendations—CDR Matt Nutaitis

Ophthalmic Glaucoma Agents Currently on the BCF

1. Timolol Ophthalmic Solution
   [Does not include timolol maleate gel (Timoptic XE)]
2. Betaxolol Ophthalmic Suspension (Betoptic; Alcon)
3. Pilocarpine Ophthalmic Gel
4. Pilocarpine Ophthalmic Solution
5. Dorzolamide Ophthalmic Solution (Trusopt; Merck)

Recommendations for BCF Changes

Removal of:

Betaxolol Ophthalmic Suspension
Pilocarpine Ophthalmic Gel
Dorzolamide Ophthalmic Solution

Addition of:

Brimonidine Ophthalmic Solution (Alphagan; Allergan)

Discussion

The review of the topical glaucoma agents and their presence on the BCF included a multi-phased decision process. The current BCF drugs were identified, input from a glaucoma specialist from each of the three services was solicited, and an adjustment to the BCF drugs was recommended.

The advisory group for this BCF decision was comprised of a representative from each of the services. The Army was represented by MAJ Brian Cavallero. LTC Flynn provided input for the Air Force, and CDR Diane Lundy supplied an opinion for the Navy.

Recommended BCF topical glaucoma agents: timolol ophthalmic solution, brimonidine ophthalmic solution, pilocarpine ophthalmic solution

- Due to pricing available through a DoD/VA mandatory source contract (awarded to Alcon Labs), timolol is the most cost-effective of the topical ophthalmic beta-blockers. The use of beta-blockers is common in the first line treatment of glaucoma, and thus, reason to include a beta-blocker on the BCF. The timolol products have a long track record of safety and efficacy, and are popular choices by ophthalmologists in the treatment of glaucoma patients. Retention of timolol ophthalmic solution on the BCF is recommended.

  The continued exception of timolol maleate gel (Timoptic XE, generics) from the BCF listing for timolol solution is recommended. Although this extended-release product is now generically available, it is still at least twice as costly as timolol solution on a daily basis. Local MTFs may decide to add timolol maleate gel to their formularies if they choose to do so. There is a DoD/VA mandatory source contract in effect for timolol maleate gel (awarded to Merck &

Co); however, this contract does not mandate inclusion of timolol ophthalmic gel on the BCF. Usage of timolol is about 56% timolol solution and 44% timolol maleate gel in terms of bottles purchased.

- Brimonidine (Alphagan; Allergan) is a safe and efficacious first line medication to treat glaucoma. In the Alpha Agonist class of anti-glaucoma medications, brimonidine is the least expensive, least allergenic, and is dosed as a BID medication, which assists in patient compliance and satisfaction. This group of medication also has a unique role in the prophylaxis of intraocular pressure spikes, a known complication of YAG laser capsulotomy. Its addition as a BCF drug was unanimous.

- Finally, continued inclusion of pilocarpine solution is recommended. It is inexpensive, efficacious and unique. It is used to treat acute angle closure and to prepare the eye for laser iridotomy procedures.

The recommendations for removal from the BCF are: dorzolamide ophthalmic solution (Trusopt; Merck), betaxolol ophthalmic suspension (Betoptic; Alcon), and pilocarpine ophthalmic gel.

- Clinically, dorzolamide is a second line medication. Brief stinging after the drop application influences patient compliance. The combination of expense and efficacy guided the decision to allow individual hospital formulary committees to consider this as a formulary drug, but not include it on the BCF.

- Betaxolol ophthalmic suspension has a smaller clinical role with the advent of multiple new anti-glaucoma agents. Removal from the BCF with local formulary consideration is recommended.

- Pilocarpine (Pilogel) ophthalmic gel has a very limited clinical role and also should be removed from the BCF.

Also considered for the BCF but not recommended for BCF addition at this time: latanoprost ophthalmic solution (Xalatan; Pharmacia).

- Latanoprost is effective and safe. However, latanoprost costs more than other agents and is not FDA-approved as a first line agent for glaucoma. Also, addition of a 4^{th} agent to treat glaucoma to the BCF was not felt to be necessary. The consultants agreed that local commands should be allowed to add latanoprost to their formularies if they so desire.

Appendix D: Oral Contraceptive Agents (OCPs)[1]

Monophasic OCPs with 20mcg ethinyl estradiol (EE)

Brand Name	Estrogen	Progestin	Cost/Cycle[2] (May 00 DAPA price)	BCF Item?
Alesse-28 Levlite-28	EE 20	0.10mg levonorgestrel	$6.00 $5.99	No
Loestrin FE 1/20	EE 20	1.00mg norethindrone acetate	$2.00 (28 day)	No

Monophasic OCPs with 30mcg EE

Levlen Levora Nordette	EE 30	0.15mg levonorgestrel	$1.28 $6.00 $6.00	No
Lo/Ovral Low-Ogestrel	**EE 30**	**0.30mg norgestrel**	**$8.00 $8.00**	**Yes**
Loestrin-FE 1.5/30	**EE 30**	**1.50mg norethindrone acetate**	**$2.00 (28 day)**	**Yes (added 11 May 00)**
Desogen Ortho-Cept Apri	EE 30	0.15mg desogestrel	$12.06 $16.57 not listed[3]	No

Monophasic OCPs with 35mcg EE

Brevicon Modicon Necon	EE 35	0.50mg norethindrone	$3.38 $16.76 $3.75	No
Demulen Zovia	**EE 35**	**1.00mg ethynodiol diacetate**	**$3.89 $3.75**	**Yes (added 11 May 00)**
Necon Norinyl Ortho-Novum	**EE 35**	**1.00mg norethindrone**	**$3.75 $3.81[4] $13.59**	**Yes**
Ovcon	EE 35	0.40mg norethindrone	$15.83	No
Ortho-Cyclen	EE 35	0.25mg norgestimate	$16.19	No

Biphasic OCPs

Mircette	EE 20/0.01mg	0.15mg desogestrel	$12.06	No
Jenest Necon 10/11 Ortho-Novum 10/11	EE 35	0.5mg/1.00mg norethindrone	$11.25 $3.75 $15.98	No

Triphasic OCPs

Tri-Norinyl	EE 35	0.5/1/0.5mg norethindrone	$3.81	No
Ortho-Novum 7/7/7	**EE 35**	**0.5/0.75/1mg norethindrone**	**$15.78[5]**	**Yes**
Ortho Tri-Cyclen	EE 35	0.18/0.215/0.25mg norgestimate	$16.35	No
Estrostep-FE	EE 20/30/35	1.00mg norethindrone acetate	$2.00	No
Trilevlen Triphasil Trivora	**EE 30/40/30**	**0.05/0.075/0.125mg levonorgestrel**	**$1.28 $6.00 $13.11**	**Yes**

Progestin-Only OCPs

Micronor Nor-Q.D.		**0.35mg norethindrone**	**$18.82 $6.30**	**Yes (added 11 May 00)**
Ovrette		0.075mg norgestrel	$15.63	No

1. OCPs with 50 mcg EE or mestranol not listed due to infrequency of use (about 2.5% of all cycles purchased)
2. DAPA prices listed are for 28-day packs, which represent approximately 95% of total use compared to 21-day packs. Prices do not reflect bulk discounts.
3. Recently approved. Per the manufacturer, FSS price is approximately $10.20 per cycle; DAPA price not yet listed
4. Norinyl 1/35 28-day packs available through the depot at approximately $5.30 per cycle, including the depot surcharge. This is higher than the $3.81 price through the prime vendor.
5. Ortho-Novum 7/7/7 (clinic packs) available through the depot at approximately $5.56 per cycle, including the depot surcharge. This is considerably lower than the $15.78 price through the prime vendor.

Appendix E: Formulary Changes

I. BCF Changes

A. *Addition of the following:*

1. Brimonidine Ophthalmic Solution (Alphagan; Allergan)—see Paragraph 5C7
2. Metronidazole vaginal gel (Metrogel Vaginal; 3M Pharmaceuticals)—see Paragraph 5C8
3. Ethinyl estradiol 30 mcg/1.5 mg norethindrone (Loestrin FE 1.5/30)—see Paragraph 5C11b
4. Ethinyl estradiol 35 mcg/1 mg ethynodiol diacetate (e.g., Demulen, Zovia)—see Paragraph 5C11c
5. 0.35 mg norethindrone (e.g., Micronor, Nor-Q.D.)—see Paragraph 5C11f
6. Extended release morphine (MS Contin or its AB-rated generic only) 15-, 30-, and 60-mg tablets [The BCF requirement does not include 100- or 200-mg tablets of MS Contin and does not include other extended release morphine products (e.g., Oramorph SR or Kadian)]. (see Paragraph 5C12)

B. *Removal of the following:*

1. Betaxolol Ophthalmic Suspension—see Paragraph 5C7
2. Dorzolamide Ophthalmic Solution—see Paragraph 5C7
3. Pilocarpine Ophthalmic Gel—see Paragraph 5C7

C. *Clarification*—The BCF listing for "oxycodone 5 mg /acetaminophen 325 and 500 mg" was clarified to specify that MTFs must have oxycodone/acetaminophen in the 5/325 and 5/500 mg strengths on their formularies. MTFs are not required to have the 2.5/325, 7.5/500, and 10/650 strengths on their formularies. (See Paragraph 5C9.)

II. NMOP Formulary Changes

A. *Added to the NMOP Formulary* (see Paragraph 5C1):

1. Levetiracetam tablets (Keppra; UCB Pharma)
2. Ciclopirox topical solution (Penlac Nail Lacquer; Dermik/Aventis)
3. Nedocromil sodium ophthalmic solution, 2% (Alocril; Allergan)
4. Cevimeline HCl capsules (Evoxac; Snowbrand Pharma)
5. Alosetron tablets (Lotronex; Glaxo)—added to the NMOP formulary for female patients only
6. Rivastigmine capsules (Exelon; Novartis)
7. Sotalol HCl (BetapaceAF™; Berlex)

B. *Excluded from the NMOP Formulary*

1. Dofetilide (Tikosyn; Pfizer) was excluded from the NMOP formulary and will not be available through the NMOP. (See Paragraph 5C2.)
2. Alosetron (Lotronex; Glaxo) was excluded from the NMOP formulary if prescribed for male patients. (See Paragraph 5C1.)

C. *Clarification*—The committee clarified the current listing for antihemophilic factors on the NMOP Covered Injectables List to read " Antihemophilic Factors (including Factor VII, Factor VIII, Factor IX, Factor IX Complex, and Anti-Inhibitor Factor Complex)." (See Paragraph 5C3.)

D. *Changes to the NMOP Preferred Drug Program*

1. Deletion of non-preferred/preferred pair for nitroglycerin patches (see Paragraph 4A2)
2. Change to calling program for herpes antivirals (see Paragraph 4C2)

III. *Quantity Limit Changes (NMOP and retail network)*

A. Quantity limits finalized and approved by committee, will be posted on the PEC website (see Paragraph 4A1).
B. Quantity limits for five high-cost topicals established (see Paragraph 4D and Appendix B).

IV. *Changes to the Prior Authorization Program (NMOP and retail network)*

A. The committee approved prior authorization criteria for the NMOP and retail network for terbinafine (Lamisil) and itraconazole (Sporanox) for treatment of onychomycosis (see Paragraph 4I).
B. The committee decided to revise prior authorization forms to include education for providers (see Paragraph 4K).

Appendix F: Reports Due to the Committee

I. *NMOP Preferred Drug Program Standing Report* (see Paragraph 4C1) — CDR Mark Brouker (PEC). Interim report due to co-chairs by 17 Jul 00, full report to committee at the next meeting.

II. *Report on Feasibility of Proposal Concerning Antivirals in the NMOP Preferred Drug Program* (see Paragraph 4C2—Mark Petruzzi (Merck-Medco). Report due to co-chairs by 17 Jul 00.

III. *Subcommittee Report on Quantity Limits for Topicals* (see Paragraph 4D)—Subcommittee members: Bill Hudson (chair); MAJ George Jones; MAJ Mickey Bellemin; Ray Nan Berry (Foundation Health); Kirby Davis (Anthem Alliance); William Hudson (Humana); Gene Lakey (TriWest); and Ron McDonald (Sierra Military Health Services). Interim report due to co-chairs by 17 Jul 00.

IV. *Subcommittee Report on Cost-Efficiency of Prior Authorizations in the NMOP* (see Paragraph 4H)—Subcommittee members to be named. Report due to co-chairs by 17 Jul 00.

Department of Defense
Pharmacoeconomic Center

1750 Greeley Rd., Bldg. 4011, Rm. 217
Fort Sam Houston, TX 78234-6190

MCCS-GPE 24 February 2000

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with Health Affairs policy 98-025, a meeting of the DoD P&T committee convened at 0800 hours on 24 February 2000, at the Naval Amphibious Base Little Creek, Portsmouth, VA.

2. MEMBERS PRESENT:

CDR Terrance Egland, MC	Co-chairman
COL Daniel D. Remund, MS	Co-chairman
COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
CDR Matt Nutaitis, MC	Navy
LCDR Kevin Cook, MSC	Navy
COL (select) Bill Sykora, MC	Air Force
COL (select) John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
LCDR Pamela Stewart Kuhn	Coast Guard (alternate)
Ronald L. Mosier	Department of Veterans Affairs (alternate)
LTC Greg Russie, BSC	Joint Readiness Clinical Advisory Board (alternate)
LTC Steven Humburg, MC	Health Affairs
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia (DSCP)
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)
Ray Nan Berry	Foundation Health
Kirby Davis	Anthem Alliance
William Hudson	Humana, Inc
Gene Lakey	TriWest
Ron McDonald	Sierra Military Health Services

Daniele Doyle was absent.

3. OTHERS PRESENT:

CAPT Charlie Hostettler, MSC	DoD Pharmacy Program Director, TMA
COL Mike Heath, MS	Army Pharmacy Consultant; Chair, DoD Pharmacy Board of Directors
CAPT Bob Wilkens, MSC	Navy Pharmacy Specialty Leader
CAPT (select) Betsy Nolan, MSC	TRICARE, Mid-Atlantic Region
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center (PEC)
Howard Altschwager	Deputy General Counsel, TMA
David Chicoine	Uniformed Services Family Health Plans (USFHP)
Tom Kellenberger	Merck-Medco
Mark Petruzzi	Merck-Medco
Shana Trice	DoD Pharmacoeconomic Center (PEC)
Paul Vasquez	Defense Supply Center Philadelphia (DSCP)

4. ADMINISTRATIVE ISSUES:

A. The minutes from the last meeting were accepted as written. In response to a question from MAJ Bellemin, the committee confirmed that zolpidem (Ambien®) is subject to the standard quantity limit of a 30-day supply for controlled substances.

5. OLD BUSINESS

A. Review of Interim Decisions

1. *Advances in Medical Practice (AMP) Program*—Voting members of the DoD P&T Committee met via teleconference on 26 Jan 00 to recommend drugs for coverage by the AMP program. The minutes for the interim meeting are at Appendix A. (NOTE: The minutes for the interim meeting were not previously posted on the PEC website because it would have been premature to announce the drug recommendations before AMP program officials had a chance to review them.) At the request of AMP program officials, the P&T committee co-chairs subsequently recommended more drugs for coverage by the AMP program. The consolidated list of all drugs recommended by the DoD P&T Committee for coverage under the AMP program is at Appendix B. MTFs will be informed when AMP officials, TMA officials, and service resource management officers have approved the list of drugs and finalized procedures for reimbursing MTFs for expenditures on drugs covered by the AMP program.

2. *Additions to BCF due to Program Budget Decision (PBD) No. 41*—The DoD P&T Committee met via teleconference on 26 Jan 00 to add drugs to the Basic Core Formulary (BCF) in response to additional funding for MTF pharmacies provided by the PBD No. 41. The minutes for this meeting were previously posted on the PEC website. The committee added the following drugs to the BCF:

    - metformin
    - tamoxifen

- alendronate
- citalopram
- fluoxetine
- paroxetine
- sertraline
- sumatriptan autoinjector

The committee also modified the BCF to stipulate that all MTFs must have at least one agent from each of the following classes on their formularies:

- oral serotonin 5-HT_1 receptor agonists (naratriptan, rizatriptan, sumatriptan, zolmitriptan)
- low molecular weight heparins/heparinoids (ardeparin, dalteparin, danaparoid, enoxaparin)
- leukotriene antagonists (montelukast, zafirlukast, zileuton)
- second-generation antihistamines (cetirizine, fexofenadine, loratadine)

The PEC will furnish information to MTFs to assist them in selecting agents for their formularies.

B. National Mail Order Pharmacy (NMOP) Preferred Drug Program

When the NMOP receives a new prescription for a non-preferred drug, the NMOP contractor, Merck Medco, attempts to contact the prescriber to request a switch to a preferred drug if clinically appropriate. CDR Brouker reported the switch rates and estimated cost avoidance for non-preferred/preferred drug pairs in the NMOP (see Appendix C). MAJ Bellemin reported that Merck-Medco started calling prescribers on 1 Dec 99 regarding the new non-preferred/preferred drug pairs that were approved at the Aug 99 meeting. These drug pairs are: famotidine/ranitidine (Geneva brand); nizatidine/ranitidine (Geneva brand); nitroglycerin patches other than Nitro-Dur®/Nitro-Dur®; and enalapril/lisinopril (Zestril®). Data for the new non-preferred/preferred drug pairs will be reported at the next meeting.

C. Quantity Limits

1. The PEC and the Defense Supply Center Philadelphia (DSCP) continue to check the quantity limits that Merck Medco actually applies in the NMOP to ensure that they match the official quantity limits that are listed on the PEC website at http://www.pec.ha.osd.mil/NMOP/qtylimit.htm.

2. *Report of the subcommittee on quantity limits for topicals*—Bill Hudson (Humana) and MAJ George Jones recommended quantity limits for five high-cost topicals [imiquimod (Aldara); calcipotriene (Dovonex); altitretinoin (Panretin); becaplermin (Regranex); and tazarotene (Tazorac)]. The proposed quantity limits for most of the agents were expressed in terms of the maximum number of containers of any size that would be dispensed in a given time period (30 or 90 days). Several committee members expressed concern that this might be overly restrictive and supported the concept of expressing the quantity limits in

terms of the maximum number of grams or milliliters dispensed in a given time period, with the maximum quantity set to allow for the vast majority of all use. The P&T Committee did not approve the recommended quantity limits for the topical agents listed above. The P&T Committee asked the subcommittee to provide additional information concerning the frequency distribution of quantities dispensed for these agents in the retail networks and the NMOP in order to more accurately establish 1) if any quantity limitation is necessary, and 2) if so, what a reasonable limit would be.

3. *Change in quantity limit for azithromycin*—The committee approved a recommendation by Gene Lakey (Triwest) to increase the current 6-tablet per 30 day quantity limit for azithromycin (Zithromax®) 250-mg tablets to 10 tablets per 30 days. This change in the quantity limits is necessary to accommodate dosing requirements for older children for the treatment of pharyngitis/tonsillitis.

D. *Cost-efficiency of prior authorizations in the NMOP*—MAJ Bellemin reported on the prior authorization programs for sildenafil, etanercept, rofecoxib, and celecoxib in the NMOP.

1. *Sildenafil*—Merck Medco performed 7696 prior authorizations (4865 approved and 2831 denied) at a cost of $307,840 from September 99 through December 99. Based on utilization data from June through December 1999 and the current government price for sildenafil, it is estimated that prior authorization of sildenafil will provide a $47,280 cost avoidance during the next 12-month period.

2. *Etanercept*—Merck Medco performed 161 prior authorizations (152 approved and 9 denied) at a cost of $6440 from August 99 through December 99. Based on utilization data from June through December 1999 and the current government price for etanercept, it is estimated that prior authorization of etanercept will provide a $64,084 cost avoidance during the next 12-month period.

3. *COX-2 inhibitors (celecoxib, rofecoxib)*— Merck-Medco processed 9695 prescriptions for COX-2 inhibitors from August 99 through December 99. The automated prior authorization process approved 5574 of the prescriptions; 4121 required prescriber contact. Of these, 3100 were approved and 1021 were denied at a cost of $164,840. Based on COX-2 utilization data from June through December 1999 and the current government price for these agents, it is estimated that DoD will realize a $908,026 cost avoidance during the next 12-month period.

Several members commented that the cost avoidance is underestimated because the mere existence of the prior authorization program may cause physicians to write fewer prescriptions for a drug (usually referred to as the “sentinel effect”). Other members commented that the cost avoidance is overestimated because prescriptions that are initially denied are sometimes filled when resubmitted because the prescriber provides additional information that satisfies the prior authorization criteria. Cost avoidance was also overestimated because the analysis did not account for the cost of NSAIDs or other drugs that were prescribed when the prior authorization process denied the COX-2 prescription. The PEC staff will work with MAJ Bellemin to improve the validity of the cost avoidance estimates. MAJ Bellemin will continue to report on this subject as a standing report at each meeting. The report for the next meeting is due to the co-chairs by 11 Apr 00.

E. *Prior authorization for terbinafine*—The committee co-chairs finalized the prior authorization criteria for terbinafine in January, but TMA directed that implementation be held in abeyance until TMA clarified the definition of cosmetic vs. non-cosmetic use of terbinafine and its status as a covered benefit under TRICARE. CAPT Hostettler informed the committee during the meeting that TMA considers treatment of a documented infection to be a covered benefit under TRICARE and that such treatment should not be characterized as cosmetic.

The question of whether the prior authorization should apply only to terbinafine or to both terbinafine and itraconazole was reintroduced. Some committee members thought that prior authorizing only terbinafine might lead to increased use of itraconazole. Arguments favoring prior authorizing only terbinafine included:

- Prior authorization of itraconazole might be cost-inefficient. Itraconazole is used for many indications other than onychomycosis, so the NMOP might incur large prior authorization expenses with little impact on itraconazole usage.
- One MCSC director stated that, in their experience, institution of a prior authorization program focused only at terbinafine did not lead to increased usage of itraconazole.

Paul Vasquez commented that the NMOP might be able to ascertain (as a benefit issue) whether or not these medications were being prescribed for onychomycosis. The government would then incur the prior authorization fee only for prescriptions for treatment of onychomycosis. Mr. Vasquez will investigate this issue and report his findings to a subcommittee consisting of CDR Egland (chair), Paul Vasquez (DSCP), MAJ Bellemin (DSCP), and MAJ Ed Zastawny (PEC). The subcommittee will then develop a prior authorization proposal and present it at the next P&T committee meeting. An interim report is due to co-chairs by 11 Apr 99.

6. NEW BUSINESS

A. Prior Authorizations

1. *Prior authorization criteria and fax forms on the PEC website*—At the last meeting, the committee directed the PEC to post the prior authorization fax forms (instead of the prior authorization criteria) on the PEC website. MTFs and Managed Care Support Contractors (MCSCs) subsequently requested that the criteria be reinstated on the website. The committee approved the request. The PEC will post both the criteria and the fax forms on the website.

2. *Proposal for prior authorization of fertility drugs*—According to the Code of Federal Regulations (CFR) and TRICARE policy, fertility drugs are not a covered benefit when used to assist in non-coital reproduction methods. Some of the MCSCs have prior authorizations in place for fertility medications, but others do not. The NMOP does not have a prior authorization process for fertility agents and is currently filling a large number of prescriptions for these medications. The committee concluded that a prior authorization for fertility drugs should be established in order to comply with TRICARE policy. CAPT Hostettler will submit draft prior authorization criteria for fertility agents to the co-chairs. The co-chairs will finalize the criteria for approval at the May P&T Committee meeting. CDR Egland is the point of contact for this action.

3. *Proposal to modify COX-2 prior authorization criteria*—The committee discussed several proposals by Bill Hudson (Humana) concerning the prior authorization criteria for COX-2 inhibitors in the NMOP and retail network. The committee agreed that there is not enough clinical evidence to justify use of a COX-2 solely on the basis of recent use of a NSAID for the last 40 of 60 days and decided to remove this as a criterion for approval of the PA for COX-2 inhibitors. The committee also agreed to replace the phrase *"situations where the physician indicates that the patient has previously been unable to tolerate therapy with at least two different NSAIDs"* with the phrase *"situations where the physician indicates that the patient has previously failed an adequate trial with at least two different NSAIDs."* The committee made this change with the intent that "failing an adequate trial" would include both failures due to intolerance and failures due to lack of effectiveness at an dose and duration considered by the physician to constitute an adequate trial.

4. *Report of the Growth Hormone subcommittee*—Bill Hudson (Humana) submitted the subcommittee report, which included proposed criteria for prior authorization of growth hormone products. The P&T committee requested additional information before acting on the subcommittee's recommendation. The subcommittee is to finalize the prior authorization criteria and ensure that they clearly address the use of growth hormone products in adults and the off-label uses of growth hormone. The subcommittee should support the prior authorization criteria with a business case analysis that includes historical usage and cost data for growth hormone products in the NMOP and retail network pharmacies. The subcommittee should provide this information to CDR Egland by 11 Apr 00.

5. *Portability of Prior Authorizations*—Bill Hudson (Humana) proposed that prior authorizations should be portable between MCSCs and the NMOP. The committee assigned MAJ Bellemin to investigate the possibility of uploading all prior authorizations completed by the NMOP and the MCSCs to a common site that could be accessed by all parties. The committee also advised MAJ Bellemin, Merck-Medco, and the MCSCs to ensure compatibility of any such process with the Pharmacy Data Transaction Service (PDTS).

B. National pharmaceutical contracts

1. *Contracts awarded since last meeting*—New generic contracts that apply to both DoD and the VA have been awarded by the VA National Acquisition Center for: timolol maleate 0.25% and 0.5% ophthalmic solution, timolol maleate 0.25% and 0.5% ophthalmic gel; levobunolol 0.25% and 0.5% ophthalmic solution; and gemfibrozil 600-mg tablets.

2. *Albuterol inhaler contract*—Warrick is the contracted brand of albuterol inhaler. The FDA issued a Class I recall because some Warrick albuterol inhalers contained no active ingredient. Some MTFs had to purchase non-contracted brands of albuterol inhalers because the Warrick brand was not available. DSCP will take these issues under consideration in regard to renewal of the albuterol inhaler contract. The committee noted that MedWatch forms should be submitted when quality concerns are identified.

3. The PEC uses prime vendor purchase data to quantify the financial impact of national pharmaceutical contracts. COL Remund presented slides showing the cost avoidance associated with the ranitidine (Geneva brand), cimetidine (Sidmak brand), lisinopril (Zestril), diltiazem extended release (Tiazac), and albuterol inhaler (Warrick brand) contracts. These five contracts yielded nearly $6.5 million in cost avoidance for MTFs in FY 99.

4. COL Remund reported on other contracting issues:

   - *Nicotine Patches*— DoD/VA initiative (DoD lead) for 3-step product only. The contract solicitation was issued 15 Feb 00 and closes 15 Mar 00. An award is expected by 28 Apr 00. MTFs that purchase a 3-step nicotine patch will be required to purchase the contracted product. The contract does not stipulate that the nicotine patch will be listed on the BCF.

   - *Felodipine*— The VA will include DoD in the renewal of its Blanket Purchase Agreement (BPA) for felodipine (Plendil). Adding DoD utilization may decrease the BPA price for felodipine.

   - *Estrogen Replacement Therapy*—In light of proposed DAPA price reductions by Wyeth/Ayerst for PremPro and PremPhase, the committee decided not to proceed with a contracting initiative for estrogen replacement products at this time. The committee noted that the possibility should remain open in the future as new products continue to enter the market. The committee agreed that the presence of the incentive agreements should be considered in DoD's future deliberations with the VA. No changes were made to the BCF.

   - *Second Generation Antihistamines*— Pharmaceutical companies are reducing prices or developing incentive pricing agreements in response to the recent change in the BCF that requires each MTF to have at least one second generation antihistamine on its formulary. After the price reductions and/or incentive agreements are finalized, the committee will reassess the advisability of pursuing a national contract for a second generation antihistamine.

     CDR Egland commented that nasal corticosteroids are more cost-effective than second-generation antihistamines for treating symptoms of allergic rhinitis. He specifically referenced a recent review of the treatment of allergic rhinitis in the *American Journal of Managed Care* (Jan 2000 supplement issue).

   - *Furosemide and hydrochlorothiazide*— Pursuing a joint DoD/VA contract (VA lead). These contracts will select specific brands of these drugs for the BCF.

   - *Returned Goods* - Joint DoD/VA initiative (DoD lead). Anticipate that the solicitation for this contract will be issued in April 00.

C. *FY00 National Defense Authorization Act*—CAPT Hostettler and Mr. Altschwager briefed the committee on the ongoing efforts to implement the provisions pertaining to the uniform formulary and the DoD P&T Committee.

D. BCF and NMOP formulary issues:

1. The following drugs that were recently approved by the FDA were added to the NMOP Formulary. None of these drugs were added to the BCF.

    a. Ethinyl estradiol / norethindrone acetate tablets (FemHRT; Parke Davis)
    b. Exemestane tablets (Aromasin; Pharmacia & Upjohn)
    c. Estradiol / norgestimate tablets (Ortho-Prefest; Ortho McNeil)
    d. Aspirin / dipyridamole extended release capsules (Aggrenox; Boehringer-Ingelheim)
    e. Moxifloxacin hydrochloride tablets (Avelox; Bayer)
    f. Gatifloxacin tablets (Tequin; Bristol Myers Squibb)
    g. Oxcarbazepine tablets (Trileptal; Novartis)

2. The following drugs were excluded from the NMOP formulary for the reasons given. Neither of these drugs was added to the BCF. Both drugs will be available through retail network pharmacies.

    a. *Oseltamivir phosphate capsules (Tamiflu; Roche)*—Oseltamivir is a neuraminidase inhibitor for the treatment of uncomplicated acute illness due to influenza A and B virus in adults who have been symptomatic for less than 2 days. Due to the narrow treatment window for this agent, the committee agreed that this drug is not well suited for dispensing through a mail order pharmacy. A similar drug, zanamivir (Relenza; Glaxo), was excluded from the NMOP formulary at the Aug 99 meeting.

    b. *Bexarotene capsules (Targretin; Ligand Pharma)*—Bexarotene is indicated for the treatment of cutaneous manifestations of cutaneous T-cell lymphoma in patients who are refractory to at least one prior systemic therapy. Bexarotene is Pregnancy Category X and carries a black box warning against use in pregnancy. Package labeling advises that a pregnancy test (for women of child-bearing age) should be obtained within one week prior to starting therapy and repeated at monthly intervals during therapy. In addition, labeling advises that "no more than a one month supply of Targretin® capsules should be given to the patient so that the results of pregnancy testing can be assessed and counseling regarding avoidance of pregnancy and birth defects can be reinforced." In light of this requirement and considering turn-around times for the mail order program, the committee decided that it was not feasible to provide bexarotene through the NMOP.

3. *Pantoprazole (Protonix; Wyeth-Ayerst)* is a new proton pump inhibitor. The national contract for omeprazole requires pantoprazole to be listed as a "non-contracted drug" on the NMOP Formulary. The national contract precludes MTFs from adding pantoprazole to their formularies.

4. *Nasal corticosteroids (BCF)*— At the May 99 meeting, the committee removed beclomethasone 42mcg/spray (Vancenase pockethaler; Schering) from the BCF due to a substantial DAPA price increase and specified that every MTF should have a nasal corticosteroid on its formulary. At the Aug 99 meeting, the committee selected fluticasone nasal spray (Flonase; Glaxo) for the BCF because it was the most cost-effective agent, it is approved for use in patients as young as 4 years old, it is dosed once a day, and allergy/immunology specialists expressed the opinion that fluticasone would be a good selection as a "workhorse" nasal corticosteroid on the BCF. Prime vendor data through the first quarter of FY00 show an increase in use of fluticasone following its selection as the BCF agent and a decrease in use of beclomethasone products following the removal of Vancenase pockethaler as the BCF selection.

   The PEC recently received prescription data from the civilian market that may affect the cost-effectiveness estimates for fluticasone and mometasone. The Aug 99 cost-effectiveness analysis was based on an adult maintenance dose of 2 puffs/day for fluticasone and 4 puffs/day for mometasone (derived from the product labeling). Civilian prescription data indicate that the prescribed puffs per day may be essentially the same for both drugs, which would make fluticasone and mometasone similar in cost-effectiveness. Mometasone was also recently approved for children as young as 3 years of age. The committee asked the PEC to analyze the dosing distribution for nasal corticosteroids within DoD and propose BCF changes if appropriate. The committee emphasized that it did not wish to make further additions to the BCF without complete information, but agreed that the presence of an additional nasal corticosteroid agent on the BCF could potentially spur competitive pricing.

5. *Consideration of Niaspan (niacin extended release; Kos Pharma) for the BCF*— Niacin is well known to have a positive effect on the lipid profile of patients with dyslipidemias and is particularly effective in raising high-density lipoprotein cholesterol (HDL-C). Patient intolerance to the common side effects of flushing and pruritis limits the usefulness of niacin in clinical practice. Sustained release forms of niacin may be tolerated better than immediate release forms, but sustained release forms have been associated with a higher incidence of liver toxicity. Niaspan is promoted as a once-daily product that is not associated with a higher incidence of liver toxicity. Niaspan costs significantly more than other sustained release forms of niacin.

   The committee is concerned that patient tolerance of niacin may be related more closely to the educational efforts regarding drug dosing than the specific dosage form that is used. Due to the limited data available, the committee also has concerns about the potential for liver toxicity with Niaspan. The committee asked the PEC to further investigate the associations between niacin dosage forms and patient tolerance and liver toxicity. The PEC will also evaluate usage patterns of all niacin products within DoD and obtain input from MTFs regarding the potential addition of Niaspan to the BCF. The PEC will provide a recommendation regarding the BCF status of Niaspan at the next meeting.

6. *Request for removal of dipivefrin ophthalmic solution (Propine, generics) from the BCF and review of ophthalmic glaucoma agents*—The committee removed dipivefrin from the BCF. Dipivefrin has been reported to have a relatively high rate of side effects relative to other available agents, which are at least equally effective. Dipivefrin represents approximately 2% of usage of glaucoma agents in DoD by number of bottles purchased, compared to timolol (Timoptic, generics) 33%, latanoprost (Xalatan) 21%, dorzolamide (Trusopt) 12%, and multiple other agents each representing 7% or less of total usage. CDR Matt Nutaitis, an ophthalmologist and allergy specialist, will undertake a review of ophthalmic glaucoma agents and make recommendations for BCF changes at the next meeting. An interim report is due to the co-chairs by 11 April.

7. *BCF status of cisapride (Propulsid; Janssen)*—The committee removed cisapride from the BCF based on recent FDA recommendations and labeling changes aimed at avoiding use of the medication in patients at known risk of rare but serious cardiac events associated with use of the drug. Labeling changes include the recommendation that an electrocardiogram, serum electrolytes, and serum creatinine be performed prior to initiation of therapy, as well as a list of contraindicated drugs and underlying conditions. With the continuing reports of heart rhythm disorders and deaths associated with use of cisapride, the committee agreed that the benefits of the drug are not likely to outweigh the known risks except for selected patients.

8. *Status of human chorionic gonadotropin injection in the NMOP*—The committee added human chorionic gonadotropin injection to the NMOP Covered Injectables list. This agent has historically been provided by the NMOP and was inadvertently omitted when the Covered Injectables list was formulated.

7. ADJOURNMENT: The meeting adjourned at 1600 hours. The next meeting will be held on Thursday, 11 May 2000, at Fort Sam Houston, Texas. All agenda items should be submitted to the co-chairs no later than 11 April 2000.

LIST OF APPENDICES

APPENDIX A: Minutes of the Interim Meeting of the DoD P&T Committee, 26 Jan 00, concerning identification of drugs for the Advances in Medical Practice (AMP) Program;

APPENDIX B: Consolidated List of Drugs Recommended for the AMP Program by the DoD P&T Committee. **Note**: This list of drugs is **not** final. The list has been submitted to AMP officials, TMA officials, and resource management officers for final approval. MTFs will be notified of the final list of drugs and finalized procedures for reimbursement for expenditures on drugs covered by the AMP program as soon as they are approved.

APPENDIX C: NMOP Preferred Drug Program Report

APPENDIX D: Formulary Changes

APPENDIX E: Reports Due to the Committee

APPENDIX A: Minutes of the Interim Meeting of the DoD P&T Committee, 26 Jan 00, Concerning Identification of Drugs for the Advances in Medical Practice (AMP) Program

NOTE: After this interim meeting and at the request of AMP program officials, the P&T committee co-chairs subsequently recommended more drugs for coverage by the AMP program. See Appendix B for the consolidated list of all drugs recommended by the DoD P&T Committee for coverage under the AMP program.

26 January 2000

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of an Interim Meeting of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee—Advances in Medical Practice (AMP) Program

1. In accordance with Health Affairs policy 98-025, an interim meeting of the DoD P&T Committee convened via teleconference at 1300 on 26 January 2000. The purpose of this meeting was to identify new drug usage that should be supported by Advances in Medical Practice (AMP) funds.

2. MEMBERS Participating in the Teleconference:

COL Daniel D. Remund, MS	Co-chairman
CDR Terrance Egland, MC	Co-chairman
COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
Danielle Doyle	Army
LCDR Kevin Cook, MSC	Navy
LTC John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Robert W. Rist	Coast Guard

COL Daniel D. Remund voted as proxy for CDR Matt Nutaitis.
COL (select) Bill Sykora was absent.

3. OTHERS Participating in the Teleconference:

COL W. Michael Heath	Pharmacy Consultant, USA
COL Ardis Meier	Associate Chief, BSC for Pharmacy, USAF
CAPT Greg Hall	Director, Pharmacy Department, Portsmouth Naval Hospital

4. NEW BUSINESS

A. The AMP funds allocated for MTF pharmacies are intended to provide "seed money" to help MTFs purchase new drugs that are clinically beneficial, but which MTF pharmacies tend not to provide to patients because of insufficient funding. The plan is to use AMP money to support the usage of certain new drugs for the first year or two until funds can be programmed into the MTF budget "base" to support ongoing use of the drugs. The DoD Pharmacy Board of Directors is working with resource managers to design a mechanism to reimburse MTFs for their usage of drugs covered by the AMP program.

B. Based on recommendations provided by the PEC, the Committee recommends that AMP funds should be used to completely reimburse MTFs for FY 00 usage of the following drugs:

1. Etanercept (Enbrel)
2. Infliximab (Remicade)
3. Leflunomide (Arava)
4. Oral ribavirin / interferon alfa-2b combination (Rebetron)
5. Palivizumab (Synagis)
6. Coagulation Factor VIIa (Recombinant) (NovoSeven)

[Note: The Committee did **NOT** add these drugs to the Basic Core Formulary (BCF).]

C. Based on recommendations provided by the PEC, the Committee recommends that AMP funds should be used to reimburse MTFs for their FY 00 usage of COX-2 inhibitors as outlined below:

1. Use AMP funds to reimburse MTFs for 50% of their expenditures for COX-2 inhibitors. The reimbursement would occur regardless of the status of COX-2 inhibitors on the MTF formulary. [Note: The 50% reimbursement rate provides a financial incentive for MTFs to target the use of COX-2 inhibitors to patients who are increased risk for gastrointestinal problems secondary to NSAID use.]

2. Do not add a COX-2 inhibitor to the BCF.

3. Do not stipulate on the BCF that MTFs must have a COX-2 inhibitor on their formularies. Each MTF decides for itself whether to have a COX-2 inhibitor(s) on the MTF formulary.

4. Require MTFs to use prescribing guidelines, prior authorization, or other means to target the use of COX-2 inhibitors to patients who are at increased risk for GI problems secondary to NSAID use.

5. Pursue pricing agreements that are based on the status of COX-2 inhibitors on the MTF formulary.

6. Any new COX-2 inhibitor will be considered for addition to the list of drugs covered by AMP funds.

D. The PEC will provide cost projections for the drugs covered by the AMP program to the DoD Pharmacy Board of Directors and the AMP program managers.

5. ADJOURNMENT: The meeting adjourned at 1445 hours.

APPENDIX B: Consolidated List of Drugs Recommended for the AMP Program by the DoD P&T Committee.

NOTE: This list of drugs is **not** final. The list has been submitted to AMP officials, TMA officials, and resource management officers for final approval. MTFs will be notified of the final list of drugs and finalized procedures for reimbursement for expenditures on drugs covered by the AMP program as soon as they are approved.

Background: The pharmacy portion of AMP funding for FY00 is intended to provide "seed money" to purchase drugs that are clinically beneficial but which MTF pharmacies tend not to provide because of insufficient funds. The drugs covered under the AMP program are newly approved, have had new indications approved since initial approval, or have an extremely high unit cost. Under current planning, AMP money will support the usage of certain new drugs for a period of two to three years until funds can be programmed into the MTF budget "base" to support the ongoing use of the drugs.

Department of Defense Pharmacy and Therapeutics (DoD P&T) Committee Recommendations: On 26 January 2000, the Department of Defense Pharmacy and Therapeutics (DoD P&T) committee recommended that the first seven drugs listed in Table 1 be funded through the AMP program. On 9 Feb 00, additional drugs were selected by an interim decision of committee co-chairs. Currently, none of the selected drugs are listed on the Basic Core Formulary (BCF). The committee recommended that none of the drugs be added to the BCF. The committee recommended using AMP funds to reimburse MTFs for 100% of their expenditures for all selected drugs with the exception of COX-2 inhibitors.

For COX-2 inhibitors, the committee recommended that AMP funds be used to reimburse MTFs for 50% of their costs (e.g., if a MTF spent $20,000 on COX-2 inhibitors for a given month, the AMP program would reimburse the MTF $10,000). The 50% reimbursement provision for COX-2 inhibitors should provide the financial incentive for MTFs to make these drugs more available to patients with a valid clinical need. Reimbursement at 100% would discourage MTF efforts to ensure appropriate use of these drugs. Lastly, the committee recommended that MTFs be required to use prescribing guidelines, prior authorization, or other means to target the use of COX-2 inhibitors to patients who are at increased risk for GI problems secondary to NSAID use.

Table 1 (continued): Consolidated List of Drugs Recommended for the AMP Program by the DoD P&T Committee.

Drug	Indication
These drugs selected for funding through the AMP program by the DoD Pharmacy & Therapeutics Committee via teleconference, 26 Jan 00.	
Etanercept (Enbrel; Immunex / Wyeth-Ayerst)	Moderately to severely active rheumatoid arthritis (RA) and polyarticular-course juvenile rheumatoid arthritis in patients with an inadequate response to one or more disease-modifying antirheumatic drugs (DMARDs). May be used in combination with methotrexate in patients who do not respond adequately to methotrexate alone.
Infliximab (Remicade; Centocor)	Moderately to severely active Crohn's disease for the reduction of signs and symptoms in patients who have an inadequate response to conventional therapies; and treatment of patients with fistulizing Crohn's disease for the reduction in the number of draining enterocutaneous fistula(s). Recently approved in combination with methotrexate for reduction in signs and symptoms of RA in patients who have had an inadequate response to methotrexate.
Leflunomide (Arava; Hoechst Marion Roussel)	Active RA to reduce signs and symptoms and to retard structural damage as evidenced by x-ray erosions and joint space narrowing in adults
Coagulation Factor VIIa (Recombinant) (NovoSeven; Novo Nordisk)	Treatment of bleeding episodes in hemophilia A or B patients with inhibitors to Factor VIII or Factor IX.
Oral ribavirin / interferon alfa-2b combination (Rebetron; Schering)	Treatment of chronic hepatitis C in patients with compensated liver disease who have relapsed following alpha interferon therapy, approved in December 98 for patients not previously treated with interferon.
Palivizumab (Synagis; MedImmune)	Prevention of serious lower respiratory tract disease caused by RSV in pediatric patients at high risk of RSV disease
Cyclooxygenase-2 (COX-2) inhibitors— Celecoxib (Celebrex; Searle/Pfizer); Rofecoxib (Vioxx; Merck)	Celecoxib is indicated for the treatment of osteoarthritis (OA) and rheumatoid arthritis (RA), and was very recently approved for reduction in the number of adenomatous colorectal polyps in familial adenomatous polyposis (FAP), as an adjunct to usual care (e.g., endoscopic surveillance, surgery). Rofecoxib is indicated for OA, acute pain, and primary dysmenorrhea. NOTE: For COX-2 inhibitors, the committee recommended that AMP funds be used to reimburse MTFs for 50% of their costs.
These drugs selected for funding through the AMP program by an interim decision of DoD Pharmacy & Therapeutics Committee co-chairs, 9 Feb 00.	
Glycoprotein IIb/IIIa inhibitors— • Eptifibatide (Integrilin; COR) • Tirofiban (Aggrastat; Merck) • Abciximab (ReoPro; Lilly)	Abciximab indicated for use as an adjunct to PTCA, tirofiban indicated for acute coronary syndrome, and eptifibatide indicated for both acute coronary syndrome or treatment of patients undergoing percutaneous coronary intervention (PCI)

Table 1 (continued): Consolidated List of Drugs Recommended for the AMP Program by the DoD P&T Committee

Drug	Indication
Immunosuppressants— • Cyclosporine (various manufacturers) • Mycophenolate mofetil (Cellcept; Roche) • Sirolimus (Rapamune; Wyeth-Ayerst) • Tacrolimus (Prograf; Fujisawa)	Cyclosporine: Prophylaxis of organ rejection in kidney, liver, and heart transplantation. RA (Neoral only), psoriasis (Neoral only). Multiple unapproved indications. Mycophenolate mofetil: Prophylaxis of organ rejection in kidney or heart transplantation. Sirolimus: Prophylaxis of organ rejection in kidney transplantation. Tacrolimus: Prophylaxis of organ rejection in liver transplantation.
Dornase alfa (Pulmozyme)	Daily administration in conjunction with standard therapies in the management of cystic fibrosis patients to reduce the frequency of respiratory infections requiring parenteral antibiotics and to improve pulmonary function
Interferon gamma 1b (Actimmune)	Reduction of the frequency and severity of serious infections associated with chronic granulomatous disease
$Alpha_1$-proteinase inhibitor (Prolastin)	Chronic replacement in patients with congenital alpha1-antitrypsin deficiency and clinically demonstrable panacinar emphysema.
Temozolomide (Temodar)	Oral chemotherapy agent for adult patients with refractory anaplastic astrocytoma; pending NDAs for other conditions.
Trastuzumab (Herceptin)	Treatment of metastatic breast cancer in patients with tumors that overexpress the HER2 protein
Rituzimab (Rituxan)	Treatment of patients with relapsed or refractory low-grade or follicular, CD20 positive, B-cell non-Hodgkin's Lymphoma.
Drugs for MS • Interferon beta 1a (Avonex) • Interferon beta 1b (Betaseron) • Glatiramer acetate (Copaxone)	Treatment of relapsing/remitting multiple sclerosis.
Colony Stimulating Factors • Filgrastim (Neupogen) • Sargramostim (Leukine)	To reduce the incidence and duration of neutropenia-related sequelae (e.g., infection, fever) associated with myelosuppressive chemotherapy, bone marrow transplant, severe chronic neutropenia, etc., and for the mobilization of hematopoietic progenitor cells into the peripheral blood for leukapheresis collection.

Table 1 (continued): Consolidated List of Drugs Recommended for the AMP Program by the DoD P&T Committee

Drug	Indication
Irinotecan (Camptosar)	Metastatic carcinoma of the colon or rectum.
Gemcitabine (Gemzar)	First-line treatment for locally advanced or metastatic pancreatic cancer and in combination with cisplatin for first-line treatment of inoperable, locally advanced or metastatic non-small cell lung cancer
Epoetin alfa [Recombinant human erythropoietin] (Epogen, Procrit)	Reduction of allogeneic blood transfusion in surgery patients and treatment of anemia from various causes, including chronic renal failure, zidovudine therapy in HIV-infected patients, and chemotherapy.
Becaplermin (Regranex)	Treatment of diabetic neuropathic ulcers in conjunction with debridement and good ulcer care.

APPENDIX C: NMOP Preferred Drug Program Report

The NMOP Preferred Drug Program

The purpose of the NMOP Preferred Drug Program is to encourage the use of drugs that are preferred on the basis of relative effectiveness, safety, and cost. The NMOP calls the prescriber on each new prescription for a non-preferred agent and requests a switch to a preferred drug. If the prescriber declines or if the prescriber cannot be contacted, the prescription is filled as written.

Methods of Calculating Cost Avoidance

The NMOP Preferred Drug Program achieves cost avoidance by shifting prescription market share to the preferred drugs. In general, cost avoidance is estimated by subtracting the actual expenditures for preferred and non-preferred drugs from the expenditures that would have been expected if the Preferred Drug Program did not exist (cost avoidance = expected expenditures – actual expenditures). The specific method used to calculate cost avoidance for a given set of preferred and non-preferred drugs depends on the distribution of prescriptions that would have been expected for preferred and non-preferred drugs if the Preferred Drug Program did not exist.

1. *Distribution of prescriptions expected to remain constant if Preferred Drug Program did not exist*—Examples include diltiazem extended release, nifedipine extended release, and the nonsteroidal anti-inflammatory drugs (NSAIDs).

   Calculation of "expected" expenditures is straightforward because we simply apply the baseline market share percentages that existed before the Preferred Drug Program was implemented. First, calculate the expected number of prescriptions for each preferred and non-preferred drug by multiplying the actual total number of prescriptions filled during the month by the percentage of the prescription market that each drug represented before the Preferred Drug Program was implemented. Second, calculate the expected expenditures by multiplying the expected number of prescriptions for each preferred and non-preferred drug by the current cost per prescription for that drug and then sum the products. Calculate the cost avoidance by subtracting the actual expenditures from the expected expenditures. [NOTE: This method accounts for the impact of both new and refill prescriptions on cost avoidance.]

2. *Distribution of prescriptions expected to change even if Preferred Drug Program did not exist*—Urinary agents (preferred drug: oxybutynin generic; non-preferred drugs Detrol, Ditropan XL) are an example. Because Detrol and Ditropan XL are relatively new agents, market share percentages are likely to change even if the Preferred Drug Program did not exist.

   Calculation of expected expenditures is not straightforward because we cannot simply apply the baseline market share percentages that existed before the Preferred Drug Program was implemented. We do not have a method for predicting what the market share percentages would have been in the absence of the Preferred Drug Program. For this set of drugs, cost avoidance was calculated by multiplying the number of prescriptions switched for each target drug by the difference in average cost per prescription between the target drug and oxybutynin. This method only accounts for the cost avoidance for the single new prescription that was switched at the time

of the phone call. It does not account for the cost avoidance that would be associated with any prescription refills. This method underestimates the cost avoidance.

3. *Drugs/drug classes for which the quantity dispensed (and cost) per prescription is highly variable*—An example is the anti-herpes drugs (preferred drug: acyclovir generic; non-preferred drugs Valtrex, Famvir). Analysis of the cost avoidance associated with this set of drugs proved difficult. Dosing regimens and quantities dispensed per prescripton vary widely for anti-herpes drugs according to the disease being treated (herpes zoster, herpes simplex) and the reason for use (treatment, prophylaxis). The cost avoidance calculation methods described above yielded results that do not readily correlate either with reported switches or the market share of acyclovir. For this reason, a cost avoidance estimate is not provided for the anti-herpes drugs in this report. Results of continued analysis will be presented at the May 00 meeting.

Non-Preferred/Preferred Drug Pairs

1. Extended Release Diltiazem

Tiazac was designated as the preferred diltiazem ER product in NMOP in May 99. Non-preferred diltiazem products include Cardizem CD, Diltia XT, Dilacor XR, and generic diltiazem ER.

Table 1: Prescriptions for Non-Preferred Diltiazem ER products in NMOP, Jun – Dec 99

Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	**Jun-Dec**
New Rxs Received	720	661	573	395	328	291	346	**3314**

Month	**Jun 99**	**Jul 99**	**Aug 99**	**Sep 99**	**Oct 99**	**Nov 99**	**Dec 99**	**Jun-Dec 99**
Cost avoidance	$21,796	$27,287	$31,098	$29,017	$28,112	$34,592	$30,123	**$202,025**

2. Extended Release Nifedipine

In Nov 98 the DOD P & T Committee selected Adalat CC as the preferred nifedipine ER product. Procardia XL is non-preferred.

Table 2: Prescriptions for Non-Preferred Nifedipine ER in NMOP, Jun – Dec 1999								
Month	**Jun**	**Jul**	**Aug**	**Sep**	**Oct**	**Nov**	**Dec**	**Jun - Dec**

Cost Avoidance	$27,494	$26,624	$24,962	$24,510	$27,938	$26,122	$24,173	**$181,823**

3. NSAIDS

Generic NSAIDs are preferred. Daypro, Relafen, Voltaren XR, Lodine XL, and Naprelan are non-preferred. Program started mid-May 99

Table 3: Prescriptions For Non-Preferred NSAIDs in NMOP, Jun – Dec 1999								
Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	**Jun - Dec**
New Rxs Received	617	596	549	456	432	361	434	**3445**

Cost Avoidance	$21,771	$19,929	$27,670	$29,294	$25,052	$36,465	$29,364	**$189,584**

4. Urinary Agents

In November 1998, the DOD P & T Committee selected oxybutynin generic as the preferred urinary agent. Detrol and Ditropan XL are non-preferred.

Table 4: Prescriptions for Non-Preferred Urinary Drugs in NMOP, Jun – Dec 99								
Month	Jun	Jul	Aug	Sep	Oct	Nov	Dec	**Jun – Dec**

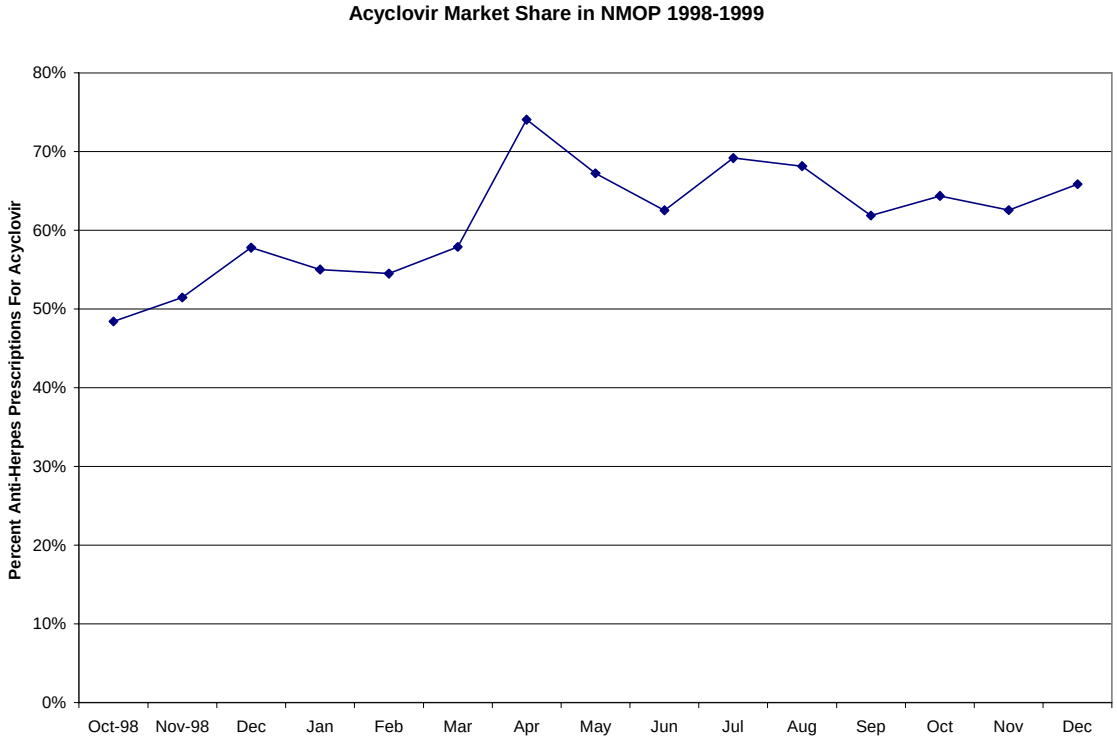
* Percentage of new prescriptions received for non-preferred drugs that were switched to acyclovir

Market Share Data (From NMOP adjudicated and non-adjudicated prescription claims files, Defense Supply Center Philadelphia)



APPENDIX D: FORMULARY CHANGES

I. BCF changes

A. BCF changes as a result of the 26 Jan 00 Interim Meeting:

1. Addition of the following:

a. metformin
b. tamoxifen
c. alendronate
d. citalopram
e. fluoxetine
f. paroxetine
g. sertraline
h. sumatriptan autoinjector

2. Specification that military treatment facilities (MTFs) must have at least one agent from each of the following classes on their formularies:

a. Oral serotonin 5-HT_1 receptor agonists (naratriptan, rizatriptan, sumatriptan, zolmitriptan)
b. Low molecular weight heparins/heparinoids (ardeparin, dalteparin, danaparoid, enoxaparin)
c. Leukotriene antagonists (montelukast, zafirlukast, zileuton)
d. Second-generation antihistamines (cetirizine, fexofenadine, loratadine)

B. Dipivefrin ophthalmic solution (Propine) removed from the BCF

C. Cisapride (Propulsid) removed from the BCF

II. NMOP Formulary Changes

A. Added to the NMOP Formulary:

1. Ethinyl estradiol / norethindrone acetate tablets (FemHRT; Parke Davis)
2. Exemestane tablets (Aromasin; Pharmacia & Upjohn)
3. Estradiol / norgestimate tablets (Ortho-Prefest; Ortho McNeil)
4. Aspirin / dipyridamole extended release capsules (Aggrenox; Boehringer-Ingelheim)
5. Moxifloxacin hydrochloride tablets (Avelox; Bayer)
6. Gatifloxacin tablets (Tequin; Bristol Myers Squibb)
7. Oxcarbazepine tablets (Trileptal; Novartis)

B. Excluded from the NMOP Formulary

1. Oseltamivir phosphate capsules (Tamiflu; Roche)
2. Bexarotene capsules (Targretin; Ligand Pharma)

APPENDIX D (continued): FORMULARY CHANGES

C. Pantoprazole (Protonix; Wyeth-Ayerst) listed as a “non-contracted drug” on the NMOP Formulary due to contractual requirements of the PPI contract

D. Human chorionic gonadotropin injection (various manufacturers) added to the NMOP Covered Injectables list (has historically been provided by the NMOP).

III. Quantity Limit Change (NMOP and retail network): Quantity limit for azithromycin (Zithromax) 250-mg tablets changed from 6 tablets per 30 days to 10 tablets per 30 days for both the NMOP and the retail network.

APPENDIX E: REPORTS DUE TO THE COMMITTEE

I. *Non-preferred/preferred drug pairs standing report* (see Paragraph 5B) — CDR Mark Brouker (PEC). Interim report due to co-chairs by April 11, full report to committee at the next meeting.

II. *Quantity limits for topicals* (see Paragraph 5C2)— The subcommittee will supply additional information concerning usage patterns for the five high-cost topicals identified at the last meeting [imiquimod (Aldara); calcipotriene (Dovonex); altitretinoin (Panretin); becaplermin (Regranex); and tazarotene (Tazorac)]. Subcommittee members: Bill Hudson (chair); MAJ George Jones; MAJ Mickey Bellemin; Ray Nan Berry (Foundation Health); Kirby Davis (Anthem Alliance); William Hudson (Humana); Gene Lakey (TriWest); and Ron McDonald (Sierra Military Health Services). Interim report due to co-chairs by April 11, full report to committee at the next meeting.

III. *Cost-efficiency of prior authorizations in the NMOP standing report* (see Paragraph 5D)—MAJ Bellemin. Interim report due to co-chairs by April 11, full report to committee at the next meeting.

IV. *Prior authorization for oral antifungals* (see Paragraph 5E)— A subcommittee consisting of CDR Egland (chair); Paul Vasquez (DSCP), MAJ Bellemin (DSCP), and MAJ Ed Zastawny (PEC) will develop a proposed PA program to be presented to the committee at the next meeting. An interim report is due to co-chairs by 11 Apr 99.

V. *Prior authorization for fertility drugs* (see Paragraph 6A2)—CAPT Charlie Hostettler (TMA) will submit authorization criteria for fertility agents to the co-chairs. The co-chairs will finalize the criteria for approval at the May P&T Committee meeting. CDR Egland is the point of contact for this action.

VI. *Growth hormone subcommittee* (see Paragraph 6A4)—(Bill Hudson (chair); MAJ George Jones; MAJ Mickey Bellemin; Ray Nan Berry (Foundation Health); Kirby Davis (Anthem Alliance); William Hudson (Humana); Gene Lakey (TriWest); Ron McDonald (Sierra Military Health Services)) — A business case analysis that covers off-label uses and uses for adults, as well as completed prior authorization criteria (including required forms) with supporting documentation, is due to CDR Egland by 11 Apr 00.

VII. *Portability of Prior Authorizations* (see Paragraph 6A5)—MAJ Bellemin (DSCP) will investigate the feasibility of a program to provide for portability of prior authorizations completed by the NMOP or the MCSCs and report back to the committee at the next meeting.

VIII. *Nasal Corticosteroids* (see Paragraph 6D4)—The PEC will analyze the dosing distribution for nasal corticosteroids within DoD and make recommendations if indicated, to be presented to the committee at the next meeting. An interim report is due to co-chairs by 11 Apr 99.

IX. *Niaspan (niacin extended release; Kos Pharma)* (See Paragraph 6D5)—The PEC will provide information to the committee at the next meeting regarding the associations between niacin dosage forms and patient tolerance and liver toxicity. The PEC will also describe usage patterns of niacin products within DoD and convey input from MTFs regarding the potential addition of Niaspan to the BCF.

X. *Review of Ophthalmic Glaucoma Agents* (See Paragraph 6D6) —CDR Matt Nutaitis will review the ophthalmic glaucoma agents and make recommendations for BCF changes to be submitted to the committee at the next meeting. An interim report is due to the co-chairs by 11 April.

Department of Defense
Pharmacoeconomic Center

1750 Greeley Rd., Bldg. 4011, Rm. 217
Fort Sam Houston, TX 78234-6190

MCCS-GPE 26 January 2000

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of an Interim Meeting of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee—Program Budget Decision (PBD) No. 041

1. In accordance with Health Affairs policy 98-025, an interim meeting of the DoD P&T Committee convened via teleconference at 1200 on 26 January 2000. The purpose of this meeting was to identify additions to the Basic Core Formulary (BCF) in response to additional funding for military pharmacies provided by the Program Budget Decision (PBD) No. 041.

2. MEMBERS Participating in the Teleconference:

COL Daniel D. Remund, MS	Co-chairman
CDR Terrance Egland, MC	Co-chairman
COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
Danielle Doyle	Army
LCDR Kevin Cook, MSC	Navy
COL (select) John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Robert W. Rist	Coast Guard

COL Daniel D. Remund voted as proxy for CDR Matt Nutaitis.
COL (select) Bill Sykora was absent.

3. OTHERS Participating in the Teleconference:

COL W. Mike Heath	Pharmacy Consultant, USA
COL Ardis Meier	Associate Chief, BSC for Pharmacy, USAF
CAPT Greg Hall	Director, Pharmacy Department, Portsmouth Naval Hospital

4. NEW BUSINESS

A. The TRICARE Management Activity (TMA) and the DoD Pharmacy Board of Directors determined that funds allocated to MTF pharmacies through PBD No. 041 should be used to increase and standardize the availability of drugs at MTF pharmacies. The DoD Pharmacoeconomic Center (PEC) developed a set of recommended changes and additions to the BCF for the DoD P&T Committee to consider.

B. The Committee added the following drugs to the BCF:

1. Metformin
2. Tamoxifen
3. Alendronate
4. Citalopram
5. Fluoxetine
6. Paroxetine
7. Sertraline
8. Sumatriptan autoinjector

C. The Committee decided to modify the BCF as follows:

1. The BCF will specify that MTFs must have at least one low molecular weight heparin/heparinoid (aldeparin, dalteparin, danaparoid, enoxaparin) on the MTF formulary. The MTF decides which low molecular weight heparin/heparinoid(s) to have on the MTF formulary.

2. The BCF will specify that MTFs must have at least one leukotriene antagonist (monelukast, zafirlukast, zileuton) on the MTF formulary. The MTF decides which leukotriene antagonist(s) to have on the MTF formulary.

3. The BCF will specify that MTFs must have at least one second-generation antihistamine (cetirizine, fexofenadine, loratadine) on the MTF formulary. The MTF decides which second generation antihistamine(s) to have on the MTF formulary.

4. The BCF will specify that MTFs must have at least one oral triptan (naratriptan, rizatriptan, sumatriptan, zolmitriptan) on the MTF formulary. The MTF decides which oral triptan to have on the MTF formulary.

D. The Committee decided not to add gabapentin to the BCF.

E. The Committee stressed that the changes and additions to the BCF are dependent on the PBD funds actually being used to support MTF pharmacy pharmaceutical purchases.

5. ADJOURNMENT: The meeting adjourned at 1400 hours. The committee immediately reconvened to determine which drugs should be covered by Advances in Medical Practice (AMP) funding.

MCCS-GPE 18 November 1999

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with Health Affairs policy 98-025, a meeting of the DoD P&T committee convened at 0800 hours on 18 November 1999, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, TX.

2. MEMBERS PRESENT:

COL Daniel D. Remund, MS	Co-chairman
CDR Terrance Egland, MC	Co-chairman
COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
Danielle Doyle	Army
CDR Matt Nutaitis, MC	Navy
LCDR Kevin Cook, MSC	Navy
COL (select) Bill Sykora, MC	Air Force
LTC John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Robert W. Rist	Coast Guard
Ronald L. Mosier	Department of Veterans Affairs (alternate)
COL George Crawford, MS	Joint Readiness Clinical Advisory Board
LTC Steven Humburg, MC	Health Affairs
MAJ Mickey Bellemin, BSC	Defense Supply Center Philadelphia (DSCP)
Trevor Rabie	Uniformed Services Family Health Plans (USFHP)
Ray Nan Berry	Foundation Health
Kirby Davis	Anthem Alliance
William Hudson	Humana, Inc
Gene Lakey	TriWest
Ron McDonald	Sierra Military Health Services

3. OTHERS PRESENT:

CAPT Charlie Hostettler, MSC	DoD Pharmacy Program Director, TMA
Howard Altschwager	Deputy General Counsel, TMA
David Chicoine	Uniformed Services Family Health Plans (USFHP)
COL Jeffery Meffert, MC	BAMC, Dermatology
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center
LCDR Mark Richerson, MSC	DoD Pharmacoeconomic Center
MAJ Barbara Roach, MC	DoD Pharmacoeconomic Center
MAJ Ed Zastawny, BSC	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Mark Petruzzi	Merck-Medco
LTC Gary Blamire, BSC	TRICARE Southwest Lead Agent Office

4. ADMINISTRATIVE ISSUES:

A. Introduction of new members and attendees: Trevor Rabie, MD, is a new committee member representing the Uniformed Services Family Health Plans (USFHP). Howard Altschwager is a new attendee as legal counsel for the DoD P&T Committee.

B. The minutes from the 13 Aug 99 meeting were accepted as written.

C. The co-chairs reported an interim decision to temporarily discontinue the 10-tablet quantity limit for zolpidem (Ambien) because almost all NMOP prescriptions were written for more than 10 tablets and many patients complained about the quantity limit. The labeling for zolpidem recommends that therapy should generally be limited to 7 to 10 days of use, but medical literature supports longer-term use of zolpidem for patients with chronic insomnia. The committee decided that zolpidem should be subject to the standard quantity limit of a 30-day supply for controlled substances.

5. OLD BUSINESS

A. Non-preferred/preferred drug pairs in the NMOP

1. CDR Brouker (PEC) reported that the cumulative switch rates from non-preferred to preferred drugs observed from 29 May 99 to 6 November 99 were similar to the switch rates observed from 29 May 99 to 31 July 99. The overall switch rate was 57%. The committee removed Zileuton (Zyflo) from the list of non-preferred drugs because the NMOP received only six prescriptions for the drug in 24 weeks, and only one of those prescriptions was switched to a preferred drug.

2. MAJ Bellemin reported that Merck-Medco has not yet implemented the new non-preferred/preferred drug pairs approved at the August 1999 P&T meeting. Merck-Medco will implement them on 1 Dec 99.

3. CDR Brouker will design a standard report for monitoring processes and outcomes related to non-preferred/preferred drug pairs in the NMOP. The report will include switch rate data, the resulting distribution of prescriptions within the pertinent drug classes, and the estimated cost avoidance. CDR Brouker will submit a draft of the report to the committee co-chairs not later than 17 December 1999. CDR Brouker will submit the finalized version of the report to the committee at the next meeting.

B. Prior authorizations in the NMOP

1. MAJ Bellemin reported that Merck-Medco has implemented prior authorization processes for celecoxib (Celebrex), rofecoxib (Vioxx), etanercept (Enbrel), and sildenafil (Viagra). He will present data concerning the cost-efficiency of prior authorizations at the next meeting.

2. Military treatment facility (MTF) providers are concerned about the amount of time they spend dealing with phone calls and fax forms from Merck-Medco for drugs requiring prior authorization. MTF providers requested that prior authorization fax forms be posted on the PEC website so that they could save time by filling out the form and having the patient submit it along with the prescription to the NMOP. Mark Petruzzi stated that Merck-Medco would concur with the proposal as long as the actual form approved by Merck Medco was posted on the PEC website. He further stated that prescriptions would be filled without calling prescribers if the prescriptions are submitted along with the correct form and meet the prior authorization criteria. The committee directed the PEC to post the prior authorization fax forms (instead of the prior authorization criteria) on the PEC website. Sufficient explanation and directions will be provided on the website to enable prescribers to fill out the fax form correctly and to emphasize that the forms are intended to facilitate sending prescriptions to the NMOP program only, not to the retail network.

C. Report on starter packs—MTFs may accept starter packs from pharmaceutical companies to the extent that the price paid for a drug includes the cost of any starter packs that are supplied by the pharmaceutical company. Present and future contracts (and DAPAs until they are deleted) should be reviewed to ensure they incorporate language to the effect that the prices charged for the drugs shall include the cost of any starter packs which may be distributed to DoD facilities and given to patients. The DOD Pharmacy Board of Directors recommended that MTFs determine local policy for the use of starter packs, with the caveat that starter packs should be dispensed by the pharmacy and not in the physician's office.

D. Report of the formulary management subcommittee—COL Remund reported that the task originally assigned to the subcommittee will be performed by a workgroup formed by TMA to draft regulations pertaining to the pharmacy benefit section of the FY 00 Defense Authorization Act. The subcommittee was dissolved.

E. Report of the fertility drugs subcommittee—This issue was tabled pending resolution of formulary redesign issues.

F. Report of the weight reduction subcommittee—TRICARE policy currently excludes coverage of drug therapy for weight reduction. MAJ Barb Roach (PEC) reported that a review of drug therapy for weight reduction did not reveal a compelling clinical imperative to recommend coverage for such therapy. The committee decided not to recommend any change to the TRICARE policy.

G. Advances in Medical Practice (AMP) funding initiative—A subcommittee was to have developed a list of drugs that could possibly be purchased with AMP funds, but officials responsible for the AMP program needed the list before the subcommittee could meet. The PEC gave the AMP officials a list of newly approved drugs that were categorized as to their relative clinical importance based on the degree of therapeutic advance over other agents, the severity/intractability of the condition, and the availability of other agents. The AMP officials will use this list to help determine which drugs should be obtained with AMP funding.

H. Status of TRICARE/CHAMPUS Policy Manual changes pertaining to pharmacy —CAPT Hostettler reported that Chapter 7 of the TRICARE/CHAMPUS Policy Manual has officially been changed so that quantity limits and prior authorizations apply uniformly to the NMOP and retail pharmacy networks.

6. NEW BUSINESS

A. Quantity Limits—MAJ Bellemin reported on quantity limits issues that were pending from the last meeting:

Blood product/biotech products: The committee decided that quantity limits on antihemophilic factors (e.g., Factor VIII, Factor IX Complex) were unnecessary, given the small number of prescriptions received by the NMOP for these agents. MAJ Bellemin informed the committee that the NMOP has quantity limits for other agents in this category that were not included on the list that the committee approved at the August 1999 meeting.

Topicals: Information regarding the typical quantities dispensed for five high-cost topicals (imiquimod (Aldara); calcipotriene (Dovonex); altitretinoin (Panretin); becaplermin (Regranex); and tazarotene (Tazorac)) is not yet available from Merck-Medco. Mark Petruzzi (Merck-Medco) will supply this information to a subcommittee consisting of Bill Hudson (Humana; subcommittee chair), MAJ George Jones, and all Managed Care Support Contractor (MCSC) pharmacy representatives. The subcommittee will formulate recommendations for quantity limits for these topical agents. An interim report is due to the co-chairs not later than 20 January 2000, and a full report is to be submitted to the committee at the next meeting. MAJ Bellemin informed the committee that the NMOP has quantity limits for other topicals that were not included on the list that the committee approved at the August 1999 meeting.

Antibiotics: MAJ Bellemin reported no problems with the current quantity limits on antibiotics. MAJ Bellemin also informed the committee that the NMOP has quantity limits for other antibiotics that were not included in the list that the committee approved at the August 1999 meeting.

Fertility Agents: MAJ Bellemin reported no problems or patient complaints associated with the 20 ampules per prescription quantity limit on injectable fertility agents.

Ophthalmics: MAJ Bellemin reported no problems with quantity limits on ophthalmics established at the last meeting.

Ondansetron for hyperemesis gravidarum: The quantity limits for ondansetron do not support the use of ondansetron for hyperemesis gravidarum. Ondansetron is Pregnancy Category B and should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. Consultation with MTF specialists indicated that ondansetron is not widely used or recommended for hyperemesis gravidarum. However, Gene Lakey (TriWest) reported that second level medical review through TriWest concluded that ondansetron is appropriate for hyperemesis gravidarum for some patients. The typical procedure in the retail network is to override the quantity limit if the medical review determines that a larger quantity is medically appropriate. The committee decided not to change the quantity limit for ondansetron in either the NMOP or the retail network because the small number of cases where ondansetron is used for hyperemesis gravidarum can be managed on an exception basis.

Actions: MAJ Bellemin and Mark Petruzzi (Merck-Medco) will supply a list of all NMOP quantity limits to the PEC. The PEC will then update the quantity limits listed on the PEC website. The PEC will submit a comprehensive list of all quantity limits for the NMOP and retail pharmacy networks for the committee to review at the next meeting.

B. Prior authorization for oral antifungal medications (NMOP and retail network)—TMA officials asked the committee to render an opinion about prior authorization criteria that attempt to differentiate between cosmetic and non-cosmetic use of oral terbinafine (Lamisil) for onychomycosis. COL Jeffery Meffert, MC, BAMC Dermatology, assisted the committee as a guest expert. After extensive discussion, the committee reached general agreement on the following points:

- It is difficult to clearly define and accurately differentiate cosmetic use from non-cosmetic use of oral terbinafine.
- Systemic antifungal therapy should not be instituted unless the presence of a fungal infection is clearly established by KOH prep, culture, or PAS stain. Use of systemic antifungal therapy in the absence of a fungal infection unnecessarily exposes the patient to the risk of adverse effects and wastes money.
- The pulse dosing of terbinafine for the treatment of onychomycosis provides the same degree of effectiveness and offers significant economic advantage over daily dosing.
- Even though the initial treatment with oral terbinafine usually eliminates the fungal infection, the nails may remain discolored until they grow out. It is inappropriate to continue oral terbinafine therapy just because the nails are discolored.

- A prior authorization program for oral terbinafine could potentially shift usage to itraconazole, which is even more expensive than terbinafine for onychomycosis.

The committee concluded that oral terbinafine should be subject to prior authorization that focuses on the appropriate diagnosis of onychomycosis and appropriate duration of therapy. The committee co-chairs will finalize the prior authorization criteria for oral terbinafine. The prior authorization program for oral terbinafine will be monitored for a shift in usage to the more expensive agent.

C. The committee considered a number of drugs for addition to the BCF and the NMOP Formulary. See Appendix A for a list of formulary changes.

D. Prior authorization for growth hormone treatment — The committee decided that in light of the costs associated with growth hormone treatment and the potential for inappropriate use, a subcommittee should evaluate the need for prior authorization and recommend appropriate criteria. The subcommittee will be chaired by Bill Hudson (Humana) and includes MAJ George Jones, MAJ Mickey Bellemin, Ray Nan Berry (Foundation Health), Kirby Davis (Anthem Alliance), William Hudson (Humana), Gene Lakey (TriWest), and Ron McDonald (Sierra Military Health Services). The subcommittee will evaluate current utilization in the NMOP and retail networks, formulate potential prior authorization criteria, and estimate potential cost savings associated with a prior authorization program. The subcommittee will submit an interim report to the co-chairs not later than 20 January 2000 and will provide the finalized report and recommendations to the committee at the next meeting.

E. Oral inhaled corticosteroids—On 1 November 1999 the price of the Schering brand of beclomethasone inhaler (Vanceril) increased from $5.75 to $19.27, and the price of the double strength beclomethasone inhaler (Vanceril DS) increased from $6.90 to $27.02. The committee decided to remove beclomethasone and beclomethasone double strength oral inhaler from the BCF because they are now among the most costly inhalers for any given dosage range (see Appendix C).

Although the triamcinolone oral inhaler is now the only oral corticosteroid inhaler remaining on the BCF, that does not mean that MTFs should have only the triamcinolone inhaler on their formularies. MTFs almost certainly need more than one oral corticosteroid to satisfy the clinical needs of patients, but the committee did not want to mandate a specific inhaler by selecting another inhaler for the BCF. Price instability within the drug class, the anticipated introduction of products reformulated without chlorofluorocarbons, and the impending introduction of a new agent make it difficult for the committee to ascertain which inhaler (in addition to triamcinolone) provides the greatest value. The committee recommends that MTFs consider the information provided in Appendix C in selecting agents for MTF formularies.

F. Selective serotonin reuptake inhibitors—The BCF currently specifies that MTFs must have at least one SSRI on their formularies, but the BCF does not identify a specific SSRI. The committee considered two options regarding the status of SSRIs on the BCF:

- Option 1: Add citalopram, fluoxetine, paroxetine, and sertraline to the BCF and provide information that the MTFs and/or TRICARE regions could use to encourage greater use of the more cost-effective agents.

- Option 2: Continue the current status of SSRIs on the BCF and provide information that the MTFs and/or TRICARE regions could use to encourage greater use of the most cost-effective agents.

The committee selected Option 2 because of concern that Option 1 would cause large increases in expenditures for SSRIs at MTFs that currently have only one SSRI on formulary. The BCF will continue to specify that MTFs must have at least one SSRI on their formularies. The committee directed the PEC to provide information about the relative cost-effectiveness of the SSRIs to MTFs and TRICARE regions. The committee strongly encourages MTFs and TRICARE regions to maximize the use of the most cost-effective SSRIs when consistent with the clinical needs of patients.

G. Withdrawal of betaxolol (Betoptic; Alcon) ophthalmic solution—The committee approved a change in the BCF listing for "betaxolol ophthalmic solution" to "betaxolol ophthalmic suspension" as a result of the withdrawal of betaxolol ophthalmic solution from the market. Betaxolol ophthalmic suspension (Betoptic S; Alcon) remains available. Another ophthalmic beta-blocker, timolol, is also on the BCF.

H. Unavailability of propranolol LA —Mel Miller (PEC) informed the committee that Wyeth-Ayerst sent a letter to physicians and patients concerning an anticipated shortage of both Inderal LA and generic propranolol LA, both of which are made by Wyeth-Ayerst. The committee concluded that this is probably not a significant issue for DoD because propranolol LA (brand and generic) accounts for a relatively small proportion of oral beta-blockers used by DoD facilities. Additionally, Wyeth-Ayerst has notified its customers that it will be shipping product by mid-December, so any shortages will be short-lived.

I. Legislation regarding the DoD P&T Committee and DoD formulary management—Capt Hostettler and Mr. Altschwager briefed the committee on the FY00 Defense Authorization Act that amends Chapter 55 of title 10, United States Code, to establish a DoD Pharmacy Benefits Program. The Pharmacy Benefits Program provides for the establishment of a uniform formulary, a DoD P&T Committee, and a Uniform Formulary Beneficiary Advisory Panel that will review and comment on the development of the uniform formulary and subsequent formulary changes.

J. Pharmaceutical contracts awarded since last P&T meeting—COL Remund reported that DoD statin contracts were awarded to Merck for simvastatin (Zocor) and to Bayer for cerivastatin (Baycol). These contracts “close” the statin class on the BCF. A joint DoD-VA contract was awarded to Novo Nordisk for 10 mL vials of human insulin (rDNA) N, R, L, and 70/30. Joint DoD-VA generic contracts were awarded for specific brands of amantadine capsules, amoxicillin capsules, captopril tablets, fluocinolone solution, fluocinonide cream, fluocinonide ointment, fluocinonide solution, nortriptyline capsules, prazosin capsules, and verapamil sustained-release tablets. A summary of national pharmaceutical contracts is provided in Appendix D.

K. DoD P&T Committee involvement in pharmaceutical procurement contracts—Any pharmaceutical contracting initiative that is more complex than the simple selection of a specific brand among AB-rated generics should be sanctioned by the DoD P&T Committee

before a solicitation is issued.

L. Potential contracting initiatives:

1. *Estrogen replacement therapy:* Conjugated estrogen (Premarin) is on the BCF and has more than 90% of the estrogen replacement therapy market in DoD. The current price for Premarin tablets is nearly triple the price that existed when the drug was in the depot system. Alternate drugs are available to compete for market share. For example, a large HMO in the state of Washington achieved significant cost savings by converting more than 14,000 patients from conjugated estrogens to an esterified estrogen product. The committee recommended that DSCP and the PEC continue to explore the potential for a joint VA and DoD contract. The committee also recommended that DSCP explore potential price reductions through DAPA incentive agreements.

2. *Nicotine patches:* The joint DoD/VA clinical practice guideline for smoking cessation includes the use of nicotine patches. Drug therapy for smoking cessation is not a covered benefit in the NMOP and retail pharmacy networks. A nicotine patch is not listed on the BCF, but some MTFs provide nicotine patches as part of smoking cessation programs. The 3-step (21 mg, 14 mg, and 7 mg) nicotine patches account for the vast majority of DoD and VA nicotine patch usage. Four companies market a 3-step nicotine patch, so an opportunity exists for price competition. The committee favors a contracting initiative that will lower the cost of nicotine patches for those MTFs that choose to have a nicotine patch on their formulary. The committee, however, does not want to select a nicotine patch for the BCF and thus mandate that all MTFs have a nicotine patch on their formularies. The committee recommended that VA and DoD seek a joint contract for a single brand of 3-step nicotine patches. The committee recommended that the contract include the following provisions:

   - The contract would not require MTFs to have a nicotine patch on their formularies. If an MTF does have a 3-step nicotine patch on its formulary, it must be the contracted brand. An MTF may not have a non-contracted brand of 3-step nicotine patches on its formulary.

   - The nicotine patch class would remain "open" on the BCF. The contract would not affect the formulary status of other types of nicotine patches (i.e. 1-step (Nicotrol) or 2-step (Prostep) patches). MTFs could choose to have Nicotrol or Prostep patches on their formularies in addition to or instead of the contracted brand of the 3-step nicotine patch.

3. *Non-sedating antihistamines:* DoD expenditures are increasing significantly in this drug class. None of the agents are on the BCF. The following issues affect the potential for a joint contract for VA and DoD in this drug class:

   - Some MTFs oppose a contract that would add a non-sedating antihistamine to the BCF because they do not want to add a non-sedating antihistamine to the MTF formulary.

   - Some MTFs want a contract that adds a non-sedating antihistamine to the BCF in order to obtain significant price reductions.

- Definition of the drug class is problematic. Loratidine (Claritin) and fexofenadine (Allegra) are classified as “non-sedating” antihistamines. Cetirizine (Zyrtec) is considered a “low-sedating” antihistamine since the incidence of sedation in clinical trials with cetirizine is significantly more than with placebo. All three agents appear to be less sedating than conventional antihistamines.

The committee recommended that VA and DoD explore the possibility of a joint contract that would select a non-sedating antihistamine for the BCF and leave the class “open” on the BCF. The committee also recommended that DSCP should seek price reductions through DAPA incentive agreements.

7. ADJOURNMENT: The meeting adjourned at 1500 hours. The next meeting will be held on Thursday, 24 February 2000, at Portsmouth, Virginia. All agenda items should be submitted to the DoD PEC no later than Friday, 28 January 2000.

LIST OF APPENDICES:

Appendix A: Formulary Changes

Appendix B: Reports Due to the Committee

Appendix C: Table: Cost per Month for Oral Inhaled Corticosteroids (Adults)

Appendix D: Table: DoD and DoD/VA Pharmaceutical Contracts

Appendix A: Formulary Changes

A. BCF

1. Beclomethasone and beclomethasone double strength oral inhalers were removed from the BCF.

2. The BCF listing for betaxolol ophthalmic solution was changed to betaxolol ophthalmic suspension as a result of the withdrawal of the solution formulation.

B. NMOP

1. Ketotifen fumarate ophthalmic solution (Zaditor; Ciba Vision) —added to NMOP Formulary

2. Pioglitazone (Actos; Takeda) —added to NMOP Formulary

3. Temozolomide (Temodar; Schering) —Bill Hudson (Humana) reported that pharmacies in national chains, which tend to have their own warehouses and distribution systems, have reported some trouble obtaining this drug, since the national chains have not been stocking this in their warehouses. Although the committee agreed that the NMOP is probably not the most efficient or desirable way for patients to acquire this chemotherapy agent, the committee agreed that temozolomide should be available through the NMOP. Added to the NMOP Formulary with a 30-day quantity limit (1 cycle).

4. Zaleplon (Sonata; Wyeth-Ayerst) —added to NMOP Formulary with a 30-day quantity limit due to its status as a Schedule IV drug as well as recommendations in product labeling

5. Doxercalciferol (Hectorol; Bone Care International) —added to NMOP Formulary

6. Cyanocobalamin intranasal gel (Nascobal; Schwarz Pharma) —The current excluded drug listing on the NMOP Formulary reads "Legend vitamins - Please note that legend formulations of folic acid, niacin, and vitamins D, K, and B12 (injection) are covered." The intranasal formulation of cyanocobalamin is an alternative for treatment of B12 deficiency states (in patients who are hematologically stable and do not have nervous system involvement). The committee agreed to change the excluded drug list notation to "Legend vitamins - Please note that legend formulations of folic acid, niacin, and vitamins D, K, and B12 are covered" and notify Merck-Medco that intranasal cyanocobalamin gel is covered.

7. Sermorelin acetate for injection (Geref; Serono) —This agent is growth hormone releasing hormone, indicated for treatment of idiopathic growth hormone deficiency in children with growth failure. It is useful only in children who retain pituitary responsiveness to growth hormone releasing hormone. Other growth hormone products are currently on the NMOP Formulary. Unlike the growth hormones, growth hormone-releasing hormone may be undetectable by current testing for growth hormone use in athletic competitions.

Added to NMOP Formulary only for patients who are 16 years old or younger. Mark Petruzzi (Merck-Medco) will report back to committee co-chairs if there are any problems with implementing the age edit in the NMOP.

8. Levonorgestrel tablets (Plan B; Women's Capital Corporation) —This emergency contraception product was excluded from the NMOP Formulary because it must be used within 72 hours of unprotected intercourse to be effective.

9. Rabeprazole (Aciphex; Eisai/Janssen) —excluded from the NMOP Formulary per contractual requirements of the proton pump inhibitor contract. Like lansoprazole (Prevacid; TAP), rabeprazole will be listed as a "non-contracted drug" on the NMOP Formulary. It will be provided by the NMOP only if medical necessity is substantiated.

10. Entacapone (Comtan; Orion/Novartis) —added to NMOP Formulary

11. Sirolimus solution (Rapamune; Wyeth Ayerst) —added to NMOP Formulary

12. Zileuton (Zyflo; Abbott) was removed from the list of non-preferred drugs.

Appendix B: Reports Due to the Committee

1. Growth hormone subcommittee (Bill Hudson (chair); MAJ George Jones; MAJ Mickey Bellemin; Ray Nan Berry (Foundation Health); Kirby Davis (Anthem Alliance); William Hudson (Humana); Gene Lakey (TriWest); Ron McDonald (Sierra Military Health Services)) — An interim report is due to the co-chairs not later than 20 January 2000, and a full report with recommendations is due at the next meeting of the P&T committee.

2. Listing of quantity limits on the PEC website — MAJ Bellemin and Mark Petruzzi (Merck-Medco) will supply a list of all NMOP quantity limits to the PEC. The PEC will then update its website to accurately reflect quantity limits for blood products/biotech products, antibiotics, topicals and other categories as necessary. The PEC will submit a complete report of all quantity limits for the NMOP and retail pharmacy networks for the committee to review at the next meeting.

3. Quantity limits for topicals — A subcommittee consisting of Bill Hudson (chair); MAJ George Jones; MAJ Mickey Bellemin; Ray Nan Berry (Foundation Health); Kirby Davis (Anthem Alliance); William Hudson (Humana); Gene Lakey (TriWest); and Ron McDonald (Sierra Military Health Services) will formulate recommendations for quantity limits on five high-cost topicals: imiquimod (Aldara); calcipotriene (Dovonex); altitretinoin (Panretin); becaplermin (Regranex); and tazarotene (Tazorac).

4. Non-preferred/preferred drug pairs standard report (see Paragraph 5A3) — CDR Brouker (PEC) will submit a draft of a standard report to the co-chairs not later than 17 December 1999. CDR Brouker will submit the finalized version of the report to the committee at the next meeting.

5. Prior authorization for oral antifungals — CDR Terry Egland, COL Dan Remund will report the status of the prior authorization for oral terbinafine at the next meeting.

Appendix C: Cost per month for oral inhaled corticosteroids (adults)

						Number of puffs per day and approximate cost per month

			00172-4280-70	500	$29.00	$0.0580		

* Most contracts have options for renewal periods

§ Estimated cost avoidance for ranitidine ranges from $765,000 (based on lowest available DAPA price at time of award) to $7,321,000 (based on actual purchases for FY98). The $4,493,000 estimate is based on the DAPA price of the Geneva brand that existed prior to the award of the contract.

° Contract was previously awarded to G.D.Searle, with a base contract performance period of 8/20/99-8/19/00. After the contract was awarded, G.D. Searle stated that they had made a mistake on the price of the 240 mg 500s ($9.50/bottle of 500). The contract will be terminated on 12/1/99. A settlement has been reached concerning the price of the 240mg bottle of 500 during the period of time the contract was in effect.

Department of Defense

1750 Greeley Rd., Bldg. 4011, Rm. 217
Fort Sam Houston, TX 78234-6190

MCCS-GPE 30 August 1999

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with Health Affairs policy 98-025, a meeting of the DoD P&T committee convened at 0800 hours on 13 August 1999, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, TX.

2. MEMBERS PRESENT:

COL Daniel D. Remund, MS	Co-chairman
CDR Terrance Egland, MC	Co-chairman
COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
Danielle Doyle	Army
CDR Matt Nutaitis, MC	Navy
LCDR Kevin Cook	Navy
LTC John R. Downs, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Robert W. Rist	Coast Guard
Ronald L. Mosier	Department of Veterans Affairs (alternate)
LTC (P) George Crawford, MS	Joint Readiness Clinical Advisory Board
LTC Steven Humburg, MC	Health Affairs
MAJ Mickey Bellemin BSC	Defense Supply Center Philadelphia (DSCP)
C. Andrew Bergman	Uniformed Services Family Health Plans (USFHP)
Ray Nan Berry	Foundation Health
Kirby Davis	Anthem Alliance
William Hudson	Humana, Inc
Gene Lakey	TriWest
Ron McDonald	Sierra Military Health Services

3. OTHERS PRESENT:

CAPT Charlie Hostettler, MSC	DoD Pharmacy Program Director, TMA
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center
MAJ Donald DeGroff	DoD Pharmacoeconomic Center
LCDR Mark Richerson	DoD Pharmacoeconomic Center
MAJ Barbara Roach	DoD Pharmacoeconomic Center
Eugene Moore	DoD Pharmacoeconomic Center
Shana Trice	DoD Pharmacoeconomic Center
Tom Kellenberger	Merck-Medco
Mark Petruzzi	Merck-Medco
Shelby Tanner, Jr.	Staff Judge Advocate, Fort Sam Houston
David Chicoine	Uniformed Services Family Health Plans (USFHP)

4. ADMINISTRATIVE ISSUES:

A. Financial disclosure reports were distributed to voting members of the committee and alternates. Voting members and alternates are to return the reports to COL Remund not later than the next meeting.

B. Introduction of new members and attendees: LCDR Kevin Cook replaced LCDR Denise Graham as a Navy representative. C. Andrew Bergman, MD, Johns Hopkins Medical Services Corporation is a new committee member representing the Uniformed Services Family Health Plans (USFHP). David Chicoine, Administrative Director, Brighton Marine Health Center also attended the meeting on behalf of the USFHP. The USFHP is a Department of Defense-sponsored managed healthcare option currently providing care to nearly 100,000 eligible family members of active duty personnel, retirees and their families in seven areas of the country.

C. The minutes from the 14 May 99 meeting were accepted as written.

5. OLD BUSINESS:

A. CDR Mark Brouker, Deputy Director of the Pharmacoeconomic Center (PEC), compared the estimated cost avoidance and phone call workload for the old NMOP preferred drug list (PDL) to the current non-preferred/preferred drugs on the restructured NMOP formulary. Based on data for a 10-week period (see Table 1, Appendix A), each phone call requesting a change from a non-preferred agent to a preferred alternative under the restructured NMOP formulary results in a $30 cost avoidance, compared to only $7 under the old NMOP PDL. DoD annual cost avoidance is projected to increase from $171,000 to $588,000. Phone calls to request switches have decreased from 2% to 1.6% of total prescriptions filled.

The Committee approved a PEC proposal to add four pairs of non-preferred/preferred drugs to the NMOP formulary (see table below). These non-preferred/preferred drugs are projected to yield an average cost avoidance of $58 per phone call and $397,000 in annual cost avoidance (see Table 2, Appendix A). A summary of the cost avoidance and phone call workload estimates is provided in Table 3, Appendix A.

Additional Non-Preferred/Preferred Drugs on NMOP Formulary

Non-Preferred Drug	**Preferred Alternative**
famotidine (Pepcid)	ranitidine (Geneva brand generic*)
nizatidine (Axid)	ranitidine (Geneva brand generic*)
enalapril (Vasotec)	lisinopril (Zestril* brand)
nitroglycerin patches (Minitran, Transderm Nitro, Nitrodisc, and generics)	nitroglycerin patches (Nitro-Dur)
	* national contracts specify the brands of these preferred alternative drugs

The Committee removed astemizole (Hismanal) from the non-preferred/preferred alternative list due to its withdrawal from the market. Cartia XT (Andrx's generic equivalent for Cardizem CD) was added to the non-preferred listing for diltiazem extended-release.

B. CDR Brouker reported that the NMOP implemented prior authorization procedures for celecoxib (Celebrex) on 2 August 1999. Prior authorization procedures for etanercept (Enbrel) are being implemented as of 13 August 1999. Prior authorization procedures for sildenafil (Viagra), which is currently available through the NMOP, will be implemented no later than 24 Sep 99.

A subcommittee will attempt to quantify the value of the NMOP prior authorization program in terms of clinical, economic, and humanistic outcomes. Members of the subcommittee are: CDR Mark Brouker (PEC); MAJ Mickey Bellemin (DSCP), Tom Kellenberger and Mark Petruzzi (Merck-Medco). The subcommittee will report on its measurement efforts at the next meeting.

C. At the May 14 meeting, the committee voted to add over-the-counter (OTC) forms of niacin prescribed for antilipemic therapy to the list of OTC items that are covered by the NMOP. Implementation of this decision was contingent on a TMA policy review. TMA legal opinion is that this decision represents an improper application of discretionary authority because it waives a policy provision for a class of cases rather than for an individual case. Based on the TMA legal opinion, OTC forms of niacin will not be available through the NMOP. Prescription forms of niacin remain available through the NMOP.

D. MAJ Bellemin reported on the current status of disposable insulin syringes, alcohol swabs, blood glucose test strips, lancets, and disposable syringes for non-insulin injectable medications on the NMOP formulary:

1) Disposable Insulin Syringes and Alcohol Swabs are dispensed on one prescription number and require only one co-pay. A quantity of alcohol swabs equal to or rounded up to the nearest 100 of the quantity of syringes prescribed is automatically dispensed whenever a prescription for insulin syringes is received.

2) Blood glucose test strips and lancets are dispensed on one prescription number and require only one co-pay. A quantity of lancets equal to or rounded up to the nearest 100 of the quantity of blood test strips prescribed is automatically dispensed whenever a prescription for blood test strips is received.

3) Syringes will be provided through the NMOP if they are prescribed in conjunction with a prescription for an injectable medication. A separate prescription should be written for the syringes, and the prescription should specify the type of syringe. A quantity of alcohol swabs equal to or rounded up to the nearest 100 of the quantity of the corresponding syringes will be automatically dispensed. A co-pay will be required for the syringes/alcohol swabs in addition to the co-pay for the injectable medication.

E. The committee reviewed the current status of oral corticosteroid inhalers on the BCF. There have been no substantial price increases in this class since the last meeting. The committee agreed that there does not appear to be any reason to make changes to the BCF agents at this time. Vanceril, Vanceril DS, and Azmacort will remain on the BCF. The PEC will continue to monitor price changes in this class and will bring the issue back to the P&T committee if it needs to be revisited.

F. Instead of pursuing a sole source contract for warfarin sodium, the committee advised the Defense Supply Center Philadelphia to accept a DAPA incentive agreement that reduces the price of the Coumadin brand of warfarin sodium. The DAPA incentive agreement will yield approximately $700,000 annually in cost avoidance for DoD based on current DoD usage data for the Coumadin brand of warfarin. The DAPA incentive agreement will obviate the need for a formal contracting initiative, so DSCP can focus its efforts on drug classes with greater economic implications to DoD. The DAPA incentive agreement does not affect the BCF listing for warfarin. The BCF will continue to list warfarin with no brand name specified. MTFs may select any brand of warfarin for their local formularies. All currently marketed brands of warfarin are AB rated to the DuPont product.

6. NEW BUSINESS:

A. Contracting update

1. *Diltiazem extended release* – The DoD/VA contract awarded to Forest Pharmaceuticals for Tiazac as the mandatory sole source product for extended-release diltiazem was effective 15 Dec 98. COL Remund reported on the success of the contract implementation for Tiazac (see Appendix B). By the end of April 99, the last month for which complete prime vendor data is available, market share for Tiazac had exceeded 80%. The cumulative cost avoidance attributable to the contract was over $1 million through April 99. The annual cost avoidance to DoD from this contract is estimated to be $5.5 million dollars.

2. *Lisinopril* – A DoD contract awarded to Zeneca Pharmaceuticals for the Zestril brand of lisinopril took effect 1 Aug 99. All MTFs and the NMOP must use only the Zestril brand of Lisinopril. The contract does not close the ACE inhibitor class. The contract has no effect on the BCF status or MTF formulary status of ACE inhibitors other than lisinopril. The Zestril brand of lisinopril is now flat-priced at $0.14 per tablet for all strengths and package sizes. An annual cost avoidance of $7.5 million is projected for the lisinopril contract.

3. *Proton pump inhibitors (PPIs)* – A DoD contract for proton pump inhibitors was awarded to Astra Pharmaceuticals for omeprazole (Prilosec) on 6 August 99. The contract takes effect on 1 Oct 99 and closes the PPI class on the BCF. Omeprazole must be on all MTF formularies. No other PPI is permitted on any MTF formulary. PPIs other than omeprazole will not be available at MTF pharmacies or the NMOP, unless a medical necessity requires the use of a PPI other than omeprazole for an individual patient. An implementation plan for the PPI contract was sent out to all MTFs. The price per capsule for omeprazole decreased from $1.72 for most strengths to the contract price of $1.40 for all strengths and all package sizes except the 100-count bottles of omeprazole 10 mg. The 100-count package size of omeprazole 10-mg remains at its previous DAPA price of $0.76 per capsule due to federal ceiling price regulations. The price reductions are projected to yield $11.6 million annually in cost avoidance to DoD.

4. *Insulin* – LTC Rick Downs reported that the DoD/VA contract solicitation for insulin was issued 26 July 99 and closes 25 August 99.

5. *Statins* – COL Remund reported that the General Accounting Office (GAO) was expected to rule on two protests concerning the DoD contract solicitation for HMG-CoA reductase inhibitors (statins) no later than 18 August 99. If the GAO decides in favor of DoD, a contract award announcement may be made shortly thereafter.

B. CAPT Hostettler informed committee members about portions of the pending FY 2000 National Defense Authorization Bill that pertain to the DoD P&T Committee and formulary

management.

C. The committee approved a recommendation that a subcommittee be established to draft a set of principles to guide formulary management decisions. Subcommittee members are CDR Egland, MAJ George Jones, COL Remund, Bill Hudson, and Tom Kellenberger. A draft set of principles is to be presented at the next P&T committee meeting.

D. Per guidance from higher authority, the committee tabled a decision on the proposal to select one SSRI for the BCF while leaving the class open.

E. The committee approved the addition of spironolactone to the BCF. This decision was primarily in response to results from the RALES (Randomized Aldactone Evaluation Study) trial in patients with severe congestive heart failure. The trial was discontinued early because an interim analysis showed that the addition of low doses of spironolactone to standard therapy in patients with severe CHF was associated with a 30 percent reduction in mortality, a 30 percent reduction in cardiac hospitalizations, and significant improvements in New York Heart Association (NYHA) class. The results of the RALES trial are available in their entirety on the Internet at www.nejm.org, and will be published in the 2 Sep 99 issue of the *New England Journal of Medicine.*

   Spironolactone 25 mg is generically available from several manufacturers at DAPA prices ranging from $0.02 per tablet for the lowest priced generic to $0.25 per tablet for the brand-name product (Aldactone; Searle). At the lowest generic price, a year of therapy with spironolactone 25 mg daily would cost $8.00. The FDA recently approved a generic version of spironolactone 50- and 100-mg tablets.

F. Due to a substantial DAPA price increase, the committee removed beclomethasone 42mcg/spray (Vancenase Pockethaler) from the BCF at the May meeting. The committee modified the BCF listing to state that each facility must have at least one nasal corticosteroid on its formulary. The committee also indicated its intention to review the corticosteroid nasal inhalers at the next meeting to see if a specific inhaler should be selected for the BCF in order to standardize availability across the MHS.

   The committee reviewed information on corticosteroid inhalers presented by LCDR Richerson and unanimously decided to add fluticasone nasal spray (Flonase) to the BCF. The class remains open on the BCF. Based on current DAPA prices and the number of puffs per day required for maintenance therapy in adults, fluticasone is 20% less expensive than flunisolide (Nasalide) 25 mcg/spray (see Appendix C). Allergy/immunology specialists reviewed the dosing, which was based on package labeling for each product. The specialists expressed the opinion that fluticasone would be a good selection as a “workhorse” nasal corticosteroid on the BCF based on their clinical experience, the information in Appendix C, and the fact that fluticasone is approved for use in patients as young as 4 years old.

G. Agents considered for BCF and NMOP formulary status:

1. *Rofecoxib (Vioxx; Merck)*: The committee did not add rofecoxib to the BCF, but approved the addition of rofecoxib to the NMOP formulary subject to prior authorization. Although committee members expressed concern that Merck Medco's prior authorization criteria allow prescriptions to be filled for short-term use for pain, the committee elected to adopt the existing Merck Medco prior authorization criteria for rofecoxib because criteria customized for DoD could take at least 90 days to implement. The percentage of prescriptions for rofecoxib that will be written for short-term therapy is unknown. The same subcommittee that was tasked to quantify the value of the NMOP prior authorization program was also tasked to quantify the usage of rofecoxib for short-term therapy.

   Rofecoxib was approved by the FDA on 20 May 99 for the treatment of osteoarthritis (OA), acute pain, and primary dysmenorrhea. Like celecoxib (Celebrex; Searle/Pfizer) rofecoxib is an NSAID that is highly selective for cyclooxygenase-2 and is commonly known as a COX-2 inhibitor. Unlike celecoxib, rofecoxib is not indicated for rheumatoid arthritis, although trials are underway. Celecoxib currently lacks indications for acute pain and primary dysmenorrhea. The use of rofecoxib for pain for more than 5 days has not studied. Rofecoxib, unlike celecoxib, is not a sulfonamide and is not contraindicated for patients allergic to sulfa drugs. Like celecoxib, rofecoxib is significantly more costly than other NSAIDs. Rofecoxib appears to be no more effective than other NSAIDs, including celecoxib, in relieving pain and inflammation; the potential benefit of the COX-2 inhibitors is primarily related to a potential reduction in the incidence of GI adverse events. Data on actual outcomes is yet not available for either celecoxib or rofecoxib. There does not appear to be any advantage in using the selective COX-2 inhibitors short-term for pain as compared to other NSAIDs, given the extreme rarity of GI events after short-term therapy.

2. *Rosiglitazone (Avandia; SmithKline Beecham)*: The committee added rosiglitazone to the NMOP formulary and did not add it to the BCF. Rosiglitazone was approved by the FDA on 25 May 99 as an adjunct to diet and exercise to lower blood glucose in patients with Type 2 diabetes mellitus, both as monotherapy and in combination with metformin (Glucophage; Bristol-Myers Squibb). Rosiglitazone has been studied in combination with sulfonylureas and insulin, although these combinations are not yet FDA approved. Rosiglitazone is a thiazolidinedione antidiabetic agent that acts primarily as an insulin sensitizer. There are currently three thiazolidinediones on the market: rosiglitazone, troglitazone (Rezulin; Parke-Davis), and pioglitazone (Actos; Takeda). Pioglitazone was approved by the FDA in mid-July and has not yet come up for P&T committee review.

   The primary difference between troglitazone and rosiglitazone appears to be the reported incidence of hepatotoxicity. LTC Rick Downs reported on the comparative safety, tolerability, effectiveness, and price of the two agents. The FDA recently withdrew the monotherapy indication for troglitazone and tightened requirements for monitoring liver enzymes in light of reports of 28 deaths and 40 liver transplants associated with a denominator of approximately a million patients exposed to the drug—an incidence of between 3-4 events per 100,000 patients. There have been no indications of

hepatotoxicity with rosiglitazone in clinical trials involving approximately 4000 patient-years of follow-up. However, according to the FDA, in order to have a 95% chance of discovering side effects that occur at an incidence of greater than 1 in 1000, a patient population of at least 3000-4000 patients is required. Because liver failure and death clearly occur much less frequently than 1 in 1000, there is insufficient evidence to draw firm conclusions about the risk of hepatotoxicity associated with rosiglitazone. There are some pharmacokinetic differences between the two drugs that are consistent with a hypothesis of less hepatoxicity with rosiglitazone than troglitazone.

Effectiveness may be considered to be a function of compliance and efficacy. Compliance with the two drugs is expected to be about the same, since both are dosed qd to bid. The actual reduction in HbA1C is modest, with 200 mg of troglitazone lowering HbA1c about as much as 2 mg bid of rosiglitazone and 400 mg of troglitazone about as efficacious as 4 mg bid of rosiglitazone. At this dose equivalence, rosiglitazone appears to cost somewhat more than troglitazone, since 4 mg once daily does not appear to work as well as 2 mg bid: $1.85 for 200 mg troglitazone *vs*. $2.l6 for 2 mg bid of rosiglitazone, and $2.94 for 400 mg of troglitazone 400 mg *vs*. $2.98 for 4 mg bid of rosiglitazone. LTC Downs proposed that rosiglitazone be retained in a pending category until the next meeting in order to more clearly define the risk of hepatotoxicity associated with the drug.

After extensive discussion, the committee concluded that there is no evidence that rosiglitazone offers a safety, efficacy, or cost advantage compared to other drugs on the market. However, leaving the drug in the "pending review" category on the NMOP formulary would likely just cause patients to obtain the drug through retail network pharmacies at a higher cost. The committee decided to add rosiglitazone to the NMOP formulary since delaying its availability through the NMOP is not likely to affect overall utilization of the drug. The committee will review this class of drugs again at the next meeting.

3. *Cilostazol (Pletal; Pharmacia & Upjohn)*: The committee added cilostazol to the NMOP formulary as a non-preferred drug, with pentoxifylline as the preferred alternative for this indication. Cilostazol was not added to the BCF.

   Cilostazol was approved by the FDA on 15 Jan 99 for the treatment of intermittent claudication, a condition that affects an estimated 18,000 to 30,000 patients in DoD. The only other drug that is currently indicated for intermittent claudication is pentoxifylline. Cilostazol is a PDE III inhibitor, a class of drugs that has been associated with increased mortality in cardiac patients. Cilostazol was approved by the FDA with a black box warning stating that it is not to be used in patients with CHF of any severity (about 10-15% of patients with intermittent claudication have CHF). In addition, the FDA was concerned about the lack of data on the use of cilostazol concurrently with clopidogrel (Plavix). Phase IV trials to more clearly define the safety of this drug are currently either in the planning stages or underway. Cilostazol costs approximately $1.78/day, compared to about $0.44/day for generic pentoxifylline, but may prove to be more efficacious.

After 24 weeks, cilostazol increased pain-free walking distances of intermittent claudication patients by about 107 meters (117 yards), compared to 65 meters (71 yards) with pentoxifylline.

The committee designated cilostazol as a non-preferred drug, with pentoxifylline as the preferred alternative on the NMOP formulary because of the safety issue as well as comparative costs. The committee will review any available information concerning safety, the volume of calls being made, and comparative costs at the next meeting.

4. *Zanamivir (Relenza; GlaxoWellcome)*: The committee excluded zanamivir from the NMOP formulary and it was not added to the BCF. Zanamivir was approved by the FDA 27 July 99. Zanamivir is an orally inhaled neuraminidase inhibitor given twice daily for 5 days for the treatment of uncomplicated acute illness due to influenza in adults and adolescents older than 12 years of age who have been symptomatic for no more than 2 days. It decreases flu symptoms and shortens the duration of symptoms by approximately 1 to 1.5 days. Although zanamivir was primarily tested in influenza A, it also appears to be active against influenza B. There is evidence that zanamivir is also effective in prevention. MAJ Barbara Roach (PEC) reported that use of the drug is likely to be limited in DoD due to the widespread administration of flu shots. In addition, other drugs with influenza A activity (e.g., amantadine, rimantadine) are available both as chemoprophylaxis and treatment, although they may cause CNS side effects. Zanamivir may cause bronchospasm in susceptible patients and has not been studied in children under 12 or in a large number of elderly patients with comorbid disease. The DAPA price for zanamivir is likely to be about $28.00 for a 5-day regimen, compared to approximately $1.20 - $13.60 for 10 days of treatment with amantadine or rimantadine, respectively. Use of zanamivir is likely to be most rational during outbreaks of the flu and then only for individuals who cannot tolerate the antiviral drugs. Another potential use may be during outbreaks of influenza B. The NMOP is not an appropriate source for zanamivir because the NMOP could not provide the medication quickly enough for it to be effective for patients.

H. At the May meeting a subcommittee was appointed to investigate the issue of fertility drugs in greater detail, obtain input from individuals outside of the P&T Committee if necessary, and recommend actions to make the coverage of fertility drugs consistent in the NMOP and the retail pharmacy networks. CDR Egland reported that the subcommittee has reviewed applicable law and federal regulations pertaining to fertility drugs and is working on a plan to make the coverage of fertility drugs consistent in the NMOP and the retail pharmacy networks. The plan will be brought back to the committee, which may then decide whether to submit the plan to TMA with its recommendations and/or requests for changes in current policy. The subcommittee will provide an interim report at the next meeting.

I. Although follitropin alfa (Gonal-F, Serono) and follitropin beta (Follistim, Organon) were not explicitly listed on the previous NMOP preferred drug list (PDL), prescriptions for both agents have been being filled through the NMOP on an ongoing basis. Because these agents were not on the PDL, they were not picked up for the Covered Injectables list during the

restructuring of the NMOP Formulary. Follitropin alfa and beta are fertility agents similar to others on the Covered Injectables list. Both can be given subcutaneously. The committee decided to add follitropin alfa (Gonal-F) and follitropin beta (Follistim) to the NMOP Covered Injectables List.

J. The committee discussed current policies regarding drug therapy for weight reduction, in light of the recent FDA approval of orlistat (Xenical), a non-systemic lipase inhibitor that reduces the absorption of dietary fat. After consideration of the policies governing dispensing of drugs through the NMOP, the committee agreed that orlistat could not be added to the NMOP Formulary since drug therapy for weight reduction is not a covered benefit. The committee also agreed that orlistat is not appropriate for the BCF.

   Further discussion centered on the necessity for alignment of policy with the current philosophy of prevention and the move from a fee-for-service system to managed healthcare. The committee agreed that it should formulate an opinion on the issue of weight reduction that could be passed along to other venues for consideration. The committee appointed a subcommittee to formulate a statement regarding weight reduction policy for the committee to consider at the next meeting. Subcommittee members include MAJ Barbara Roach, LTC Rick Downs, COL Humberg, CAPT Hostettler. COL Humberg will report recommendations and proposed policy changes (if appropriate) to TMA.

K. The committee discussed pending changes in the TRICARE/CHAMPUS Policy Manual that will apply quantity limits and prior authorization requirements to the retail network. The quantity limits and prior authorization requirements will be consistent with those in the NMOP
   .

L. The Quantity Limits Subcommittee [MAJ Bellemin, Danielle Doyle, Ray Nan Berry (Foundation Health), Eugene Moore (PEC)] submitted a proposed list of quantity limits to the committee. The quantity limits will also apply to the retail network pharmacies when changes to Chapter 7, Section 7.1 of the TRICARE/CHAMPUS policy manual are finalized. After considerable discussion and modification of some quantity limits, the committee approved the list of quantity limits shown in Appendix D. Specific matters of discussion for which reports are due to the committee are listed below:

   - *Zolpidem (Ambien)*—The committee approved the proposed limit of 10 tablets in 30 days for mail order proposed by the subcommittee, but requested that MAJ Bellemin report back to the committee at the next meeting concerning the number of prescriptions returned to the patient because of exceeding the maximum daily dose. This concern was based on literature support for use of zolpidem in psychiatric disorders more frequently than once per day. Tom Kellenberger from Merck-Medco explained that the usual procedure for prescriptions that exceed the maximum daily dose is to call the physician and obtain an affidavit that the physician understands the maximum and accepts responsibility. If the physician cannot be contacted, the prescription is returned to the patient.

- *Blood products/biotech products*— The committee discussed the difficulty of determining actual quantity limits for these medications, which tend to be very dependent on patient-specific factors. Quantity limits are easier to administer if they are expressed as the maximum amount of medication provided per copayment or period of time. However, it is difficult to decide where to set the maximum amount, since prescriptions may be written "as directed." Options discussed included increasing the current "30-days supply" limit to 45 days, increasing the limit to 90 days, or eliminating quantity limits for this category. The committee agreed that some control is desirable due to the high cost of these agents and the possibility that the patient might experience side effects necessitating discontinuation, might no longer require, or might not respond to the drug. The committee requested that Merck-Medco report back to the committee with the customary dose, supply, and refill quantity of blood products and biotech drugs being dispensed by Merck-Medco.
- *Topicals:* The committee was unable to reach consensus on the six topical agents selected for the quantity limits list. Merck-Medco was asked to report back to the committee with the customary dose, supply, and refill quantity of these agents in order to better quantify reasonable quantity limits. Bill Hudson (Humana) will also report on utilization through managed care.
- *Antibiotic quantity limits* – MAJ Bellemin will report at the next meeting concerning any issues with the current limits and report on utilization.
- *Injectable fertility agents:* The committee requested that MAJ Bellemin report back at the next meeting concerning utilization of injectable fertility agents to determine whether the current 20 amp per prescription limit is adequate (since the quantity may increase with each cycle). MAJ Bellemin will also report on current prior authorization policies and issues concerning fertility treatment.

The quantity limit for etanercept injection (Enbrel) was increased to a 6-week supply (3 cartons of 4 injections) in the NMOP. This will decrease the likelihood that patients would run out of medication between refills, and it increases the incentive for filling prescriptions for the drug through the NMOP as compared to the retail network pharmacies.

M. Anthem Alliance requested that the P&T Committee review a proposed utilization program for non-sedating antihistamines. The request was referred to the P&T committee by TMA-West in order to ensure proper coordination and support for the goal of having the MCSC, NMOP, and MTFs provide the same equitable, consistent, and cost-effective benefit. The request led to a general discussion about coordinating national contracting efforts, DAPA incentive agreements, DoD P&T formulary decisions, regional/MTF formulary decisions, and managed care contractor utilization programs. The committee did not endorse the Anthem Alliance proposal because:

- Utilization programs should ideally be applied consistently across the retail pharmacy networks for all TRICARE regions. A decision to apply should a program across all regions would require more in depth analysis and extensive coordination to obtain agreement by all MCSC.

- ♦ The PEC plans to review the non-sedating antihistamine drug class for the BCF and the NMOP formulary. The drug class may be appropriate for a contacting initiative or DAPA incentive agreement. Anthem Alliance may want to ensure that its utilization management program is in agreement with BCF and NMOP formulary decisions.

N. The Advances in Medical Practice (AMP) funding initiative will provide additional funding to the Defense Health Program in FY 00 and beyond. This funding initiative is designed to support the adoption of technological advances in medical care. The Surgeons General have identified funding for pharmacy—specifically new drug technologies—as one of the areas where this money could be utilized. The committee empowered a subcommittee to make recommendations and decisions concerning the use of these funds. Subcommittee members include: COL Rosa Stith, CDR Mark Brouker, LCDR Mark Richerson, CDR Terry Egland, MAJ Mickey Bellemin.

O. Pharmaceutical manufacturers typically distribute "starter packs" for free in the private sector. MTF pharmacies cannot accept free goods unless they comply with cumbersome regulations governing the acceptance of gifts by the government. CDR Egland suggested that MTFs could buy starter packs in bulk for a minimal fee in order to facilitate initial therapy. CAPT Hostettler agreed to address this issue with DSCP and will report back to the committee at the next meeting.

P. The committee discussed the procedure for interim committee decisions. CDR Egland stated that while ideally he would prefer to present proposals for discussion via electronic connections, sometimes the co-chairs will have to decide issues on an interim basis. The committee agreed that interim decisions should be communicated to the committee via e-mail. A standing report of all interim decisions will be placed as one of the first items on the agenda at each meeting.

7. ADJOURNMENT: The meeting adjourned at 1400 hours. The next meeting will be held on Thursday, November 18th at the DoD Pharmacoeconomic Center, Fort Sam Houston, Texas, beginning at 0800 hours. All agenda items are to be submitted to the DoD PEC no later than Friday, October 15th.

Appendix A: Non-Preferred Drugs/Preferred Alternatives in the NMOP

Table 1. Annual cost avoidance to DoD and workload impact on Merck-Medco: Old PDL NMOP Formulary as compared to restructured NMOP Formulary

	Estimated Annual Cost Avoidance to DOD	Phone Calls Generated as a Percent of Total Rx's Filled†	Cost Avoidance Per Phone Call
Old NMOP Formulary	$171,000[1]	2.00%[2]	$7
Restructured NMOP Formulary	$587,713[3]	1.57%[4]	$30
Net Change	**$416,713**	**(0.43%) or 22% decrease**	**$23**

† Actual phone calls generated by Merck-Medco during report period divided by actual prescriptions filled by Merck-Medco during same report period.

1. The vast majority of 'mapped drugs' used previous to the May 1999 DoD P&T committee by Merck-Medco resulted in saving to DoD of less than $1,000/year. In fact, some of the mapping requests actually resulted in cost increases to DoD. Assuming that each of the estimated 342 previously mapped drugs saved DoD $500/year, we estimate that the cost savings from the previous list of mapped drugs was $171,000/year (342 x $500).
2. Phone calls generated by Merck-Medco during report period of 21 November 1998 through 27 March 1999 (8142) divided by actual prescriptions filled by Merck-Medco during same reporting period (406,040).
3. Estimated, based on switch rate data (29 May 1999 -31 July 1999), current DAPA prices and CY98 NMOP usage data.
4. Phone calls generated by Merck-Medco during report period of 29 May 1999 through 31 July 1999 (3720) divided by actual prescriptions filled by Merck-Medco during same reporting period (237,346).

Table 2. Phone calls generated for Merck-Medco and projected cost avoidance to DoD if Pepcid, Axid, Vasotec and nitroglycerin patches are included as non-preferred drugs on the NMOP Formulary

Non-Preferred Drug	Preferred Drug	Switch Rate	Annual Cost Avoidance to DoD†	Phone calls (per year) generated for Merck Medco††	Cost Avoidance Per Phone Call
Minitran Deponit Transderm Nitro Nitrodisc, NTG patch generics	Nitrodur	74%*	$20,647	334	$62
Pepcid	Generic ranitidine	50%**	$152,919	2015	$76
Axid	Generic ranitidine	50%**	$40,389	915	$44
Vasotec	Lisinopril (Zestril)	52%*	$183,075	3585	$51
Total			**$397,030**	**6849**	**$58**

† Estimated, based on CY1998 NMOP usage data, current DAPA prices and estimated/actual switch rates.

†† From Merck-Medco. Represents number of new prescriptions filled for the non-preferred drug(s) in CY98. Assumes phone calls are made only on new prescriptions.

* Based on switch rates for specific non-preferred/preferred drug pair as provided by Merck-Medco.

** Switch rate data not available - switch rate assumed to be 50%.

Table 3. Annual cost avoidance to DoD and workload impact on Merck-Medco: Old PDL NMOP Formulary as compared to restructured NMOP Formulary plus Axid, Pepcid, Vasotec and nitroglycerine patches added as non-preferred drugs to the NMOP Formulary.

	Estimated Annual Cost Avoidance to DoD	Phone Calls Generated as a Percent of Total Rx Filled†	Cost Avoidance per Phone Call
Old NMOP Formulary[1]	$171,000	2.00%	$7
Restructured NMOP Formulary[1]	$587,713	1.57%	$30
Restructured NMOP Formulary plus Axid, Pepcid, Vasotec and nitroglycerine patches added as non-preferred drugs to the NMOP Formulary	$984,743[2]	1.88%[3]	$38
Net Change (Old NMOP Formulary as compared to proposed changes)	**$813,743**	**(0.12%) or 6% decrease**	**$31**

1. From Table 1.
2. Totals from Tables 1 and 2.
3. Estimated number of phone calls generated by Merck-Medco in the next 12 months (26,193) divided by projected number of prescriptions filled by Merck-Medco in the next 12 months [total prescriptions filled in May 1999, June 1999, July 1999 = 347,960 multiplied by 4 = 1,391,840]

Appendix B: Contract Implementation Results for Diltiazem (Tiazac)

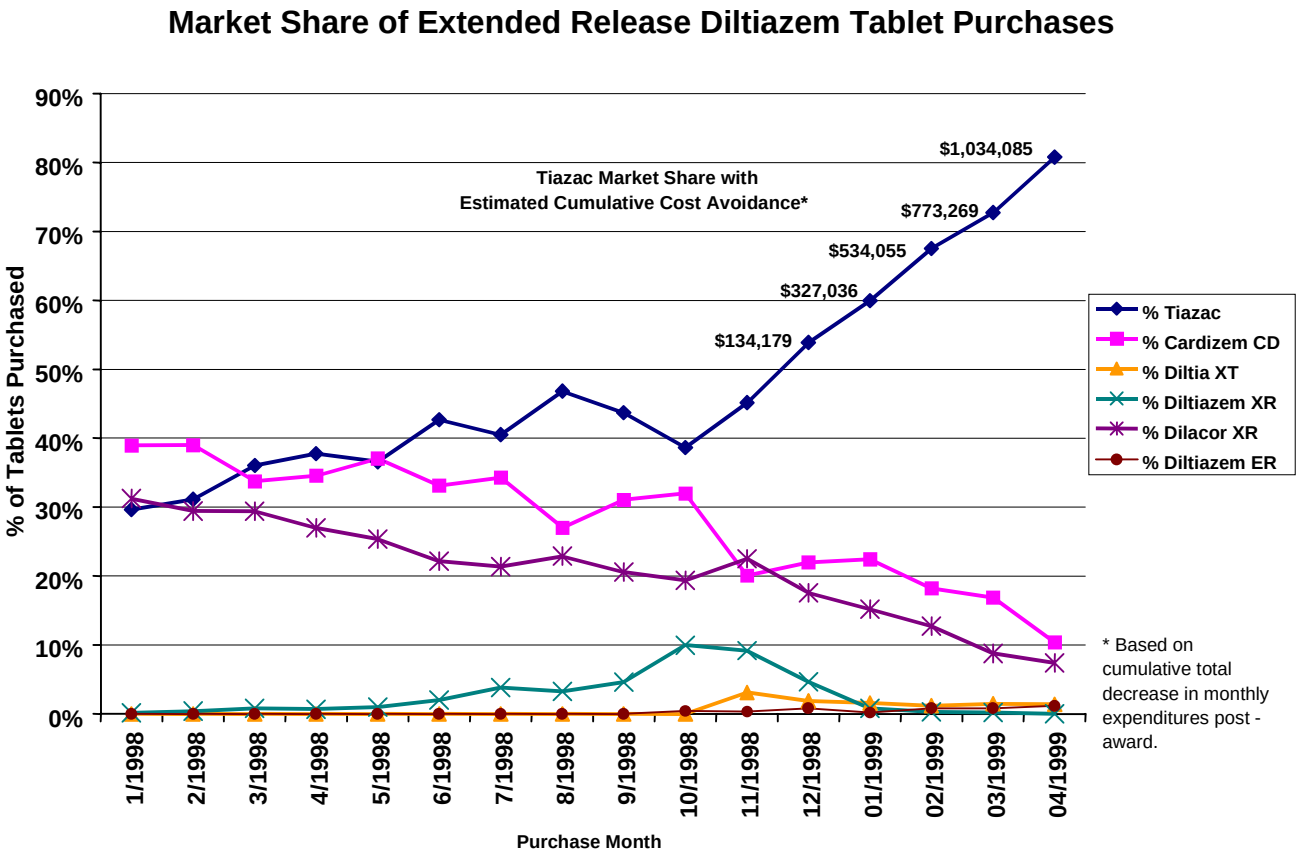

Figure 1: Market Share of Extended Release Diltiazem Tablet Purchases

Table 1: Impact of Diltiazem (Tiazac) Contract Over Time

(Contract Start Date: 12/15/98)

Month	Total Purchased	Total Cost	Cost per Tablet	Cumulative Cost Avoidance*
Jan 98	1,416,730	$919,553	0.649	0
Feb 98	1,261,430	$817,966	0.649	0
Mar 98	1,429,710	$911,019	0.634	0
Apr 98	1,568,720	$994,208	0.639	0
May 98	1,345,110	$860,270	0.628	0
Jun 98	1,401,220	$880,033	0.629	0
Jul 98	1,452,630	$913,433	0.601	0
Aug 98	1,383,700	$831,405	0.625	0
Sep 98	1,801,750	$1,125,832	0.582	0

Nov 98	1,255,470	$655,365	0.522	0
Dec 98	1,481,370	$801,344	0.547	$134,179
Jan 99	1,461,310	$732,871	0.501	$327,036
Feb 99	1,404,200	$639,490	0.455	$534,055
Mar 99	1,510,620	$676,970	0.448	$773,269
Apr 99	1,482,210	$593,330	0.40	$1,034,085

* Where applicable, cumulative cost avoidance calculated as follows:

a. Total units purchased for each drug and strength were multiplied times the prices in effect prior to the contract award.

b. Total units purchased for each drug and strength were multiplied times the prices in effect after the contract award.

c. Results of b. above were subtracted from a. above.

*** Metered Dose Inhaler**

Appendix D: Quantity Limits for NMOP and Retail Pharmacy Network

The quantity of medication dispensed is generally limited to a 90-day supply in the National Mail Order Pharmacy (NMOP) and a 30-day supply in retail network pharmacies. If a patient obtains more than a 30-day supply at a retail pharmacy, the patient must pay an additional co-pay for each additional 30-day supply increment, up to a 90-day supply (3 co-pays).

A subcommittee of the DoD P & T Committee and Pharmacoeconomic Center (PEC) staff members developed proposed quantity limits that either (1) deviate from the general 30- or 90-day limits, or (2) specify the quantity that is associated with a specific time period. The following table shows the proposed quantity limits and the rationale for these limits. If a specific rationale is not stated, the quantity limit was calculated by multiplying the maximum daily dose times the days supply limit.

A quantity limit represents the maximum allowable quantity that may be dispensed for a given time period. Maximum quantities to be dispensed are determined by directions for use or the proposed quantity limits below, whichever is less.

Drug	Previous NMOP Limit	New Quantity Limits	Rationale
Antiemetics			
Granisetron 1mg tablet (Kytril)	None	Retail: 8 per 30 days Mail: 24 per 90 days	Indication is for 1 tablet (1 mg) twice daily on days that chemotherapy is given. Most chemotherapy regimes are for 4 or 5 days per cycle. However, Drug Facts & Comparisons lists several chemo regimens (e.g., COPP for lymphoma) that require oral therapy with highly emetogenic drugs for periods ranging from 8 to 14 days per cycle.
Ondansetron 4mg and 8mg (Zofran)	45 tablets or 90 days, whichever is less	Retail: 15 per 30 days Mail: 45 per 90 days	Indication is for 1 tablet (4 or 8 mg) twice daily on days that chemotherapy is given, and for 1 or two days after regimen is finished. Most chemotherapy regimes are for 4 or 5 days per cycle. However, Drug Facts & Comparisons lists several chemo regimens (e.g., COPP for lymphoma) that require oral therapy with highly emetogenic drugs for periods ranging from 8 to 14 days per cycle.
Dolasetron 50mg and 100 mg (Anzemet)	None	Retail: 5 per 30 days Mail: 15 per 90 days	Indication is for 1 tablet (50 or 100 mg) prior to chemotherapy. Most chemotherapy regimes are for 4 or 5 days per cycle. However, Drug Facts & Comparisons lists several chemo regimens (e.g., COPP for lymphoma) that require oral therapy with highly emetogenic drugs for periods ranging from 8 to 14 days per cycle.
Oral and Nasal Inhalers			
Albuterol Inh Soln 20ml (0.5%)	9 units (180ml) or 90 days, whichever is less	Retail: 3 units per 30 days Mail: 9 units per 90 days	
Albuterol Inhaler	5 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Beclomethasone AQ Nasal Spray 19gm (Beconase)	3 units or 90 days, whichever is less	Retail: 1 units per 30 days Mail: 3 units per 90 days	
Beclomethasone Inhaler 16.8 gm	9 units or 90 days, whichever is less	Retail: 3 units per 30 days Mail: 9 units per 90 days	
Beclomethasone Nasal Inhaler (Beconase, Vancenase)	4 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Bitolterol Inhaler 15cc (Tornalate)	4 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	

Drug	Previous NMOP Limit	New Quantity Limits	Rationale
Budesonide (Pulmicort)	None	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Budesonide Nasal Inhaler 7gm (Rhinocort)	4 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Cromolyn Sodium Inhaler 112 Puff (Intal)	6 units or 90 days, whichever is less	Retail: 3 units per 30 days Mail: 9 units per 90 days	
Cromolyn Sodium Inhaler 200 Puff (Intal)	4 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Cromolyn Sodium Nebulizing Soln (20mg)	360 units or days, whichever is less	Retail: 150 units per 30 days Mail: 450 units per 90 days	
Flunisolide Inhaler (Aerobid, Aerobid-M)	7 units or 90 days, whichever is less	Retail: 3 per 30 days Mail: 9 per 90 days	
Flunisolide Nasal Soln (.025%)	7 units or 90 days, whichever is less	Retail: 3 units per 30 days Mail: 9 units per 90 days	
Fluticasone 110mcg (Flovent)	6 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Fluticasone 220mcg (Flovent)	6 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Fluticasone 44mcg (Flovent)	None	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Fluticasone Nasal Spray (Flonase)	3 units or 90 days, whichever is less	Retail: 1 units per 30 days Mail: 3 units per 90 days	
Ipratropium 0.03% Nasal Spray 30ml (Atrovent)	3 units or 90 days, whichever is less	Retail: 1 unit per 30 days Mail: 3units per 90 days	
Ipratropium 0.06% Nasal Spray 15ml	4 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	Indicated for rhinorrhea associated with the common cold. 16 Sprays per day maximum. 165 sprays per container. Appropriate, because a common cold is a self-limiting illness.
Ipratropium Inhalant Soln 2.5ml (.02%)	360 units or 90 days, whichever is less	Retail: 150 units per 30 days Mail: 450 units per 90 days	
Ipratropium Inhaler	6 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Metaproterenol Inhalant Soln (0.6%)	None	Retail: 150 units per 30 days Mail: 450 units per 90 days	
Metaproterenol Inhaler (Alupent)	6 units or 90 days, whichever is less	Retail: 3 units per 30 days Mail: 9 units per 90 days	
Triamcinolone Aqueous Nasal Spray (16.5gm) (Nasacort)	6 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Nedocromil Inhaler (Tilade)	6 units	Retail: 3 units per 30 days Mail: 9 units per 90 days	
Pirebutolol Inhaler 300 puff (Maxair) Inh	4 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Pirebutolol Autohaler 400 inh	3 units or 90 days, whichever is less	Retail: 1 unit per 30 days Mail: 3 units per 90 days	

Drug	Previous NMOP Limit	New Quantity Limits	Rationale
Salmeterol (Serevent)	6 inhalers or 90 days, whichever is less	Retail: 1 inh per 30 days Mail: 3 inh per 90 days	
Triamcinolone oral Inhaler (Azmacort)	6 units or 90 days, whichever is less	Retail: 2 units per 30 days Mail: 6 units per 90 days	
Antimigraine Drugs			
Note on dosing of 5HT-1 receptor antagonists for treatment of migraine. Generally for an acute migraine attack, the 5HT-1 antagonists are given once, and the dose is repeated in 4 hours if the headache returns or is still present. This is expected to successfully abort a classical migraine attack in 68% to 86% of patients. Subsequent doses may be given at 4-hour intervals, up to the maximum amount specified in a 24-hour period. Safety of treating more than 4 headaches in a 30-day period has not been established. [2,3,4]			
Dihydroergotamine Nasal Spray (Migranal)	None	Retail: 8 units per 30 days Mail: 24units per 90 days	Safety of using more than 3mg/24 hour or 4mg in a 7-day period has not been established.[2,3,4]
Naratriptan 1mg (Amerge)	8 tablets or 30 days, whichever is less	Retail: 9 tabs per 30 days Mail: 27 tabs per 90days	Two tablets per headache, 4 headaches per month. If more than 8 tablets are required, patient should be receiving 2.5 mg tablets.[2,3,4] (Tablets packaged in 9's)
Naratriptan 2.5mg Tablet (Amerge)	8 tablets or 30 days, whichever is less	Retail: 9 tabs per 30 days Mail: 27 tabs per 90 days	Two tablets per headache, 4 headaches per month. Max of 5mg in 24 hours.[2,3,4] (Tablets packaged in 9's)
Rizatriptan 5mg, 10mg Tablet, MLT-5mg, 10mg Tablet 16.8 gm (Maxalt)	None	Retail: 12 tabs or 30 days Mail: 36 tabs or 90 days	Two tablets per headache, 4 headaches per month. Max of 30mg in 24 hours. If more than 12 of the 5mg tablets are needed, patient should be changed to 10mg tablets.[2,3,4]
Sumatriptan 25mg Tablet (Imitrex)	48 tablets or 30 days, whichever is less	Retail: 18 tabs or 30 days Mail: 54 tabs or 90 days	Max of 200 mg (8 tablets) in 24 hours, 4 headaches per month. If more than 18 25-mg tablets are needed in 30 days, patient should move to the 50-mg tablet.[2,3,4] (AWP is the same for both strengths)
Sumatriptan 50mg Tablet (Imitrex)	48 tablets or 30 days, whichever is less	Retail: 18 tabs or 30 days Mail: 54 tabs or 90 days	Max of 200mg (4 tablets) in 24 hours, 4 headaches per month.[2,3,4]
Sumatriptan Injection (Imitrex)	8 injections (4ml) or 30 days, whichever is less	Retail: 8 units per 30 days Mail: 24 units per 90 days	2 injections per 24 hours, maximum recommended. 4 headaches per month.
Sumatriptan Nasal Spray 5mg/unit, 20mg/unit (Imitrex)	None	Retail: 6 units per 30 days Mail: 18 units per 90 days	Packaged in 6's. Maximum of 40 mg/24 hours. If more than 6 units of 5 mg required, should consider 20 mg.[2,3,4]
Zolmitripan 2.5mg and 5mg Tablet (Zomig)	None	Retail: 8 tabs or 30 days Mail: 24 tabs or 90 days	Two tablets per headache, 4 headaches per month. If more than 8 of the 2.5mg tablets are needed, patient should be changed to 5mg tablets.[2,3,4]
Miscellaneous			
Alcohol Swabs	1 swab per syringe	1 swab per syringe rounded up to nearest 100	
Blood/Urine Test Strips	90 days supply or 400 units, whichever is less	90 days supply or 400 units, whichever is less	
Butorphanol NS (Stadol)	4 units or 30 days, whichever is less	Retail: 4 units per 30 days Mail: 4 units per 30 days	Indicated for acute, severe pain. Maximum 4 mg (sprays)/day. 14 sprays/unit.

Drug	Previous NMOP Limit	New Quantity Limits	Rationale
Dornase Alpha (Pulmozyme)	60 ampules or 30 days, whichever is less	Retail: 30-day supply or 120 amps, whichever is less Mail: 90-day supply or 360 amps, whichever is less	Recommended daily dose is 1 amp per day, some patients may benefit from 1 amp BID. However, some patients receive 4 amps BID, two weeks on - two weeks off.[6]
Etanercept injection (Enbrel)	None	Retail: 8 injections (2 cartons of 4 injections) (4 weeks supply) Mail: 12 injections (3 cartons of 4 injections) (6 weeks supply)	Indicated use is for one injection twice weekly. Patients must meet prior authorization criteria for etanercept.
Insulin Syringes & Needles	90 days supply or 400 units, whichever is less	90 days supply or 400 units, whichever is less	
Ketorolac 10mg Tablet (Toradol)	None	Retail: 20 tabs per 5 days Mail: 20 tabs per 5 days	Safety.[3] There were deaths from renal toxicity associated with this drug. Boxed warning is for acute treatment of pain, 4 tablets per day, for 5 days maximum per treatment episode.
Schedule III, IV, V Drugs for non-active duty only	Up to a max of 30 day supply and 5 refills	Retail: max of 30-day supply and 5 refills Mail: max of 30-day supply and 5 refills	Federal and State laws
Phenobarbital, Pemoline, other ADHD drugs	Up to a max of a 90 day supply and 1 refill	Retail: max of 90-day supply and 1 refill Mail: max of 90-day supply and 1 refill	Exception to above laws when used for seizure disorder and ADHD
Tramadol 50 mg (Ultram)	None	Retail: 240 tabs per 30 days Mail: 720 tabs per 90 days	FDB limit[7] There was toxicity and deaths associated with this drug. Boxed warning is for no more than 8 tablets per day.
Zolpidem 10mg Tablet (Ambien)	None	Retail: 10 tabs per 30 days Mail: 10 tabs per 30 days	
Antifungals			
Fluconazole 150mg (Diflucan)	1 tablet/90 days	Retail: 1 tablet per 30 days Mail: 3 tablets per 90 days	One tablet a month of the 150 mg strength is indicated for prophylaxis in 5% of patients.[8]
Oral Antifungals	None	Retail: 30 days supply maximum Mail 90 days supply maximum	While medically indicated for onychomycosis, lifestyle changes are also important.
Terconazole Vaginal Cream (Terazol-3)	1 box (20gm) or 30 days	Retail: 1 box (20 gm) per 30 days Mail: 1 box (20 gm) per 30 days	Short term med
Terconazole Vaginal Cream (Terazole-7)	1 box (45gm) or 30 days	Retail: 1 box (45gm) per 30 days Mail: 1 box (45gm) per 30 days	Short term med
Terconazole Vaginal Suppositories (Terazole-3)	1 box (3 units) or 30 days	Retail: 1 box (3 units) per 30 days Mail: 1 box (3 units) per 30 days	Short term med

Drug	Previous NMOP Limit	New Quantity Limits	Rationale
Ophthalmics			
Antibiotic Ophthalmics	None	Retail: 1 unit per 15 days Mail: 1 unit per 15 days	Short term med, not appropriate for mail order
Antiviral Ophthalmics	None	Retail: 1 unit per 15 days Mail: 1 unit per 15 days	Short term med, not appropriate for mail order
Ketorolac Opth (Acular) 3,5,10ml	None	Retail: 2 units per 30 days Mail: 6 units per 90 days	Two units of the 10ml would accommodate the maintenance dose. Smaller package sizes are appropriate for short-term indications.
Latanoprost (Xalatan) 2.5 ml	None	Retail: 2 units/30 days Mail: 6 units/90 days	Usual in most plans
NSAID ophthalmics Ocufen, Profenal, Voltaren	None	Retail: 1 unit per 15 days Mail: 1 unit per 15 days	Short term med, not appropriate for mail order
Olopatadine Hcl (Patanol) 5 ml	None	Retail: 2 units per month Mail: 2 unit per month	Usual in most plans.
Antibiotics			
Zithromax 250mg	6 tablets or 90 days, whichever is less	Retail: 6 tabs per 30 days Mail: 6 tabs per 30 days	Antibiotic, inappropriate for mail order
Zithromax 600mg	6 tablets or 90 days, whichever is less	Retail: 8 tabs per 30 days Mail: 24 tabs per 90 days	Prophylaxis of MAC at a dose of 2 tablets/week in HIV infected individuals
Fertility and Impotence			
Oral Fertility Agents (except clomiphene)	30 day supply	Retail: 30 day supply Mail: 30 day supply	
Injectable Fertility Agents	20 units or 30 days, whichever is less -no refills allowed.	Retail: 20 units per 30 days - no refills allowed Mail: 20 units per 30 days -no refills allowed	
Clomiphene citrate (e.g., Clomid)	10 tablets or 30 days, whichever is less	Retail: 10 tablets per 30 days Mail: 10 tablets per 30 days	
Alprostadil injection (Caverject, Edex)	6 injections or 30 days, whichever is less	Retail: 6 injections per 30 days Mail: 18 injections per 90 days	Health Affairs policy
Alprostadil intraurethral pellet (Muse)	6 pellets or 30 days, whichever is less	Retail: 6 pellets per 30 days Mail: 18 pellets per 90 days	Health Affairs policy
Sildenafil (Viagra)	6 tablets or 30 days, whichever is less	Retail: 6 tablets per 30 days Mail: 18 tablets per 90 days	Health Affairs policy

Notes/References:

1. Current TRICARE policy allows for patients to receive up to a 90-day supply at retail for most medications. Patients pay a co-payment for each month received.

MCCS-GPE 17 May 1999

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with Health Affairs policy 98-025, a meeting of the DoD P&T committee convened at 0800 hours on 14 May 1999, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, TX.

2. MEMBERS PRESENT:

COL Daniel D. Remund, MS	Co-chairman
CDR Terrance Egland, MC	Co-chairman
COL Rosa Stith, MC	Army
LTC Judith O'Connor, MC	Army
Danielle Doyle	Army
CDR Matt Nutaitis, MC	Navy
LCDR Denise Graham, MSC	Navy
LtCol John R. Downs, MC	Air Force
LtCol William Sykora, MC	Air Force
MAJ George Jones, BSC	Air Force
CDR Robert W. Rist	Coast Guard
LTC (P) George Crawford, MS	Joint Readiness Clinical Advisory Board
MAJ Steven Humburg, MC	Health Affairs
MAJ Mickey Bellemin BSC	Defense Supply Center Philadelphia (DSCP)
Ronald L. Mosier	Department of Veterans Affairs (alternate)
Ray Nan Berry	Foundation Health
William Hudson	Humana, Inc
Ron McDonald	Sierra Military Health Service
Gene Lakey	TriWest

3. OTHERS PRESENT:

CAPT Charlie Hostettler, MSC	DoD Pharmacy Program Director, TMA
CDR Mark Brouker, MSC	DoD Pharmacoeconomic Center
Lt Col Gary Blamire, BSC	Tricare Southwest Lead Agent
Lt Col (sel) Greg Russie, BSC	Air Force (alternate representative)
Tom Kellenberger	Merck-Medco Representative
Shelby Tanner, Jr.	Staff Judge Advocate, Fort Sam Houston
Shana Trice	DoD Pharmacoeconomic Center

4. ADMINISTRATIVE ISSUES:

   A. The minutes from the 5 February 1999 meeting were accepted as written.

   B. Committee membership: MAJ George Jones replaced Lt Col (sel) Greg Russie as the Air Force pharmacist committee member. Lt Col (sel) Russie will serve as the alternate Air Force pharmacist committee member. LCDR Denise Graham will enter a Duty Under Instruction (DUINS) Program. A Navy pharmacist has not yet been named to replace LCDR Graham on the committee. LTC Joel Schmidt, Walter Reed Army Medical Center, is the alternate Army physician member. LTC Kent Maneval, Walter Reed Army Medical Center, is the alternate Army pharmacist committee member.

5. OLD BUSINESS: Issues pending from previous meetings were addressed under new business because the committee needed to address the proposal to restructure the National Mail Order Pharmacy (NMOP) formulary as its first item of business.

6. NEW BUSINESS: Proposal to restructure the NMOP formulary.

   A. The committee approved a PEC proposal to replace the NMOP Preferred Drug List (PDL) with a restructured NMOP formulary. The restructured NMOP formulary is designed to:

      - Enable patients and providers to more easily and accurately determine the availability of medications in the NMOP.
      - Increase the use of medications that offer significant clinical or economic advantages compared to other medications.
      - Support compliance with DoD and joint VA/DoD pharmaceutical contracts.

   B. The NMOP Preferred Drug List (PDL) will be replaced by an NMOP formulary that includes specific injectable drugs and all non-injectable prescription drugs with the following exceptions or limitations:

- *Excluded drugs and drug classes:* Some drugs or classes of drugs are excluded from the NMOP formulary due to TRICARE policy or DoD P&T Committee decisions. These drugs are not available through the NMOP.
- *Drugs subject to prescribing guidelines or prior authorization:* These drugs must be dispensed in accordance with prescribing guidelines or prior authorization criteria that are established by the DoD P&T Committee.
- *Non-preferred drugs and preferred alternatives:* If the prescriber agrees that a preferred drug is clinically appropriate, a prescription for a non-preferred drug will be changed to a preferred alternative drug.
- *Covered injectable drugs:* The formulary includes selected injectable drugs that are intended for self-administration or are commonly administered in the home setting
- *Covered over-the-counter (OTC) drugs/products*: The formulary includes selected OTC drugs and products.
- *Drugs pending P&T committee review:* Drugs newly approved by the Food & Drug Administration (FDA) that are pending P&T Committee review will not be available through the NMOP until the P&T Committee completes the review and assigns the drug to the appropriate category on the NMOP formulary.

C. Appendix A identifies the drugs that are included in each formulary category in the initial edition of the NMOP formulary.

7. NEW BUSINESS: Agents considered for Basic Core Formulary and NMOP formulary status.

A. Celecoxib (Celebrex), commonly known as a COX-2 inhibitor, is indicated for relief of the symptoms of osteoarthritis and adult rheumatoid arthritis. A summary of efficacy, safety, and cost issues associated with celecoxib is provided at Appendix B. Committee decision: **Do not add to the BCF. Add to the NMOP formulary subject to a prescribing guideline/prior authorization.** Celecoxib is significantly more expensive than other non-steroidal anti-inflammatory drugs, so the prescribing guideline will be designed to target the use of celecoxib to patients who are at high risk for adverse gastrointestinal events. The committee discussed a draft prescribing guideline and provided precepts for the PEC to finalize the guideline. Celecoxib will be available through the NMOP when DSCP and Merck Medco have established procedures for implementing the prescribing guideline.

B. Brand name NSAIDS are 2 to 20 times more expensive than generic NSAIDs based on current DAPA prices. Generic NSAIDs, rather than brand name NSAIDs, should be used to the maximum extent consistent with patients' clinical needs. Committee decision: **The brand name NSAIDs listed below are designated as non-preferred drugs. The preferred alternatives are listed in Appendix 1.**

- nabumetone (Relafen)
- oxaprozin (Daypro)

- etodolac extended release (Lodine XL)
- diclofenac extended release (Voltaren XR)
- naproxen sodium extended release (Napralen)

C. Etanercept (Enbrel) is a new biotech inhibitor of tumor necrosis factor for use in patients with moderate to severe rheumatoid arthritis who have failed other agents. Discussion of a draft prescribing guideline centered on the number and identity of disease-modifying anti-rheumatoid drugs (DMARDS) that a patient must fail before receiving etanercept. The committee was also concerned that the prescribing guideline should take into account an apparent increased risk of serious infections that was recently detected through post-marketing surveillance of patients taking etanercept. The increased risk of serious infections prompted the FDA to revise the warnings section of the package insert for etanercept. The DAPA price for etanercept if $81.93 per dose, which equates to $655.44 per month of therapy. Committee decision: **Do not add to the BCF. Add to the NMOP formulary subject to prescribing guideline/prior authorization.** The committee provided precepts for the PEC to finalize the prescribing guideline. Etanercept will be available through the NMOP when DSCP and Merck Medco have established procedures for implementing the prescribing guideline. To limit the financial waste that occurs when patients discontinue the medication, the NMOP will dispense no more than a 30-day supply of etanercept (2 cartons of 4 injections).

D. Sevelamer hydrochloride (Renagel) is indicated for the reduction of serum phosphorus in patients with end-stage renal disease. It is a nonabsorbable hydrogel polymer that avoids the problems that are associated with phosphate binders containing aluminum or calcium. Aluminum-containing phosphate binders may cause aluminum toxicity resulting in osteomalacia, anemia, and dementia. Systemic absorption of calcium-containing phosphate binders may cause hypercalcemia and increased risk of metastatic calcification. Committee decision: **Do not add to BCF. Add to the NMOP formulary.**

E. Modafinil (Provigil) is used to improve wakefulness in patients with excessive daytime sleepiness associated with narcolepsy. In clinical trials modafinil showed significant improvement on objective and subjective measures of excessive daytime sleepiness compared to placebo. Direct comparisons of the efficacy of modafinil to other agents are not available. The National Transportation Safety Board has requested that the manufacturer conduct trials using modafinil in long-haul truckers to promote wakefulness. The committee expressed concern about the potential for inappropriate use of modafinil to increase alertness among patients who do not have narcolepsy. Committee decision: **Do not add to BCF. Add to the NMOP formulary and monitor usage patterns for evidence of inappropriate use.** (Note: the manufacturer estimates that only about 125,000 people suffer from narcolepsy in the United States, so usage of this drug should be minimal.)

F. Polyethylene glycol (Miralax) is an osmotic agent that is used as a laxative. Committee decision: **Do not add to the BCF. Add to the NMOP formulary.**

G. Corticosteroid oral inhalers: At the Feb 99 meeting the committee tabled action on a proposal to remove triamcinolone (Azmacort) inhaler from the BCF due to an announced DAPA price increase from $7.95 to $12.90 per inhaler. The DAPA price for Azmacort was subsequently reduced to $9.60 per inhaler. The DAPA price for beclomethasone (Vanceril) inhaler was recently increased from $3.45 to $5.75 per inhaler and Vanceril-DS inhaler went from $5.16 to $6.90 per inhaler. The cost per day for Vanceril, Vanceril-DS, and Azmacort inhalers is still less than the cost per day for other corticosteroids for oral inhalation. Committee decision: **Do not change the corticosteroid oral inhalers on the BCF, but continue to monitor price changes in this drug class. Vanceril, Vanceril-DS, and Azmacort remain on the BCF.**

H. Corticosteroid nasal inhalers: Beclomethasone 42mcg/spray (Vancenase Pockethaler) has been the only corticosteroid nasal inhaler on the BCF. The DAPA price for the Vancenase Pockethaler recently increased from $3.76 to $9.25 per inhaler. A PEC estimate of the monthly maintenance costs for various corticosteroid nasal inhalers (based on the dosing frequency and the number of sprays/puffs available in each on the inhalers) showed that the Vancenase Pockethaler no longer offers an economic advantage compared to other inhalers. Committee decision: **Remove beclomethasone 42mcg/spray (Vancenase Pockethaler) from the BCF. The BCF will state that the MTF must have a corticosteroid nasal inhaler on its formulary, but the MTF can select which one to have on its formulary.** The committee intends to review the corticosteroid nasal inhalers at the next meeting to see if a specific inhaler should be selected for the BCF in order to standardize availability across the Military Health System. (OPEN)

I. Premarin vs Ogen vaginal cream: Conjugated estrogen (Premarin) vaginal cream is currently on the BCF. An MTF requested a BCF modification that would allow the MTF to preferentially use estropipate (Ogen) vaginal cream instead of Premarin. There are no apparent differences in efficacy or safety between Premarin and Ogen vaginal creams. The DAPA price for Premarin vaginal cream is almost twice that of Ogen vaginal cream. Committee decision: **Change the BCF listing from conjugated estrogen vaginal cream to "estrogenic vaginal cream." All MTFs must include an estrogenic vaginal cream on their formularies, but the MTFs will select the specific brand.**

8. NEW BUSINESS: Other issues:

A. Fertility drugs: The TRICARE policy manual classifies noncoital reproductive technologies (artificial insemination, in vitro fertilization, gamete intrafallopian transfer, etc.) as noncovered treatments and specifies that services and supplies directly related to a noncovered procedure are not covered. Based on this policy, managed care support contractors in some TRICARE regions use prior authorization procedures to deny coverage at retail network pharmacies for fertility drugs when they are prescribed for use with noncoital reproductive technologies. Currently, the NMOP does not perform prior authorization procedures for fertility drugs. In some cases, the NMOP dispenses fertility drugs to patients who were previously denied coverage through a retail network pharmacy because the drugs were prescribed for use with noncoital reproductive technologies. The

committee concluded that this issue was too complex to be solved at the meeting. A subcommittee was appointed to investigate this issue in greater detail, obtain input from individuals outside of the P&T Committee if necessary, and recommend actions to make the coverage of fertility drugs consistent in the NMOP and the retail pharmacy networks. (OPEN)

B. Sildenafil (Viagra): The prescribing guideline that the PEC prepared for Merck Medco to fax to prescribers is still not used. The committee discussed the stipulation in the prescribing guideline that sildenafil will only be used for organic erectile dysfunction and hypothesized that provisions in the TRICARE policy manual are the basis for this stipulation. The committee reaffirmed that sildenafil should only be dispensed by the NMOP in accordance with the prescribing guideline.

C. Migraine drug usage in the NMOP: MAJ Bellemin reported that the NMOP receives very few complaints regarding the quantity limits for migraine drug therapy. Several committee members commented that the NMOP quantity limits are quite generous compared to quantity limits at MTFs or in other managed care settings. A subcommittee was appointed to review quantity limits for migraine drugs and submit recommendations to the P&T committee at the next meeting. (OPEN)

D. Niacin for antilipemic therapy: The committee reaffirmed its position that the NMOP should provide niacin (in both OTC and prescription forms) for antilipemic therapy. The committee does not intend that niacin should be provided for vitamin supplementation. A basis for the provision of OTC form of niacin may exist in the TRICARE final rule that established requirements and procedures for implementation of the TRICARE program. The TRICARE final rule allows the establishment of "other procedures for the effective operation of the pharmacy programs" to include drug formularies. While drug formularies are often viewed as a means to limit the availability of medications, the NMOP formulary could also be used to expand the availability of medications to include OTC forms of niacin for antilipemic therapy. The restructured NMOP formulary automatically includes prescription forms of niacin. Committee decision: **Add over-the-counter (OTC) forms of niacin prescribed for antilipemic therapy to the list of OTC items that are covered by the NMOP. Implementation is contingent on TMA West policy review.**

E. The discussion of OTC niacin led to a suggestion that needles, syringes, alcohol pads, and lancet should also be provided through the NMOP. Some committee members expressed concern that when co-pays and dispensing fees are taken into account, the beneficiaries would obtain very little benefit and the government would incur a substantial increase in cost. Other members suggested that costs to the government or the managed care support contractor are much higher if the beneficiary obtains such supplies through home health providers. Committee decision: **The NMOP should supply needles, syringes, and alcohol pads when a medication is dispensed for home injection. The NMOP should also supply alcohol pads and lancets for diabetic patients.** The provision of these items through the NMOP is contingent upon the ability of the NMOP COTR and

contracting officer identify methods by which these items can be provided at a reasonable cost.

F. Handling of high dollar items in the NMOP: The committee tabled this issue at the last meeting and asked the NMOP COTR, the PEC, and the MCS contractors to work out a draft design of an NMOP prior authorization process that the committee could review. This issue is resolved by the restructuring of the NMOP formulary, which includes a category of drugs that are subject to prescribing guidelines/prior authorization.

G. NMOP quantity limitations for ophthalmics and topicals (specifically urea 40% cream): The subcommittee that was appointed to review quantity limitations for migraine drugs will also develop recommendations for the P&T committee regarding quantity limitations for ophthalmics and topicals. (OPEN)

9. NEW BUSINESS: Contracting update

A. Insulin: Pre-solicitation conferences with the pharmaceutical companies are scheduled for 18 and 20 May 99. The solicitation will probably be issued within a week to 10 days after pre-solicitation conferences are completed. This is a joint VA/DoD contracting initiative.

B. Statins: DSCP recently completed discussions with the offerors. The deadline for final proposal revisions is 21 May 99. Target date for awarding the contract is 11 Jun 99.

C. Proton pump inhibitors: The solicitation was issued on 7 May 99 and closes on 10 Jun 99.

D. Lisinopril: The solicitation closes on 21 May 99.

E. Blood glucose test strips: The PEC recommends discontinuation of the current contracting initiative to select a single blood glucose test strip for a closed class on the BCF. Contracting initiatives are taking much longer to complete than originally anticipated. Some MTFs are reluctant to adopt the test strip that is currently on the BCF (Precision QID) because they do not want to switch patients twice in the event that a contract is awarded for a different test strip. Given the number of contracting initiatives that DSCP is already working on, a contract for blood glucose test strips would very likely take 8 to 12 months to complete. It is unreasonable to hold up MTF formulary decisions for that length of time. Committee decision: **Discontinue the current blood glucose test strip contracting initiative. Precision QID remains as the blood glucose test strip in an open class on the BCF.**

F. Selective serotonin reuptake inhibitors (SSRIs): At the Nov 98 meeting the committee concurred with a proposal to select one SSRI for an open class on the BCF. It was anticipated that blanket purchase agreements or DAPA incentive agreements would be established to facilitate the selection of an SSRI for an open class on the BCF, but such

agreements have not been established. The committee intends to select one SSRI for an open class on the BCF at the Aug 99 meeting.

G. Warfarin: At the Nov 98 meeting the committee removed the Coumadin brand only designation from the BCF with the intent of pursuing a sole source contract for a single brand of warfarin. Price competition appears to be increasing in the warfarin market. Increased price competition may diminish the need to pursue a sole source contract.

10. ADJOURNMENT: The meeting adjourned at 1400 hours. The next meeting will be held on 13 August 1999 at the DoD Pharmacoeconomic Center, Fort Sam Houston, Texas, beginning at 0800 hours. All agenda items are to be submitted to the DoD PEC no later than 16 July 1999.

<signed>	<signed>
DANIEL D. REMUND COL, MS, USA Co-chairman	TERRANCE EGLAND CDR, MC, USN Co-chairman

Appendix A: NMOP Formulary

Drugs that are covered:

- All non-injectable prescription drugs that are *not* excluded. (Excluded drugs are listed in the Excluded Drugs category.)
- Injectable drugs listed in the Covered Injectable Drugs category
- Non-prescription drugs or products listed in the Covered OTC Drugs/Products category

Excluded Drugs

Drug Classes Excluded for Active Duty Members Only:
- Amphetamines
- CNS stimulants
- Controlled substances in Schedules II, III, IV, V

Excluded Drug Classes:
- Anabolic steroids
- Contraceptive creams, foams, implants, injections, jellies
- Immune globulins
- Immunizations
- Injectable drugs (unless listed in the Covered Injectable Drug category)
- Legend prenatal vitamins for males, and females age 46 and over
- Legend vitamins
- Over-the-counter (OTC) drugs (unless listed in the Covered OTC Drugs/Products category)
- Smoking deterrents
- Vaccines

Exclusions by Drug Use:
- Drugs for cosmetic use as a result of the aging process (e.g., tretinoin cream (Renova)) or whose sole use is to stimulate hair growth [e.g., topical minoxidil (Rogaine), finasteride (Propecia)].
- Drugs for investigational use
- Drugs for obesity and/or weight reduction

Specific Drug Exclusions:
- Clozapine (Clozaril)
- Enoxaparin (Lovenox)
- Quinine
- Thalidomide (Thalomid)
- Tretinoin (Retin-A) age 36 and over

New FDA-approved drugs:
- Excluded until reviewed by the DoD P&T Committee (will be listed in the Drugs Pending P&T Committee review category—to be updated as new drugs are approved by the FDA)

Drugs Pending P&T Committee Review

- Cilostazol (Pletal)

Covered Injectable Drugs*

- Alprostadil (Caverject, Muse) intracavernosal injection
- Antihemophilic Factor VIII
- Antihemophilic Factor IX Complex
- Calcitonin salmon injection
- Cyanocobalamin injection
- Epoetin alfa, recombinant (Epogen, Procrit)
- Filgrastim (Neupogen) injection
- Glatiramer acetate (Copaxone) injection
- Glucagon
- Goserelin acetate (Zoladex) implant syringe
- Insect Sting Treatment Kit
- Insulin
- Insulin analog (Humalog) injection
- Interferon Alpha (Infergen, Roferon-A, Intron A, Rebetron)
- Interferon Beta (Avonex, Betaseron)
- Interferon Gamma-1b (Actimmune)
- Leuprolide (Lupron) depot and subcutaneous injections
- Menotropins (Repronex) injection
- Octreotide (Sandostatin) injection
- Sargramostim (Leukine) injection
- Somatrem (Protropin)
- Somatropin (Humatrope)
- Sumatriptan (Imitrex) injection
- Urofollitropin (Fertinex) injection

**** many of these agents currently have quantity restrictions***

Covered OTC Drugs/Products

- Glucose Test Strips
- Insulin and Insulin syringes
- Lancets
- Niacin (for antilipemic therapy)
- Alcohol swabs, needles and syringes (for injectable drugs dispensed for home injection only)

Drugs Subject to Practice Guidelines/Prior Authorization
• Celecoxib (Celebrex) • Etanercept (Enbrel) • Sildenafil (Viagra)

Non-Preferred Drugs and Preferred Alternatives	
Non-Preferred	**Preferred**
Astemizole (Hismanal)	➢ **Cetirizine (Zyrtec)** **Fexofenadine (Allegra)** **Loratadine (Claritin)**
Diclofenac extended release (ER) (Voltaren XR)	➢ **Diclofenac (generic)** **Naproxen (generic)** **Ibuprofen (generic)** **Salsalate (generic)** **Piroxicam (generic)**
Diltiazem ER (Cardizem CD) Diltiazem ER (Dilacor XR) Diltiazem ER (Diltia XT) Diltiazem ER (Diltiazem XR)	➢ **Diltiazem ER (Tiazac)**
Etodolac ER (Lodine XL)	➢ **Etodolac (generic)** **Ibuprofen (generic)** **Naproxen (generic)** **Sulindac (generic)** **Piroxicam (generic)**
Famciclovir (Famvir)	➢ **Acyclovir (generic)**
Nabumetone (Relafen)	➢ **Salsalate (generic)** **Naproxen (generic)** **Ibuprofen (generic)** **Sulindac (generic)** **Piroxicam (generic)**
Naproxen sodium ER (Naprelan)	➢ **Naproxen (generic)** **Ibuprofen (generic)** **Salsalate (generic)** **Sulindac (generic)** **Piroxicam (generic)**
Nifedipine ER (Procardia XL)	➢ **Nifedipine ER (Adalat CC)**
Oxaprozin (Daypro)	➢ **Salsalate (generic)** **Naproxen (generic)** **Ibuprofen (generic)** **Sulindac (generic)** **Piroxicam (generic)**
Oxybutynin ER (Ditropan XL)	➢ **Oxybutynin (generic)**
Tolterodine (Detrol)	➢ **Oxybutynin (generic)**
Valacyclovir (Valtrex)	➢ **Acyclovir (generic)**
Zileuton (Zyflo)	➢ **Montelukast (Singulair)**

	Zafirlukast (Accolate)

Appendix B: Summary of efficacy, safety and cost issues associated with celecoxib (Celebrex; Searle/Pfizer)

1. Celecoxib does not appear to be any more or any less effective than other non-steroidal anti-inflammatory drugs (NSAIDs) in treating the symptoms of osteoarthritis (OA) or rheumatoid arthritis (RA).
2. The potential benefit of a cyclooxygenase-2 (COX-2) inhibitor such as celecoxib is primarily due to the lack of inhibition of cyclooxygenase-1 (COX-1) at therapeutic doses. Lack of COX-1 inhibition is mechanistically related to a potential decrease in the risk of GI adverse events (ulceration, bleeding, and perforation). Celecoxib lacks the platelet effects associated with other NSAIDs. Celecoxib does not appear to differ from other NSAIDs in terms of renal adverse effects or use during pregnancy.
3. Labeling for celecoxib includes the same warnings about increased risk of adverse gastrointestinal (GI) events as other NSAIDs. During its first three months on the market, 10 deaths and 11 serious gastrointestinal events (bleeding or ulcer) were reported in patients receiving celecoxib. This must be considered in the context of the number of patients who have been exposed to celecoxib during this period, as well as the expected background rate of adverse GI events in patients not exposed to NSAIDs.
4. Trials with celecoxib have shown a significant reduction in the incidence of endoscopically detected ulcerations compared to other NSAIDs. The correlation between endoscopic ulcers and actual GI adverse events is unclear. Premarketing trials with celecoxib were not designed to collect outcomes data on actual events, and no firm conclusions can be drawn from these results.
5. Overall, about 10% of patients (20.7 million) in the U.S. have OA; about 1% (2.1 million) have RA. Patients with RA are at greater risk for NSAID-induced adverse events because they are older, receive higher NSAID doses, and are more likely to be receiving other medications that increase risk.
6. For patients with rheumatoid arthritis (RA), the annual rate of GI hospitalizations is about 1.46% in patients taking NSAIDs compared to 0.27% in patients not taking NSAIDs. Number-needed-to-harm (NNH) = 84. For patients with osteoarthritis (OA), the annual rate of GI hospitalizations is about 0.73% in patients taking NSAIDs compared to 0.29% in patients not taking NSAIDs. NNH = 227.
7. *If the assumption is made that the rate of GI adverse events in patients receiving celecoxib is equal to the rate in patients not receiving NSAIDs,* 84 RA patients or 227 OA patients (or an even greater number of patients in the general patient population) would have to be treated with celecoxib for 1 year in order to avert 1 GI hospitalization. Treating 84 RA patients with celecoxib would increase annual drug costs by approximately $41,403 compared to treatment with conventional NSAIDs. Treating 227 OA patients with celecoxib would increase annual drug costs by approximately $111,888 compared to treatment with conventional NSAIDs. (Note: these estimates are based on the mean daily cost for NSAIDs in the National Mail Order Pharmacy (NMOP) program during calendar year 1998 (about $0.71) and an estimated daily cost for celecoxib of $2.06. Facilities with a lower mean daily cost for NSAIDs would experience greater increases in drug costs if patients were switched from current NSAID therapy to celecoxib.)
8. Use of COX-2 inhibitors such as celecoxib may decrease costs by reducing the number of patients who require concomitant treatment with misoprostol, H2 blockers, or proton pump inhibitors (PPIs). It is difficult to quantify the number of patients who could successfully be taken off H2 blockers or PPIs, since patients may require treatment with such agents for conditions that are independent of NSAID use.
9. Risk factors for increased risk of NSAID-induced GI adverse events include previous history of GI complications, age, concomitant use of corticosteroids and anticoagulants, high doses of NSAIDs, and general health status.
10. A prescribing guideline designed to target the use of celecoxib to patients at high risk for a GI adverse event would minimize the number of patients who must be treated to avert such an event and maximize the *potential* safety benefit associated with celecoxib. It must be noted that an actual reduction in the rate of GI adverse events with celecoxib has not yet been demonstrated in clinical trials. Outcomes studies to address this question are currently in progress.

Fort Sam Houston, TX 78234-6190

MCCS-GPE 5 February 1999

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with Health Affairs policy 98-025, a meeting of the DoD P&T committee convened at 0800 hours on 5 February 1999, at the Skyline office complex in Falls Church, Virginia.

2. MEMBERS PRESENT:

COL William D. Strampel, MC	Co-chairman
COL Daniel D. Remund, MS	Co-chairman
COL Rosa Stith, MC	Army Representative
LTC Judith O'Connor, MC	Army Representative
Ms. Danielle Doyle, DAC	Army Representative
CDR Terrance Egland, MC	Navy Representative
LCDR Denise Graham, MSC	Navy Representative
LCDR John Tourtelot, MC	Navy Representative (alternate)
LtCol John R. Downs, MC	Air Force Representative
LtCol William Sykora, MC	Air Force Representative
LtCol (Sel) Greg Russie, BSC	Air Force Representative
LCDR Pamela Stewart-Kuhn	Coast Guard Representative (alternate)
Capt Debra Parrish, BSC	DSCP Representative
Mr. John Lowe	VA Representative
Mr. Kirby Davis	Anthem Alliance Representative
Ms. Ray Nan Berry	Foundation Health Representative
Mr. William Hudson	Humana, Inc., Representative
Mr. Ron McDonald	Sierra Military Health Service Representative
Mr. Gene Lakey	TriWest Representative

3. OTHERS PRESENT:

CAPT (Sel) Charlie Hostettler	DoD Pharmacy Program Director
MAJ Mickey Bellemin, BSC	DSCP
Mr. Tom Kellenberger	Merck-Medco Representative
Ms. Shana Trice, DAC	Army

4. ADMINISTRATIVE ISSUES:

A. New attendees were introduced:

(1) CAPT (Sel) Charlie Hostettler - DoD Pharmacy Program Director
(2) LCDR John Tourtelot - Pharmacist/Endocrinologist, Bethesda Naval Medical Center

B. COL Strampel stated that this is his last duty day and that he is relinquishing his co-chair duties. MAJ Steve Humburg, MC, USAF, will replace COL Strampel as the physican representative from the TRICARE Management Activity (TMA) to the DoD P&T Committee.

C. The DoD P&T committee charter states that the physician co-chair is to be selected from within the membership. The committee selected CDR Terry Egland as the physician co-chair.

D. An audio recording of the committee meeting is being made to assist in preparation of the minutes. The tape will be destroyed after the minutes are written.

5. OLD BUSINESS:

A. The committee reviewed the minutes from the 13 November 1998 meeting and accepted them as written.

B. All financial disclosure statements have been submitted.

C. Alternate P&T members have still not been identified for the Army. (OPEN)

D. Potential limitations on fertility drugs in the NMOP: The PEC reviewed the medical literature and found studies showing modest reductions in the success rate with fertility drugs as the number of treatment cycles increased. However, there is no precipitous drop in the success rate that would provide a definitive clinical rationale for limiting treatment to a specific number of cycles. Guidelines and criteria developed by Merck-Medco for other health plans suggest continuation of drug therapy for up to six months. Continuation of therapy beyond six months is typically handled on a prior authorization basis. The NMOP contract does not currently provide a mechanism for prior authorization.

The committee decided that more information is needed about fertility drug usage in the NMOP before the committee is willing to explore the establishment of a prior authorization process. The NMOP is to provide information about the number of patients treated, the distribution of those patients according to number of treatment cycles, and the drug therapy costs. (OPEN)

E. Migraine therapy: The clinical practice guideline group confirmed that it does not plan to develop a guideline for migraine therapy. Capt Parrish stated that the NMOP already has migraine product quantity limits that are similar to what Merck-Medco recommends for other health care plans. These quantity limits have not engendered large numbers of patient complaints. Some committee members commented that the NMOP quantity limits are more generous than the quantity limits typically established at MTF pharmacies. Capt Parrish remarked that patient complaints more frequently involve prescriptions for unapproved uses of the drugs (e.g. sumatriptan 50 mg twice daily for a 90-day supply).

   The committee concluded that it is unclear whether a problem actually exists regarding migraine therapy in the NMOP. The NMOP is to provide drug usage data for migraine therapy and include, if possible, an assessment of the extent to which patients obtain migraine medications simultaneously from the NMOP, retail network and MTF pharmacies. (OPEN)

F. Sildenafil (Viagra) policy: COL Strampel stated that a change in the policy or publication of an implementation plan to address flaws in the policy are unlikely to occur. The PEC developed a one-page guideline sheet for Merck-Medco to fax to prescribers so that they can certify that the clinical guideline has been met before Viagra is dispensed. The NMOP has not started to use the guideline sheet. The delay in implementation is presumed to be due to an ongoing legal review of the document by Merck-Medco.

G. Oral contraceptives: Capt Parrish stated that more companies have agreed to offer the same prices for different size packs of oral contraceptives (e.g., 21-, 28-day packs). Sufficient progress has been made to close out this issue.

H. Impact of worldwide flu shots: This item was in reference to a paper that appeared just prior to the last meeting indicating that a push to immunize children against the flu might yield even more benefit than that realized from immunizing older people. This issue is not within the purview of the committee.

6. NEW BUSINESS: FDA priority review drugs—automatic consideration for the BCF and NMOP

   A. **None of the drugs discussed below were added to the BCF** because they are not essential for every MTF to have on their formulary to meet the primary care needs of patients. Committee members were reminded of the four categories that a drug may occupy regarding availability through the NMOP:

(1) **Drug is on the NMOP preferred drug list (PDL)**.

(2) **Drug is not on the NMOP PDL but is "mapped" to one or more drugs that are on the NMOP PDL.** Prescriptions for drugs in this category are filled by the NMOP when none of the drugs on the NMOP PDL can satisfy the clinical needs of the patient. Mapping associates a drug that is not on the NMOP PDL with one or more drugs that are on the NMOP PDL. When a prescription is received for a drug in this category, the NMOP will contact the prescriber to attempt to change the prescription to a drug that it is mapped to on the NMOP PDL. If the prescriber determines that none of the drugs on the NMOP PDL will meet the clinical needs of the patient, the prescription will be filled as originally written.

(3) **Drug is not on the NMOP PDL and is not mapped to a drug on the NMOP PDL, but prescriptions are filled by the NMOP.** Very few drugs will be included in this category. These drugs are deemed to be inappropriate for designation as "preferred" drugs, and they cannot be mapped to acceptable substitutes on the NMOP PDL. Nevertheless, these drugs may be beneficial for some patients and do not appear to present unacceptable safety risks. Prescriptions for drugs in this category will be filled without contacting the prescriber. Papaverine is an example of a drug in this category (see discussion in paragraph 8G).

(4) **Drug is excluded from the NMOP.** Prescriptions will not be filled for drugs that are excluded from the NMOP. The statement of work for the NMOP contract identifies a number of drugs that are excluded from the NMOP. The DoD P&T Committee may also exclude drugs from the NMOP. All newly approved drugs are automatically excluded from the NMOP unless and until the DoD P&T Committee places the drug in one of the three preceding categories.

B. Valrubicin (Valstar) solution is a chemotherapeutic agent that is instilled into the urinary bladder once a week for treatment of urinary carcinoma. **Exclude valrubicin from the NMOP** because it requires special handling as a cytotoxic agent and must be administered using aseptic technique and under the supervision of a physician experienced in the use of intravesical chemotherapeutic agents.

C. The discussion of valrubicin led to a discussion about the status of leuprolide depot (Lupron) injection, which is on the NMOP PDL, and leuprolide acetate for subcutaneous injection, which is not on the NMOP PDL. The leuprolide depot injection is known to be given at home. The committee decided to retain leuprolide depot injection on the NMOP PDL and **add leuprolide subcutaneous injection to the NMOP PDL.**

D. Octreotide acetate depot injection (Sandostatin LAR) is a long-acting intramuscular injection for the reduction of growth hormone and IGF-1 in acromegaly; the suppression of severe diarrhea and flushing associated with malignant carcinoid syndrome; and the

treatment of profuse watery diarrhea associated with VIPomas (vasoactive intestinal peptide secreting tumors). Octreotide subcutaneous injection is listed on the NMOP PDL. **Exclude Sandostatin LAR from the NMOP** because it is an intragluteal injection that is not designed for self-administration.

E. Lamivudine (Epivir-HBV) tablets and oral solution are indicated for the treatment of adults with chronic hepatitis B associated with evidence of hepatitis B viral replication and active liver inflammation. Epivir-HBV should not be used in HIV-infected patients because it contains a lower dose of lamivudine than is required for treatment of HIV infection. Testing for HIV is advised prior to beginning treatment with the drug and periodically during treatment. **Add Epivir-HBV to the NMOP PDL** because of its clinical effectiveness for the treatment of hepatitis B and because other dosage forms of lamivudine are on the NMOP PDL.

F. Abacavir (Ziagen) is a nucleoside analogue reverse transcriptase inhibitor for combination treatment of HIV_1 infection in adults and pediatric patients older than 3 months of age. Prescriptions for abacavir are already being filled through the NMOP based on the committee's previous decision that HIV antiretrovirals would automatically be added to the NMOP PDL. A question arose about whether the "automatic addition" policy for antiretrovirals meant that the NMOP should start filling prescriptions for the drug even before the committee formally approved the addition of the drug to the NMOP PDL. The committee confirmed the **addition of abacavir to the NMOP PDL** and decided that in the future a committee co-chair should give the NMOP interim approval to fill prescriptions for antiretrovirals until the committee formally approves the addition of the drug to the NMOP PDL.

G. Celecoxib (Celebrex), commonly known as a COX-2 inhibitor, is indicated for relief of the signs and symptoms of osteoarthritis and adult rheumatoid arthritis. At least one other COX-2 inhibitor is expected to enter the market in the near future. Celecoxib does not appear to be any more effective than NSAIDs for osteoarthritis and adult rheumatoid arthritis. Clinical trials comparing celecoxib to naproxen or ibuprofen show that celecoxib is associated with a lower incidence of endoscopically determined ulcerations. However, definitive evidence that celecoxib reduces the incidence of clinically relevant gastrointestinal events is not yet available. The official labeling for celecoxib includes warnings against gastrointestinal side effects similar to those for NSAIDs. Celecoxib is similar in cost to brand name NSAIDs, but is many time more expensive than generic NSAIDs. Prescribing guidelines will likely be required to target usage of COX-2 inhibitors for patients requiring chronic NSAID therapy who are at increased risk for gastrointestinal problems. The minimal amount of available information concerning the actual clinical benefit of celecoxib makes it difficult to develop prescribing guidelines. The committee concluded that there is not a clear imperative to make celecoxib immediately available through the NMOP. The committee **tabled consideration of celecoxib until the next meeting** when more information will hopefully be available to more clearly quantify the clinical benefit that this agent potentially offers. **In the interim, celecoxib is**

excluded from the NMOP. The committee also suggested that MTFs might want to provide this drug through the special order process rather than add it to their formularies at this time. (OPEN)

H. The discussion of celecoxib led to a discussion about the presence of brand name NSAIDs on the NMOP PDL. The NMOP began in October 1997 with a closed formulary that did not include brand name NSAIDs. Brand name NSAIDs were added to the closed NMOP formulary because it was thought that many patients would obtain brand name NSAIDs through the retail network pharmacies at a higher cost to the government if they were not included on the NMOP formulary. The closed NMOP formulary changed to the NMOP PDL in April 1998 and brand name NSAIDs remained on the NMOP PDL. It was suggested that brand name NSAIDs should now be removed from the NMOP PDL and mapped to the generic NSAIDs because brand name NSAIDs do not offer incremental clinical benefits that are commensurate with their high cost compared to generic NSAIDs. The committee tabled this issue until the next meeting in order to consider the brand name NSAIDs and COX-2 inhibitors in an integrated fashion. (OPEN)

7. NEW BUSINESS: BCF Issues

A. Oxybutynin extended release (Ditropan XL): Oxybutynin oral is listed on the BCF, so Ditropan XL would automatically be included on the BCF unless it is specifically excluded. The committee decided to **exclude Ditropan XL from the BCF** because it is unlikely that the incremental clinical benefit will counterbalance the fact that it is more than four times more costly than the immediate release form of oxybutynin. The committee also decided to **map Ditropan XL to immediate release oxybutynin on the NMOP**, which is the same decision that was made at the last meeting for tolterodine (Detrol).

B. Timolol maleate gel (Timoptic XE): Timolol ophthalmic solution is listed on the BCF. The committee decided to **exclude Timoptic XE from the BCF** because it is unlikely to offer sufficient incremental clinical benefit to offset the fact that it is seven to nine times more costly than timolol ophthalmic solution.

C. Triamcinolone oral inhaler (Azmacort): A recent substantial increase in the DAPA price for Azmacort (raised from $7.95 to $12.90 per inhaler) caused the committee to consider the removal of Azmacort from the BCF. The PEC was recently informed that the manufacturer will reduce the price to $9.60 per inhaler effective 1 Mar 99. The committee voted to **table this issue**. The committee wants to be more certain about the price and also wants to ensure that the BCF adequately supports the asthma/COPD treatment guideline that is being developed by the DoD/VA Clinical Practice Guideline Workgroup. (OPEN)

D. Verapamil dosage forms: Verapamil oral is currently listed on the BCF. The committee decided to specify that the BCF listing for verapamil oral includes only the dosage forms

for which generic equivalent products are available. Generic equivalent products are available for the immediate release tablets (e.g. Calan, Isoptin, and others) and the sustained release tablets (e.g. Calan SR, Isoptin SR and others). All other forms of verapamil are excluded from the BCF (such as Verelan, Verelan PM and Covera HS).

E. "Brand Name Only" items: "A" rated generics are available for phenytoin and carbamazepine, but these drugs are still designated as "brand name only" on the BCF. The committee supports the position of the FDA that an "A" rated generic drug is both bioequivalent and therapeutically equivalent to the innovator (brand name) drug. The committee voted to **remove the brand name only designation for phenytoin and carbamazepine on the BCF**. The committee further stipulated that only "A" rated generic equivalent products should be substituted for the brand name products. The NMOP must comply with state laws and regulations that govern the substitutability of generic drugs, so the committee cannot necessarily apply the same policy to the NMOP. Capt Parrish stated that the NMOP operates under New Jersey regulations that currently do not allow generic substitution for phenytoin and carbamazepine.

F. Montelukast (Singulair): Portsmouth Naval Medical Center requested the addition of montelukast to the BCF and NMOP PDL. The BCF does not include any leukotriene receptor antagonists. Zafirlukast (Accolate) is on the NMOP PDL. Montelukast is not on the NMOP PDL but is mapped to zafirlukast. Montelukast is indicated for use in patients as young as six years of age while zafirlukast is only approved for patients aged 12 years and older. Montelukast may also cause less diarrhea, can be given without regard to meals, and is a once-daily agent. The committee **did not add montelukast to the BCF** because it is not an agent that every MTF should be required to have on its formulary. The committee noted that excluding montelukast from the BCF does not preclude any MTF from having montelukast on its formulary. The committee **added montelukast to the NMOP PDL** because it offers clinical advantages commensurate with the higher cost ($1.39 per day for montelukast versus $1.07 per day for zafirlukast). Additionally, Capt Parrish reported that the switch rate for monelukast prescriptions in the NMOP is low, and that the NMOP fills more prescriptions for montelukast than anyother agent not listed on the NMOP PDL.

8. NEW BUSINESS: Other NMOP Issues

A. Report on top "mapped" items: Capt Parrish identified the ten mapped agents for which the NMOP received the most prescriptions. Each time a prescription is received for a mapped agent, the NMOP calls the prescriber to request a change to an agent that is on the NMOP PDL. The "switch rates" identified below refer to the percentage of prescriptions that are switched to agents that are on the NMOP PDL and the number of prescriptions were received over a 6-month period. The committee changed the NMOP status of the various drugs as described below. [Note: In order to make more informed decisions about the NMOP PDL, the committee requested that more data be provided in the future about what prescriptions are being switched to and the relative efficacy, cost

and safety of the various agents.]

(1) Montelukast (Singulair): decision already made to **add to NMOP PDL**.

(2) Glimepiride (Amaryl): Received 912 prescriptions and attained a 15% switch rate. Information on the agents these prescriptions were switched to is not available (i.e. whether a change was made to Glucotrol XL or to generic sulfonylureas). The committee **added glimepiride to the NMOP PDL** on the supposition that glimeperide prescriptions received by the NMOP would most likely be switched to Glucotrol XL, which is more expensive than glimeperide.

(3) Loratadine and pseudoephedrine (Claritin-D 12-Hour and Claritin-D 24-Hour) tablets: The NMOP PDL currently includes fexofenadine (Allegra) and loratadine (Claritin), but does not include the dosage forms that combine these agents with pseudoephedrine. The committee **added Claritin-D 12-Hour, Claritin-D 24-Hour, and Allegra-D tablets to the NMOP PDL** because they cost the same or only slightly more than the plain loratadine or fexofenadine dosage forms.

The committee also considered a request from Walter Reed Army Medical Center (WRAMC) to add cetirizine (Zyrtec) to the NMOP PDL to support WRAMC's new guidelines which may increase the number of cetirizine prescriptions that are submitted to the NMOP. WRAMC is implementing a rhinitis clinical practice guideline that identifies cetirizine as the lead antihistamine. WRAMC submitted documentation indicating that cetirizine (1) is slightly less expensive than other "non sedating" antihistamines and less than half as expensive if tablets are broken in half, (2) has a pediatric indication down to age 2 and is nonsedating at the 5 mg dose in the under 12 age group, and (3) enables WRAMC to comply with the new Joint Task Force Practice Parameters on Diagnosis and Management of Rhinitis. The **committee added cetirizine to the NMOP PDL**. The committee also decided that astemizole (Hismanal) should remain mapped, and that the mapping should be expanded to include the newly added agents.

(4) Tamsulosin (Flomax): **Leave tamsulosin mapped to other alpha-1-adrenergic blockers**.

(5) Norgestimate and ethinyl estradiol (Ortho Tri-Cyclen): Received 754 prescriptions. **Add Ortho Tri-Cyclen to the NMOP PDL**.

(6) Torsemide (Demadex): Received 736 prescriptions and attained a 22% switch rate. The committee decided to leave **torsemide mapped to other diuretics** since most of the switches were probably to a generic furosemide at significantly lower cost.

(7) Mometasone nasal spray (Nasonex): Received 404 prescriptions and attained an 81% switch rate. The committee **tabled consideration of this agent** until prices for agents in this category are known with greater certainty. (OPEN)

(8) Irbesartan (Avapro): Attained a 55% switch rate. **Leave irbesartan mapped** to other angiotensin II receptor antagonists.

(9) Bisoprolol/hydrochlorothiazide (Ziac): Received 628 prescriptions and attained a 12% switch rate. It was not clear to which drugs the prescriptions were being switched. The difficulty in recommending an alternative for a combination product such as Ziac was discussed. The committee voted to **add Ziac to the NMOP PDL**.

(10) Insulin analog injection (Humalog): Received 362 prescriptions with a 0% switch rate. The committee voted to **add Humalog to the NMOP PDL**.

B. Handling of high-dollar items in NMOP: The committee considered a proposal to establish an NMOP prior authorization process that is accomplished by the entity (MTF or MCS contractor) that is at financial risk for the prescription. The committee asked the NMOP COTR, the PEC, and the MCS contractors to work out a draft design of an NMOP prior authorization process that the committee could review prior to forwarding any recommendations to TMA or Health Affairs. (Open)

C. Quantity limits on eye drops: The NMOP computer system allows large quantities of ophthalmic drops for allergic conditions to be dispensed based on the maximum possible doses per day. Until the computer system can be modified to alleviate this problem, Capt Parrish sought guidance from the committee on reasonable quantity limitations. The committee decided to limit quantities for ophthalmic drops for allergic conditions to a maximum of two bottles per month or six bottles per three months. The committee asked the NMOP COTR to provide a list of the agents that will be subject to this limitation. The NMOP COTR will also identify any other ophthalmic agents that should be considered for quantity limitations. (OPEN)

D. Leflunomide (Arava): A decision on leflunomide was tabled at the last meeting. The NMOP PDL includes six other disease-modifying antirheumatic drugs (DMARDs): methotrexate, sulfasalazine, hydroxychlorquine, auranofin, penicillamine, and azathioprine. Drug acquisition cost for one year of therapy with leflunomide would be about $1900. Other DMARDs are less expensive, but mapping leflunomide to other DMARDs would likely result in few switches to agents on the NMOP PDL. Leflunomide appears to represent a therapeutic advance in a relatively well defined population of patients and may serve as an alternative to methotrexate. The committee voted to **add leflunomide to the NMOP PDL**. **Leflunomide was not added to the BCF**.

E. Urea 40% topical (Carmol-40 and others): This is a topical agent used as a moisturizing agent for severely dry skin or under an occlusive dressing to remove diseased nails. The committee **approved addition of this agent to the NMOP PDL**. The committee did not specify a quantity limitation, but the NMOP contracting

officer's technical representative (COTR) is to assess the need for a quantity limitation and report back to the committee. (Open)

F. Quinine: Quinine has historically been used to treat night leg cramps, although this has never been an approved indication. In 1994 the FDA ordered a halt to the marketing of over-the-counter (OTC) quinine sulfate for night leg cramps based on its serious risks. In 1995 the FDA ordered a halt to the marketing of prescription quinine for this use because, even under a physician's care, the risks outweigh any possible benefits. Quinine is now available only as a prescription drug for the second line treatment of malaria. The committee voted to **exclude quinine from the NMOP** in order to preclude inappropriate use of the drug for night leg cramps. The relatively small number of patients who require quinine for second line treatment of malaria can obtain the medication through MTF pharmacies or retail network pharmacies. No new prescriptions will be filled at the NMOP, but existing refills will be honored.

G. Papaverine: Papaverine is a pre-1962 drug that is classified as probably effective for the relief of cerebral and peripheral ischemia associated with arterial spasm and myocardial ischemia complicated by arrhythmias. Given the limited evidence of clinical effectiveness, the committee does not want to list papaverine on the NMOP PDL. Mapping papaverine to other agents is not practical because there is not a specific agent to suggest as an alternative to papaverine. The committee decided that **papaverine will not be on the NMOP PDL and will not be mapped, but prescriptions for papaverine will continue to be filled by the NMOP.**

H. Tobramycin nebulizer solution (TOBI): This is the only nebulizer solution available for treatment of pseudomonas infection in cystic fibrosis patients. A number of other nebulizer solutions are currently supplied by the NMOP. The committee voted to **add TOBI to the NMOP PDL**.

I. Ofloxacin (Floxin) and grepafloxacin (Raxar) package sizes: Capt Parrish reported that special dose packs has recently been introduced for these agents. The prices of these dose packs are very high in relation to simply dispensing the equivalent number of tablets. In contrast, the Zithromax "Z-pak" is less expensive for the NMOP to dispense than 6 tablets. The committee decided to **exclude the ofloxacin and grepafloxacin dose packs from the NMOP.** The NMOP is to offer to fill prescriptions for ofloxacin and grepafloxacin dose packs with the equivalent number of tablets from traditional packaging.

The committee also authorized the NMOP to routinely exclude other more expensive special packaging from coverage through the NMOP when the special packaging does not offer sufficient incremental benefit to justify a higher cost. The general rule is that the substitution must be less expensive than the special packaging and result in no difference in the education or the therapy received by the patient. For example, it would not be feasible to substitute for something like a Medrol dose-pak because it

would be difficult to explain the dosing regimen to patients. The NMOP COTR will routinely report such exclusions to the committee for its concurrence.

J. Nitroglycerin patches: A review of DAPA prices revealed that Nitrodur is significantly less expensive at $.26 per patch than other brands of nitroglycerin patches. The Nitrodur brand offers an extensive array of patch strengths. The committee voted to **specifically list only the Nitrodur brand of nitroglycerin patch on the NMOP PDL. All other brands of nitroglycerin patches will be mapped to the Nitrodur brand**.

K. Antivirals for herpes: Acyclovir and valacyclovir (Valtrex) are currently listed on the NMOP PDL, while Famvir (famciclovir) is mapped to these agents. All three agents are indicated for the treatment of herpes zoster (shingles), recurrent genital herpes (herpes simplex), and suppression of recurrent genital herpes. Famciclovir is indicated for cold sores in HIV patients. Acyclovir is indicated for the treatment of varicella (chicken pox). Depending on the indication, famciclovir and valacyclovir range from three to seventeen times more expensive than acyclovir. The substantially greater cost of famciclovir and valacyclovir appears to outweigh any incremental clinical benefit they might offer over acyclovir. The committee voted to **remove valacyclovir (Valtrex) from the NMOP PDL and to map both valacyclovir and famciclovir to acyclovir** as the more cost-effective alternative. Merck-Medco will place calls to physicians to encourage the use of acyclovir when new prescriptions are submitted for famciclovir or valacyclovir. Existing refills for valacyclovir and famciclovir will be honored. The rate of switching from these agents to generic acyclovir will be monitored by the NMOP.

L. Enbrel (Etanercept): Etanercept is indicated for reduction in signs and symptoms of moderately to severely active rheumatoid arthritis in patients who have had an inadequate response to one or more disease-modifying antirheumatic drugs (DMARDs). Etanercept can be used in combination with methotrexate when patients have an inadequate response to methotrexate alone. Etanercept is given via subcutaneous injection twice weekly and is designed and packaged with necessary supplies for self-administration. It has been shown to be effective for rheumatoid arthritis; however, little evidence is available on long-term use and symptoms return promptly after discontinuation. The drug cost for one year of therapy is approximately $8,500.

Given the extremely high cost of etanercept, it may be important to establish a prescribing guideline to ensure that it is used only for patients for whom it is clearly indicated. Information is also needed regarding the manufacturer's shipping policies and the necessity for shipping the drug on dry ice. The committee agreed to **table a decision on etanercept** to allow some time to explore the development of a prescribing guideline and to clarify the logistical issues associated with mailing the drug. **In the interim, etanercept is excluded from the NMOP.** (OPEN)

M. Urine glucose test strips and urine ketone test strips: The committee did not think these agents should be added to the NMOP PDL. Mapping urine glucose test strips and urine ketone test strips to other agents would be nonsensical. The committee decided that **urine glucose test strips and urine ketone test strips will not be added to the NMOP PDL and will not be mapped, but prescriptions for these agents will be filled by the NMOP.**

N. Niacin for antilipemic therapy: Various barriers work against the provision of niacin through the NMOP. The NMOP does not provide over-the-counter (OTC) items except for insulin and insulin syringes. The NMOP is also prohibited from providing OTC or prescription vitamins, with the exception of prescription multivitamins with folic acid for women ≤ 45 years of age. Capt Parrish stated that the NMOP is not permitted to dispense a niacin product that requires a prescription if the same dosage form and strength is also available OTC. Prescription dosage forms and strengths of niacin are generally also available as OTC products. The majority of the committee members agreed that niacin for antilipemic therapy should be available through the NMOP. The committee tabled this issue to allow consultation with TMA officials about how niacin can be made available for antilipemic therapy through the NMOP. (Open)

9. NEW BUSINESS: Other Issues

A. A managed care support contractor representative asked the committee to consider two proposals: 1) that the NMOP supply blood glucose testing devices and syringes for covered injections, and 2) that the NMOP waive additional co-pays for supplies when dispensed with a covered injection. These proposals are apparently related to a pending managed care support contract modification that specifies waiving of the co-pay for supplies when dispensed with the covered injection.

1. The NMOP statement of work limits authorized supplies to "insulin and related supplies limited to disposable insulin syringes and consumable products intended for home testing for glucose in the blood or urine." Syringes for covered injections other than insulin are not included in the NMOP statement of work. Blood glucose meters are not consumable products, so they are not included in the NMOP statement of work. The committee does not have the authority to unilaterally alter the NMOP statement of work.

2. The committee does not have the authority to waive the co-pays that are established in the NMOP statement of work.

B. BCF limitations on glucose test strips: Brooke Army Medical Center and Wilford Hall Air Force Medical Center (BAMC/WHMC) requested that the committee reconsider the BCF limits on glucose test strips. The BCF limits glucose test strips to a maximum of 100 per 90 days for non-insulin dependent diabetics and 400 strips per 90 days for diabetics who use insulin. The BCF does not limit quantities for any BCF agents other

than glucose test strips. BAMC/WHMC presented concerns about pregnant patients or patients using an insulin pump, who may use up to 7 strips per day, and patients on oral medications who may want or need to test more often than once per day. It was pointed out that it should be possible for facilities to have patients bring in their monitors, download, see what they are using, and supply appropriate amounts. The committee agreed that individual MTFs should be able to establish their own quantity limitations. The committee voted to **remove the quantity limitations on blood glucose test strips from the BCF**. No change was made to the quantity limits for the NMOP.

C. Application of quantity limits in NMOP to prescriptions filled in retail network pharmacies: This issue requires action by TMA and/or Health Affairs and is beyond the purview of the committee.

D. Contracting issues: Contracting issues were not addressed at this meeting.

10. ADJOURNMENT: The meeting adjourned at 1210 hours. The next meeting will be held on 14 May 1999 at the DoD Pharmacoeconomic Center, Fort Sam Houston, Texas, beginning at 0800 hours. All agenda items are to be submitted to the DoD PEC no later than 14 April 1999.

11. A summary of changes to the BCF and NMOP PDL is attached to these minutes.

<signed>	<signed>
DANIEL D. REMUND	TERRANCE EGLAND
COL, MS, USA	CDR, MC, USN
Co-chairman	Co-chairman

Summary of BCF Changes

1. Blood glucose test strips: Remove the BCF quantity limitations. MTFs may establish their own quantity limitations.

2. Carbamazepine oral: Remove the "Tegretol brand only" designation

3. Oxybutynin oral: Does not include extended release (Ditropan XL)

4. Phenytoin oral: Remove the "Dilantin brand only" designation

5. Timolol ophthalmic solution: Does not include timolol maleate gel (Timoptic XE)

6. Verapamil oral: Includes only the immediate release dosage forms (Calan, Isoptin, or equivalent) and sustained release dosage forms (Calan SR, Isoptin SR, or equivalent) for which generic equivalent products are available. Verapamil oral does not include other forms of verapamil for which generic equivalent products are not available (such as Verelan, Verelan-PM and Covera-HS).

Summary of NMOP Changes

1. **Added to the NMOP PDL:**
   Abacavir (Ziagen)
   Bisoprolol and hydrochlorothiazide (Ziac)
   Leuprolide (Lupron) subcutaneous injection
   Cetirizine (Zyrtec)
   Fexofenadine and pseudoephedrine (Allegra-D)
   Glimepiride (Amaryl)
   Insulin analog injection (Humalog)
   Lamivudine (Epivir-HBV)
   Leflunomide (Arava)
   Loratidine and pseudoephedrine (Claritin-D 12-Hour and Claritin-D 24-Hour)
   Montelukast (Singulair)
   Norgestimate and ethinyl estradiol (Ortho Tri-Cyclen)
   Tobramycin nebublizer solution (TOBI)
   Urea 40% topical (Carmol-40 and others)

2. **Deleted from the NMOP PDL:**
   Nitroglycerin patches: All brands of nitroglycerin patches other than Nitrodur
   Valacyclovir (Valtrex)

3. **Mapped to other agents on the NMOP PDL:**
   Oxybutynin extended release (Ditropan XL)

Nitroglycerin patches: All brands other than Nitrodur are mapped to Nitrodur
Valacyclovir (Valtrex)

4. **Not on NMOP PDL and not mapped, but prescriptions are filled by NMOP:**
   Papaverine oral
   Urine glucose and urine ketone test strips

5. **Excluded from the NMOP:**
   Celecoxib (Celebrex)
   Etanercept (Enbrel)
   Grepafloxacin dose pack
   Octreotide acetate depot injection (Sandostatin LAR)
   Ofloxacin dose pack
   Quinine
   Valrubicin (Valstar) solution

6. **Other changes/notes:**

   Limit ophthalmic drops for allergic conditions to a maximum of two bottles per month or six bottles per three months.
   Nitrodur is the only brand of nitroglycerin patch listed on the NMOP PDL.

MCCS-GPE 13 November 1998

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with the Office of the Assistant Secretary of Defense (Health Affairs) [OASD(HA)] Policy 98-025, signed 23 March 1998, a meeting of the DoD P&T committee convened at 0800 hours on 13 November 1998, at Fort Sam Houston, TX.

2. MEMBERS PRESENT:

COL William D. Strampel, MC	Co-chairman
COL Errol L. Moran, MS	Co-chairman
COL Rosa Stith, MC	US Army Representative
LTC Judith O'Connor, MC	US Army Representative
Ms. Danielle Doyle, DAC	US Army Representative
CDR Terrance Egland, MC	US Navy Representative
CDR Matt Nutaitis, MC	US Navy Representative
LCDR Denise Graham, MSC	US Navy Representative
LTC William Sykora, MC	US Air Force Representative
LtCol John R. Downs, MC	US Air Force Representative
LtCol (Sel) Greg Russie, BSC	US Air Force Representative
CDR Robert Rist	US Coast Guard Representative
Mr. John Lowe	VA Representative
LTC (P) George Crawford, MS	DMSB Representative
Capt Debra Parrish, BSC	DSCP Representative
Ms. Ray Nan Berry	Foundation Health Representative
Mr. William Hudson	Humana, Inc. Representative
Mr. Gene Lakey	TriWest Representative

3. OTHERS PRESENT:

COL Daniel Remund, MS	US Army
COL Ernest Sutton, M C	US Army

MCCS-GPE
SUBJECT: Minutes of the Department of Defense Pharmacy & Therapeutics Committee Meeting, 13 November 1998

LCDR Pamela Stewart-Kuhn	US Coast Guard
MAJ Mickey Bellemin, BSC	DSCP
LCDR Mark Richerson, MS	US Navy
Mr. Thomas Kellenberger	Merck-Medco Representative
Mr. Melvin Miller, DAC	US Army
Ms. Carol Scott, DAC	US Army
Mr. Shelby Tanner, SJA	US Army
Dr. Shana Trice, DAC	US Army

4. ISSUES DISCUSSED:

a. COL Strampel opened by stating that this will be his last meeting as co-chair since he is no longer at DoD and is now Chief of Staff for the Assistant Surgeon General of the Army at the Pentagon (1E518). At this time, no replacement has been named, however, COL Strampel stated that he would seek to get a replacement named prior to next meeting.

b. COL Moran introduced new attendees – COL Remund, PEC; MAJ Mickey Bellemi n, who will be Capt Parrish's replacement at DSCP; Mr. Thomas Kellenberger, Merck-Medco (M-M); and LTC (P) George Crawford, Defense Medical Standardization Board (DMSB). COL Moran stated that this would also be his last meeting as a member of the committee. COL Dan Remund, Deputy Director for the PEC will assume COL Moran's role as co-chair.

5. OLD BUSINESS:

a. The committee reviewed the minutes from 14 July meeting. Two changes to be made: (1) On page 5, para 6(e)(i) - change "prenatal" to "prenatal with folic acid 1mg" and change "women" to "female"; and (2) On page 6, para (9) - add weight loss and dental products (Gel-Kam and Peridex). Minutes were approved with these changes.

b. LCDR Graham commented on the last meeting minutes posted on website - Navy facilities have requested a more detailed explanation for why the committee selected/deleted certain products. The committee agreed with this request. (CLOSED)

c. Financial disclosure statements (OGE Form 450) - Mr. Tanner stated that a few members of the committee have not submitted statements. He requested that those named individuals submit such statements as soon as possible. (OPEN)

d. Alternate P&T membership: Coast Guard - LCDR Pamela Stewart-Kuhn; Air Force - LtCol Arnyce Pock and MAJ George Jones; Navy - CDR Mark Brouker and Capt Michael Fredericks; VA - Mr. Ron Moser. Army alternates not yet provided. (OPEN)

e. Fertility drugs - limitations and guidelines : Capt Parrish stated that some women were on fertility drugs for two years without results. As the cost continues to escalate for these drugs, should we continue administering to women who are infertile? COL Strampel stated that

although this is a sensitive issue, a limitation policy should be implemented. The committee recommended that this issue be forwarded to Health Affairs for consideration of establishing a DoD-wide policy. (OPEN)

f. Migraine therapy : This issue was referred to the Clinical Practice Guideline (CPG) group to consider doing a migraine treatment guideline. Their response was that they had no plans to develop a clinical practice guideline for migraine treatment and this would be better served by a PEC dispensing guideline and an educational promotional piece. COL Moran stated that he might not have satisfactorily conveyed the committee's desire to the CPG group. The committee recommended that additional communication be sent to LTC Dolter at MEDCOM, to ask the group to rethink this issue. COL Strampel said that he would also call COL Sid Adkinson on this issue. LtCol (Sel) Russie stated that if this issue is still on the table in January/February, there will be three graduate students coming to the PEC who will need a project to work on. This could be something for them to work on and gather information for guidelines. (OPEN)

g. Policy for Viagra – The policy (HA Policy 98-040) was signed by Dr. Sue Bailey on 6 August 1998. COL Strampel stated that after the policy was released he expressed several concerns about the policy to Health Affairs and sought to write an implementation plan that would clearly outline the intent of the policy. The policy contains ambiguities and questionable provisions such as:

- It appears to open up the special order process at military pharmacies to providers outside the military treatment facility, which was never the intent. The special order process is reserved only for military treatment facility providers.
- Removes Viagra from the National Mail Order Pharmacy (NMOP) formulary which would force many patients to Standard CHAMPUS at a much higher cost to DoD or would possibly cause a switch to Caverject or Muse, also at a higher cost
- Reimbursement of only six tablets per month through Standard CHAMPUS may be unenforceable.

The general counsel agreed that the policy, as written, would cause problems and COL Strampel wrote an implementation policy, which was never sent forward by Health Affairs Clinical. The Air Force has sent out their own implementation guidance and the Army Surgeon General has endorsed the HA policy. COL Moran stated that Viagra prescriptions are currently being filled at the NMOP because of the expected release of an implementation plan that would have authorized doing so. Capt Parrish stated that if Viagra were removed from the NMOP formulary, it would produce thousands of calls per month by Merck-Medco (M-M) to physicians to seek a change to more expensive agents, in which case, most physicians would probably not authorize anyway. In an effort to ensure that NMOP patients meet the HA guidelines, the PEC will develop a one-page guideline sheet which M-M will then fax to the physicians who will sign and certify that all the clinical guidelines have been met and return form within 48 hours. If not returned within that timeframe, M-M will return the prescription and inform the patient that the physician did not fill out the paperwork to have it filled. The committee recommended that COL Strampel go back to Health Affairs/TMA and seek publication of an implementation plan that would eliminate the flaws in the policy as outlined above. (OPEN)

h. NMOP antibiotic dispensing policy : CDR Egland circulated a list of antibiotics that were proposed to be exempt from the 30-day maximum quantity limitation. The committee limited the exemption for three agents (azithromycin, clarithromycin, and ciprofloxacin) to specific indications. Atovaquone and Cephalexin were deleted from the list. The committee approved the list as shown at Enclosure 1. (CLOSED)

i. Early refills - Capt Parrish s tated that M-M has implemented a procedure to handle early refill requests. Refills that are submitted early will be input into their computer, but not be filled for mail out until the due date. As an example, if a refill is due on the 14 th of the month and is sent in on the first, it will be entered and queued for mail out at the appropriate time. New prescriptions will be returned because there is no system in place to queue them for filling. Provisions have also been made for patients who call their prescription in too early. (CLOSED)

j. Oral contraceptives (21/28-day packages) - Capt Parrish stated that DSCP has asked manufacturers to reduce the prices for the 21-tablet packages to be comparable to the 28-tablet prices. Some price reductions have occurred, and some companies have not yet responded. (OPEN)

6. NEW BUSINESS:

a. **Priority Review Drugs - Automatic NMOP and Basic Core Formulary (BCF) Consideration :** None of the agents listed below were added to the BCF. Decisions regarding the NMOP preferred drug list are outlined below:

1) Rebetron® (combination of Rebetol® and Intron-A®) is currently mapped and being filled. **Add to NMOP** because it appears to offer a therapeutic advantage to interferon alone. Also **add to NMOP,** Roferon® and Infergen®.

2) Priftin® (rifapentine) - **Not added to NMOP** at this time. Wait until more usage has occurred before reconsidering. Mapped to rifampin.

3) Thalomid® (thalidomide) – **Exclusion from NMOP** due to restricted distribution requirements and mandatory testing requirements.

4) Preven® - **Exclusion from NMOP** due to time sensitivity of dosing.

5) Arava® (leflunomide) - defer decision pending evidence of usage and place in therapy. Will not be filled at NMOP at this time.

6) Sustiva® (efavirenz) – **Add to NMOP** because of indication.

7) Combivir® (lamivudine/zidovudine) – **Add to NMOP** because no more expensive than total cost of individual drugs. Committee recommended that **all oral retrovirals be added to NMOP.**

8) Xeloda® (capecitabine) – **Add to NMOP** because of indication. Committee recommended that **all oral antineoplastics be added to NMOP.**

9) Evista® (raloxifene) – **Add to NMOP** because of indication.

10) Plavix® (clopidogrel) – **Add to NMOP** because of indication and advantages to ticlopidine in aspects of dosing, monitoring requirements, and incidence of adverse effects..

11) Sulfamylon® (mafenide acetate powder) for 5% topical solution. **Not added to NMOP.** Cream is already on the NMOP. The solution has to be freshly prepared, so it is not a suitable dosage form for dispensing via the NMOP.

12) Detrol® (tolterodine) - Request from Naval Medical Center in Portsmouth to add to NMOP. Currently mapped to oxybutynin with a 20% success rate of switching. Currently, 370 patients are receiving 1mg or 2mg tablets through the NMOP. Although tolterodine has a slightly better side effect profile than oxybutynin, the committee voted to **not add to NMOP** because it is not more effective than oxybutynin and costs over four times as much.

b. **Other NMOP Issues:**

1) **Add to NMOP** – Rondec® oral drops because of listing on BCF.

2) **Add to NMOP** – Inhaler Spacers because of listing on BCF.

3) **Delete from NMOP** – Herplex® ophthalmic drops because no longer manufactured.

4) Mapping of agents by the PEC – drugs that have been mapped are: new angiotensin II receptor blocker candesartan (Atacand®) mapped to losartan, valsartan; new migraine agent rizatriptan (Maxalt® & Maxalt MLT®) mapped to sumatriptan; new SSRI citalopram (Celexa®) mapped to fluoxetine, sertraline, paroxetine; new low estrogen oral contraceptive Levlite® mapped to other oral contraceptives; mephobarbital (Mebaral®) mapped to phenobarbital; and mephenytoin (Mesantoin®) and ethotoin (Peganone®) mapped to phenytoin.

c. **BCF Issues:**

1) Non-steroidal ophthalmic agents – Fort Leavenworth requested a review of this class of drugs. Current BCF selection is flurbiprofen (Ocufen®), which lacks a primary care indication. Ketorolac (Acular®) would appear to be a more logical BCF selection because of its primary indication, however, it is more expensive than flurbiprofen. COL Moran also questioned if one is even needed for the BCF. It was suggested that local commands make their own selection. Mr. Lakey questioned the impact on the Managed Care Support contractors or inconvenience to patients. COL Strampel commented that removal of a drug from the BCF does not necessarily effect an MTF formulary because most facilities will more than likely keep an agent in this class on their local formulary. The committee removed Ocufen® from the BCF because it does not have a primary care indication that is necessary for inclusion on the BCF. The committee also did not recommend any other such agent for the BCF, preferring to let MTFs make their own choice.

2) Budesonide (Pulmicort®) and fluticasone (Flovent®) Oral Inhalers (see Enclosure 2): The committee approved the recommendation that budesonide and fluticasone oral inhalers be removed from the BCF for the reasons given in the enclosure. CDR Egland opposed removal from the BCF because his facility advocates that it is more cost effective in a subset of patients. The remaining committee members agreed that it is possible that these agents may be more cost effective for certain patients requiring high doses. However, there is insufficient evidence in the literature to strongly support this claim, and the committee does not want to mandate that facilities have a drug available at 3 to 8 times the cost of equally effective agents. Also, this decision does not prohibit individual MTFs from including these agents on their local formulary. These agents will remain on the NMOP.

3) Consider removal of specific brand designation (i.e., Coumadin® brand only) from the BCF because an AB rated generic agent is available. The primary reason the BCF listed

"Coumadin® brand (Dupont) only" is historical in nature. Back in the days of the depot system, DMSB had designated a few items as "sole source", meaning that only a designated brand could be purchased. At some point in time, Dupont brand warfarin was added as a "sole source" item. This listing carried over to the TriService Formulary (the predecessor to the BCF), then to the BCF. Also, there were not AB-rated warfarin products at that time. The first question is whether it is appropriate to have the brand name only designation on the BCF? Clinical evidence, from crossover studies, shows no difference in brand name vs. generic warfarin. Both are equally safe and efficacious according to the FDA. One initial difference is that Dupont-Merck, the maker of Coumadin®, came out with 3mg and 6mg strengths, which Barr, the maker of an AB-rated generic warfarin, did not have. However, Barr now does provide 3mg and 6mg strengths. Barr also does not currently provide the drug in unit dose packaging. Barr is anticipating providing unit dose packaging next spring. The generic tablets provided by Barr are scored, imprinted with the dosage strength, and are provided in the same color-strength combinations as the Dupont-Merck product. After discussion, the committee unanimously approved the removal of specific brand designation [i.e., Coumadin® brand (Dupont) only] from the BCF. The product will be listed on the BCF as "Warfarin oral". With this change, MTFs are now free to make their own choice as to which warfarin product is provided at their facility. The second question asked was should DoD contract for a sole source warfarin product in order to provide uniformity of product availability throughout DoD and, at the same time, generate cost savings? The committee agreed that a contract for a sole source warfarin product for DoD, either unilaterally or jointly with the VA, should be sought. COL Remund suggested that the committee make an interim special designation for dispensing warfarin through the NMOP to avoid potentially switching patients from the brand name to the generic and back to the brand name (depending on which agent is selected for the contract). The special designation would be that switching NMOP patients to generic warfarin would be held in abeyance until the contracting issue is completed. No calls will be made on prescriptions for Coumadin® , they will be filled as written. If a prescription comes in as "warfarin" or "substitution allowed", then the prescription can be filled with generic warfarin. The committee agreed. (CLOSED)

4) Long-acting nifedipine: Currently, the BCF states that all facilities must have a long-acting nifedipine on their formulary, the choices being either Adalat CC® or Procardia XL®. An MTF may have both on their formulary , however, they are not required to have both. COL Remund suggested that the PEC and DSCP go out for a blanket purchase agreement to identify the single form of nifedipine extended release that would be placed on the BCF without the closing the class. This would allow flexibility for MTFs who want both drugs and it would also achieve uniformity and possibly lower prices. Currently, the DAPA prices for Adalat CC® are $0.46 per tablet for all strengths (30mg, 60mg, & 90mg). DAPA per tablet prices for Procardia XL® are $0.65 for 30mg, $1.18 for 60mg, & $1.20 for 90mg. Since the VA has selected Adalat CC® as their preferred long-acting nifedipine and current prices favor Adalat CC®, COL Strampel recommended that the following be listed on the BCF: "Long-acting nifedipine (Adalat CC®) – class remains open. MTFs must have Adalat CC® on their formulary, but may choose to also have Procardia XL®". Again, this will help to establish uniformity across DoD, yet, allow MTFs to also add Procardia XL® if they so desire. The committee agreed. The committee also agreed that only Adalat CC® should be listed on the NMOP. Procardia XL® will be removed from the NMOP Preferred Drug List. (CLOSED)

5) Angiotensin II Receptors - should one be included on the BCF? The committee does not support adding such an agent to the BCF because most patients can be successfully treated with an ACE inhibitor. Should DSCP seek BPAs with the manufacturers in an effort to obtain lower prices? The committee supported this strategy , however, one will not be placed on the BCF. (OPEN)

d. **Contracting Issues:**

1) Non-sedating antihistamines – seek price reductions through BPAs, but not for the purpose of putting one on the BCF. Motion passed. (OPEN)

2) Selective Serotonin Reuptake Inhibitors (SSRIs) – COL Sutton stated that the proposed strategy is to select one SSRI for placement on the BCF and NMOP. The SSRI class would remain open on the BCF and the NMOP. This strategy would ensure uniform availability of one SSRI throughout DoD. Local P&T committees could add additional SSRIs to their formularies as necessary to meet the clinical needs of patients and the preferences of MTF providers. The committee approved the proposed contracting strategy and five of the six proposed evaluation factors as presented by Mr. Miller. These evaluation factors may be contract sensitive, therefore, specific details are not provided in these minutes. (OPEN)

3) Proton Pump Inhibitors (PPIs) – COL Sutton stated that the proposed strategy is to seek a sole source contract through DPSC to select one PPI, either omeprazole (Prilosec®) or lansoprazole (Prevacid®), for the BCF and NMOP. The PPI class would be closed. This means that the selected agent will be the only PPI that will be dispensed through the NMOP and at MTFs. MTFs would still be able to utilize a local special order process for patients not successfully treated with the selected agent. Managed Care Support contractors would use the prior authorization process for prescriptions that are for the agent not selected. The NMOP contract does not allow for the prior authorization process, therefore, only the selected agent will be dispensed through the NMOP. The committee approved the strategy. (OPEN)

4) Glucose Test Strips – LtCol (Sel) Russie stated that the proposed strategy is to seek a sole source contract through DPSC to select one glucose test strip for the BCF and NMOP, with the class being closed. Five companies have made pre-solicitation presentations. The committee approved the proposed contracting strategy and the evaluation factors as presented by LtCol (Sel) Russie. These evaluation factors may be contract sensitive, therefore, specific details are not provided in these minutes. Target date for issuing the solicitation is January/February timeframe. (OPEN)

5) Fluoroquinolones – Does the committee think it's reasonable to have a fluoroquinolone on the BCF? One concern raised by LtCol (Sel) Russie was do we really want to mandate a fluoroquinolone on small facilities or clinics? The committee members agreed that every facility should have a fluoroquinolone on their formulary. A notation will be place on the BCF that will indicate that each facility must have a fluoroquinolone on their formulary. A specific fluoroquinolone will not be selected unless a clear choice can be made due to voluntary price reductions. Until a BCF selection is made, individual facilities will make their own choice as to which fluoroquinolone is carried on their formulary. (OPEN)

e. Other Issues:

MCCS-GPE
SUBJECT: Minutes of the Department of Defense Pharmacy & Therapeutics Committee Meeting, 13 November 1998

1) Palivizumab (Synagis®) - Do we need prescribing guidelines for this agent? One issue is that some MTFs are/were sending patients downtown to obtain the drug and brought back to the hospital for administration. TriWest has had numerous communications with TMA to get this issue resolved, without success. COL Strampel will discuss this issue with the medical director of TMA. COL Strampel stated that it should be emphasized that if the hospital has responsibility for the primary care of the patient, they should be taking care of them and not sending them out. If the hospital does not have the capability for such treatment, which is unlikely, then, they should terminate their care and turn the patient over to the contractor. If the hospital is already providing the care, it is their responsibility to obtain the drug for the patient. Dr. Egland provided the committee with criteria for use of Synagis® and Respigam® that are being used at Naval Medical Center, Portsmouth, VA. LtCol (Sel) Russie recommended that these guidelines be attached to the minutes of this meeting to serve as a guide for developing local guidelines. The committee approved this recommendation (see Enclosure 3). (CLOSED)

2) Status of statins contract - COL Remund stated that DSCP issued the statin solicitation on 23 Oct 98. Offers are due on 23 Nov 98. The solicitation was issued without a final review by the PEC. DSCP is working on an amendment to correct various errors and modify certain clauses in the solicitation. DSCP may decide to extend the due date for offers. COL Remund reiterated the strategy that was approved at the last P&T meeting – the class will be closed and a minimum of one, maximum of two statins will be selected for the BCF and NMOP. Either atorvastatin or simvastatin will be selected in order to meet the needs of patients requiring large reductions in LDL-C. A contract will be established for a second statin if the addition of the second statin to the BCF and NMOP is predicted to be more cost-efficacious than atorvastatin or simvastatin alone. (OPEN)

3) Request that quantity limitations which are in effect at the NMOP be equally applied to prescriptions filled by the TRICARE contractors. The committee position was that an appeal be made to TMA to allow this. COL Strampel stated that this was an issue going back to HA to ask if they will write a policy to do this as a first step. (OPEN)

4) COL Strampel raised the issue of flu shots for all the children in the world. Will this raise any problems or impact us? May become a bigger issue by next year. Put on the agenda for next meeting. (OPEN)

5) Capt Parrish raised one issue of a letter she received from TMA concerning non FDA-approved indications for some odd things such as Nizoral® for prostate cancer, Clomid® for men, tamoxifen for brain cancer, etc. COL Moran stated that current rules allow for filling of prescriptions for off-label use if there is literature substantiating such use. TMA said they would pay for it under standard CHAMPUS although CHAMPUS does not set forth who conducts the medical review and who makes the ultimate decision. The rules aren't very clear. The decision for the committee may be that because of the limited number of patients in this situation it would be beyond the scope of the NMOP to deal with. Therefore, prescriptions for off-label indications would not be filled by the NMOP, on a routine basis. (CLOSED)

7. ADJOURNMENT:

MCCS-GPE
SUBJECT: Minutes of the Department of Defense Pharmacy & Therapeutics Committee Meeting, 13 November 1998

The meeting adjourned at 1215 hours. Location and date of next meeting has been set for 5 February 1999, 0800 hrs, at Health Affairs in Skyline Five. This will coincide with the TRICARE meeting, 1-5 Feb, in Washington, DC.

Enclosures

MCCS-GPE
SUBJECT: Minutes of the Department of Defense Pharmacy & Therapeutics Committee Meeting, 13 November 1998

Summary of BCF Changes

1. **Additions:**
   Nifedipine long-acting (Adalat CC®) (see pg 6-7)
2. **Deletions:**
   Budesonide (Pulmicort®) (see pg 5-6)
   Flurbiprofen (Ocufen®) (see pg 5)
   Fluticasone (Flovent®) (see pg 5-6)
   Nifedipine long-acting (Procardia XL®) (see pg 6-7)
3. **Other changes/notes:**
   Removal of "Coumadin® brand (Dupont) only" notation for Warfarin (see pg 6)
   Removal of notation that MTFs must have one long-acting nifedipine. The long-acting nifedipine of choice is Adalat CC® (see pg 6-7)

Summary of NMOP Changes

1. **Additions:**
   Combivir® (see pg 4)
   Evista® (see pg 4)
   Infergen® (see pg 4)
   Inhaler spacers (see pg 5)
   Plavix® (see pg 5)
   Rebetron® (see pg 4)
   Roferon® (see pg 4)
   Rondec oral drops (see pg 5)
   Sustiva® (see pg 4)
   Xeloda® (see pg 4)
2. **Deletions:**
   Herplex® ophthalmic drops (see pg 5)
   Procardia XL® (see pg 6-7)
3. **Exclusions:**
   Preven® (see pg 4)
   Thalidomide (Thalomid®) (see pg 4)
4. **Other changes/notes:**
   Approved list of antibiotics exempt from 30-day maximum quantity limitation (see pg 4)
   Merck-Medco implemented procedure for handling early refill requests (see pg 4)
   In future, all oral antineoplastics and oral retrovirals will be added automatically (see pg 4)
   Some price reductions obtained on 21-day oral contraceptives (see pg 4)
   Removal of Coumadin® brand only – patients not to be switched to generic, yet (see pg 6)

8:00 ANTI-INFECTIVE AGENTS EXEMPT FROM THE NMOP 30 DAY TREATMENT LIMIT

AHFS Classification	Anti-Infective Agent	FDA Indication	Non-FDA Indication	Comments
8:04 Amebicides (none – tx <20 days)				
8:08 Anthelmintics (none – tx is 30 days or less)				
8:12 Antibiotics				
8:12.04 Antifungal				
8:12.04 (addition)	Fluconazole (Diflucan®)	Cryptococcal, thrush prophylaxis & coccidiomycoci		
8:12.04	Flucytosine (Ancobon®)	Candida or Cryptococcus septicemias & UTI	Chromomycosis	
8:12.04	Griseofulvin (Fulvicin®, etc)	Ringworm infections		
8:12.04	Itraconazole (Sporanox®)	Blastomycosis, Histoplasmosis, Aspergillosis, Onychomycosis	Dermatophytoses, Pityriasis versicolor, Sebopsoriasis, Candidiasis	
8:12.04	Ketoconazole (Nizoral®)	Systemic funal infections	Onychomycosis, pityriasis versicolor, tinea pedis, corporis and cruuris, tinea capitis and vaginal candidiasis; advanced prostate ca; cushing's syndrome	
8:12.04	Nystatin (Mycostatin®, Nilstat®)	Candidiasis		
8:12.04 (addition)	Terbinafine (Lamisil®)	Onchomycosis		
8:12.06 Cephalosporins (deletion)				
8:12.06 (deletion)	Cephalexin (Kelfex®)		UTI Prophylaxis and osteomyelitis	
8:12.12 Macrolides				
8:12.12 (addition)	Erythromycin	Acne		
8:12.12 (addition)	Azithromycin	Mycobacterium avium Complex		**Over 30 days only for listed indication(s)**
8:12.12 (addition)	Clarithromycin	MAC		**Over 30 days only for listed indication(s)**
8:12.16 Penicillins				
8:12.16 (addition)	Penicillin V K or Penicillin G	Prophylaxis of Pneumococcal Infections and recurrent rheumatic fever	SS dx	
8:12.16 (addition)	Amoxicillin (Amoxil®)	Chronic UTI tx.		

AHFS Classification	Anti-Infective Agent	FDA Indication	Non-FDA Indication	Comments
8:12.24 Tetracyclines				
8:12.24 (addition)	Doxycycline (Vibramycin®)	Chemoprophylaxis of malaria		
8:12.24	Minocycline (Minocin®)	Inflammatory acne, Nocardiosis		
8:12.24	Tetracycline (Sumycin®)	Inflammatory Acne, H. Pylori, actinomycosis		
8:12.28 Miscellanous				
8:12.28 (addition)	Clindamycin (Cleocin®)	Toxoplasmosis, acne vulgaris		
8:16 Antituberculosis Agents				
8:16 (addition)	P-Aminosalicylic Acid (Sodium P.A.S®)	Retreatment of TB		
8:16 (addition)	Cycloserine (Seromycin®)	Active pulmonary & extrapulmonary TB		
8:16	Ethambutol (Myambutol®)	Primary agent in tx of TB		
8:16	Ethionamide (Trecator-SC®)	Treatment of TB when first line fails		
8:16	Isoniazid	Primary tx of TB		
8:16	Rifamate® - 150 mg INH with 300 mg Rifampin	Primary tx of TB		
8:16	Rifater® - 50 mg INH with Pyrazinamide 300 mg and Rifampin 120 mg	Primary tx of TB		
8:16	Pyrazinamide	Primary tx of TB		
8:16	Ribabutim (Mycobutin®)	Prevention of disseminated MAC		
8:16	Rifampin (Rifadin®)	Primary tx of TB		
8:18 Antivials				
8:18	Acyclovir (Zovirax®)	Chronic suppresssive tx of genital herpes		
8:18	Amantadine (Symmetrel®)	Influenza A Chemoprophylaxis		
8:18 (addition)	Famciclovir (Famvir®)	Suppression of genital herpes		
8:18	Ganciclovir (Cytovene®)	Prevention of CMV in HIV pts		
8:18 (addition)	Rimantadine	Prophylaxis of		

	(Flumadine®)	various strains of influenza A		

AHFS Classification	Anti-Infective Agent	FDA Indication	Non-FDA Indication	Comments
8:18.08 Antiretroviral Agents (all agents in class such as those listed here as new additions to class)				
8:18.08	Delaviridine Mesylate (Rescriptor®)	HIV Infection		
8:18.08	Didanosine (Videx®)	HIV Infection		
8:18.08	Indinavir (Crixivan®)	HIV Infection		
8:18.08	Lamivudine (Epivir®)	HIV Infection		
8:18.08 (addition)	Lamivudine/ Zidovudine (Combivir®)	HIV Infection		
8:18.08	Nelfinavir Mesylate (Viracept®)	HIV Infection		
8:18.08	Nevirapine (Viramune®)	HIV Infection		
8:18.08	Ritonavir (Novir®)	HIV Infection		
8:18.08	Saquinavir (Invirase®)	HIV Infection		
8:18.08	Stavudine (Zerit®)	HIV Infection		
8:18.08	Zalcitabine (Hivid®)	HIV Infection		
8:18.08	Zidovudine (Retrovir®)	HIV Infection		
8:20 Antimalarial Agents				
8:20	Chloroquine (Aralen®)	Malaria prophylaxis		
8:20	Hydroxychloroquine (Plaquenil®)	Malaria, lupus erythematous, rheumatoid arthiritis		
8:20	Mefloquine (Lariam®)	Malaria prophylaxis		
8:20	Pyrimethamine (Daraprim®)	Chemoprophylaxis of malaria, Toxoplasmosis		
8:20	Pyrimethamine/ Sulfadiazine (Fansidar®)	Malaria, toxoplasmosis		
8:20 (addition)	Doxycycline	Malaria Prophylaxis		
8:22 Quinolones				
8:22 (addition)	Ciprofloxacin (Cipro®)	Osteomeylitis, prostatitis, Mycobacterial Inf		**Over 30 days only for listed indication(s)**
8:24 Sulfonamides				
8:24 (addition)	Sulfadiazine	Toxoplasmosis in HIV , Nocardiosis, Prophylaxis of		

		Recurrent Rheumatic fever		
8:24	Sulfasalazine (Azulfidine®)	Ulcerative colitis		

AHFS Classification	Anti-Infective Agent	FDA Indication	Non-FDA Indication	Comments
8:26 Sulfones				
8:26	Dapsone	Leprosy, Dermatitis Herpetiformis, Malaria, PCP		
8:36 Urinary Anti- Infectives				
8:36 (addition)	Methenamine (Hiprex®, Urex®)	Prophylaxis of recurrent UTI		
8:36 (addition)	Nitrofurantoin (Macrodantin®)	Prophylaxis of recurrent UTI		
8:36 (addition)	Trimethoprim (Trimpex®)	Suppression of recurrent UTI, PCP		
8:40 Miscellaneous Anti- Infectives				
8:40 (deletion)	Atovaquone (Mepron®)	Pneumocystits carinii		750 mg bid for 21 days therefore <30 days.
8:40	Clofazimine (Lamprene®)	Leprosy	Tx of MAC, mycobatcterial infections	
8:40 (addition)	Co-trimoxazole	PCP prophylaxis, Nocardia, pneumonic plaque,, toxoplasmosis prophylaxis		

Budesonide and Fluticasone

1. Objective

a. Should Pulmicort Turbuhaler® (budesonide) and Flovent® (fluticasone) be retained on the Basic Core Formulary?

2. Cost Comparison Chart

Drug	Equivalent Puffs	Cost of Equivalent Puffs
Triamcinolone	4	$0.12
Flunisolide	4	$0.12
Beclomethasone 42 mcg	2	$0.04
Beclomethasone 84 mcg	1	$0.04
Fluticasone 44 mcg	4	$0.44
Fluticasone 110 mcg	2	$0.36
Fluticasone 220 mcg	1	$0.35
Budesonide 100 mcg	1	$0.33

3. Areas Where Evidence Is Sufficient

a. Clinical trials suggest that pulmicort and fluticasone are equally efficacious compared to other oral inhaled corticosteroids when used in equipotent doses.

b. Clinical trials suggest that use of higher potency corticosteroid inhalers results in patients being maintained on fewer puffs per day, possibly enhancing compliance.

c. Some patients may find benefit in using an inhaler that delivers an effective dose with fewer puffs per day.

d. Some patients may find budesonide's dry powder inhaler/delivery device easier to use than inhalers requiring coordination of a spacer device.

4. Areas Where Evidence Is Lacking

a. The PEC's selection of fluticasone and budesonide for inclusion on the BCF was based on an analysis of the effect of steroid inhaler usage on total costs (i.e. admissions, emergency department visits, lost productivity). However, this analysis may have overestimated the effect of multi-puff administration on regimen compliance.

b. There is no evidence in the literature that directly correlates the prescribed number of puffs per administration with adherence to the prescribed regimen.

c. There is no evidence in the literature that the benefits of fluticasone and budesonide (fewer puffs per day, increased compliance, and ease of use) directly produce a quantifiable, statistically significant difference in clinical outcomes (admissions, E.D. visits, symptom free days) of asthma care.

4. Recommendation:

The DOD PEC recommends that Pulmicort (budesonide) and Flovent (fluticasone) be removed from the BCF for the following reasons:

1. Lack of quantifiable evidence in the literature that the benefits of these drugs directly influence the clinical outcomes of asthma significantly more than their lower potency comparator drugs.

2. Possibility that the PEC's earlier analysis of asthma corticosteroid therapy may have overestimated the effect of potentially improved compliance on the overall cost of asthma therapy.

Eugene Moore, PharmD
DOD Pharmacoeconomic Center

Criteria for Use of Synagis® and Respigam® To Select Infant Patients*

1. For use with the approval of a staff neonatologist, pediatric pulmonologist, or pediatric cardiologist between the months of November and April.

2. Infants born at or less than 28 weeks gestational age, with or without the diagnosis of Chronic Lung Disease (CLD), and less than 12 months corrected age.

3. Infants born between 29 and up to 32 weeks gestational age with the diagnosis of CLD and less than 12 months corrected age.

4. Infants born between 29 and up to 32 weeks gestational age without the diagnosis of CLD and less than 6 months of corrected age.

5. Premature infants born at greater than 32 weeks gestation, discharged between November and March, will be considered on a case by case basis. Consideration will be given to severity of lung disease, need for supplemental oxygen and pulmonary medications.

6. Infants in the NICU at highest risk for severe RSV morbidity, potentially exposed to an index case of RSV in the NICU.

7. Patients with a diagnosis of CLD and less than two years of age who have received oxygen or medications (steroids, diuretics) for CLD within the past 6 months.

8. Infants with congenital heart disease will be considered on a case by case basis by a neonatologist or pediatric cardiologist.

9. Infants with cystic fibrosis, other forms of chronic lung disease, or pulmonary hypoplasia, will be considered on a case by case basis by a neonatologist or pediatric pulmonologist.

***** These criteria were prepared for use at Naval Medical Center, Portsmouth, VA, and is intended as a guide for use by medical treatment facilities within DoD

MCCS-GPE 14 July 1998

MEMORANDUM FOR Assistant Secretary of Defense (Health Affairs)

SUBJECT: Minutes of the Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee Meeting

1. In accordance with the Office of the Assistant Secretary of Defense (Health Affairs) [OASD(HA)] Policy 98-025, signed 23 March 1998, a meeting of the DoD P&T committee convened on 13-14 July 1998, at Fort Sam Houston, TX.

2. MEMBERS PRESENT:

COL William D. Strampel, MC	Co-chairman
COL Errol L. Moran, MS	Co-chairman
COL Rosa Stith, MC	US Army Representative
LTC Judith O'Connor, MC	US Army Representative
Ms. Danielle Doyle, DAC	US Army Representative
CDR Terrance Egland, MC	US Navy Representative
CDR Matt Nutaitis, MC	US Navy Representative
LCDR Denise Graham, MSC	US Navy Representative
LTC William Sykora, MC	US Air Force Representative
LtCol John R. Downs, MC	US Air Force Representative
MAJ Greg Russie, BSC	US Air Force Representative
CDR Robert Rist	US Coast Guard Representative
Mr. John Lowe	VA Representative
LtCol Wayne Cheatum, BSC	DMSB Representative
Capt Debra Parrish, BSC	DSCP Representative
Ms. Ray Nan Berry	Foundation Health Representative
Mr. William Hudson	Humana, Inc. Representative
Mr. Gene Lakey	TriWest Representative

3. OTHERS PRESENT:

CAPT Chuck Bruner	USCG
COL Patricia Hobbs, BSC	USAF

COL James Normark, BSC	USAF
COL Ernest Sutton, MC	USA
COL Roger F. Williams, MS	USA
Mr. Shelby Tanner, SJA	USA

4. ISSUES DISCUSSED:

a. P&T Committee members introduced themselves and gave a background review of their experience. COL Moran introduced the members of the DoD Pharmacy Board of Directors, managed care support contractors, and other attendees.

b. MAJ Russie gave a presentation on the global perspective of formulary management and an overview of the drug distribution systems within DoD.

c. COL Moran provided the committee with a background review of how and why this committee was formed and the role of the PEC.

d. Mr. Shelby Tanner explained the need for each member to fill out an OGE 450 form (Financial Disclosure Statement). Each member is required to fax a copy of this form to the PEC by next meeting date.

e. Selection of physician co-chair: COL Strampel, as a representative of TRICARE Management Activity, will serve as co-chair.

f. Meeting schedules, locations and meeting process: The next P&T committee meeting will be held 13 November 1998, in conjunction with the AMSUS meeting, in San Antonio, TX. Exact location to be determined. Subsequent meetings will be scheduled at each future meeting. The committee will request through the appropriate commands that an alternate representative be nominated for each member in the event the primary member is unable to make a meeting. The uniform for meetings will be casual civilian attire. Discussions will be limited to agenda items, unless there is a pressing issue. Submissions of topics for inclusion on the agenda should be submitted as soon as possible. The deadline for items to be included on the agenda is 30 days prior to meeting.

g. Policies/procedures regarding communication and interaction between pharmaceutical representatives and DoD P&T committee members: All communication, dealing with P&T issues, are to be routed through the PEC. COL Moran will assign a PEC staff member (non-P&T member) as a liaison. Individual members will determine to what extent they will interact with pharmaceutical representatives at their facility.

h. CDR Egland questioned who was the approval authority for P&T issues and meeting minutes. COL Moran responded that, as per the policy that established this committee, the P&T committee is the final approving authority for any and all changes to the BCF/NMOP and the meeting minutes, which will be posted to the PEC web page.

i. Policies/procedures for including/excluding/deleting products on the BCF/NMOP and Special Purchase Request Data Sheet: All Medical Treatment Facilities (MTFs) may submit requests for changes to the DoD P&T committee. Such requests must be recommended by the MTF P&T committee and approved by the MTF commander and must provide all information as required by Appendix A of the policy that established the DoD P&T committee. All MTFs will be notified of this requirement. The special purchase data sheet (Appendix B of the DoD P&T policy) will not come into effect until therapeutic classes are closed. Patient care will be the main focus as opposed to saving money.

j. Mechanism for interim changes: When an issue arises that requires timely action, COL Moran will call together a subgroup of the membership to develop a decision, which will then be communicated to all members for a consensus. This process will be accomplished within 48 hours. Such actions will be formally approved at the next scheduled meeting. In order to facilitate this process, COL Moran requested that each member inform him of all leaves or absences.

k. Treatment guidelines development: COL Moran informed the membership that DoD and VA are working together to develop treatment guidelines for specific diseases. The current joint effort includes: Tier 1: smoking cessation, hypertension, and lower back pain; Tier 2: reactive airway diseases, hyperlipidemia, AMI, and diabetes; Tier 3: depression/suicide prevention. A PEC member is involved in each of the workgroups. Decisions by these workgroups may affect decisions this P&T committee makes and vice versa.

l. Contracting Issues:

(1) Joint ventures with the VA:

(a) A Federal Pharmacy Executive Steering Committee (FPESC) was formed which will meet in August 1998 to identify classes of drugs suitable for joint contracting efforts. Both co-chairs of the DoD P&T committee are members of the FPESC.

(b) There currently are several contracting initiatives ongoing. These include: long-acting diltiazem, generic albuterol inhaler, generic cimetidine and ranitidine, and the SSRI class of drugs.

(2) Strategies and technical evaluation factors for product selection: DoD very much wanted to join with the VA in contracting for one or more HMG-CoA reductase inhibitors (statins), however, the VA unilaterally decided to continue with their current contract for lovastatin and simvastatin. Therefore, DoD (PEC and the Board of Pharmacy) decided to pursue a separate contract. COL Moran explained the proposed contracting strategy. He also explained the technical evaluation factors that the PEC is proposing for selecting the agent(s). The committee approved, unanimously, both the strategy and the technical evaluation factors.

(3) Categories for future contracting: COL Moran explained that efforts to pursue contracts are generally based on high-dollar, high-volume agents or drug classes. As such, the following list of drugs/classes were considered for contracting initiatives: Proton pump inhibitors, ACE inhibitors, long-acting nifedipine, and glucose test strips. The committee approved pursuing contracting initiatives for these, whether jointly with the VA, or unilaterally through the Defense Supply Center Philadelphia (DSCP). The decision to pursue joint contracts will be made by the

FPESC. Once efforts are underway, the interim decision process will be utilized for decisions on contracting strategies and use of technical evaluation factors.

m. BCF issues to be addressed:

(1) Deletion of Idoxuridine Ophthalmic Soln - no longer available: Committee concurred. In the future, all discontinued drugs will be automatically removed from the BCF and the committee will be notified at the next scheduled meeting. (CLOSED)

(2) Request from Madigan Army Medical Center (MAMC) to remove blood glucose test strips from BCF: The committee unanimously agreed that test strips should remain on the BCF because of the need to provide a uniform benefit across the Military Health System. COL Moran will prepare and send a response letter to MAMC, explaining the committee's decision. (CLOSED)

(3) Other issues: Mr. Bill Hudson, Humana, asked "When a class is closed, how long is it locked out for?" COL Moran responded that drug classes would only be closed through the issuance of a contract and that most contracts are for five years with annual renewal options. (CLOSED)

n. NMOP Issues to be addressed:

(1) Capt Parrish provided the committee with a brief history and summary of the NMOP program. She explained to the committee that DSCP is utilizing the formulary, prepared by the PEC, as a preferred agent list. If a prescription comes in for something that is not on the list, the mail order contractor, Merck-Medco (M-M), will call the physician and ask if the item can be switched to something that is on the list. If the prescriber does not want to change, then M-M will fill the prescription as written. (CLOSED)

(2) Combination products where both ingredients are currently on the preferred drug list: Since the patient would be required to pay two co-pays and the government two dispensing fees, the committee decided that the majority of such combination products should be added to the NMOP formulary. However, if the cost/benefit ratio comes into question (i.e., the price of the combination product is more than the cost of the two individual ingredients and the two dispensing fees), then the issue will be brought before the committee. (CLOSED)

(3) Dispense as written: The contractor fills between 2,000 and 3,000 such prescriptions per month. The Statement of Work (SOW) states that mandatory generic substitution will be utilized, unless the doctor justifies that a brand name product is necessary. Capt Parrish reviews all of these claims and there are many justifications that are questionable. She suggested that one way to handle such prescriptions is for M-M to FAX the prescriber a standardized form to justify the use of a brand name. Prescriber would be required to return the completed form prior to filling the prescription. If the doctor refuses to fill out the form, the medication will not be dispensed as written. The committee approved this recommendation with a few changes to include the date the physician reported the adverse reaction to the FDA. The following products will be dispensed as written: Birth control pills, carbamazepam (Tegretol®), digoxin (Lanoxin®), phenytoin sodium (Dilantin®), and warfarin sodium (Coumadin®). Currently, thyroids are also dispensed as written. That is to say, Synthroid filled with Synthroid, Levothroid with Levothroid, etc. (CLOSED)

(4) Coverage of antibiotics: Current policy is a maximum of a 21-day supply, if not on the exempt list (approximately 38 anti-infectives – includes antivirals, antifungals, & antibiotics).

The committee agreed that antibiotics should be filled through the NMOP, but only up to a 30-day supply, unless included on the exempt list. If a prescription is received for a greater than 30-day supply and drug is not on the exempt list, but has a definitive FDA approved diagnosis, the prescription will be filled for the greater amount. If the same occurs, but no diagnosis is given, the prescription will be filled for a 30 day supply. The explanation of benefits will direct them to member services to determine how to facilitate the 90 day supply. When a diagnosis is provided, M-M will fill the balance of the prescription and the additional co-pay for the patient will be waived. However, the government will incur the additional dispensing fee expense. CDR Egland will lead a subgroup (CDR Graham, Capt Parrish, and Ms. Doyle) to review the exempt list for potential changes. Capt Parrish will provide him with a printout of questionable greater than 30-day prescriptions. (OPEN)

(5) Coverage of vitamins: The committee decided that no changes need to be made.

(6) Review of product limitations in NMOP: The committee decided the following:

(a) Fertility Drugs – remain as a maximum of 30-day supply. PEC to review and provide recommendation to the committee. (OPEN)

(b) Diabetic Test Strips – change to a maximum of 400 strips per 90 days for insulin dependent diabetics and 100 strips per 90 days for non-insulin dependent diabetics. Same limitations for BCF. (CLOSED)

(c) Insulin syringes – remain at a maximum of 300 per 90 days. Same limitation for BCF. (CLOSED)

(d) Anti-emetics – remain at 15 tablets/30 days to max of 45 tablets/90 days. (CLOSED)

(e) Impotence – Viagra® to remain at maximum of 6 tablets per 30 days. Caverject® and Muse® changed to maximum of 6 per 30 days. (CLOSED)

(f) Migraine therapy – Imitrex® to remain as a maximum of 48 tablets of 25mg, 24 tablets of 50mg, and 8 injections per 30 days. New agents, such as the nasal product will default to the M-M clinical max. The committee recommends that the DoD/VA Practice Guideline Group consider addressing the need for guidelines for treating this condition. A letter will be sent to the group. (OPEN)

(g) High Dollar Pharmaceuticals – to remain unchanged; list includes a 30-day supply for myeloid stimulants, Interferon Alpha, Interferon Gamma, Erythroid stimulants, Sandostatin®, anti-hemophilic factors, and factor IX preps; and includes a 90-day supply for interferon beta, growth hormones, and Copaxone®. (CLOSED)

(h) Retin-A® – to remain unchanged; only to patients up to age 35. (CLOSED)

(i) Prenatal Vitamins – to remain unchanged; only to women up to age 45. Same limitations for BCF. (CLOSED)

COL Hobbs suggested that any future quantity limitations and preferred agent status that applies to the NMOP should also be the same for the retail network. The committee agreed, however, such changes will probably have to be approved by TMA-West.

(7) New FDA approved products – "mapping" to preferred agent list: "Mapping" refers to the process where newly marketed pharmaceuticals, that are not included on the NMOP, are matched against a drug or class of drugs that are on the NMOP. This will allow M-M to call prescribers of these newly marketed pharmaceuticals and request a change. Capt Parrish stated that until a newly marketed agent is "mapped", M-M would not be able to fill any prescriptions

for the agent. The committee's decision was that the PEC would perform all "mapping" of these new agents within 180 days of FDA approval. (CLOSED)

(8) Adderall®: This product is a Class II agent and cannot be "mapped" to another Class II agent because of Federal Regulations. The committee approved addition to the NMOP. (CLOSED)

(9) Coverage of agents specifically excluded by CHAMPUS: The following agents will not be provided by NMOP: lancets, OTC products (unless specifically included), drugs for cosmetic use (i.e., Renova®, Propecia®), devices, Clozaril®, smoking deterrents, injectable medications (unless specifically included), and vitamins (unless specifically included). (CLOSED)

(10) Same drugs, different manufacturers with different prices – NJ law prohibits substitution: These include Desogen®/OrthoCept®, TriPhasil®/Trilevlen®, Prinivil®/Zestril®, and Trandate®/Normodyne®. Capt Parrish requested, and received, the committee's approval to seek alternatives through MM to possibly move the filling of those prescriptions to another state where those items are interchangeable. (CLOSED)

(11) Birth control pills – 28-day packages are cheaper than 21-day packages: Capt Parrish will work with the DAPA section at DSCP to see if 21-day package price could be changed to matched the 28-day package price. (OPEN)

(12) Time limits for refills – SOW currently states that 75% must be used before refilling: Until recently, M-M had been filling all refill requests, regardless of time limit. M-M has been informed that they will follow 75% rule. Now, M-M returns refill requests to patients unfilled, if 75% rule is not met. The committee stated that the needs of the patients have to be considered and that undue hardship should not be placed on them. Mr. Lowe responded that the VA does not return early refill requests, that these are held until the established time limits are met, then the requests are filled and mailed to the patient. COL Strampel asked if this could also be done by M-M. Capt Parrish stated that this would require a modification in the SOW and could possibly cost the government more. Issue is tabled until next meeting by which time Capt Parrish will check to see if and how much a change in the SOW will cost. (OPEN)

o. Viagra® policy: Issues of concern are safety and cost. Since Health Affairs has already written a "draft" policy and it appears that it will be imminently approved, the committee will defer on this issue. (OPEN)

5. ADJOURNMENT: The meeting was held from 1400-1700 on 13 July 1998 and from 0800-1515 on 14 July 1998. The next meeting will be held on 13 November 1998. The office of record for official minutes is the Pharmacoeconomic Center, Fort Sam Houston, TX 78234.
