DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE
MINUTES AND RECOMMENDATIONS

February 2015

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on February 11 and 12, 2015, at the Defense Health Agency (DHA) Formulary Management Branch, Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is listed in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of November Minutes**—Lt. Gen. Douglas J. Robb, DO, MPH, Director, DHA, approved the minutes from the November 2014 DoD P&T Committee meeting on February 3, 2015.

2. **Correction to the November 2014 Minutes**

   a) Self-Monitoring Blood Glucose Test Strips—The November minutes were corrected to state the implementation period for the self-monitoring blood glucose test strips will be 180 days, instead of 120 days. The implementation date is August 5, 2015.

   b) Compound Prescriptions—The Director's decision is final regarding the manual prior authorization (PA) criteria for all new and current users of compound prescriptions. Coverage will be approved if the prescriber provides the information listed in the March 11, 2015 signed Determination Letter on Compounds and implementation of the PA will occur no later than May 1, 2015.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and Basic Core Formulary (BCF) recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Newer Sedative Hypnotics Agents (SED-1s): Tasimelteon (Hetlioz)

Background—Tasimelteon (Hetlioz) is a melatonin receptor agonist indicated solely for treatment of the non-24 sleep wake disorder, a circadian rhythm disorder sometimes found in blind patients.

Only two placebo-controlled trials in patients with non-24 sleep wake disorder are available; no head-to-head or active comparator studies are available. Many limitations exist with these two studies, including the small numbers of patients enrolled (less than 100 patients), the inclusion of patients shown to previously respond to tasimelteon (RESET trial), and the high patient discontinuation rate (SET trial).

One study in sighted patients with insomnia showed improvements in sleep parameters, but other products on the UF [e.g., zolpidem, eszopiclone (Lunesta)] should be prescribed for insomnia instead of tasimelteon.

Two agents with a similar structure as tasimelteon [melatonin supplement and ramelteon (Rozerem)] are marketed to treat insomnia caused by difficulties with sleep onset.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that other than its unique indication for treating blind patients with non-24 sleep wake disorder, tasimelteon offers no clinically compelling advantages over the existing SED-1 drugs on the UF that are used to treat sleep disorders.

Relative Cost-Effectiveness Analysis and Conclusion—Cost-minimization analysis (CMA) was performed. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) tasimelteon (Hetlioz) is more costly than the formulary and nonformulary SED-1 agents and melatonin.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) tasimelteon (Hetlioz) be designated NF due to the lack of compelling clinical advantages, other than its unique indication, and cost disadvantage compared to SED-1 agents on the UF.
2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for tasimelteon (Hetlioz). See Appendix B for the full criteria.
3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA*** Automated (step therapy) and manual PA criteria were recommended at the August 2014 DoD P&T Committee meeting and implemented December 10, 2014 for tasimelteon, requiring a trial of zolpidem immediate release (IR) or zaleplon first, and a diagnosis of blindness. The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) updating the PA criteria for tasimelteon, including removing the step therapy requirement, and requiring all new patients to undergo the manual PA process. See Appendix C for the full criteria.
4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent)

1) an effective date of the first Wednesday after a 60-day implementation period in all points of service (POS); and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is July 15, 2015.

5. ***COMMITTEE ACTION: EXCLUDE FROM 2015 NDAA SECTION 702 REQUIREMENT FOR NF MEDICATIONS AVAILABLE AT MAIL ORDER ONLY***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) tasimelteon be excluded from the requirement that NF drugs be solely available from the ~~TRICARE~~ Mail Order Pharmacy. See Section VIII.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Sodium-Glucose Co-Transporter 2 (SGLT2) Inhibitors: Empagliflozin (Jardiance)

Background—Empagliflozin (Jardiance) is the third FDA-approved SGLT2 inhibitor. The drug is effective in lowering hemoglobin A1c (A1c) by about 0.65%–0.8% when used as monotherapy, by about 0.5%–0.8% as part of dual therapy, and by about 0.6%–1.3% as part of triple or quadruple therapy. It is similar to canagliflozin (Invokana) and dapagliflozin (Farxiga) in terms of its effects on increasing low-density lipoprotein cholesterol, increasing high-density lipoprotein cholesterol, and decreasing systolic blood pressure and body weight.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) empagliflozin offers no clinically compelling advantages over the existing UF non-insulin diabetes drugs, given the modest decrease in A1c, risk of adverse reactions, including female genital mycotic infections and urinary tract infections, and unknown long-term cardiovascular safety profile.

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed to evaluate empagliflozin (Jardiance) with other oral products on the UF used in the treatment of diabetes. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) the following:

- CMA results showed empagliflozin (Jardiance) was not cost effective compared to existing formulary agents in the non-insulin diabetes class including metformin, sulfonylureas, thiazolidinediones, and dipeptidyl-dipeptidase-4 (DPP-4) inhibitors.
- Current costs for empagliflozin (Jardiance) show it was comparable to canagliflozin (Invokana) and dapagliflozin (Farxiga), the other agents available in the SGLT2 subclass.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent)

empagliflozin (Jardiance) be designated NF due to the lack of compelling clinical advantages, safety concerns, lack of long-term outcomes, and cost disadvantage compared to the oral UF products used for treating diabetes.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for empagliflozin (Jardiance). See Appendix B for the full criteria.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) a trial of metformin or a sulfonylurea and a DPP-4 inhibitor in all new and current users of empagliflozin (Jardiance), consistent with the PA requirements in place for canagliflozin and dapagliflozin. See Appendix C for full criteria.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD*** The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is August 19, 2015.

Director, DHA, Decision ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Antiplatelet Agents: Vorapaxar (Zontivity)

Background—Vorapaxar (Zontivity) is a new antiplatelet with a novel mechanism of action [protease-activated receptor-1 antagonist] that inhibits thrombin-induced platelet activation. It is approved in the setting of secondary prevention for the reduction of cardiovascular (CV) events (including CV death, myocardial infarction (MI), and stroke) in patients with a history of MI or with peripheral artery disease. Vorapaxar must be used with aspirin and or clopidogrel. It remains unknown whether adding vorapaxar to aspirin and or clopidogrel offers benefits similar to that seen with other antiplatelet agents.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that clinically, the place in therapy for vorapaxar is limited due to the significantly increased bleeding risk. Vorapaxar should be reserved for those patients with stable atherosclerotic disease who have failed other antiplatelet therapies.

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed to evaluate vorapaxar (Zontivity) with other oral antiplatelet agents on the UF. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that vorapaxar (Zontivity) was not cost effective compared to other oral antiplatelet agents on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) vorapaxar (Zontivity) be designated NF based on clinical and cost effectiveness.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) MN criteria for vorapaxar (Zontivity). See Appendix B for the full criteria.

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is August 19, 2015.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. Phosphodiesterase-5 (PDE-5) Inhibitors for Erectile Dysfunction (ED): Avanafil (Stendra)

Background—Avanafil (Stendra) is the fourth PDE-5 inhibitor for ED to enter the market. There are no head-to-head clinical trials comparing avanafil with the other PDE-5 inhibitors for treating ED. However, the change in efficacy endpoints for ED with avanafil and the safety profile appears similar to the other PDE-5 inhibitors. In one study, the higher doses of avanafil were effective in improving ED after prostatectomy, compared to placebo.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that although avanafil differs from the other PDE-5 inhibitors in that it has a 15-minute onset of action, only one PDE-5 is required on the UF to meet the needs of the Military Health System (MHS).

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) avanafil (Stendra) was more costly than the other UF and NF PDE-5 inhibitors.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) avanafil (Stendra) be designated NF due to the lack of compelling clinical advantages and the cost disadvantage compared to the BCF, step-preferred product, sildenafil (Viagra).

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for avanafil (Stendra). See Appendix B for the full criteria.

3. ***COMMTTEE ACTION: PA CRITERIA***—Existing automated (step therapy) PA criteria for the PDE-5 inhibitors used for the treatment of ED requires a trial of sildenafil (Viagra) first, prior to receiving another PDE-5 inhibitor. The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) PA criteria for all current users of avanafil (Stendra), similar to the existing PA criteria for the class. See Appendix C for the full criteria.

4. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) QLs for avanafil (Stendra), consistent with the FDA-approved package labeling and the QLs in place for the other PDE-5s used in for the treatment of ED. See Appendix E for QLs.

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) an 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is August 19, 2015.

Director, DHA, Decision: ☐ Approved ☐ Disapproved

Approved, but modified as follows:

E. Proton Pump Inhibitors (PPIs): Esomeprazole Strontium

Background—Esomeprazole strontium (no brand name) is the eighth PPI to reach the market. It was approved via section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act using efficacy and safety data primarily obtained from information contained in the package insert for esomeprazole magnesium (Nexium).

There are no clinical trials assessing efficacy. Esomeprazole strontium has the same indications as Nexium, with the exception that it is not approved for children. The FDA concluded that that daily dose of strontium contained in the product is not a significant risk to bone health.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that esomeprazole strontium offers no clinically compelling advantages compared to esomeprazole magnesium (Nexium) or the other PPIs.

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that esomeprazole strontium is not cost effective compared to other PPIs on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) esomeprazole strontium be designated NF due to the lack of compelling clinical advantages and the cost disadvantage compared to the other PPIs on the UF.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for esomeprazole strontium. See Appendix B for the full criteria.

3. ***COMMTTEE ACTION: PA CRITERIA***—Existing automated (step therapy) PA criteria for the PPIs requires a trial of Nexium or omeprazole first, prior to receiving another PPI. The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) PA criteria for all new and current users of esomeprazole strontium similar to the existing PA criteria for the class. See Appendix C for the full criteria.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) an 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is August 19, 2015.

Director, ~~DHA~~, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

V. UF DRUG CLASS REVIEWS

A. Pulmonary Arterial Hypertension (PAH) Agents

Background—The P&T Committee reviewed the clinical effectiveness of the PAH Agents, which is divided into the three subclasses outlined below. The intravenous prostacyclins (e.g., Flolan and Remodulin) and PDE-5 inhibitors indicated for ED (e.g., Viagra, Cialis, and Levitra) were not included in the review.

- **Prostacyclins**: treprostinil nebulized solution (Tyvaso), treprostinil oral tablets [Orenitram extended release (ER)], and iloprost nebulized solution (Ventavis);

- **Endothelin Receptor Antagonists (ERAs)**: bosentan (Tracleer), ambrisentan (Letairis), and macitentan (Opsumit);
- **Nitric Oxide Drugs**: the soluble guanylate cyclase stimulator, riociguat (Adempas); and, the PDE-5 inhibitors, sildenafil generic, sildenafil brand (Revatio), and tadalafil (Adcirca).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) the following for the PAH agents:

1. There are no head-to-head comparisons among the PAH drugs; therefore, no evidence-based first-line treatment can be proposed.
2. For the PDE-5 inhibitors, there was no new data to change the conclusion from the previous UF review (November 2009).
    - Sildenafil and tadalafil show similar improvements in 6-minute walking distance (6MWD), based on indirect comparisons of clinical trial results.
    - The product labeling for the two drugs is similar with regard to contraindications, precautions, and warnings.
    - Tadalafil (Adcirca) is dosed once daily, which is more convenient compared to the three-times daily dosing required with sildenafil (Revatio).
3. In one systematic review (CHEST 2014), all the PAH drugs increased the 6MWD by 27.9 meters to 39.9 meters when compared to placebo; however, comparisons between agents are inconclusive. Of note, the minimal clinically important difference for the 6MWD is a distance of at least 33 meters.
4. Monotherapy with the ERAs or PDE-5-inhibitors showed decreased hospitalization rates. There is insufficient information to determine whether ERAs or the PDE-5 inhibitors decrease mortality.
5. The CHEST 2014 systematic review did not include treprostinil (Orenitram ER), macitentan (Opsumit) and riociguat (Adempas). In their individual trials, Orenitram ER, Opsumit, and Adempas caused statistically significant improvements in the 6MWD compared to placebo. The improvement in 6MWD was clinically significant with Adempas. Orenitram ER and Adempas have not shown mortality benefits. Orenitram ER showed a significant reduction in the endpoint of time to clinical worsening. Adempas has an additional indication for chronic thromboembolic pulmonary hypertension (CTEPH).
6. Within and among the subclasses, the PAH drugs have distinct adverse reaction profiles. The ERAs and riociguat are pregnancy category X.

Overall relative clinical effectiveness conclusion: The P&T Committee concluded the choice of drug for PAH depends on a variety of factors including indication, product labeling, mechanism of action, route of administration, side effect profile, drug interactions, patient preference, and physician experience.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and budget impact analysis (BIA) was performed to evaluate the PAH subclasses. BIA was performed to evaluate

the potential impact of designating selected agents in various formulary scenarios. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) the following:

ERAs:

- CMA results showed that ambrisentan (Letairis) was the most cost-effective agent in this subclass, followed by macitentan (Opsumit) and bosentan (Tracleer).
- BIA results showed that the scenario with Letairis, Opsumit, and Tracleer designated with UF status and no step requirement yielded the lowest budget impact for the MHS.

Prostacyclins:

- CMA results showed that treprostinil tablets (Orenitram ER) was the most cost-effective agent in this subclass, followed by treprostinil nebulized solution (Tyvaso) and iloprost (Ventavis).
- BIA results showed that the scenario with Orenitram ER, Tyvaso, and Ventavis designated with UF status and no step requirement yielded the lowest budget impact for the MHS.

Nitric Oxide Drugs:

- CMA results showed that sildenafil generic was the most cost-effective agent in this subclass, followed by tadalafil (Adcirca), sildenafil brand (Revatio), and riociguat (Adempas).
- BIA results showed that the scenario with sildenafil generic and sildenafil brand (Revatio) as step-preferred and formulary on the UF, with tadalafil (Adcirca) and riociguat (Adempas) as non step-preferred and formulary on the UF, yielded the lowest budget impact for the MHS.

a) ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) the following:

- ERAs: designate bosentan (Tracleer), ambrisentan (Letairis), and macitentan (Opsumit) as UF.
- Prostacyclins: designate treprostinil nebulized solution (Tyvaso), treprostinil tablets (Orenitram ER), and iloprost (Ventavis) as UF.
- Nitric Oxide Drugs:
    - UF and step-preferred: sildenafil 20mg generic and sildenafil brand (Revatio)
    - UF and non step-preferred: tadalafil (Adcirca) and riociguat (Adempas)

- This recommendation includes step therapy, which requires a trial of sildenafil 20 mg generic or sildenafil brand (Revatio) in all new users of tadalafil (Adcirca) or riociguat (Adempas).

b) ***COMMITTEE ACTION: EXTENDED CORE FORMULARY (ECF) RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) adding sildenafil 20mg generic and sildenafil brand (Revatio) tabs to the ECF.

c) ***COMMITTEE ACTION: NITRIC OXIDE DRUGS PA CRITERIA*** Existing manual PA criteria apply to sildenafil 20 mg (Revatio) or tadalafil (Adcirca) for patients with primary PAH. The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) automated (step therapy) criteria for all new users of the non-preferred nitric oxide PAH drugs [tadalafil (Adcirca) and riociguat (Adempas)], requiring a trial of sildenafil 20 mg generic or sildenafil brand (Revatio) first. See Appendix C for the full criteria.

d) ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 90-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is August 19, 2015.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Oral Oncology Drugs—Prostate Cancer

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the Prostate Cancer drugs, which is comprised of the following:

- **Subclass I (Anti-Androgen Agents)**: bicalutamide (Casodex; generic), flutamide (Eulexin; generic), and nilutamide (Nilandron)

- **Subclass II (Survival-Prolonging Drugs)**: enzalutamide (Xtandi) and abiraterone (Zytiga)

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) the following conclusions for the Prostate Cancer drugs:

- **Subclass I (Anti-Androgen Agents):**
    1. The American Society of Clinical Oncologists/Cancer Care Ontario 2014 Guidelines found only limited data regarding clinical benefits of the Subclass I agents (bicalutamide, flutamide, and nilutamide). The guidelines also stated that the three anti-androgens demonstrate unknown survival and quality of life benefit.
    2. In one head-to-head trial, bicalutamide was as effective as flutamide. There was no significant difference between the two drugs in the median time to progression of disease or median time to death.
    3. Flutamide has a higher incidence of gastrointestinal side effects than bicalutamide, and has warnings for hepatotoxicity. Nilutamide has a black box warning for pulmonary toxicity and delays visual light-to-dark adaptation that can limit its use.
    4. Bicalutamide is considered the initial drug of choice when used for complete androgen blockage, based on its dosing frequency (once daily dosing, compared to three times daily dosing with flutamide), toxicity profile, and clinical trial data.
    5. Although nilutamide has no compelling advantages compared with flutamide or bicalutamide and has the least favorable safety profile, it is required on the UF due to its unique indication for use in combination with surgical castration.

- **Subclass II (Survival Prolonging Drugs):**
    1. For the Subclass II agents, abiraterone (Zytiga) and enzalutamide (Xtandi) have independently been shown to improve overall survival and progression-free survival when compared to placebo, both in the post-chemotherapy and chemotherapy-naïve settings. There is no data to guide sequencing.
    2. Zytiga requires the co-administration of prednisone to help mitigate the mineralocorticoid excess that can result from its mechanism of action. Xtandi does not require concomitant administration of steroids, but 30%–47% of patients were receiving some form of steroids therapy in the two phase 3 studies that led to its FDA approval.
    3. The Subclass II agents have differing safety profiles. Zytiga can cause adrenocortical insufficiency, hypertension, hypokalemia, and edema, which requires close monitoring for these complications. Xtandi has been associated with seizures as well as hypertension when compared to placebo.

Overall relative clinical effectiveness conclusion: The P&T Committee concluded the choice of prostate cancer agent depends on clinical considerations, patient preferences, prior treatment, presence or absence of visceral disease, patient symptoms, and drug side effect profiles.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and BIA were performed to evaluate the Prostate Cancer drugs. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) the following:

- CMA results showed that in Subclass I, bicalutamide was the most cost-effective agent, followed by flutamide and nilutamide. In Subclass II, abiraterone (Zytiga) was more cost effective than enzalutamide (Xtandi).
- BIA results showed that designating all the prostate cancer drugs as formulary on the UF, with no step-preferred agents in either subclass, demonstrated significant cost avoidance for the MHS.

a) ***COMMITTEE ACTION: UF RECOMMENDATIONS***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) the following:

- UF:
  - Flutamide (Eulexin; generic)
  - Bicalutamide (Casodex; generic)
  - Nilutamide (Nilandron)
  - Abiraterone (Zytiga)
  - Enzalutamide (Xtandi)
- NF: None

b) ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) bicalutamide (Casodex) be designated with BCF status.

c) ***COMMITTEE ACTION: MANUAL PA CRITERIA***—Manual PA criteria currently apply to enzalutamide (Xtandi) and abiraterone (Zytiga). The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) maintaining the current PA criteria for Xtandi and Zytiga. The P&T Committee also recommended manual PA criteria for all new users of nilutamide (Nilandron) due to its limited indication. See Appendix C for full criteria.

d) ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) an effective date of the first Wednesday after a 90-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is August 19, 2015.

Director, DHA Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. Transmucosal IR Fentanyl Products (TIRFs)

Relative Clinical Effectiveness—The TIRF subclass is comprised of the following formulations of transmucosal fentanyl: oral lozenge (Actiq, generics), buccal tablet (Fentora), sublingual tablet (Abstral), nasal spray (Lazanda), and sublingual spray (Subsys). The soluble buccal film (Onsolis) is no longer marketed. The TIRFs are a subclass of the narcotic analgesics.

All of the TIRFs are indicated for the management of breakthrough cancer pain in patients who are already receiving opioids, and who are tolerant to around-the-clock therapy for their underlying persistent cancer pain. Short-acting opioids also remain a viable option for the treatment of breakthrough cancer pain.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) the following for the TIRF formulations:

1. No head-to-head comparisons of the various TIRF formulations have been conducted to date. Indirect comparisons are difficult to make, due to differences in patient selection criteria, severity of breakthrough pain episodes, and titration as well as repeat dosing protocols.
2. Evidence from a network meta-analysis and a Cochrane systematic review demonstrate that all the TIRFs provide rapid onset of analgesia, with clinically meaningful differences in pain intensity achieved after 30 minutes following administration.
3. Minor pharmacokinetic differences (such as bioavailability and onset of analgesia) do not result in clinically relevant differences in pain relief.
4. Adverse effects are similar for all the TIRFs and are consistent with opioid therapy in cancer patients. Unique application site reactions include dental caries with the lozenge (Actiq) and nasal irritation with the nasal spray (Lazanda).
5. Unique advantages of the products include the following: administration of the lozenge (Actiq) can be interrupted in case of toxicity and it is approved for adolescents 16 years and older. The sublingual tablet (Abstral) and spray (Subsys) have faster dissolution rates than the lozenge (Actiq) and buccal (Fentora) formulations. The nasal spray (Lazanda) is convenient and can be administered by caregivers.
6. Unique disadvantages include the following: the sugar content in the lozenge (Actiq) may cause formation of dental caries and subsequent tooth loss. Lazanda may be unsuitable for patients with respiratory illnesses. Co-administration of Lazanda with a vasoconstrictive nasal decongestant (e.g., oxymetazoline) may lead to reduced fentanyl plasma concentrations.

Overall Clinical-Effectiveness Conclusion—In the absence of direct comparative trials, TIRF selection should be based on individual patient characteristics, likelihood of adherence, and patient preferences.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and BIA were performed to evaluate the TIRF subclass. The P&T Committee concluded (14 for, 0 opposed, 1 abstained, 1 absent) the following:

- CMA results showed that generic fentanyl citrate lozenge (Actiq) was the most cost-effective TIRF, followed by Fentora, Lazanda, and Abstral. Subsys was the least cost effective.
- BIA results showed that all modeled scenarios demonstrated a cost avoidance for the MHS, compared to the current baseline formulary status. The scenario with generic fentanyl lozenge (Actiq) with no step requirement and formulary on the UF, and all other branded agents NF, demonstrated a cost avoidance for the MHS, with the smallest impact to patients from disruption in therapy.

a) ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (9 for, 5 opposed, 1 abstained, 1 absent) the following:

- UF: fentanyl transmucosal lozenge (Actiq, generics)
- NF:
  - Fentanyl sublingual tablet (Abstral)
  - Fentanyl buccal tablet (Fentora)
  - Fentanyl nasal spray (Lazanda)
  - Fentanyl sublingual spray (Subsys)

b) ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) not to add a TIRF to the BCF; morphine sulfate IR will remain the BCF selection for the narcotic analgesics class.

c) ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for Abstral, Fentora, Lazanda, and Subsys. See Appendix B for the full criteria.

d) ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is August 19, 2015.

e) ***COMMITTEE ACTION: EXCLUDE FROM 2015 NDAA SECTION 702 REQUIREMENT FOR NF MEDICATIONS AVAILABLE AT MAIL ORDER***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) that the TIRFs recommended for NF status (Abstral, Fentora, Lazanda, and Subsys) be excluded from the requirement that NF drugs be solely available from the TRICARE Mail Order Pharmacy. See Section VIII.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VI. UTILIZATION MANAGEMENT

A. PAs and MN Criteria

1. **Hepatitis C Virus (HCV) Agents, Direct Acting Antivirals (DAAs): Paritaprevir/Ritonavir/Ombitasvir with Dasabuvir (Viekira Pak) Manual PA Criteria**—The combination product Viekira Pak contains paritaprevir 75 mg, ritonavir 50 mg, and ombitasvir 12.5 mg (dosed two tablets once daily), packaged with dasabuvir 250 mg (dosed twice daily). Viekira Pak was approved by the FDA in December 2014 and is the third FDA-approved interferon-free regimen indicated to treat HCV genotype 1. The hepatitis C drugs will be reviewed at an upcoming meeting.

   a) ***COMMITTEE ACTION: VIEKIRA PAK MANUAL PA CRITERIA***—PA criteria currently apply to the DAAs. The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) manual PA criteria for new users of paritaprevir/ritonavir/ombitasvir with dasabuvir (Viekira Pak), consistent with FDA-approved labeling. Prior authorization will expire after 12–24 weeks, based on the treatment regimen. See Appendix C for the full criteria.

2. **Targeted Immunomodulatory Biologics (TIBs): Secukinumab (Cosentyx)** Secukinumab (Cosentyx) is a new TIB indicated for the treatment of moderate to severe plaque psoriasis in adult patients who are candidates for systemic therapy or phototherapy. The TIBs were reviewed by the P&T Committee in August 2014 and automated PA (step therapy) and manual PA criteria were recommended for the class (implemented on December 17, 2014).

   a) ***COMMITTEE ACTION: SECUKINUMAB (COSENTYX) PA CRITERIA*** The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) manual PA criteria and step therapy for secukinumab (Cosentyx), consistent with the FDA-approved indication. See Appendix C for the full criteria.

3. **Topical Antifungals: Efinaconazole 10% (Jublia) and Tavaborole 5% (Kerydin) Topical Solutions**—Jublia and Kerydin are indicated for the topical treatment of toenail onychomycosis. Both products are dosed once daily for 48 weeks. The P&T Committee reviewed the current recommended treatment guidelines, FDA-approved indications, efficacy data, safety information, and utilization and cost data for the topical antifungals for toenail onychomycosis.

    a) ***COMMITTEE ACTION: EFINACONAZOLE 10% (JUBLIA) AND TAVABORALE 5% (KERYDIN) MANUAL PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) manual PA criteria for efinaconazole 10% (Jublia) and tavaborole 5% (Kerydin) in all new and current users of the products. PA criteria were recommended due to the modest efficacy of the products, lack of head-to-head clinical trials, limited efficacy and safety data, and high cost. See Appendix C for the full criteria.

    b) ***COMMITTEE ACTION: EFINACONAZOLE 10% (JUBLIA) AND TAVABORALE 5% (KERYDIN)) PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the PA. Based on the P&T Committee's recommendation, the effective date is August 19, 2015.

4. **Cystic Fibrosis Drugs: Ivacaftor (Kalydeco)**—Ivacaftor (Kalydeco) is indicated for the treatment of cystic fibrosis. PA criteria were recommended at the February 2012 meeting, updated in May 2014, and reflect the FDA-approved indication for various mutations in the cystic fibrosis transmembrane conductance regulator (CFTR) gene. In December 2014, Kalydeco received an additional indication for the R117H mutation in the CFTR gene.

    a) ***COMMITTEE ACTION: IVACAFTOR (KALYDECO) MANUAL PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) updated manual PA criteria for Kalydeco to include the expanded FDA-approved indication. See Appendix C for the full criteria.

5. **Non-Insulin Diabetes Mellitus Drugs: Glucagon-Like Peptide-1 Receptor Agonist (GLP1RAs); Exenatide Once Weekly Pen (Bydureon Pen)**—Exenatide (Bydureon) is now available in a pre-filled pen in addition to the original vial formulation. Manual PA criteria were recommended at the November 2014 P&T Committee meeting due to the significant price difference between the Bydureon Pen formulation and the Bydureon vials. The cost of the Bydureon pen is now comparable to the vial formulation.

a) ***COMMITTEE ACTION: EXENATIDE PEN (BYDUREON PEN) REMOVAL OF PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) to remove the manual PA criteria for the Bydureon pen, requiring use of Bydureon vials first. The existing step therapy PA, requiring a trial of metformin or a sulfonylurea first, will remain for the formulation.

6. **Nasal Allergy Drugs: Mometasone (Nasonex) and Fluticasone Furoate (Veramyst) Nasal Inhalers**—The Nasal Allergy Drugs were reviewed by the P&T Committee in May 2014 and automated PA (step therapy) and manual PA criteria were recommended for the class, requiring a trial of generic fluticasone propionate (Flonase) azelastine 137 mcg, flunisolide, or ipratropium. Step therapy does not apply to patients younger than age four. Nasonex and Veramyst were recommended for NF and non step-preferred status. Both drugs are approved for treating symptoms of allergic rhinitis in patients as young as two years of age, while generic Flonase is approved in children as young as four years of age. The P&T Committee recommended updating the MN criteria to reflect the pediatric indications for Nasonex and Veramyst.

   a) ***COMMITTEE ACTION: MOMETASONE (NASONEX) AND FLUTICASONE FUROATE (VERAMYST) MN CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) revised MN criteria for Nasonex and Veramyst, consistent with the FDA-approved product labeling for use in children as young as two years of age. See Appendix B for the full criteria.

B. QLs—QLs were reviewed for several drugs from the Hepatitis C drugs, inhaled corticosteroids, nasal allergy drugs, antiemetics, and oral chemotherapy drug classes. QLs apply to products in these respective drug classes.

1. ***COMMITTEE ACTIONS: QLs***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) QLs for paritaprevir/ritonavir/ombitasvir dasabuvir (Viekira Pak), fluticasone furoate inhaler (Arnuity Ellipta), beclomethasone hydrofluoroalkane (HFA) pediatric 40 mcg/spray (QNASL), netupitant/palonosetron (Akynzeo), and olaparib (Lynparza), consistent with the product labeling. See Appendix E for QLs.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VII. LINE EXTENSIONS

A. Formulary Status Clarification—The P&T Committee clarified the formulary status for one product line extension ("follow-on product") by the original manufacturer. Line extensions have the same FDA indications and pricing as the "parent" drug.

1. ***COMMITTEE ACTION: LINE EXTENSIONS FORMULARY STATUS CLARIFICATION***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) clarifying the formulary status of beclomethasone HFA nasal spray 40 mcg/spray (Children's QNASL). The 40 mcg/spray is a new formulation approved for children aged 4–11 years. Children's QNASL is recommended to have the same formulary status as the 80 mcg/spray formulation (QNASAL), which is indicated for adults and children older than 12 years. Implementation will occur upon signing of the minutes.

    - Beclomethasone HFA nasal spray 40 mcg/spray (Children's QNASL): NF and non step-preferred, similar to beclomethasone HFA nasal spray 80 mcg/spray (QNASL). The same step therapy criteria and manual PA criteria will apply.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VIII. 2015 National Defense Authorization Act (NDAA) Section 702

A. NF Medications Available at Mail Order Pharmacy Only—The P&T Committee was briefed on the following four components in 2015 NDAA Section 702 impacting the pharmacy benefit:

- co-pay changes,
- generic drugs to NF tier,
- termination of the TRICARE For Life pilot, subsequently making the program permanent and expanding to under 65, and
- NF medications available at the Mail Order Pharmacy only.

The 2015 NDAA, signed in December 2014, restricts the availability of NF drugs to one point of service, the Mail Order Pharmacy. Beneficiaries with medical necessity will be able to obtain NF drugs at other points of service at the UF co-pay.

This law takes effect with decisions made during the 2015 P&T Committee meetings. Drugs designated with NF status by the P&T Committee will be restricted to the Mail Order Pharmacy. However, an additional vote by the P&T Committee is required for certain drugs (including those for acute therapy, schedule II controlled substances, antipsychotics, oncology agents, and limited distribution drugs) to be excluded from the requirement that NF drugs be

solely available from the Mail Order Pharmacy. Emergent overrides (e.g., drug shortages, special circumstances or emergencies, natural disasters) will be allowed.

PA criteria were recommended to ensure patient safety. Additionally, the P&T Committee requested a 90-day PA expiration for patients meeting the titration criteria listed in (c), below. This request will be evaluated and implemented when operationally feasible.

1. ***COMMITTEE ACTION: NF PRESCRIPTIONS MANUAL PA CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) manual PA criteria for all new NF prescriptions. Coverage will be approved if the prescriber provides the following information listed below.

   a) Does the patient reside in a long-term care facility?

   b) Does the patient have barriers to receiving medications by mail (e.g., no permanent mail address, resides in a rural setting)?

   c) Is the patient not on a stable dose of medication or is the medication currently being titrated?

Director, DHA Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

IX. ITEMS FOR INFORMATION

A. New Drugs Go to Third Tier—The current 32 Code of Federal Regulations (CFR) Part 199 statute states that new FDA-approved drugs are immediately placed on the Second Tier (formulary brand-name drugs).

The Proposed Pharmacy TRICARE Rule, published in the CFR on September 19, 2014, clarifies the process for formulary placement of newly approved innovator drugs brought to market under a New Drug Application approved by the FDA. The proposed rule provides the P&T Committee up to 120 days to recommend tier placement on the UF. During this 120-day period, new drugs would be assigned a "pending status" and be available in the Retail Network and Mail Order Pharmacy under terms comparable to NF (Third Tier) drugs. Tier classification will normally occur at the next P&T Committee meeting following FDA approval. The rule is available at http://www.gpo.gov/fdsys/pkg/FR-2014-09-19/pdf/2014-22276.pdf.

X. ADJOURNMENT

The meeting adjourned at 1130 hours on February 12, 2015. The next meeting will be in May 2015.

David Meade, PharmD, BCPS via phone	DHA Pharmacy Operations Division
Ms. Deborah Garcia	DHA Pharmacy Operations Division contractor
Mr. Kirk Stocker	DHA Pharmacy Operations Division contractor
Esmond Nwokeji, PhD	DHA Pharmacy Operations Division contractor
Maj Ellen Roska	University of Texas PhD student
Brittny Wolda	Incarnate Word Pharmacy student

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Tasimelteon (Hetlioz) **Sedative Hypnotic-1s (SED-1s)**	• No alternative formulary agent – patient is blind and has non-24 sleep wake disorder **Formulary alternatives:** melatonin supplement, zolpidem IR, zaleplon, eszopiclone
• Empagliflozin (Jardiance) **Sodium-Glucose Co-transporter 2 (SGLT2) Inhibitors**	• Use of the formulary agent is contraindicated **Formulary alternatives:** metformin, sulfonylureas, sitagliptin (Januvia, Janumet), linagliptin (Tradjenta, Jentadueto), GLP1RAs, pioglitazone, insulin
• Vorapaxar (Zontivity) **Antiplatelet Agents**	• Formulary agents result or are likely to result in therapeutic failure. **Formulary alternatives:** clopidogrel, cilostazol, pentoxifylline, dipyridamole, Aggrenox, prasugrel, ticagrelor
• Avanafil (Stendra) **PDE-5 Inhibitors for Erectile Dysfunction**	• Use of formulary agents is contraindicated • Patient has experienced or is likely to experience significant adverse effects from formulary agents • Formulary agents result or are likely to result in therapeutic failure **Formulary alternative:** sildenafil (Viagra)
• Esomeprazole Strontium **Proton Pump Inhibitors (PPIs)**	• Use of ALL formulary agents is contraindicated • Patient has experienced or is likely to experience significant adverse effects from ALL formulary agents • All formulary agents result or are likely to result in therapeutic failure **Formulary alternatives:** omeprazole (Prilosec, generics), pantoprazole tablets (Protonix, generics), and esomeprazole magnesium (Nexium)
• Fentanyl sublingual tablet (Abstral) • Fentanyl buccal tablet (Fentora) • Fentanyl nasal spray (Lazanda) • Fentanyl sublingual spray (Subsys) **Transmucosal Immediate Release Fentanyl Products (TIRFs)**	• Use of formulary agents is contraindicated • Patient has experienced or is likely to experience significant adverse effects from formulary agents o For example, dental caries with Actiq or uncontrolled diabetic patients requiring sugar-free formulations • Patient previously responded to nonformulary agent and changing to a formulary agent would incur unacceptable risk o For example, patient has xerostomia or mucositis and requires non-oral route of administration • **Formulary alternatives:** fentanyl citrate lozenge, morphine sulfate IR, oxycodone IR, oxymorphone IR, hydromorphone IR

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• Tasimelteon (Hetlioz) **Newer Sedative Hypnotics (SED-1s)**	The previous automated (step therapy) criteria for tasimelteon (Hetlioz) (requiring a trial of zolpidem IR or zaleplon) no longer apply. Manual PA criteria apply to all new users of tasimelteon (Hetlioz). Manual PA criteria: Tasimelteon (Hetlioz) is approved if: i. The patient is totally blind and has a documented diagnosis of non-24 sleep wake disorder AND ii. The patient has had a trial of melatonin and either failed or had an adverse event AND iii. The patient is not taking a drug that will interact with tasimelteon (i.e., beta blockers or strong CYP3A4 inducers) PA Criteria will expire after 6 months (if patient has not responded after 6 months, they will be deemed a non-responder)
• Empagliflozin (Jardiance) **Sodium-Glucose Co-transporter 2 (SGLT2) Inhibitors**	All new and current users of empagliflozin (Jardiance) are required to try metformin or a sulfonylurea (SU), and a dipeptidyl-dipeptidase-4 (DPP-4) inhibitor before empagliflozin (Jardiance). Automated PA criteria: The patient has filled a prescription for metformin or a SU, AND a DPP-4 inhibitor at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, empagliflozin (Jardiance) is approved (e.g., trial of metformin or SU AND a DPP-4 inhibitor is NOT required) if: • The patient has experienced any of the following issues on metformin: o impaired renal function precluding treatment with metformin o history of lactic acidosis • The patient has experienced any of the following issues on a sulfonylurea: o hypoglycemia requiring medical treatment • The patient has had inadequate response to metformin or a SU or a DPP-4 inhibitor • The patient has a contraindication to metformin or a SU or DPP-4 inhibitor

Drug / Drug Class	Prior Authorization Criteria
• Avanafil (Stendra) **PDE-5 Inhibitors for Erectile Dysfunction (ED)**	PA criteria apply to all current users of avanafil. Automated PA criteria: Coverage approved for treatment of ED if: a) The patient has received a prescription for sildenafil (Viagra) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days, AND b) The patient is a male aged 40 years or older. Manual PA criteria: A trial of sildenafil (Viagra) is not required if: • Patient has tried sildenafil (Viagra) and has had an inadequate response or was unable to tolerate treatment due to adverse effects. • Treatment with sildenafil (Viagra) is contraindicated. • Patient is between 18 and 39 years of age and is being treated for ED of organic or mixed organic/psychogenic origin. [Must try sildenafil (Viagra) first or indicate inability to due to reasons stated above in a) or b).] • Patient is between 18 and 39 years of age and is being treated for drug-induced ED where the causative drug cannot be altered or discontinued. [Must try sildenafil (Viagra) first or indicate inability to due to reasons stated above in a) or b).] Coverage is approved for the following non-ED uses requiring daily therapy: • Use of sildenafil, tadalafil, or avanafil (Stendra) for preservation/restoration of erectile dysfunction after prostatectomy. PA expires after one year.
• Esomeprazole Strontium **Proton Pump Inhibitors (PPIs)**	PA criteria apply to all new and current users of esomeprazole strontium. Automated PA criteria: The patient has filled a prescription for omeprazole (Prilosec, generics), pantoprazole tablets (Protonix, generics), or esomeprazole magnesium (Nexium) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order), during the previously 180 days. AND Manual PA criteria: A trial of omeprazole (Prilosec, generics), pantoprazole tablets (Protonix, generics), or esomeprazole magnesium (Nexium) is NOT required if: • The patient has tried omeprazole, pantoprazole tablets, and esomeprazole magnesium (Nexium) and had an inadequate response. • The patient has tried omeprazole, pantoprazole tablets, and esomeprazole magnesium (Nexium) and was unable to tolerate it due to adverse effects. • Treatment with omeprazole, pantoprazole tablets, and esomeprazole magnesium (Nexium) is contraindicated (e.g., hypersensitivity; moderate to severe hepatic insufficiency).

Drug / Drug Class	Prior Authorization Criteria
• Sildenafil 20mg generic • Sildenafil brand (Revatio) • Tadalafil (Adcirca) • Riociguat (Adempas) **Pulmonary Arterial Hypertension Agents (PAH) – Nitric Oxide Drugs Subclass**	PA criteria apply to all new users of Adempas and Adcirca. Automated PA criteria: The patient has filled a prescription for sildenafil 20mg generic or sildenafil brand (Revatio) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: Adempas and Adcirca is approved (e.g., a trial of sildenafil is NOT required) if: • For Adempas: o Patient has a documented diagnosis of chronic thromboembolic pulmonary hypertension (CTEPH) o Patient has tried a PDE-5 inhibitor and failed or did not respond to therapy o Patient has experienced significant adverse effects from the PDE-5 inhibitor • For Adcirca: o Patient has tried a sildenafil 20 mg generic or sildenafil brand (Revatio) and failed or did not respond to therapy • For both Adempas and Adcirca: o Patient is not taking a nitrate drug.
• Enzalutamide (Xtandi) **Prostate Cancer Drugs Subclass II – Survival Prolonging Drugs**	Coverage is approved if: • Documented diagnosis of metastatic castration-resistant prostate cancer No expiration date for the PA
• Abiraterone (Zytiga) **Prostate Cancer Drugs Subclass II – Survival Prolonging Drugs**	Coverage is approved if: • Documented diagnosis of metastatic castration-resistant prostate cancer AND • Patient is receiving concomitant therapy with prednisone. No expiration date for the PA
• Nilutamide (Nilandron) **Prostate Cancer Subclass I – Anti-Androgens**	Manual PA criteria: PA criteria apply to all new users of nilutamide. Nilutamide is approved if any of the following: • Patient has experienced significant adverse effects or contraindication from bicalutamide or flutamide; or • Patient has experienced therapeutic failure with bicalutamide or flutamide; or • Patient has a diagnosis of metastatic prostate cancer (stage D2) disease and the patient has undergone orchiectomy.

Drug / Drug Class	Prior Authorization Criteria
• Secukinumab (Cosentyx) **Targeted Immunomodulatory Biologics (TIBs)**	PA criteria apply to all new and current users of Cosentyx. Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days AND Manual PA criteria: If automated criteria are not met, coverage is approved for Cosentyx if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • Adverse reactions to Humira not expected with requested non-step preferred TIB AND Coverage approved for patients > 18 years with: • Active moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy Coverage is NOT provided for concomitant use with other TIBs.
• Efinaconazole 10% (Jublia) and tavaborole 5% (Kerydin) Topical Solutions **Topical Antifungals**	PA criteria apply to all new and current users of Jublia and Kerydin. Manual PA criteria: Jublia and Kerydin are approved if all of the following criteria apply: 1. The patient must have diagnostically confirmed onychomycosis by either KOH preparation, fungal culture, nail biopsy, or other assessment to confirm diagnosis. 2. The patient is immunocompromised, has diabetes mellitus, or peripheral vascular disease and has swelling and/or redness in the surrounding nail tissue or pain in affected nail(s). 3. The patient has history of one of the following (therapeutic failure, contraindication or adverse events, or intolerance) to one of the following antifungals: itraconazole, terbinafine, or ciclopirox • therapeutic failure • contraindication (e.g., renal impairment, pre-existing liver disease, or evidence of ventricular dysfunction such as CHF) • adverse event/intolerance to one of the following antifungal agents 4. Treatment is requested due to a medical condition and not for cosmetic purposes. Examples include the following: • patients with history of cellulitis of the lower extremity who have ipsilateral toenail onychomycosis • diabetic patients with additional risk factors for cellulitis • patients who experience pain/discomfort associated with the infected nail 5. The patient's condition is causing debility or a disruption in their activities of daily living. 6. Jublia or Kerydin have not been used in the previous 24 months. PA nilutamide expires after 1 year.

Drug / Drug Class	Prior Authorization Criteria
• Ivacaftor (Kalydeco) **Cystic Fibrosis Drugs**	Manual PA Criteria apply to all new and current users of Ivacaftor (Kalydeco). 1. Coverage will be approved for the treatment of CF patients aged 6 years and older who have a G551D, G1244E, G1349D, G178R, G551S, S1251N, S1255P, S549N, S549R or for R117H mutation in the CFTR gene, detected by an FDA-approved test. 2. Coverage is not approved for patients who are homozygous for the F508del mutation in the CFTR gene.
• Exenatide once weekly pen (Bydureon pen) **Glucagon-Like Peptide-1 Receptor Agonists (GLP1RAs)**	Manual PA criteria from the November 2014 meeting recommended to be removed. Exenatide once weekly (Bydureon pen) • Coverage approved if patient has first tried Bydureon 2mg vial/cartridge first AND • Patient has dexterity issues and cannot assemble the Bydureon vial/cartridge

Appendix D—Table of Prior Authorization (PA) Criteria for Hepatitis C Drugs

Prior Authorization Criteria

Paritaprevir/ritonavir/ombitasvir with dasabuvir (Viekira Pak)
Direct Acting Antiviral Subclass

- New users of paritaprevir/ritonavir/ombitasvir with dasabuvir (Viekira Pak) are required to undergo the PA process.
- Current users are not affected by PA; they can continue therapy uninterrupted.
- Patients are encouraged to use the Mail Order Pharmacy or MTFs to fill their Viekira Pak prescriptions.
- Consult the AASLD/IDSA HCV guidelines (www.hcvguidelines.org) for the most up-to-date and comprehensive treatment for HCV. Unique patient populations are also addressed and treatment recommendations may differ from those for the general population.

Manual PA Criteria:

- Age ≥ 18
- Has laboratory evidence of chronic HCV genotype 1 infection
    1. State the HCV genotype and HCV RNA viral load on the PA form
- Paritaprevir/ritonavir/ombitasvir + dasabuvir (Viekira Pak) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.
- The patient is not co-infected with Hepatitis B virus (HBV).

Treatment Regimens and Duration of Therapy

- Treatment and duration of therapy are approved for one of the following regimens outlined below, based on HCV genotype, prior treatment, and presence of cirrhosis.
- Prior authorization will expire after 12 weeks or 24 weeks, based on the treatment regimen selected.

Genotype 1 Patient Populations[1,2]	***Treatment***	***Duration***
GT1a without cirrhosis	Viekira Pak + ribavirin bid	12 weeks
GT1a with cirrhosis	Viekira Pak + ribavirin bid	24 weeks[3]
GT1b without cirrhosis	Viekira Pak	12 weeks
GT1b with cirrhosis	Viekira Pak + ribavirin bid	12 weeks
Liver transplant recipients with normal hepatic function and mild fibrosis (Metavir ≤2)	Viekira Pak + ribavirin bid	24 weeks

[1]Follow GT1a dosing recommendation in patients with an unknown GT1 or mixed GT1 infection
[2]Treatment naïve or treatment-experienced with peginterferon alpha plus ribavirin
[3]For treatment naïve OR prior IFN+RBV relapser/partial responder, consider 12 weeks

Appendix E—Table of Quantity Limits

Drug / Drug Class	Quantity Limits
• Avanafil (Stendra) **PDE-5 Inhibitors**	• Retail and MTF Network: 6 tablets per 30 days (collective of all PDE-5 inhibitors) • Mail Order Pharmacy: 18 tablets per 90 days (collective of all PDE-5 inhibitors)
• Paritaprevir/ritonavir/ombitasvir plus dasabuvir (Viekira Pak) **Hepatitis C Drugs**	• Retail Network, Mail Order and MTF: 4 Paks /28 days • Each Viekira Pak contains 7 individual packages and provides for daily dosing for one week • Individual packages contain 2 paritaprevir/ritonavir/ombitasvir tablets and 2 dasabuvir tablets
• Fluticasone furoate oral inhaler (Arnuity Ellipta) **Inhaled Corticosteroid**	• Retail: 60 blisters (1 Diskus)/30 days • MTF and Mail: 180 blisters (3 Diskus)/90 days
• Beclomethasone HFA pediatric nasal spray (QNASL) 40 mcg **Nasal Allergy Drug**	• Retail: 1 canister/30 days • MTF and Mail: 3 canisters/90 days
• Netupitant/palonosetron (Akynzeo) 300 mg/0.5 mg cap **Antiemetic**	• Retail: 2 boxes/30 days • MTF and Mail: 6 boxes/90 days
• Olaparib (Lynparza) 50 mg cap **Oral Oncology Drug (Ovarian Cancer)**	• Retail: 448 caps (4 bottles)/28 days • MTF and Mail: 896 caps (8 bottles)/56 days

Appendix F—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2015	**Pulmonary Arterial Hypertension (PAH) Agents**	UF class review Not previously reviewed (PDE-5 inhibitors for PAH reviewed Nov 2009)	▪ ECF: Sildenafil 20 mg (generic) and sildenafil brand (Revatio)	*Nitric oxide pathway:* *Step preferred:* ▪ sildenafil 20mg generic ▪ sildenafil brand (Revatio) *Non step-preferred* ▪ tadalafil (Adcirca) ▪ riociguat (Adempas) *Endothelin receptor antagonists:* ▪ bosentan (Tracleer) ▪ ambrisentan (Letairis) ▪ macitentan (Opsumit) *Prostacyclins:* ▪ treprostinil nebulized solution (Tyvaso) ▪ treprostinil tabs (Orenitram ER) ▪ iloprost nebulized solution (Ventavis)	▪ None	Pending singing of the minutes / 90 days	▪Step therapy required for the nitric oxide agents; see comments	▪ For the nitric oxide pathway drugs, a trial of sildenafil 20 mg generic or sildenafil brand (Revatio) is required prior to Adcirca or Adempas. See Appendix C. ▪ Adcirca was previously NF, but now is UF, and non step-preferred.
Feb 2015	**Prostate Cancer Drugs**	UF class review	▪ Bicalutamide (Casodex)	▪ Flutamide (Eulexin) ▪ Nilutamide (Nilandron) ▪ Enzalutamide (Xtandi) ▪ Abiraterone (Zytiga)	▪ None	Pending singing of the minutes / 90 days	▪PA required for nilutamide (See Appendix C)	▪ Bicalutamide is now BCF. ▪ No change recommended for the current PA for Zytiga and Xtandi

Date	DoD PEC Drug Class	Type of Action	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2015	**Transmucosal Immediate Release Fentanyl Products (TIRFs)**	UF subclass review Not Previously reviewed	▪ None (see Comments)	▪ Fentanyl transmucosal lozenge (Actiq, generics)	▪ Fentanyl sublingual tablet (Abstral) ▪ Fentanyl buccal tablet (Fentora) ▪ Fentanyl nasal spray (Lazanda) ▪ Fentanyl sublingual spray (Subsys)	Pending singing of the minutes / 90 days	▪ High opioid safety edit in place	▪ No BCF selection for this subclass ▪ This is a subclass of the High Potency narcotic drugs; morphine sulfate IR and controlled release morphine sulfate (MS Contin, generics) are designated BCF
Feb 2015	**Newer Sedative Hypnotics (SED-1s)**	New Drug	▪ Zolpidem immediate-release	*Step preferred* ▪ Zaleplon (Sonata) *Non step-preferred* ▪ Zolpidem ER (Ambien CR) ▪ Eszopiclone (Lunesta) ▪ Doxepin (Silenor)	▪ **Tasimelteon (Hetlioz) February 2015** ▪ Ramelteon (Rozerem) ▪ Zolpidem SL (Edluar) ▪ Zolpidem SL (Intermezzo)	Pending signing of the minutes / 60 days	▪ Step therapy (automated PA); requires a trial of zolpidem IR or zaleplon for all SED-1 agents except tasimelteon	▪ All new users of Hetlioz will undergo a manual PA process ▪ See Appendix C for Manual PA criteria.

Date	DoD PEC Drug Class	Type of Action	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2015	**Non-Insulin Diabetes Drugs: Sodium-Glucose Co-Transporter 2 (SGLT2) Inhibitors**	New Drug	▪ None (see comments)	▪ None (see comments)	▪ **Empagliflozin (Jardiance) February 2015** ▪ Dapagliflozin (Farxiga) May 2014 ▪ Canagliflozin (Invokana)	Pending signing of the minutes / 90 days	▪ Step therapy (automated PA); requires a trial of metformin, or sulfonylureas (SUs), and a DPP-4 inhibitor in all new and current users of a SGLT2 inhibitor.	▪ BCF, UF, and NF drugs are designated for metformin, SUs, DPP-4 inhibitors, GLP-1RAs, TZDs, meglitinides, and alpha glucosidase inhibitors. See DoD P&T Minutes for Nov 2010, Aug 2012, and Nov 2012.
Feb 2015	**Antiplatelet Agents**	New Drug Review	▪ Clopidogrel (Plavix)	▪ Prasugrel (Effient) ▪ Ticagrelor (Brilinta) ▪ Aspirin/dipyridamole ER (Aggrenox) ▪ Ticlopidine (Ticlid, generics) ▪ Cilostazol (Pletal, generics) ▪ Dipyridamole (Persantine, generics) ▪ Pentoxifylline (Trental, generics)	▪ **Vorapaxar (Zontivity) February 2015**	Pending signing of the minutes / 90 days	▪ N/A	▪ None

Date	DoD PEC Drug Class	Type of Action	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2015	**PDE-5 Inhibitors for Erectile Dysfunctions**	New Drug Review	▪ Sildenafil (Viagra)	▪ None for Erectile Dysfunction	▪ **Avanafil (Stendra) February 2015** ▪ Tadalafil (Cialis) ▪ Vardenafil (Levitra, Staxyn)	Pending singing of the minutes / 90 days	▪PA required for Stendra (See Appendix C) ▪QL apply – see Appendix E	▪ Viagra is the BCF and step-preferred PDE-5 inhibitor for erectile dysfunction.
Feb 2015	**Proton Pump Inhibitors**	New Drug Review	▪ Omeprazole (Prilosec, generic) excludes 40mg Prilosec capsule ▪ Esomeprazole (Nexium)	▪ Prilosec 40mg (brand) ▪ Pantoprazole (Protonix, generic) tablets	▪ **Esomeprazole strontium (February 2015)** ▪ Lansoprazole (Prevacid) ▪ Omeprazole NaHCO3 (Zegerid) ▪ Rabeprazole (Aciphex) ▪ Dexlansoprazole (Dexilant)	Pending signing of the minutes / 90 days	▪PA applies (See Appendix C)	▪ See DoD P&T Minutes for Nov 2012, May 2009, Feb 2008, & May 2007

SGLT2	Sodium-Glucose Co-Transporter 2 Inhibitors Drug Class
TIBs	targeted immunomodulatory biologics
TIRFs	transmucosal IR fentanyl products
UF	Uniform Formulary

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE
MINUTES AND RECOMMENDATIONS

November 2014

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on November 19 and 20, 2014, at the Defense Health Agency (DHA) Formulary Management Branch, Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is listed in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of August Minutes**—Lt. Gen. Douglas J. Robb, DO, MPH, Director, DHA, approved the minutes from the August 2014 DoD P&T Committee meeting on November 13, 2014.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and Basic Core Formulary (BCF) recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Insulin Drugs: Miscellaneous Insulin Delivery Devices—Valeritas V-Go (V-Go)

Background—V-Go is a disposable insulin delivery device approved for patients with diabetes mellitus. Unlike an insulin pump, V-Go does not require any tubing or catheters. The device is filled daily with rapid-acting insulin, allowing for continuous administration of basal insulin and optional bolus dosing. After 24 hours, the device is discarded and replaced with a new unit.

The advantages of using V-Go include convenience for the patient who desires increased control over their blood glucose levels and elimination of the need for multiple daily insulin injections. Compared to multiple insulin injections, V-Go may reduce prandial glycemic excursions.

There are no randomized controlled trials using the V-Go insulin delivery device compared to usual care with basal or basal/bolus insulin dosing using pens or vials. Limitations of the V-Go studies include small sample sizes (<140 patients enrolled), varied efficacy endpoints, short trial duration, and lack of published studies. Another limitation is that reports of patients requiring overall reduced total daily insulin doses was based on subjective patient-reported data and not on objective endpoints. Additionally, the discontinuation rates in the V-Go studies were high. Although the V-Go studies reported improvements in hemoglobin A1c- lowering, it is difficult to attribute those improvements to the V-Go device due to the lack of control groups and limitations in study design. Long-term data on whether the V-Go device improves patient adherence is lacking.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) that the V-Go delivery device offers patient convenience because multiple daily insulin injections are not needed; however, it offers no clinically compelling advantages over existing UF insulin agents administered with pens or vials.

Relative Cost-Effectiveness Analysis and Conclusion—Cost-minimization analysis (CMA) was performed. The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) that the CMA showed V-Go was more costly than other combinations of basal/bolus insulin (e.g., Lantus/Novolog) currently on the UF.

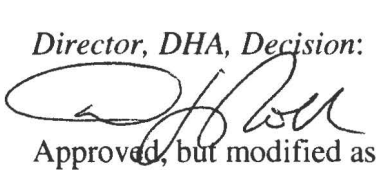
1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) V-Go be designated NF due to the lack of compelling clinical advantages and the cost disadvantage compared to the other UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) MN criteria for V-Go. See Appendix B for the full criteria.

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA*** Manual PA criteria were recommended at the August 2014 DoD P&T Committee meeting and implemented on November 14, 2014. The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) clarifying the PA criteria for V-Go. See Appendix C for the full criteria.

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service (POS). Based on the P&T Committee's recommendation, the effective date is April 8, 2015.

Director, DHA, Decision: ☒ Approved ☐ Disapproved



Approved, but modified as follows:

B. Chronic Obstructive Pulmonary Disease (COPD) Drugs—Umeclidinium/Vilanterol (Anoro Ellipta)

Background—Umeclidinium/vilanterol is the first fixed dose combination of a long-acting muscarinic agent (LAMA) with a long-acting beta agonist (LABA) to reach the market. Anoro Ellipta is indicated for maintenance treatment of COPD; in contrast, other products have the additional indication for reducing COPD exacerbations (Spiriva, Advair, and Breo Ellipta).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) the main clinical benefits of umeclidinium/vilanterol are its superior improvements in forced expiration volume in 1 second (FEV_1) compared to single ingredient inhalers, the convenience to patients of combining two long-acting bronchodilators into one inhaler, and once daily dosing. The COPD agents will be re-reviewed at an upcoming meeting for UF and BCF placement. Additionally, the P&T Committee recommended adding the LAMA/LABA combinations to the Pulmonary II Drug Class, which includes other chemical entities used for treating COPD.

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed to evaluate umeclidinium/vilanterol (Anoro Ellipta) with other LAMA and LABA therapies in the treatment of COPD. The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) the following:

- CMA showed that the Anoro Ellipta fixed dose combination bronchodilator offers a cost-effective alternative to combining available LAMA and LABA inhalers.

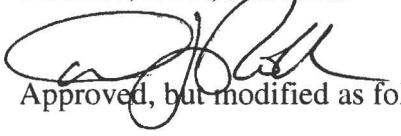
1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) umeclidinium/vilanterol (Anoro Ellipta) be designated formulary on the UF, based on clinical and cost effectiveness.

2. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) the following QLs for umeclidinium/vilanterol (Anoro Ellipta), consistent with the FDA-approved package labeling:

    - Retail Network: 1 inhaler per 30 days
    - Mail Order Pharmacy: 3 inhalers per 90 days

3. ***COMMITTEE ACTION: TRICARE FOR LIFE PHARMACY DRUG LIST***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 2 absent) adding Anoro Ellipta to the TRICARE for Life Pharmacy Drug List due to the potential for additional cost avoidance, and for consistency with other inhaled bronchodilators on the UF that are already included on the Pharmacy Drug List.

Director, DHA, Decision: ☑ Approved □ Disapprov



Approved, but modified as follows:

C. Glaucoma Drugs: Brinzolamide 1%/Brimonidine 0.2% Ophthalmic Suspension (Simbrinza)

Background—Brinzolamide/brimonidine ophthalmic suspension (Simbrinza) is the first fixed dose combination product for glaucoma that has components other than a beta blocker. It contains a carbonic anhydrase inhibitor (brinzolamide, Azopt) and an alpha 2 adrenergic receptor agonist (brimonidine, Alphagan).

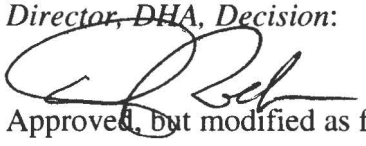
Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) Simbrinza's fixed combination offers a convenience to the patient versus using two drugs concomitantly, even though it requires dosing three times a day. Simbriniza also decreases intraocular pressure to a greater extent than the individual components administered alone.

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed to evaluate brinzolamide/brimonidine (Simbrinza) with other drugs used in the treatment of glaucoma. The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) the following:

- CMA showed that brinzolamide/brimonidine (Simbrinza) was comparable to the UF carbonic anhydrase inhibitors and alpha 2 adrenergic receptor agonists when taken in combination.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) brinzolamide 1%/brimonidine 0.2% ophthalmic suspension (Simbrinza) be designated with formulary status on the UF, based on clinical and cost effectiveness.

Director, DHA, Decision: ☑ Approved □ Disapproved



Approved, but modified as follows:

D. Ophthalmic Non-Steroidal Anti-Inflammatory Drugs (NSAIDs)—Bromfenac 0.07% Ophthalmic Solution (Prolensa)

Background—Bromfenac 0.07% (Prolensa) is FDA-indicated for the treatment of postoperative inflammation and pain in patients following cataract surgery. It is the third bromfenac formulation to obtain FDA approval. The branded formulations of bromfenac 0.09% (Xibrom)

dosed twice daily and bromfenac 0.09% (Bromday) dosed once daily (QD) have been discontinued by the manufacturer.

There are no head-to-head clinical trials comparing Prolensa with another ophthalmic NSAID. There is no data to show that Prolensa is better tolerated when compared to generic bromfenac 0.09% (Bromday) QD. While Prolensa offers the convenience of once daily dosing, generic Bromday is also dosed once daily.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) that Prolensa does not offer clinically relevant advantages over the other UF ocular NSAIDs that are FDA-approved for use following cataract surgery.

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed to evaluate bromfenac 0.07% ophthalmic solution (Prolensa) with other ophthalmic NSAIDs on the UF. The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) that Prolensa was the most costly ocular NSAID.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) bromfenac 0.07% ophthalmic solution (Prolensa) be designated NF due to the lack of compelling clinical advantages and the cost disadvantage compared to the other UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) MN criteria for bromfenac 0.07% ophthalmic solution (Prolensa). See Appendix B for the full criteria.

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 90-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is May 6, 2015.

Director, DHA Decision ☑ Approved ☐ Disapproved

Approved, but modified as follows:

V. UF DRUG CLASS REVIEWS

A. Self-Monitoring Blood Glucose System (SMBGS) Test Strips

Background—The P&T Committee reviewed the clinical effectiveness of the SMBGS test strips. See Appendix D for a full list of the SMBGS test strips in the class. SMBGS

glucometers are not included as part of the TRICARE outpatient pharmacy benefit (they are included under the medical benefit) and are not the focus of the review.

U.S. Federal Government contracting requirements stated the following:

> The Company shall ensure test strips are made available to all three Points of Service (Military Treatment Facilities, TRICARE Mail Order Pharmacy, and Retail Network). In accordance with industry practice, the Company shall make meters available to DoD beneficiaries at no additional charge or cost to the DoD beneficiary.

The FDA classifies SMBGS test strips and glucometers as medical devices rather than drugs. The clinical effectiveness review focused on differences in the technical aspects/attributes among the test strips and glucometers. The P&T Committee recommended that the potential test strips considered for inclusion on the UF should meet standards relating to such factors as FDA requirements for accuracy based on the International Organization for Standardization (ISO) 15197 guidelines from 2003, sample size, alternate site testing, result time, memory capacity, ease of calibration, customer support, downloading capabilities, and data management capabilities.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) the following for the SMBGS test strips:

- Potential SMBGS test strips considered for inclusion on the UF must meet all U.S. Federal Government contracting requirements and the technical factors listed above.
- Potential SMBGS test strips considered for inclusion on the UF included FreeStyle Lite; FreeStyle InsuLinx; Precision Xtra; ACCU-CHEK Aviva Plus; OneTouch Ultra Blue; OneTouch Verio; CONTOUR NEXT; TRUEtest; Nova Max; GLUCOCARD 01-SENSOR; GLUCOCARD Vital; and Prodigy No Coding.
- *Overall relative clinical effectiveness conclusion:* The P&T Committee concluded there were no clinically relevant differences between the 12 SMBGS test strips that were reviewed and met the contracting requirements and technical factors, and that any of the 12 test strips were acceptable for inclusion on the UF.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and budget impact analysis (BIA) were performed to evaluate the SMBGS test strips that were considered for inclusion on the UF. The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) the following:

- Results from a comprehensive cost analysis, which included a CMA and considered the cost of patient switching and related DoD administrative costs in addition to SMBGS test strip per unit costs, showed FreeStyle Lite and Precision Xtra test strips were the most cost-effective SMBGS test strips, followed by ACCU-CHEK Aviva Plus, GLUCOCARD Vital and GLUCOCARD 01-SENSOR, TRUEtest, Prodigy No Coding, CONTOUR NEXT, Nova Max, and all other SMBGS test strips. OneTouch Ultra Blue test strips were the least cost-effective.

- BIA was performed to evaluate the potential impact of scenarios, with selected test strips designated step-preferred and UF or non-preferred and NF on the UF. BIA results showed the scenario with FreeStyle Lite and Precision Xtra designated as step-preferred on the UF and all remaining test strips designated NF and non-step preferred, where all current and new users are required to try FreeStyle Lite or Precision Xtra first, was the most cost-effective option for the Military Health System (MHS).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) the following:

    - UF and step-preferred:
        - FreeStyle Lite
        - Precision Xtra

    - NF and non-step preferred:
        - ACCU-CHEK Aviva Plus
        - GLUCOCARD 01-SENSOR
        - GLUCOCARD Vital
        - CONTOUR NEXT
        - FreeStyle InsuLinx
        - Nova Max
        - TRUEtest
        - Prodigy No Coding
        - OneTouch Verio
        - OneTouch Ultra Blue
        - All other test strips listed in Appendix D with the exception of FreeStyle Lite and Precision Xtra

    - This recommendation includes step therapy, which requires a trial of FreeStyle Lite or Precision Xtra prior to use of a NF test strip. The recommendation requires all current and new users of a non-preferred test strip try FreeStyle Lite or Precision Xtra, or meet the PA criteria for the non-preferred strips.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) maintaining Precision Xtra test strips on the BCF and adding FreeStyle Lite test strips to the BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) MN criteria for the SMBGS test strips. See Appendix B for full criteria.

4. ***COMMITTEE ACTION: MANUAL PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) manual PA criteria for all new and current users of NF test strips. The manual PA criteria requires a trial of FreeStyle Lite or Precision Xtra prior to the use of a NF test strip. See Appendix C for the full criteria.

5. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) QLs for the SMBGS test strips, limiting use to 100 strips per 30-day supply in the Retail Network and 300 strips per 90-day supply in the Mail Order and MTF points of service. See Appendix F for the full criteria.

   Quantity Limits for the SMBGS test strips may be exceeded in the following situations: patient is receiving insulin; using an insulin pump; has gestational diabetes; requires more frequent testing due to endocrine disorders (e.g., insulinoma, endogenous hyperinsulinism, non-islet cell tumor); or, has a history of poorly controlled blood glucose levels with adverse outcomes (e.g., ketoacidosis or hypoglycemic episode), requiring medical intervention.

6. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 120-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is June 3, 2015.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: implement in 180 days.

B. Multiple Sclerosis (MS)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the MS Drug Class, which is comprised of the following injectable and oral disease-modifying drugs:

- **Injectable:** Interferon beta-1b (Betaseron and Extavia subcutaneous (SC) injections), interferon beta-1a (Avonex intramuscular (IM) injection; Rebif SC injection), and, glatiramer (Copaxone 20 mg SC daily injection and 40 mg three times a week (TIW) SC injection)

- **Oral**: dimethyl fumarate (Tecfidera), fingolimod (Gilenya), and teriflunomide (Aubagio)

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 2 absent) the following conclusions for the MS drugs:

1. For the injectables, no one interferon product is preferred over the other in terms of efficacy and safety. Interferon beta-1a IM (Avonex) is possibly less effective than the other interferons, based on the Oregon Drug Effectiveness Review Project (DERP, 2010).
2. In a Cochrane review (2014), similar outcomes (including clinical and magnetic resonance imaging activity measures) were reported when the interferons were compared to glatiramer (Copaxone) for treating patients with relapsing-remitting forms of MS. These findings differ from the DERP 2010 report, where Avonex was presented as less effective.
3. The Copaxone 40 mg TIW formulation has the convenience of less frequent administration than the 20 mg daily Copaxone formulation. However, the 40 mg TIW product has not been directly compared to the 20 mg daily formulation for efficacy or safety; trials are ongoing.
4. There are no head-to-head trials of one oral drug with another oral drug; placebo controlled studies were used to obtain FDA approval. Limited data from head-to-head trials of the injectables versus oral medications report the following:
    - Fingolimod produces a greater reduction in the annualized relapse rate (ARR) compared to interferon beta-1a IM (Avonex).
    - Teriflunomide (Aubagio) 14 mg and interferon beta-1a SC (Rebif) produced similar reductions in the ARR, while teriflunomide 7 mg was less effective than the 14 mg dose and Rebif.
    - There were no clinically relevant differences in the ARR when glatiramer (Copaxone) was compared to dimethyl fumarate (Tecfidera).
5. The Canadian Agency for Drugs in Technology and Health (CADTH, October 2013) reported the relative ARRs of the various MS treatments compared to placebo. Fingolimod (Gilenya) and dimethyl fumarate (Tecfidera) had the lowest ARRs; teriflunomide, interferon beta-1b SC (Betaseron), interferon beta-1a SC (Rebif), and glatiramer (Copaxone) all had similar ARRs; and, interferon beta-1a (Avonex) had the highest ARR.
6. The MS drugs have distinctly different adverse event profiles. Copaxone has the advantage of a pregnancy category B rating.
7. Dalfampridine (Ampyra) is an orally administered drug that is not disease-modifying; it is solely approved for symptom management to improve walking distance.

8. Due to their differing safety profiles and low degree of therapeutic interchangeability, several MS products are required on the UF to meet the needs of the MHS population.

Relative Cost-Effectiveness Analysis and Conclusion—A cost-effectiveness analysis (CEA) and BIA were performed to evaluate the MS Drug Class. The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) the following:

- CEA results showed that, when considering the incremental cost-effectiveness ratios per relapse avoided, all scenarios were within a range considered to be cost-effective to the MHS. Ampyra was not included in the CEA as it is not a disease-modifying drug.
- BIA was performed to evaluate the potential impact of designating selected agents as formulary or NF on the UF. BIA results showed that all modeled scenarios demonstrated a similar level of cost avoidance for the MHS, with only slight differences between evaluated scenarios.

1. ***COMMITTEE ACTION: UF RECOMMENDATIONS***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) the following:
    - UF:
        - Interferon beta-1a SQ (Rebif and Rebif Rebidose)
        - Interferon beta-1a IM (Avonex IM)
        - Interferon beta-1b SC (Betaseron)
        - Interferon beta-1b SC (Extavia)
        - Dalfampridine (Ampyra)
        - Dimethyl fumarate (Tecfidera)
        - Fingolimod (Gilenya)
        - Glatiramer (Copaxone)
        - Teriflunomide (Aubagio)
    - NF: None
2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The MS Drugs Class is now a BCF class; it was previously an Extended Core Formulary (ECF) drug class. The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) interferon beta-1b SC (Betaseron) be designated with BCF status since it is the most cost-effective MS drug. As a result of this action, interferon beta-1a IM (Avonex) is no longer ECF; it remains on the UF.
3. ***COMMITTEE ACTION: MANUAL PA CRITERIA***—Manual PA criteria recommended in November 2010 and November 2013 currently apply to fingolimod (Gilenya) and dimethyl fumarate (Tecfidera), respectively. The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) maintaining the current PA criteria for Tecfidera and

revising the PA criteria for Gilenya due to recent updates in the package insert for cardiovascular toxicity. See Appendix C for full criteria.

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date no later than 30 days after signing of the minutes in all POS.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VI. UTILIZATION MANAGEMENT

A. Prior Authorizations and Medical Necessity

1. **Hepatitis C Virus (HCV) Agents, Direct Acting Antivirals (DAAs): Ledipasvir/Sofosbuvir (Harvoni) Manual PA Criteria and QLs**—Ledipasvir 90 mg/sofosbuvir 400 mg (Harvoni) is a once daily fixed dose combination tablet that was approved by the FDA in October 2014 for the treatment of HCV genotype 1. It is the first FDA-approved interferon-free regimen indicated to treat HCV genotype 1. Harvoni will be reviewed as a new drug at an upcoming meeting.

   a) ***COMMITTEE ACTION: HARVONI MANUAL PA CRITERIA***—PA criteria currently apply to the DAAs. The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) manual PA criteria for new users of ledipasvir/sofosbuvir (Harvoni), consistent with FDA-approved labeling. Prior authorization will expire after 8–24 weeks based on the treatment regimen. See Appendix E for the full criteria.

2. **Hepatitis C Virus Agents, Direct Acting Antivirals (DAAs): Simeprevir (Olysio) Manual PA Criteria**—PA criteria were recommended for Simeprevir (Olysio) at the May 2014 DoD P&T Committee meeting. Simeprevir received a new FDA indication in November 2014 as a component of an interferon-free combination treatment for chronic HCV genotype 1.

   a) ***COMMITTEE ACTION: SIMEPREVIR (OLYSIO) PA CRITERIA***
   The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) revising the existing PA criteria for Olysio to include the expanded FDA-approved indication. See Appendix E for the full criteria.

3. **Targeted Immunomodulatory Biologics (TIBs): Adalimumab (Humira), Apremilast (Otezla), and Etanercept (Enbrel)**—The TIBs were reviewed by the P&T Committee in August 2014 and automated PA (step therapy) and manual PA criteria

were recommended for the class. Recently, adalimumab (Humira) received FDA approval for pediatric Crohn's disease in patients as young as six years and juvenile idiopathic arthritis (JIA) in patients as young as four years; apremilast (Otezla) received FDA approval for plaque psoriasis. PA criteria were updated for Humira and Otezla to reflect their new respective FDA indications. See Appendix C for the full criteria.

Accordingly, step therapy criteria and MN criteria for etanercept (Enbrel) were also revised since Enbrel and Humira are now indicated for the same age range in patients with JIA.

a) ***COMMITTEE ACTION: ADALIMUMAB (HUMIRA) AND APREMILAST (OTEZLA) PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) revised manual and step therapy PA criteria for Humira and Otezla, consistent with the new FDA-approved product labeling. See Appendix C for the full criteria.

b) ***COMMITTEE ACTION: ETANERCEPT (ENBREL) MN AND PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) an update to the MN and PA criteria for Enbrel since Humira is now indicated for JIA. See Appendices B and C for the full criteria.

4. **Prostate Cancer: Enzalutamide (Xtandi)**—Xtandi is an androgen receptor inhibitor that prolongs survival of metastatic castration-resistant prostate cancer. Manual PA criteria were recommended at the November 2012 P&T Committee meeting. The package insert for Xtandi was updated to state that prior treatment with docetaxel is no longer required.

a) ***COMMITTEE ACTION: ENZALUTAMIDE (XTANDI) PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) an update to the manual PA criteria for Xtandi, consistent with the product's labeling for treatment of metastatic castration-resistant prostate cancer. See Appendix C for the full criteria.

5. **Non-Insulin Diabetes Mellitus Drugs: Glucagon-Like Peptide-1 Receptor Agonist (GLP1RAs); Exenatide Once Weekly Pen (Bydureon Pen)**—Exenatide (Bydureon) is now available in a pre-filled pen, in addition to the original vial formulation. The manufacturer states that they do not intend to discontinue the original vial formulation. Both products are dosed once weekly. However, the cost of the Bydureon pen formulation is significantly higher than the Bydureon vials despite having the same dosing and FDA-approved indications. Exenatide (Byetta) is also available in a pen formulation that is dosed twice daily. Manual PA criteria were recommended for the Bydureon pen due to the cost and because other exenatide products (Bydureon vials and Byetta) are available on the UF. The GLP1RA Drug Subclass, including the Bydureon

pen formulation, is scheduled for review at an upcoming meeting.

a) ***COMMITTEE ACTION: EXENATIDE PEN (BYDUREON PEN) PA CRITERIA***—The P&T Committee recommended (16 for, 1 opposed, 0 abstained, 1 absent) manual PA criteria for the Bydureon pen, requiring use of Bydureon vials first. Additionally, a trial of metformin or a sulfonylurea is also required, consistent with the PA criteria for other GLP1RAs. See Appendix C for the full criteria.

B. QLs—QLs for several drugs were reviewed, including the HCV direct acting antiviral ledipasvir/sofosbuvir (Harvoni); the pulmonary fibrosis drugs nintedanib (Ofev) and pirfenidone (Esbriet); and, the LABA olodaterol (Striverdi Respimat). QLs apply to the other products in these drug classes.

1. ***COMMITTEE ACTIONS: QLs***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) QLs for ledipasvir/sofosbuvir (Harvoni), nintedanib (Ofev), pirfenidone (Esbriet), and olodaterol (Striverdi Respimat), consistent with the product labeling. See Appendix F for QLs.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

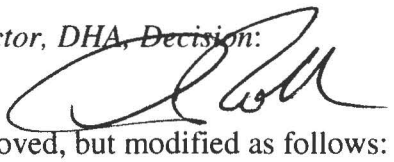
VII. SECTION 716 OF THE NATIONAL DEFENSE AUTHORIZATION ACT (NDAA) FISCAL YEAR 2013 PILOT PROGRAM FOR REFILLS OF MAINTENANCE MEDICATIONS FOR TRICARE FOR LIFE BENFICIARIES THROUGH THE TRICARE MAIL ORDER PROGRAM

A. Medication Drug List for the Pilot Program: Updates—The Medication Drug list for the Pilot Program for TRICARE for Life beneficiaries was recommended at the November 2013 P&T Committee meeting. An update to the drug list is required due to products discontinuations from the market, availability issues, and to ensure consistency within the drug classes. See the TRICARE Formulary Search Tool at *http://pec.ha.osd.mil/TFL_maintenance_drug_list.php* for the full medication drug list.

1. ***COMMITTEE ACTION: MAINTENANCE MEDICATION PROGRAM DRUG LIST UPDATE***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 2 absent) changes to the list of covered maintenance medications for the Section 716 pilot program. Implementation will occur upon signing of the minutes. See Appendix H for the full list of changes.

☑ Approved ☐ Disapproved

Director, DHA, Decision:



Approved, but modified as follows:

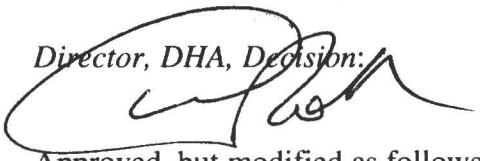
VIII. LINE EXTENSIONS

A. Formulary Status Clarification—The P&T Committee clarified the formulary status for one product line extension ("follow-on product") by the original manufacturer. Line extensions have the same FDA indications and pricing as the "parent" drug.

1. ***COMMITTEE ACTION: LINE EXTENSIONS FORMULARY STATUS CLARIFICATION***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 2 absent) clarifying the formulary status of insulin detemir (Levemir Flextouch). The Levemir Flextouch formulation is replacing the Levemir Flexpen formulation, which was discontinued from the market in the summer of 2014. Implementation will occur upon signing of the minutes.

    - Insulin detemir (Levemir Flextouch): NF, similar to Levemir Flexpen

Director, DHA, Decision: ☑ Approved ☐ Disapproved



Approved, but modified as follows:

IX. COMPOUND PRESCRIPTIONS

A. PA Criteria—The P&T Committee was presented with an update on the status of compounded medications. MHS expenditures for compounded medications are significant and increasing, and compounded medications have a high potential for inappropriate use. From June 2013 through May 2014, 140,000 beneficiaries filled 360,000 compounded prescriptions that totaled over $410 million in expenditures at the Retail Network and Mail Order POS. In an effort to decrease inappropriate use and ensure safety for beneficiaries, PA criteria were proposed.

1. ***COMMITTEE ACTION: COMPOUND PRESCRIPTIONS MANUAL PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 2 absent) manual PA criteria for all new and current users of compounds. Coverage will be approved if the prescriber provides the following information listed below and implementation of the PA will occur when a final recommendation is made.

    a) What is the diagnosis?

b) Has the patient tried commercially available products for the diagnosis provided? Please state all products tried.

c) Is there a current national drug shortage of an otherwise commercially available product?

d) What is the proposed duration of therapy?

AND

The patient meets the following criteria:

(1) Each active ingredient(s) is/are a chemical entity of an FDA-approved drug for marketing in the United States AND the drugs have not been withdrawn for safety reasons from the U.S. market. (If True, proceed to (2); if False, claim rejects.)

(2) Each active ingredient(s) used in this compound is indicated by the FDA to treat the diagnosis provided. (If True, proceed to (3); if False, claim rejects.)

(3) An FDA-approved commercially available product is not appropriate because the patient requires a unique dosage form or concentration (e.g., inability to take a solid dosage form, dose based on age or weight) and/or an FDA-approved product cannot be taken due to allergies or contraindication. (If True, Approved; if False, claim rejects.

Director, DHA, Decision: □ Approved ☒ Disapproved

Approved, but modified as follows: pending consideration of BAP recommendations

X. SPECIALTY MEDICATIONS

A. Clinical Services Drug List and DoD Specialty Agent Reporting List—The P&T Committee was briefed on two separate drug lists for specialty medications, the Clinical Services Drug List and the DoD Specialty Agent Reporting List.

Drugs are assigned to the DoD Specialty Agent Reporting List when they generally meet at least two of these four criteria: cost $500 or more per dose or $6,000 or more per year, have a difficult or unusual process of delivery, require patient management beyond traditional dispensing practices, or as defined by DoD. The DoD Specialty Agent Reporting List is used internally for reporting purposes to monitor drug spend and trends in utilization of specialty medications.

The Clinical Services Drug List is a subset of the DoD Specialty Agent Reporting List and identifies drugs for which contractor-provided pharmacy services at the Retail Network and Mail Order Pharmacy will be provided in conjunction with the new TRICARE Pharmacy contract effective in May 2015.

The P&T Committee reviewed the list of drugs recommended for the Clinical Services Drugs List and voted to remove drugs that are no longer marketed, remove drugs that do not require enhanced clinical services, remove certain drugs classes to allow consideration at future P&T Committee meetings, and add drugs to the list that meet the definition above and require enhanced clinical services.

The Clinical Services Drug List comprises 79 products from a variety of drug classes, including bleeding disorders (hemophilia), MS, HCV, rheumatoid arthritis and other inflammatory conditions, oncology, osteoporosis, neutropenia, acromegaly, iron overload, and hormonal therapies.

The P&T Committee also recommended that additions or deletions to the Clinical Services Drug List be made administratively when new products are approved or when market discontinuations occur to maintain the currency of the list and to ensure timely patient access to specialty medications. The P&T Committee will then review any administrative actions at the next scheduled P&T Committee meeting.

1. ***COMMITTEE ACTION: CLINICAL SERVICES DRUG LIST AND DOD SPECIALTY AGENT REPORTING LIST***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the changes to the Clinical Services Drug List outlined above, and recommended the List be maintained administratively, with any additions or deletions reported at the next scheduled DoD P&T Committee meeting.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

XI. ITEMS FOR INFORMATION

A. Naloxone—The P&T Committee was briefed on an executive action by President Obama to expand the availability of opioid overdose reversal kits for first responders on military bases and other areas under DoD control to improve patient safety and prevent suicides. In April 2014, the FDA approved the first naloxone auto-injectable (Evzio) formulation intended for caregiver administration in emergency situations. The potential implications of wider access of Evzio to patients/family members using opioids who are at increased risk for opioid overdose were discussed. Updates to the P&T Committee will be provided as new information becomes available.

B. UF Proposed Rule—A Proposed Pharmacy TRICARE Rule published in the CFR on September 19, 2014 (http://www.gpo.gov/fdsys/pkg/FR-2014-09-19/pdf/2014-22276.pdf) proposes administrative changes to align the Pharmacy Benefit Program regulation with the statute (10 U.S.C. 1074g), clarifies some uniform formulary procedures, and designates the over-the-counter demonstration program as permanent. The main points of the Proposed Rule are to limit NF drugs to one point of service, place new drugs approved by the FDA in a provisional status for 120 days, and allow generic drugs to be placed in the third tier co-pay. The review period is scheduled to end on January 19, 2015.

XII. ADJOURNMENT

The meeting adjourned at 1130 hours on November 20, 2014. The next meeting will be in February 2015.

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Valeritas Insulin Delivery Device (V-Go) **Insulin–Miscellaneous Insulin Delivery Devices**	• Formulary agents result or are likely to result in therapeutic failure **Formulary alternative:** Uniform Formulary insulin products (insulin glargine, insulin lispro, insulin aspart) pens and vials
• Bromfenac 0.07% ophthalmic solution (Prolensa) **Ophthalmic NSAIDS**	• Patient has experienced or is likely to experience significant adverse effects from formulary agents **Formulary alternatives:** bromfenac, diclofenac, flurbiprofen, ketorolac, nepafenac ophthalmic NSAIDs
• ACCU-CHEK Aviva Plus • GLUCOCARD 01-SENSOR • GLUCOCARD Vital • CONTOUR NEXT • FreeStyle InsuLinx • Nova Max • TRUEtest • Prodigy No Coding • One Touch Verio • One Touch Ultra Blue • Plus all other SMBGS test strips listed in Appendix D, except for FreeStyle Lite and Precision Xtra **Self-Monitoring Blood Glucose System (SMBGS) test strips**	• No alternative formulary – applies in the following situations: • Patient is blind/severely visually impaired and requires a test strip used in a talking meter – Prodigy Voice, Prodigy AutoCode, Advocate Redicode • Patient uses an insulin pump and requires a specific test strip that communicates wirelessly with a specific meter o Contour NEXT strip with CONTOUR NEXT Link meter for Medtronic pump o Nova Max strip with Nova Max Link meter for Medtronic pump o For Retail Network Only: One Touch Ultra test strips with One Touch Ultra Link meter for Medtronic Mini Med Paradigm insulin pump o For Retail Network Only: One Touch Ultra test strips with One Touch Ping meter and using the One Touch Ping insulin pump • The patient has a documented physical or mental health disability requiring a special strip or meter. For example, the patient requires ACCU-CHEK Aviva Plus strip due to manual dexterity issues (Arthritis Association Seal of Approval) **Formulary alternatives:** Freestyle Lite and Precision Xtra
• Etanercept (Enbrel) **Targeted Immunomodulatory Biologics (TIBs)**	• Use of adalimumab (Humira) is contraindicated • The patient has experienced or is likely to experience significant adverse effects from adalimumab (Humira) • Adalimumab (Humira) resulted or is likely to result in therapeutic failure. • The patient previously responded to the nonformulary agent and changing to adalimumab (Humira) would incur unacceptable risk • No alternative formulary agent applies only to: 1. Abatacept (Orencia): The patient is transitioning from IV abatacept or has symptomatic congestive heart failure (CHF). 2. Anakinra (Kineret): The patient has neonatal onset multisystem inflammatory disease (NOMID), a subtype of cryopyrin associated periodic syndrome (CAPS). 3. Etanercept (Enbrel): The patient has hepatitis C infection. 4. Tocilizumab (Actemra): The patient is transitioning from IV abatacept or has symptomatic CHF. **Formulary alternative: adalimumab (Humira)**

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• Valeritas Insulin Delivery Device (V-Go) **Insulin–Miscellaneous Insulin Delivery Devices**	PA criteria apply to all new users of the V-Go device. Manual PA criteria: (1) Patient has Type 2 diabetes mellitus (2) Patient does not need more than 40 units of basal insulin daily AND the patient does not need more than 36 units of bolus insulin daily (3) Patient does not need less than 2 unit increments of bolus dosing (4) Patient has been maintained on stable basal insulin for at least 3 months (at dosages ranging from 20U to 40U) (5) Patient has been using prandial insulin for at least 3 months
• Fingolimod (Gilenya) **Multiple Sclerosis Drugs (MS)**	Manual PA criteria: • A documented diagnosis of relapsing forms of MS • No current use of a disease-modifying therapy (e.g., interferon 1a or 1b or Copaxone) • Avoid use in patients with significant cardiac history, including: o Patients with a recent history (within the past 6 months) of class III/IV heart failure, myocardial infarction, unstable angina, stroke, transient ischemic attack, or decompensated heart failure requiring hospitalization o Those with a history or presence of Mobitz type II second-degree or third-degree atrioventricular (AV) block or sick sinus syndrome, unless they have a functioning pacemaker o Patients with a baseline QTc interval ≥500 ms o Those receiving treatment with class Ia or class III antiarrhythmic drugs
• ACCU-CHEK Aviva Plus • GLUCOCARD 01-SENSOR • GLUCOCARD Vital • CONTOUR NEXT • FreeStyle InsuLinx • Nova Max • TRUEtest • Prodigy No Coding • One Touch Verio • One Touch Ultra Blue • Plus all other SMBGS test strips listed in Appendix D **Self-Monitoring Blood Glucose System (SMBGS) test strips**	New and current users of the nonformulary test strips are required to try FreeStyle Lite or Precision Xtra Manual PA Criteria—Non-preferred test strip allowed if: • Patient is blind/severely visually impaired and requires a test strip used in a talking meter – Prodigy Voice, Prodigy AutoCode, Advocate Redicode • Patient uses an insulin pump and requires a specific test strip that communicates wirelessly with a specific meter o Contour NEXT strip with CONTOUR NEXT Link meter for Medtronic pump o Nova Max strip with Nova Max Link meter for Medtronic pump o For Retail Network Only: One Touch Ultra test strips with One Touch Ultra Link meter for Medtronic Mini Med Paradigm insulin pump o For Retail Network Only: One Touch Ultra test strips with One Touch Ping meter and using the One Touch Ping insulin pump • The patient has a documented physical or mental health disability requiring a special strip or meter. For example, the patient requires ACCU-CHEK Aviva Plus strip due to manual dexterity issues (Arthritis Association Seal of Approval)
• Adalimumab (Humira) **Targeted Immunomodulatory Biologics (TIBs)**	Coverage approved for patients ≥ 18 years with: (Changes highlighted in bold) • Moderate to severe active rheumatoid arthritis, active psoriatic arthritis, or active ankylosing spondylitis • Moderate to severe chronic plaque psoriasis who are candidates for systemic or phototherapy, and when other systemic therapies are medically

Drug / Drug Class	Prior Authorization Criteria
• Adalimumab (Humira) **Targeted Immunomodulatory Biologics (TIBs)**	less appropriate • Moderate to severely active Crohn's disease following an inadequate response to conventional therapy, loss of response to Remicade, or an inability to tolerate Remicade • Moderate to severely active ulcerative colitis following inadequate response to immunosuppressants **Pediatric patients with** • **Moderate to severe active polyarticular juvenile idiopathic arthritis (pediatric patients: 2–17 years)** • **Moderate to severely active Crohn's disease (≥ 6 years)** who have had an inadequate response to corticosteroids, azathioprine, 6-mercaptopurine, or methotrexate Coverage is NOT provided for concomitant use with other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Apremilast (Otezla) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Otezla if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • There is no formulary alternative: patient requires a non-TNF TIB for symptomatic CHF • Adverse reactions to Humira not expected with requested non-step preferred TIB AND Coverage approved for patients ≥ 18 years with: • Active psoriatic arthritis • **Moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy** Coverage is NOT provided for concomitant use with other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Etanercept (Enbrel) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Enbrel if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF)

Drug / Drug Class	Prior Authorization Criteria
• Etanercept (Enbrel) **Targeted Immunomodulatory Biologics (TIBs)**	• Adverse reactions to Humira not expected with requested non-step preferred TIB • There is no formulary alternative (Enbrel is prescribed for a patient with hepatitis C virus) AND Coverage approved for patients ≥ 18 years with: • Moderate to severe active rheumatoid arthritis, active psoriatic arthritis, or active ankylosing spondylitis • Moderate to severe chronic plaque psoriasis who are candidates for systemic or phototherapy Coverage approved for pediatric patients (age 2–17) with: • Moderate to severe active polyarticular Juvenile Idiopathic Arthritis Coverage is NOT provided for concomitant use with other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Enzalutamide (Xtandi) **Prostate Cancer Drugs**	Coverage is approved if: • Documented diagnosis of metastatic castration-resistant prostate cancer No expiration date for the PA
• Exenatide once weekly pen (Bydureon pen) **Glucagon-Like Peptide-1 Receptor Agonists (GLP1RAs)**	New GLP1RA users are required to try metformin or a sulfonylurea (SU) before receiving Byetta, Bydureon, or Victoza. Automated PA criteria: The patient has received a prescription for metformin or SU at any Military Health System pharmacy point of service (Military Treatment Facilities, retail network pharmacies, or mail order) during the previous 180 days, AND Manual PA criteria, if automated criteria are not met: Byetta, Bydureon, or Victoza is approved (e.g., trial of metformin or SU is NOT required) if: 1) The patient has a confirmed diagnosis of Type 2 Diabetes Mellitus 2) The patient has experienced any of the following adverse events while receiving metformin: impaired renal function that precludes treatment with metformin or history of lactic acidosis. 3) The patient has experienced the following adverse event while receiving a SU: hypoglycemia requiring medical treatment. 4) The patient has a contraindication to both metformin and a SU. 5) The patient has had an inadequate response to metformin and a SU. 6) **Also for exenatide once weekly (Bydureon pen)** ▪ **Coverage approved if patient has first tried Bydureon 2mg vial/cartridge first AND** ▪ **Patient has dexterity issues and cannot assemble the Bydureon vial/cartridge**

Appendix D—Table of Self-Monitoring Blood Glucose System Test Strips in the Class

Appendix E—Table of Prior Authorization (PA) Criteria for Hepatitis C Drugs

Prior Authorization Criteria

Ledipasvir/sofosbuvir (Harvoni)
Direct Acting Antiviral Subclass

- New users of ledipasvir/sofosbuvir (Harvoni) are required to undergo the PA process.
- Current users are not affected by PA; they can continue therapy uninterrupted.
- Patients are encouraged to use the Mail Order Pharmacy or MTFs to fill their Harvoni prescriptions.
- Consult the AASLD/IDSA HCV guidelines (www.hcvguidelines.org) for the most up-to-date and comprehensive treatment for HCV. Unique patient populations are also addressed, and treatment recommendations may differ from those for the general population.

Manual PA Criteria:

- Age ≥ 18
- Has laboratory evidence of chronic HCV genotype 1 infection
    1. State the HCV genotype and HCV RNA viral load on the PA form
- Ledipasvir/sofosbuvir (Harvoni) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.
- The patient is not co-infected with Hepatitis B virus (HBV).

Treatment Regimens and Duration of Therapy

- Treatment and duration of therapy are approved for one of the following regimens outlined below, based on HCV genotype, prior treatment, and presence of cirrhosis.
- Prior authorization will expire after 8 weeks or 12 weeks or 24 weeks, based on the treatment regimen selected.

Genotype 1 Patient Populations	***Treatment Duration***
Treatment naïve with or without cirrhosis	8* - 12 weeks
Treatment experienced** without cirrhosis	12 weeks
Treatment experienced** with cirrhosis	24 weeks
*Consider treatment duration of 8 weeks in treatment-naïve patients without cirrhosis who have a pretreatment HCV RNA less than 6 million IU/mL. **Treatment-experienced patients who have failed treatment with either (a) peginterferon alfa plus ribavirin or (b) HCV protease inhibitor plus peginterferon alfa plus ribavirin	

Prior Authorization Criteria

Simeprevir (Olysio)
Direct Acting Antiviral Subclass

- New users of simeprevir (Olysio) are required to undergo the PA process.
- Current users are not affected by PA; they can continue therapy uninterrupted.
- The FDA-approved indication of simeprevir + PEG-interferon + ribavirin for 24 to 48 weeks is not recommended for HCV treatment by the AASLD/IDSA. See www.hcvguidelines.org.
- Patients are encouraged to use the Mail Order Pharmacy or MTFs to fill their simeprevir prescriptions.
- Consult the AASLD/IDSA HCV guidelines (www.hcvguidelines.org) for the most up-to-date and comprehensive treatment for HCV. Unique patient populations are also addressed, and treatment recommendations may differ from those for the general population.

Manual PA Criteria:

- Age ≥ 18
- Has laboratory evidence of chronic HCV genotype 1 infection
- State the HCV genotype and HCV RNA viral load on the PA form
- If HCV genotype 1a, the patient is negative for NS3 Q80K polymorphism at baseline
- Simeprevir (Olysio) is prescribed by or in consultation with a gastroenterologist, hepatologist, infectious diseases physician, or a liver transplant physician.
- The patient is not co-infected with HIV or Hepatitis B virus (HBV).
- Not recommended for monotherapy
- The patient has not previously used a HCV protease inhibitor (boceprevir, telaprevir, or simeprevir)

Treatment Regimens and Duration of Therapy

- Treatment and duration of therapy are approved for one of the following regimens outlined below, based on HCV genotype, prior treatment, and presence of cirrhosis.
- Prior authorization will expire after 12 weeks or 24 weeks, based on the treatment regimen selected.

Genotype 1 Patient Populations	Treatments	Treatment Duration
Treatment naïve or experienced* without cirrhosis	simeprevir 150 mg once daily sofosbuvir 400 mg once daily	12 weeks
Treatment naïve or experienced* with cirrhosis	simeprevir 150 mg once daily sofosbuvir 400 mg once daily	24 weeks
*Treatment-experienced patients who have failed treatment with peginterferon alfa plus ribavirin but not a HCV protease inhibitor Prior Authorization expires at the end of treatment duration (12–24 weeks)		

Appendix F—Table of Quantity Limits

Drug / Drug Class	Quantity Limits
Self-Monitoring Blood Glucose Test Strips (all products)	▪ Retail Network: 100 strips/30-day supply ▪ Mail Order and MTF: 300 strips/90-day supply Override criteria include the following situations: ▪ receiving insulin ▪ using an insulin pump ▪ gestational diabetes ▪ requires more frequent testing due to endocrine disorders (e.g., insulinoma, endogenous hyperinsulinism, non-islet cell tumor) ▪ history of poorly-controlled blood glucose levels with history of adverse outcomes (e.g., ketoacidosis or hypoglycemic episode) requiring medical intervention
• Umeclidinium/vilanterol (Anoro Ellipta) **Pulmonary II Drugs for COPD**	▪ Retail Network: 1 inhaler per 30 days ▪ Mail Order and MTF: 3 inhalers per 90 days
• Ledipasvir/sofosbuvir (Harvoni **Hepatitis C Drugs–Direct Acting Agents**	▪ Retail Network, Mail Order and MTF: 28 tablets per 28 days
• Nintedanib (Ofev) **Pulmonary Fibrosis**	▪ Retail Network, Mail Order, and MTF: 50/100 mg capsules, 60 tabs (30-day supply)
• Pirfenidone (Esbriet) **Pulmonary Fibrosis**	▪ Retail Network, Mail Order, and MTF: 267 mg caps, 270 capsules (30-day supply)
• Olodaterol (Striverdi Respimat) **Pulmonary Fibrosis Long-Acting Beta Agonist (LABA)**	▪ Retail Network: 1 inhaler (60 actuations) per 30 days ▪ Mail Order and MTF: 3 inhalers (180 actuations) per 90 days

Appendix G—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Nov 2014	**Multiple Sclerosis Drugs**	UF class review Previously reviewed	▪ Interferon beta-1b SC (Betaseron)	▪ Interferon beta-1a SC (Rebif and Rebif Rebidose) ▪ Interferon beta-1a IM (Avonex) ▪ Interferon beta 1b SC (Extavia) ▪ Dalfampridine (Ampyra) ▪ Teriflunomide (Aubagio) ▪ Glatiramer (Copaxone) ▪ Fingolimod (Gilenya) ▪ Dimethyl fumarate (Tecfidera)	▪ None	Pending singing of the minutes / 30 days	▪PA required for Gilenya and Tecfidera (See Appendix C)	▪ MS drugs s are no longer an ECF class; Betaseron is now BCF and Avonex is removed from the ECF.
Nov 2014	**Pulmonary II: Chronic Obstructive Pulmonary Disease**	New Drug Review	▪ Ipratropium bromide (Atrovent HFA) ▪ Ipratropium bromide/albuterol nebulized solution (Duoneb) ▪ Salmeterol (Serevent) ▪ Tiotropium (Spiriva)	**May 2013** ▪ Aclidinium (Tudorza) ▪ Arformoterol (Brovana) ▪ Formoterol (Foradil) ▪ Ipratropium bromide/albuterol (Combivent Respimat) ▪ Roflumilast (Daliresp) **Nov 2014** ▪ **Umeclidinium/ vilanterol (Anoro Ellipta) Nov 2014**	▪ Formoterol (Perforomist) ▪ Indacaterol (Arcapta)	Pending signing of the minutes	▪QL apply	▪ BCF, UF, and NF choices are designated for COPD drugs for LABAs, LAMAs, SABA/SAMA, SAMAs, and oral PDE-4 inhibitors. See DoD P&T Minutes for Feb 2009, May 2013, and May 2014.
Nov 2014	**Ophthalmic NSAIDs**	New Drug Review	▪ None	**Aug 2010** ▪ Bromfenac 0.9%, generic ▪ Diclofenac (Voltaren) ▪ Flurbiprofen (Ocufen) ▪ Ketorolac 0.4% (Acular LS) ▪ Ketorolac 0.45% (Acuvail) ▪ Ketorolac 0.5% (Acular) ▪ Nepafenac (Nevanac)	**Nov 2014** ▪ **Bromfenac 0.07% (Prolensa)**	Pending singing of the minutes / 90 days	▪None	▪ Medical Necessity Criteria apply. See Appendix B

Date	DoD PEC Drug Class	Type of Action	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Nov 2014	**Ophthalmic Glaucoma Agents**	New Drug Review	▪ Latanoprost, generic ▪ Timolol, generic ▪ Brimonidine 0.15%, 0.2%, generic	**Nov 2014** ▪ **brinzolamide 1% /brimonidine 0.2% (Simbrinza)** **Feb 2007** ▪ Bimatoprost (Lumigan) ▪ Betaxolol (Betoptic, Betoptic-S) ▪ Carteolol (Ocupress) ▪ Levobunolol (Betagan) ▪ Metipranolol (Optipranolol) ▪ Timolol maleate (Timoptic) ▪ Timolol maleate gel forming solution (Timoptic XE) ▪ Dorzolamide (Trusopt) ▪ Dorzolamide / timolol (Cosopt) ▪ Brimonidine purite 0.1% (Alphagan P) ▪ Apraclonidine (Iopidine) ▪ Dipivefrin (Propine) ▪ Acetylcholine (Miochol-E) ▪ Carbachol (Isopto Carbachol) ▪ Pilocarpine (Pilocar, Pilopine HS) ▪ Echothiophate (Phospholine iodide)	▪ travoprost (Travatan and Travatan Z) ▪ tafluprost (Zioptan) ▪ timolol (Betimol) ▪ timolol (Istalol) ▪ brinzolamide (Azopt)	Pending singing of the minutes / 90 days	▪None	▪ None

Date	DoD PEC Drug Class	Type of Action	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Nov 2014	**Self-Monitoring Blood Glucose System (SMBS) test strips**	UF Class Review	▪ FreeStyle Lite (Abbott) ▪ Precision Xtra (Abbott)	Uniform Formulary and Step-Preferred ▪ FreeStyle Lite (Abbott) ▪ Precision Xtra (Abbott)	Nonformulary and non-step preferred ▪ACCU-CHEK Aviva Plus (Roche) ▪GLUCOCARD 01-SENSOR (Arkray) ▪GLUCOCARD Vital (Arkray) ▪CONTOUR NEXT (Bayer) ▪ FreeStyle InsuLinx (Abbott) ▪NovaMax (Nova) ▪TRUEtest (Nipro) ▪Prodigy No Coding (Prodigy) ▪One Touch Ultra Blue (Lifescan) ▪One Touch Verio (Lifescan) ▪For a V2 (For a) ▪Solus V12 (Biosense) ▪All other test strips listed in Appendix D, with the exception of Freestyle Lite, and Precision Xtra	Pending signing of the minutes / 120 days	Step therapy requires a trial of an FreeStyle Lite, or Precision Xtra in all new and current users of the nonformulary strips	▪ FreeStyle Lite added to the BCF; Precision Xtra remains on the BCF

TRICARE Formulary Search tool: *http://www.pec.ha.osd.mil/formulary_search.php*

Appendix H—Section 716 Maintenance Medication Program Drug List

- Removed from list due to manufacturer discontinuation:
  - ANTARA 45 mg, 130 mg CAPS
  - CENESTIN 0.3, 0.45 mg TABS
  - LEVATOL 20 mg TABs
  - LUVOX CR 150 mg CAPS
  - SANCTURA 20 mg TABS
  - UNIRETIC 7.5 mg/12.5 mg TABS

- Added to the list, due to consistency with the drug class (new strengths or dosage formulations):
  - ACTONEL 30 mg TABLET
  - ANGELIQ 0.25 mg–0.5 mg TABLET
  - ARICEPT 23 mg TABLET
  - BETAPACE 160 mg TABLET
  - CARAFATE 1 g/10 ml ORAL SUSP
  - CLORPRES 0.1 mg–15 mg TABLET
  - EFFER-K 25 mEq TABLET EFF
  - EXELON 13.3 mg/24 hours PATCH TD24
  - KLOR-CON 20 mEq PACKET
  - K-TAB ER 20 mEq TABLET ER
  - LANOXIN 62.5 mcg and 1875 mcg TABLET
  - LUPRON DEPOT 45 mg SYRINGE KIT
  - LUPRON DEPOT-PED 30 mg and 11.25 mg SYRINGE KIT
  - MINITRAN 0.4 mg/hr PATCH TD24
  - NAPROSYN 250 mg TABLET
  - NEUPRO 1 mg/24 hour, 3 mg/24 hour and 8 mg/24 hour PATCH TD24
  - NEXIUM 2.5 mg and 5 mg SUSPDR PKT
  - NORDITROPIN FLEXPRO 10 mg/1.5 ml PEN
  - NUTROPIN AQ 20 mg/2 ml CARTRIDGE and NUTROPIN AQ NUSPIN 5 mg/2 ml CARTRIDGE
  - RAZADYNE ER 8 mg CAP 24 hour PEL
  - SAIZEN 8.8 mg VIAL and 8.8 mg/1.5 CARTRIDGE
  - SPRYCEL 140 mg TABLET
  - TRELSTAR 3.75 mg/2 ml SYRINGE
  - NAMENDA 5 mg–10 mg TAB DS PK

Appendix I—Table of Abbreviations

ARR	annualized relapse rate
BCF	Basic Core Formulary
BIA	budget impact analysis
CADHT	Canadian Agency for Drugs in Technology and Health
CEA	cost-effectiveness analysis
CMA	cost minimization analysis
COPD	chronic obstructive pulmonary disease
DAAs	direct acting antivirals

UF	Uniform Formulary
V-Go	Valeritas V-Go insulin delivery device

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE
MINUTES AND RECOMMENDATIONS

August 2014

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on August 13, 2014, at the Defense Health Agency (DHA) Pharmacoeconomic Branch, Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is listed in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of May Minutes**—Lt. Gen. Douglas J. Robb, DO, MPH, Director, DHA, approved the minutes for the May 2014 DoD P&T Committee meeting on September 12, 2014.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and Basic Core Formulary (BCF) recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Non-Insulin Diabetes Drugs—Glucagon-Like Peptide-1 Receptor Agonist (GLP1RA): Albiglutide (Tanzeum)

Background—Albiglutide (Tanzeum) is the fourth GLP1RA and the second product with once weekly dosing. Similar to the other GLP1RAs [(exenatide once weekly (Bydureon), liraglutide (Victoza), and exenatide twice daily (Byetta)], albiglutide has beneficial effects on reducing hemoglobin A1c, blood pressure, weight, and improving lipid lab profiles. Albiglutide has a lower incidence of nausea and vomiting compared to Bydureon, Victoza, or Byetta. However, it has a slightly higher incidence of diarrhea. All four GLP1RAs have the same warnings and contraindications for the risk of serious adverse effects, including medullary thyroid cancer, multiple endocrine neoplasia syndrome type 2, and pancreatitis. There are currently no long-term cardiovascular outcome studies published with any GLP1RA.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the main benefit of albiglutide is its once weekly dosing regimen and lower incidence of nausea compared to the other GLP1RA drugs. The GLP1RAs will be re-reviewed at an upcoming meeting for UF and potential BCF placement.

Relative Cost-Effectiveness Analysis and Conclusion—Cost minimization (CMA) was performed to evaluate albiglutide (Tanzeum) with the other GLP1RA agents. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that albiglutide (Tanzeum) is cost-effective compared with other GLP1RA agents on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) albiglutide (Tanzeum) be designated formulary on the UF, based on clinical and cost effectiveness.

2. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA*** Existing automated PA (step therapy) criteria for the GLP1RAs requires a trial of metformin or a sulfonylurea first, based on positive long-term outcomes data with metformin and the sulfonylureas. The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) PA criteria for albiglutide, requiring a trial of metformin or a sulfonylurea in all new and current users of albiglutide (Tanzeum), consistent with the PA requirements for the other GLP1RAs. Use of albiglutide is approved only for patients with Type 2 diabetes mellitus, consistent with the FDA-approved indication. (See Appendix C for full criteria.)

3. ***COMMITTEE ACTION***: ***PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) an effective date of the first Wednesday after a 30-day implementation period in all points of service (POS). Based on the P&T Committee's recommendation, the effective date is December 10, 2014.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Attention Deficit Hyperactivity Disorder (ADHD) Stimulants Subclass: Methylphenidate Extended Release (ER) Oral Suspension (Quillivant XR)

Background—Quillivant XR is FDA-indicated for the treatment of ADHD in children six years of age or older; it is dosed once daily. Quillivant XR delivers medication directly via a suspension, instead of opening capsules and mixing the beads or powder with food, which is required with other long-acting stimulants (e.g., Metadate CD, Ritalin LA, Adderall XR). There are no head-to-head studies comparing Quillivant XR to other ADHD medications. Current clinical practice guidelines suggest that all stimulant compounds indicated for ADHD

have very few differences among them in their ability to improve symptoms, their tolerability profiles, or risk of adverse events.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that although Quillivant XR offers the convenience of an oral suspension of methylphenidate ER, it failed to demonstrate clinically compelling advantages over existing UF agents for ADHD. Other long-acting stimulant preparations with alternative dosing formulations (e.g., sprinkles) are available on the UF.

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed to evaluate methylphenidate ER suspension (Quillivant XR) with other long-acting methylphenidate agents on the UF. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that Quillivant XR was not cost-effective compared with other long-acting methylphenidate agents on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) methylphenidate ER oral solution (Quillivant XR) be designated NF due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) MN criteria for methylphenidate ER oral solution (Quillivant XR). (See Appendix B for the full criteria.)

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***
The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is February 18, 2014.

Director, DHA, Decision: ☒ Approved □ Disapproved

Approved, but modified as follows:

V. UF DRUG CLASS REVIEWS

A. Targeted Immunomodulatory Biologics (TIBs)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the TIBs Drug Class, which is comprised of the following injectable and oral medications:

- **Anti-tumor necrosis factor (TNF) biologics**: adalimumab (Humira), certolizumab (Cimzia), etanercept (Enbrel), and golimumab (Simponi)
- **Non-TNF biologics**: abatacept (Orencia), anakinra (Kineret), apremilast (Otezla), tocilizumab (Actemra), tofacitinib (Xeljanz), and ustekinumab (Stelara)

The TIBs are FDA-approved for a variety of indications, including rheumatologic, dermatologic, and gastrointestinal inflammatory conditions. The TIBs were reviewed for UF placement in November 2007 and adalimumab (Humira) was recommended as the only multi-indication TIB on the Extended Core Formulary (ECF). Since the 2007 class review, several new TIBs have been marketed. Two oral therapies, tofacitinib (Xeljanz) and apremilast (Otezla) are now available.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) the following conclusions for the TIBs, based on FDA-approved indications:

1. All the TIBs (adalimumab, etanercept, certolizumab, golimumab, abatacept, tocilizumab, tofacitinib, anakinra, ustekinumab and apremilast) are highly effective for their FDA indications versus placebo, based on randomized controlled trials (RCTs).

2. There are few direct head-to-head trials between the TIBs; the majority of studies are non-inferiority trials. Comparative effectiveness is primarily determined though network meta-analysis (NMA) and indirect comparison; i.e., number needed to treat (NNT). The strength of evidence is typically low.

3. For rheumatoid arthritis, the available evidence is insufficient to clearly show superiority of one TIB over another with regard to the American College of Rheumatology 50 (ACR50) endpoint for response to treatment.

   In three systematic reviews, there was a trend favoring etanercept over the other TIBs in terms of efficacy. The same reviews found anakinra had a statistically significant lower mean response when compared to etanercept and adalimumab, but the strength of evidence was low.

4. For juvenile inflammatory arthritis, there is insufficient evidence to suggest clinically relevant differences between adalimumab and etanercept, the two TIBs approved in pediatric patients.

5. For psoriatic arthritis, due to the lack of head-to-head clinical trials and heterogeneous study populations, there is insufficient evidence to determine comparative efficacy between the four anti-TNFs (adalimumab, certolizumab, etanercept, and golimumab), and the non-TNFs (ustekinumab, and apremilast). Indirect comparisons from RCTs suggest similar NNTs for these drugs.

6. For psoriasis, three products are approved, adalimumab, etanercept, and ustekinumab. In one head-to-head RCT, ustekinumab was superior to etanercept

in achieving response, based on the Psoriasis Activity and Severity Index 75 (PASI 75) score. NMA demonstrated similar efficacy for adalimumab and ustekinumab.

7. For Crohn's disease, a NMA demonstrated that adalimumab and certolizumab are both effective for the induction of response and maintenance of remission and maintenance of response. The same analysis showed adalimumab is superior to certolizumab for induction of remission.

8. For ulcerative colitis, adalimumab and golimumab are effective for inducing clinical response, clinical remission, and mucosal healing. There is insufficient data for direct comparison of these agents.

9. With regard to safety, the overall rates of adverse events (AEs) are similar between the TIBs. In short-term trials, adalimumab and abatacept had a lower risk of serious AEs (serious infections, malignancies, lymphomas, withdrawals and other AEs) compared to other TIBs.

10. Evidence from indirect comparisons of two systematic reviews and one NMA shows the rate of serious infections is higher with certolizumab than the other TIBs. A subgroup analysis from one systematic review and a NMA showed the risk of serious infections was not increased with etanercept, in contrast to the increased risk seen with the other anti-TNF drugs, compared to controls.

11. The risk of tuberculosis (TB) is increased with the TIBs as a group. There is evidence (low strength) that suggests an increased risk with adalimumab, compared with etanercept.

12. The evidence (low strength) from indirect comparisons suggesting a safety benefit with etanercept in terms of serious infections and TB compared to the other anti-TNFs, must be weighed against its lack of efficacy for gastrointestinal conditions (Crohn's disease and ulcerative colitis).

13. Although the strength of evidence is low, there does not appear to be an elevated risk of malignancy with the TIBs. However, the risk of nonmelanoma skin cancer is increased with adalimumab and etanercept, compared to controls.

14. Concurrent use of a TIB with another TIB results in increased AEs and is not recommended by current practice guidelines.

15. Unique safety concerns with the non-TNF biologics include the following:

    - abatacept: Increased risk of chronic obstructive pulmonary disease (COPD) exacerbation in adults with COPD
    - tocilizumab and tofacitinib: gastrointestinal perforation and lab abnormalities, including elevated lipids and transaminases

- apremilast: psychiatric adverse effects such as depression and suicidal ideations

16. Overall, adalimumab has the highest clinical utility within the Military Health System (MHS) given its seven FDA-approved indications and wide spectrum of clinical coverage.
17. Inclusion of a non-TNF biologic on the formulary is required for patients who do not respond to an anti-TNF biologic.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and budget impact analysis (BIA) were performed to evaluate the TIBs used to treat rheumatologic (stratified by rheumatoid arthritis and psoriatic arthritis), dermatologic, and gastrointestinal (stratified by Crohn's disease and ulcerative colitis) inflammatory conditions. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

1. CMA results for the TIBs showed the following:
    - For rheumatoid arthritis, adalimumab (Humira) was the most cost-effective TIB, followed by certolizumab (Cimzia), anakinra (Kineret), tofacitinib (Xeljanz), golimumab (Simponi), etanercept (Enbrel), abatacept (Orencia), and tocilizumab (Actemra).
    - For psoriatic arthritis, adalimumab was the most cost-effective drug, followed by apremilast (Otezla), certolizumab, golimumab, etanercept, and ustekinumab (Stelara).
    - For dermatologic conditions, adalimumab was the most cost-effective TIB, followed by etanercept, and ustekinumab.
    - For gastrointestinal conditions (Crohn's disease), adalimumab was the most cost-effective agent, followed by certolizumab. For ulcerative colitis, adalimumab was the most cost-effective agent, followed by golimumab.
2. A BIA was performed to evaluate the potential impact of scenarios, with selected agents designated step-preferred and UF or non-preferred and NF.

Robust BIA results showed the scenario with adalimumab designated as formulary and step preferred on the UF; apremilast, golimumab, tofacitinib, and ustekinumab designated as formulary and non-preferred; and, abatacept, anakinra, certolizumab, etanercept, and tocilizumab designated as NF and non-step preferred, was the most cost-effective option for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATIONS***—The P&T Committee recommended (16 for, 1 opposed, 0 abstained, 0 absent) the following for the TIBs, based on clinical effectiveness, and cost effectiveness.

- UF and step-preferred ("in front of the step"): adalimumab (Humira)
- UF and non-preferred ("behind the step"): apremilast (Otezla), golimumab (Simponi), tofacitinib (Xeljanz), and ustekinumab (Stelara)
- NF and non-preferred: abatacept (Orencia), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), and tocilizumab (Actemra)
- This recommendation includes step therapy, which requires a trial of adalimumab for all new users of a TIB.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent), adalimumab (Humira) be designated BCF upon signing of the minutes. The TIBs are now classified as a BCF rather than an ECF drug class. Military Treatment Facilities (MTFs) that do not currently have adalimumab on formulary are required to add it to their local formularies and make it available to beneficiaries on the same basis as any other BCF agent.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) MN criteria for abatacept (Orencia), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), and tocilizumab (Actemra). (See Appendix B for full MN criteria.)

4. ***COMMITTEE ACTION: PA CRITERIA***—Existing manual PA criteria currently apply to all the TIBs. The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) automated (step therapy) criteria for all new users of the non-preferred TIBs [abatacept (Orencia), anakinra (Kineret), apremilast (Otezla), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), tocilizumab (Actemra), tofacitinib (Xeljanz), and ustekinumab (Stelara)], requiring a trial of adalimumab (Humira) before the non-step preferred drugs.

   A trial of Humira is not required if:

   - Contraindications exist to Humira
   - The patient has had an inadequate response to Humira, and requires a different anti-TNF biologic or a non-TNF biologic
   - The patient has experienced adverse reactions to Humira which are not expected to occur with the requested non-preferred TIB
   - There is no formulary alternative for the following:
     - Enbrel: Patient is a child younger than four years of age or the patient has hepatitis C virus

- Non-TNF TIB (Orencia, Actemra, Xeljanz, Kineret, Stelara, and Otezla): Patient has symptomatic chronic heart failure
- Actemra, Orencia or Simponi: Patient has been stable on an intravenous formulation, with continuous use in the past three months and needs to transition to the subcutaneous formulation

The P&T Committee also recommended manual PA criteria for all users of Humira or a non-preferred TIB. Coverage for the TIBs is only allowed for the FDA-approved indications, and coverage is not approved for concomitant use of a TIB with other biologics. (See Appendix C for full criteria.)

5. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—QLs currently apply to the TIBs. The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) to continue the current QLs for abatacept, adalimumab, anakinra, apremilast, certolizumab, etanercept, golimumab, tofacitinib, tocilizumab, and ustekinumab, at a maximum of a 28-day supply in the Retail Network and maximum of a 56-day supply in the Mail Order Pharmacy.

6. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is February 18, 2014.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VI. BCF CHANGES

A. Non-Insulin Diabetes Drugs—Sulfonylureas: MTF Request for Glyburide Deletion from the BCF

The P&T Committee reviewed a MTF request to delete glyburide from the BCF. Two sulfonylureas, glyburide (Diabeta, Glynase, generics) and glipizide (Glucotrol, generics) have been maintained on the BCF since 1998. Two other sulfonylureas, glimepiride (Amaryl, generics) and glipizide XL (Glucotrol XL, generics) are designated UF. Glipizide is safer to use than glyburide in diabetic patients with renal insufficiency.

However, glyburide is the sulfonylurea of choice for treating pregnant women, based on an article in the New England Journal of Medicine from 2000. P&T Committee members were concerned about the availability of glyburide for pregnant patients at all MTFs if it was removed from the BCF.

1. ***COMMITTEE ACTION: GLYBURIDE DELETION FROM THE BCF***
   The P&T Committee recommended (0 for, 17 opposed, 0 abstained, 0 absent) to remove glyburide on the BCF. Glyburide will be retained on the BCF. Providers are cautioned about the risk of renal insufficiency with glyburide.

B. Contraceptives Agents (Triphasics): Ethinyl Estradiol (EE) 25 mcg; Norgestimate 0.18/0.215/0.25mg (Ortho Tri-Cyclen Lo, generics) Deletion from the BCF

The P&T Committee reviewed trends in utilization and spend for the Contraceptives Agents. Multiple generic entrants, product discontinuations, and pricing changes frequently occur for the various products. Eleven contraceptive subclasses are on the BCF, including six monophasic, one triphasic, and one progestogen-only formulation; all the contraceptive subclasses have designated UF products.

The triphasic product EE 25 mcg with 0.18/0.215/0.25mg norgestimate (Ortho Tri-Cyclen Lo) has been maintained on the BCF since May 2006. An increase in the Ortho Tri-Cyclen Lo price has been noted over the past two years. Other triphasic products with EE 25 mcg, containing a different progestin (e.g., desogestrel in the formulations of Cyclessa and Velivet) and norgestimate-containing products with EE 35 mcg (e.g., Ortho Tri-Cyclen and Trinessa) are available on the UF at significant cost savings.

1. ***COMMITTEE ACTION: EE 25 MCG; 0.18/0.215/0.25MG NORGESTIMATE (ORTHO TRI-CYCLEN LO) DELETION FROM THE BCF***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) removing EE 25 mcg; 0.18/0.215/0.25mg norgestimate (Ortho Tri-Cyclen Lo) from the BCF upon signing of the minutes; the drug remains UF.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VII. UTILIZATION MANAGEMENT

A. PA and QLs

1. **Valeritas V-Go Insulin Delivery Device**—V-Go is a disposable insulin delivery device approved for patients with Type 2 diabetes mellitus. Unlike an insulin pump, V-Go does not require any tubing or catheters. The device is filled daily with rapid acting insulin, allowing for continuous administration of basal insulin. After 24 hours, the

device is discarded and replaced with a new unit. Advantages of V-Go include convenience to the patient desiring increased control over their blood glucose levels and elimination of the need for multiple daily insulin injections. Additionally, V-Go may reduce prandial glycemic excursions compared to multiple insulin injections. Potential disadvantages of V-Go include the risk of hypoglycemia and infection, the requirement for daily manual filling of the device with insulin, non-adjustable preset basal rates, and the potential for wastage.

The P&T Committee considered PA criteria for V-Go, consistent with the product labeling, including the capacity and purpose of the system (a maximum allowable dose of insulin of 76 units per day), and the meal time bolus insulin dose capability (no less than 2 unit increments of insulin).

a) ***COMMITTEE ACTION: V-GO MANUAL PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) manual prior authorization criteria for all new users of V-Go. Coverage will be approved if the patient meets all of the following criteria:

(1) Patient has Type 2 diabetes mellitus; AND

(2) Patient does not need more than 40 units of basal insulin daily AND the patient does not need more than 36 units of bolus insulin daily; AND

(3) Patient does not need less than 2 unit increments of bolus dosing; AND

(4) Patient has been maintained on stable basal insulin for at least three months (at dosages of 20U, 30U, or 40U); AND

(5) Patient has been using prandial insulin for at least three months.

b) ***COMMITTEE ACTION: V-GO QLS***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) QLs of 30 units per 30 days, consistent with the product labeling of 1 unit used daily.

c) ***V-GO PA IMPLEMENTATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) implementation of the PA upon signing of the minutes.

2. **Newer Sedative Hypnotics (SED-1s): Tasimelteon (Hetlioz)**—Tasimelteon is a melatonin receptor agonist that is approved for treating blind patients who have non-24 hours sleep-wake disorder and have no light perception. It will be reviewed as a new drug at an upcoming meeting. Automated PA (step therapy) currently applies to the SED-1s Drug Class, where a trial of generic zolpidem immediate release (IR) or zaleplon is required first.

a) ***COMMITTEE ACTION: TASIMELTEON (HETLIOZ) PA CRITERIA***
The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) PA criteria for all new users of tasimelteon (Hetlioz) who are blind and have non-24 hour sleep-wake disorder. PA criteria will require a trial of generic zolpidem IR or zaleplon before Hetlioz. (See Appendix C for full criteria.)

b) ***COMMITTEE ACTION: TASIMELTEON (HETLIOZ) PA IMPLEMENTATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) an effective date of no later than the first Wednesday after a 30-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is December 10, 2014.

3. **Metastatic Melanoma Medications: Trametinib (Mekinist) and Dabrafenib (Tafinlar) Manual PA Criteria**—Mekinist and Tafinlar are oral kinase inhibitors approved for treating patients with unresectable or metastatic melanoma who have documented BRAF V600E or V600K mutations as detected by an FDA-approved test. PA criteria currently apply to other oral kinase inhibitors for this diagnosis.

   a) ***COMMITTEE ACTION: TRAMETINIB (MEKINIST) AND DABRAFENIB (TAFINLAR) PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) manual PA criteria should apply to all new users of Mekinist and Tafinlar, consistent with the FDA-approved product labeling. The PA will ensure that candidates likely to respond to Mekinist and Tafinlar are identified prior to initiating therapy. (See Appendix C for full criteria.)

4. **Seizure Medications: Topiramate ER capsules (Trokendi XR and Qudexy XR) Manual PA Criteria**—Trokendi XR and Qudexy XR are branded ER formulations of topiramate that are dosed once daily. Generic formulations of topiramate IR have been marketed since 1996, and include both tablets and capsules. Generic topiramate IR is FDA-approved for treating patients with seizures, down to the age of two years, and migraine headache. Topiramate is sometimes used off –label for weight loss.

   Trokendi XR and Qudexy XR are indicated for the treatment of seizures, but are only approved for patients down to the age of six or ten years, depending on the diagnosis.

   a) ***COMMITTEE ACTION: TOPIRAMATE ER (TROKENDI XR AND QUDEXY XR) PA CRITERIA***—The P&T Committee recommended (16 for, 1 opposed, 0 abstained, 0 absent) PA criteria for all new users of Trokendi XR and Qudexy XR consistent with the product's labeling for treatment of seizures, due to the potential for off-label use. Patients will be required to try generic topiramate IR first, unless there is a contraindication or adverse reaction with the generic product. (See Appendix C for full criteria.)

b) ***COMMITTEE ACTION: TOPIRAMATE ER (TROKENDI XR AND QUDEXY XR) PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) an effective date no later than the first Wednesday after a 30-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is December 10, 2014.

5. **Oral Chemotherapy Agents: Ibrutinib (Imbruvica), Idealisib (Zydelig), and Everolimus (Afinitor Disperz)**—QLs currently apply to the oral chemotherapy agents.

a) ***COMMITTEE ACTION: IBRUTINIB (IMBRUVICA), IDEALISIB (ZYDELIG,) AND EVEROLIMUS (AFINITOR DISPERZ)—QLs***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) the following QLs, consistent with the products' packaging and labeling:

(1) Ibrutinib (Imbruvica): A maximum allowable quantity at the retail network POS of 60 tablets (30-day supply) and 120 tablets at the Mail Order Pharmacy (60-day supply)

(2) Idealisib (Zydelig): A maximum allowable quantity at the retail network POS of 60 tablets (30-day supply) and 120 tablets at the Mail Order Pharmacy (60-day supply)

(3) Everolimus (Afinitor Disperz): A maximum allowable quantity at the retail network POS of a 28-day supply, and a 56-day supply at the Mail Order Pharmacy.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VIII. SECTION 716 OF THE NATIONAL DEFENSE AUTHORIZATION ACT (NDAA) FISCAL YEAR 2013 PILOT PROGRAM FOR REFILLS OF MAINTENANCE MEDICATIONS FOR TRICARE FOR LIFE BENFICIARIES THROUGH THE TRICARE MAIL ORDER PROGRAM

A. Medication Drug List for the Pilot Program: Updates—The Medication Drug list for the Pilot Program for TRICARE for Life beneficiaries was recommended at the November 2013 P&T Committee meeting. An update to the drug list is required due to some products being discontinued from the market, availability issues, and to ensure consistency within the drug classes. (See the November 2013 P&T Committee meeting minutes, Appendix F, found at

http://pec.ha.osd.mil/PT_min_charter.php?submenuheader=5
or the TRICARE Formulary Search Tool at
http://pec.ha.osd.mil/TFL_maintenance_drug_list.php for the full medication drug list.)

1. ***COMMITTEE ACTION: MAINTENANCE MEDICATION PROGRAM DRUG LIST UPDATE***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) the following changes to the list of covered maintenance medications for the Section 716 pilot program. Implementation will occur upon signing of the minutes.

    - Remove from list due to manufacturer discontinuation: Cardizem 90 mg tablet; Dilacor XR 240 mg capsule; Estraderm 0.05 mg patch; Exelon 2 mg/mL solution; Lantus 100 units/mL cartridge; Lufyllin-GG elixir; Namenda 5mg–10 mg titration pack; Parcopa 10 mg–100 mg orally dissolving tablet (ODT); Parcopa 25 mg–100 mg ODT; Parcopa 25 mg–250 mg ODT; Potaba 500 mg tablet; Questran Light packet; Sanctura XR 60 mg capsules; Teveten 400 mg tablets; Uniretic 15mg–25 mg tablet
    - Remove from list due to noncompliance with the Trade Agreements Act: Isopoto carpine 2% eye drops; Lopid 600 mg tablet; Pepcid 40 mg tablet
    - Remove from list due to availability issues: Theo24
    - Add to list, due to consistency with the drug class: Humulin 70/30 Kwikpen; Humilin 100 units/mL Kwikpen; Pegasys 180 mcg/0.5 mL syringe
    - Add to list due to consistency with the class and UF changes recommended at the August 2014 P&T Committee meeting: TIBs formulary drugs—Otezla, Simponi, Stelara, and Xeljanz

    Director, DHA, Decision: ☒ Approved ☐ Disapproved

    Approved, but modified as follows:

IX. LINE EXTENSIONS

A. Formulary Status Clarification—The P&T Committee clarified the formulary status for one product line extension ("follow-on product") by the original manufacturer. Line extensions have the same FDA indications and pricing as the "parent" drug. The product is a new dosage strength of buprenorphine transdermal system (Butrans).

1. ***COMMITTEE ACTION: LINE EXTENSIONS FORMULARY STATUS CLARIFICATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) clarifying the formulary status of the following product to reflect

the current formulary status and step therapy/PA criteria of the parent compound. Implementation will occur upon signing of the minutes.

- Buprenorphine patch (Butrans) 7.5 mcg/hour patch: UF with PA, similar to Butrans patch 5, 10, 15, and 20 mcg/hour

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

X. FISCAL YEAR 2008 NDAA, Section 703

The P&T Committee reviewed drugs from manufacturers that were not included on a DoD Retail Refund Pricing Agreement; these drugs are not in compliance with the Fiscal Year 2008 NDAA, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated NF on the UF and will require pre-authorization prior to use in the Retail POS and medical necessity in the MTFs. These NF drugs will remain available in the Mail Order POS without preauthorization.

1. ***COMMITTEE ACTION: DRUGS DESIGNATED NF***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) that the following products be designated NF on the UF:

Auxilium Pharma:	Robaxin 750, Robaxin, Levatol
Bluepoint Lab:	Nitrofurantoin Mono-M; Nitrofurantoin
Eli Lilly:	Livalo
Kowa:	Livalo
Major Pharma:	sulfasalazine, methotrexate
Orexo:	Zubsolv
Purdue:	Dilaudid, Intermezzo
VistaPharm:	sucralfate
Xenoport:	Horizant
Zylera:	Ulesfia

2. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) the following pre-authorization criteria for the drugs recommended NF above: 1) obtaining the product by home delivery would be detrimental to the patient; and, 2) for branded products with AB generic availability, use of the generic product would be detrimental to the patient. These pre-authorization criteria do not apply to any POS other than retail network pharmacies.

3. ***COMMITTEE ACTION: IMPLEMENTATION PERIOD FOR PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in the Retail Network; and, 2) DHA send a letter to beneficiaries affected by these decisions. Based on the P&T Committee's recommendation, the effective date is February 18, 2014.

4. ***COMMITTEE ACTION: DRUG DESIGNATED FORMULARY***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) retaining the following drugs, due to their unique clinical niches: oxycodone 5 mg/mL solution (VistaPharm); nitrogen mustard topical gel for the treatment of mycosis fungoides-type cutaneous T-cell lymphoma (Valchlor; Actelion); and, typhoid vaccine live oral (Vivotif; Berne Products Crucell).

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

XI. ITEMS FOR INFORMATION

A. Specialty Medications—The P&T Committee was briefed on an initial plan for specialty medications, including a discussion of a proposed definition of a specialty agent. DHA's goal is to provide a standardized means to measure utilization and spend of specialty agents, and to evaluate patient outcomes. Other aspects include providing tools to assist patients, providers, and MTFs in the course of managing drug and associated therapy for these complex disease states. The P&T Committee will receive updates and will review specialty agents eligible for contractor-provided clinical pharmacy services at future meetings.

XII. ADJOURNMENT

The meeting adjourned at 1730 hours on August 13, 2014. The next meeting will be in November 2014.

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Abatacept (Orencia) • Anakinra (Kineret) • Certolizumab (Cimzia) • Etanercept (Enbrel) • Tocilizumab (Actemra) **Targeted Immunomodulatory Biologics (TIBs)**	• Use of adalimumab (Humira) is contraindicated • The patient has experienced or is likely to experience significant adverse effects from adalimumab (Humira) • Adalimumab (Humira) resulted or is likely to result in therapeutic failure. • The patient previously responded to the nonformulary agent and changing to adalimumab (Humira) would incur unacceptable risk • No alternative formulary agent applies only to: 1. Abatacept (Orencia): The patient is transitioning from IV abatacept or has symptomatic congestive heart failure CHF. 2. Anakinra (Kineret): The patient has neonatal onset multisystem inflammatory disease (NOMID), a subtype of cryopyrin associated periodic syndrome (CAPS). 3. Etanercept (Enbrel): The patient is less than 4 years of age or has hepatitis C infection. 4. Tocilizumab (Actemra): The patient is transitioning from IV abatacept or has symptomatic CHF. **Formulary alternative:** adalimumab (Humira)
• Methylphenidate ER oral suspension (Quillivant XR) **Attention Deficit Hyperactivity Disorder Stimulants**	• The formulary agents resulted in therapeutic failure. • No alternative formulary agent — patient has a G-tube. **Formulary alternatives:** Methylphenidate immediate release, sustained release, or extended release

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• Adalimumab (Humira) **Targeted Immunomodulatory Biologics (TIBs)**	Coverage approved for patients ≥ 18 years with: • Moderate to severe active rheumatoid arthritis, active psoriatic arthritis, or active ankylosing spondylitis • Moderate to severe chronic plaque psoriasis who are candidates for systemic or phototherapy, and when other systemic therapies are medically less appropriate • Moderate to severely active Crohn's disease following an inadequate response to conventional therapy, loss of response to Remicade, or an inability to tolerate Remicade • Moderate to severely active ulcerative colitis following inadequate response to immunosuppressants Coverage approved for pediatric patients (age 4-17 years) with: • Moderate to severe active polyarticular juvenile idiopathic arthritis Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Golimumab (Simponi) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not me, coverage is approved for Simponi if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • Adverse reactions to Humira is not expected with requested non-step preferred TIB • Patient has been stable on IV Simponi with continuous use in last 3 months and needs to transition to the SC formulation of Simponi AND Coverage approved for patients ≥ 18 years with: • Moderate to severe active rheumatoid arthritis in combination with methotrexate • Active psoriatic arthritis or active ankylosing spondylitis • Moderately to severely active ulcerative colitis with an inadequate response or intolerant to prior treatment or requiring continuous steroid therapy Rheumatoid arthritis patients require an active methotrexate script. Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)

Drug / Drug Class	Prior Authorization Criteria
• Certolizumab (Cimzia) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Cimzia if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • Adverse reactions to Humira not expected with requested non-step preferred TIB AND Coverage approved for patients ≥ 18 years with: • Moderate to severe active rheumatoid arthritis, active psoriatic arthritis, or active ankylosing spondylitis • Moderately to severely active Crohn's disease following an inadequate response to conventional therapy. Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Etanercept (Enbrel) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Enbrel if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • Adverse reactions to Humira not expected with requested non-step preferred TIB • There is no formulary alternative (Enbrel is prescribed for children < 4years of age; Enbrel is prescribed for a patient with hepatitis C virus) AND Coverage approved for patients ≥ 18 years with: • Moderate to severe active rheumatoid arthritis, active psoriatic arthritis, or active ankylosing spondylitis • Moderate to severe chronic plaque psoriasis who are candidates for systemic or phototherapy Coverage approved for pediatric patients (age 2–17) with: • Moderate to severe active polyarticular Juvenile Idiopathic Arthritis Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)

Drug / Drug Class	Prior Authorization Criteria
• Anakinra (Kineret) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria If automated criteria are not met, coverage is approved for Kineret if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • Adverse reactions to Humira not expected with requested non-step preferred TIB • There is no formulary alternative (Kineret for pediatric patient with Neonatal-Onset Multisystem Inflammatory Disease (NOMID), a subset of Cryoprin Associated Period Syndrome (CAPS) NOMID • There is no formulary alternative: patient requires a non-TNF TIB for symptomatic CHF AND Coverage approved for patients ≥ 18 years with: • Moderate to severe active rheumatoid arthritis, who have failed ≥ 1 disease modifying anti-rheumatic drugs (DMARDs) Coverage approved for pediatric patients (all ages) with: • Neonatal-Onset Multisystem Inflammatory Disease (NOMID), a subset of Cryoprin Associated Period Syndrome (CAPS) Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Abatacept (Orencia) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Orencia if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • Adverse reactions to Humira not expected with requested non-step preferred TIB • There is no formulary alternative: patient requires a non-TNF TIB for symptomatic CHF • Patient has been stable on IV Orencia with continuous use in last 3 months and needs to transition to the SC formulation of Orencia AND Coverage approved for patients ≥ 18 years with: • Moderate to severe active rheumatoid arthritis • Subcutaneous Orencia is not approved for use in systemic or polyarticular Juvenile Idiopathic Arthritis

Drug / Drug Class	Prior Authorization Criteria
	Abatacept (Orencia)—continued Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Tocilizumab (Actemra) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Actemra if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • Adverse reactions to Humira not expected with requested non-step preferred TIB • There is no formulary alternative: patient requires a non-TNF TIB for symptomatic CHF • Patient has been stable on an IV TIB with continuous use in last 3 months and needs to transition to the SC formulation of Actemra AND Coverage approved for patients ≥ 18 years with: • Moderate to severe active rheumatoid arthritis who have had an inadequate response to ≥ 1 disease modifying anti-rheumatic drugs (DMARDs) • Subcutaneous Actemra is not approved for use in systemic or polyarticular Juvenile Idiopathic Arthritis Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Tofacitinib (Xeljanz) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Xeljanz if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • Adverse reactions to Humira not expected with requested non-step preferred TIB • There is no formulary alternative: patient requires a non-TNF TIB for symptomatic CHF AND Coverage approved for patients ≥ 18 years with: • Moderate to severely active rheumatoid arthritis who have had an inadequate response or intolerance to methotrexate.

Drug / Drug Class	Prior Authorization Criteria
	Tofacitinib (Xeljanz)—continued Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Apremilast (Otezla) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Otezla if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • There is no formulary alternative: patient requires a non-TNF TIB for symptomatic CHF • Adverse reactions to Humira not expected with requested non-step preferred TIB AND Coverage approved for patients ≥ 18 years with: • Active psoriatic arthritis Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• Ustekinumab (Stelara) **Targeted Immunomodulatory Biologics (TIBs)**	Automated PA criteria: The patient has filled a prescription for adalimumab (Humira) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria: If automated criteria are not met, coverage is approved for Stelara if: • Contraindications exist to Humira • Inadequate response to Humira (need for different anti-TNF or non-TNF) • There is no formulary alternative: patient requires a non-TNF TIB for symptomatic CHF • Adverse reactions to Humira not expected with requested non-step preferred TIB AND Coverage approved for patients ≥ 18 years with: • Active psoriatic arthritis • Moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy

Drug / Drug Class	Prior Authorization Criteria
	Ustekinumab (Stelara)—continued Coverage is NOT provided for concomitant use other TIBs including but not limited to adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), abatacept (Orencia), tocilizumab (Actemra), tofacitinib (Xeljanz), ustekinumab (Stelara), apremilast (Otezla), or rituximab (Rituxan)
• albiglutide once weekly (Tanzeum) **Glucagon-Like Peptide-1 Receptor Agonists (GLP1RAs)**	All new and current users of albiglutide (Tanzeum) are required to try metformin or a sulfonylurea (SU) before receiving Tanzeum. Automated PA criteria: The patient has received a prescription for metformin or SU at any Military Health System pharmacy point of service (Military Treatment Facilities, retail network pharmacies, or mail order) during the previous 180 days, AND Manual PA criteria: If automated criteria are not met, albiglutide (Tanzeum) is approved (e.g., trial of metformin or SU is NOT required) if: • The patient has a confirmed diagnosis of Type 2 Diabetes Mellitus • The patient has experienced any of the following issues on metformin: o impaired renal function precluding treatment with metformin o history of lactic acidosis • The patient has experienced any of the following issues on a sulfonylurea: o hypoglycemia requiring medical treatment • The patient has had inadequate response to metformin or a SU • The patient has a contraindication to metformin or a SU
• Valeritas V-Go Insulin Delivery Device (V-Go) **Insulins**	PA criteria apply to all new users of the V-Go device. Manual PA criteria: (1) Patient has Type 2 diabetes mellitus AND (2) Patient does not need more than 40 units of basal insulin daily AND the patient does not need more than 36 units of bolus insulin daily AND (3) Patient does not need less than 2 unit increments of bolus dosing AND (4) Patient has been maintained on stable basal insulin for at least 3 months (at dosages of 20U, 30U, or 40U) AND (5) Patient has been using prandial insulin for at least 3 months.
• Tasimelteon (Hetlioz) **Newer Sedative Hypnotic-1s**	PA criteria apply to all new users of tasimelteon (Hetlioz). A trial of generic zolpidem IR or zaleplon is required before Hetlioz. Automated PA: The patient has filled a prescription for zolpidem IR or zaleplon at any MHS pharmacy POS (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA: If automated criteria are not met, tasimelteon (Hetlioz) is approved (e.g., trial of zolpidem immediate release or zaleplon is NOT required) if the patient meets criterion #1 below, and one of the other criteria (#2, #3, or #4).

Drug / Drug Class	Prior Authorization Criteria
	Tasimelteon (Hetlioz)—continued (1) The patient is totally blind and has no light perception. AND (2) The patient has received a trial of zolpidem IR or zaleplon and had an inadequate response. OR (3) The patient received a trial of zolpidem IR or zaleplon but was unable to tolerate it due to adverse effects. OR (4) Treatment with zolpidem IR or zaleplon is contraindicated for this patient (e.g., due to hypersensitivity, aberrant behaviors, or intolerable rebound insomnia).
• Trametinib (Mekinist) and Dabrafenib (Tafinlar) **Metastatic Melanoma Medications**	Manual PA criteria apply to all new users of trametinib (Mekinist) and dabrafenib (Tafinlar) Mekinist: • Coverage approved for treatment of patients alone or in combination with dabrafenib (Tafinlar) in patients with unresectable or metastatic melanoma with BRAF V600E or V600K mutations as detected by an FDA-approved test. • Coverage not approved as a single agent in patients who have received prior BRAF-inhibitor therapy Tafinlar: • Coverage approved as a single agent for treatment of patients with unresectable or metastatic melanoma with BRAF V600E mutation as detected by an FDA-approved test. • Combination use with Mekinist in the treatment of patients with unresectable or metastatic melanoma with BRAF V600E or V600K mutations as detected by an FDA-approved test. • Not approved for patients with wild-type BRAF melanoma
• Topiramate ER (Trokendi XR and Qudexy XR) **Seizure Medications**	Manual PA criteria apply to all new users of Trokendi XR and Qudexy XR: • Coverage approved for o Partial onset seizure and 1° generalized tonic-clonic seizures in patients ≥ 10 years o Lennox-Gastaut seizures in patients ≥ 6 years • Coverage not approved for o Non-FDA approved indications, including migraine headache and weight loss • Patient is required to try topiramate first, unless the following has occurred: o Inadequate response not expected to occur with Trokendi XR or Qudexy XR o Patient has contraindication or adverse reaction to a component of generic topiramate not expected to occur with Trokendi XR or Qudexy XR

Appendix D—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Aug 2014	**Targeted Immunologic Biologics**	UF class review Previously reviewed	▪ Adalimumab (Humira)	▪ Apremilast (Otezla) ▪ Golimumab (Simponi) ▪ Tofacitinib (Xeljanz) ▪ Ustekinumab (Stelara)	▪ Abatacept (Orencia ▪ Anakinra (Kineret) ▪ Certolizumab (Cimzia) ▪ Etanercept (Enbrel) ▪ Tocilizumab (Actemra)	Pending singing of the minutes / 90 days	▪Step therapy required; see comments ▪Quantity Limits apply; see Formulary Search Tool	▪ Must try Humira first in all new users before the other TIBs. (See Appendix C) ▪ TIBs are no longer an ECF class; Humira now BCF

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE
MINUTES AND RECOMMENDATIONS

February 2014

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on February 12, 2014, at the Defense Health Agency (DHA) Pharmacoeconomic Branch, Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is listed in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of August Minutes**—Lt. Gen. Douglas J. Robb, DO, MPH, Director, DHA, approved the minutes for the November 2013 DoD P&T Committee meeting on February 10, 2014.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and Basic Core Formulary (BCF) recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Antidepressants (AD-1s)—Bupropion extended release 450 mg (Forfivo XL), desvenlafaxine extended release (ER) (Khedezla), levomilnacipran (Fetzima), and vortioxetine (Brintellix).

Background and Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 against, 0 absent, 0 abstain) the following with regard to the clinical efficacy and safety of bupropion XL 450 mg (Forfivo XL), desvenlafaxine ER (Khedezla), levomilnacipran (Fetzima), and vortioxetine (Brintellix). All four drugs are indicated solely for the treatment of major depressive disorder (MDD).

1. Forfivo XL

    a) Forfivo XL is an extended-release 450 mg formulation of bupropion, a norepinephrine/dopamine reuptake inhibitor (NDRI). Several generic formulations of bupropion (Wellbutrin, Wellbutrin SR, and Wellbutrin XL) are on the BCF. There are no clinical trials with Forfivo XL; FDA approval was based on demonstrated bioequivalence to three tablets of 150 mg Wellbutrin XL.

    b) Limitations to the product include that patients must be titrated with another bupropion formulation first, and the dose cannot be adjusted in renal or hepatic impairment.

    c) Forfivo XL has similar safety and tolerability concerns as other bupropion agents.

    d) While Forfivo XL offers an alternative treatment option of one tablet administered once daily for patients requiring a high dose of bupropion, it offers no compelling clinical advantages over the other bupropion formulations on the BCF or UF.

2. Desvenlafaxine ER (Khedezla)

    a) Khedezla is a serotonin/norepinephrine reuptake inhibitor (SNRI) that is an extended-release form of desvenlafaxine (Pristiq). Khedezla differs from Pristiq in the salt form (desvenlafaxine base versus desvenlafaxine succinate). Generic desvenlafaxine formulations are now available.

    b) Khedezla has shown bioequivalence to Pristiq in three studies; there are no clinical trials available.

    c) Khedezla offers no clinically relevant advantages over the venlafaxine products (Effexor, Effexor XR, generic) products on the UF.

3. Levomilnacipran (Fetzima)

    a) Levomilnacipran is a SNRI and is an extended-release stereoisomer of milnacipran (Savella). Fetzima is indicated for MDD whereas Savella is indicated for fibromyalgia.

    b) There are no head-to-head studies comparing levomilnacipran with other antidepressants.

    c) In the three placebo-controlled studies used to gain FDA approval, all levomilnacipran doses produced a statistically significant change from baseline in the Montgomery-Asberg Depression Rating Scale (MADRS). However, varying effects on response rates (e.g., a 50% reduction in the MADRS score from baseline) have been reported, depending on the dose and study design. There was no difference from placebo in remission rate at any levomilnacipran dose.

d) The safety profile of levomilnacipran is similar to milnacipran (Savella) and carries the same warnings.

e) Levomilnacipran offers no clinically compelling advantages over the other AD-1s on the UF.

4. Vortioxetine (Brintellix)

a) There have been no head-to-head studies between vortioxetine and other antidepressants. In four of seven placebo-controlled studies, vortioxetine was superior to placebo in improving MADRS or HAMD (Hamilton Depression Rating Scale) scores from baseline.

b) In active comparator studies using duloxetine (Cymbalta) or venlafaxine (Effexor), vortioxetine showed similar clinical results in the endpoints of MADRS, HAMD, response, or remission.

c) The most common adverse events (AEs) with vortioxetine include nausea and vomiting. Vortioxetine has fewer known AEs and warnings compared to desvenlafaxine, duloxetine (Cymbalta), and levomilnacipran. However, vortioxetine is the newest AD-1 to reach the market and additional AEs may increase during post-marketing surveillance.

d) Although vortioxetine offers additional serotonergic effects in its mechanism of action and has fewer AEs overall than some of the other AD-1s, this has not translated into greater efficacy in treating depression.

Relative Cost-Effectiveness Analysis and Conclusion—Cost minimization analysis (CMA) was performed to evaluate new antidepressants bupropion XL 450 mg (Forfivo XL), desvenlafaxine ER (Khedezla), levomilnacipran (Fetzima), and vortioxetine (Brintellix) compared with other AD-1 subclasses, including selective serotonin reuptake inhibitors (SSRIs), SNRIs, and NDRIs. Based on the CMA results, the P&T Committee concluded (16 for, 0 against, 0 absent, 0 abstain) the following:

- For the NDRIs, the current BCF drugs—generic bupropion IR, sustained release and ER formulations—were the most cost-effective agents, followed by the new entrant Forfivo XL and then followed by the NF branded product bupropion hydrobromide (Aplenzin).

- For the SNRIs and SSRIs subclasses, the BCF drugs citalopram and sertaline were the most cost-effective drugs, followed by generic venlafaxine IR and ER, and then followed by generic desvenlafaxine, Khedezla, generic duloxetine (Cymbalta), levomilnacipran (Fetzima), vortioxetine (Brintellix), and branded duloxetine (Cymbalta), ranked in order from most to least cost effective.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 against, 0 absent, 1 abstain) bupropion XL 450 mg

(Forfivo XL), desvenlafaxine ER (Khedezla), levomilnacipran (Fetzima), and vortioxetine (Brintellix) be designated NF, based on clinical and cost effectiveness. Additionally, the P&T Committee recommended Khedezla, Fetzima, and Brintellix be non-step preferred ("behind the step"), which requires a trial of a formulary AD-1 prior to use in all current and new patients. See Prior Authorization section, below.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 0 against, 0 absent, 1 abstain) MN criteria for bupropion 450 mg XL (Forfivo XL), desvenlafaxine ER (Khedezla), levomilnacipran (Fetzima), and vortioxetine (Brintellix). (See Appendix B for the full criteria.)

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***—The P&T Committee recommended (15 for, 0 against, 0 absent, 1 abstain) PA criteria should apply to Khedezla, Fetzima, and Brintellix. (See Appendix C for the full PA criteria.)

    a) Desvenlafaxine ER (Khedezla): For all new users of Khedezla, patients are required to try venlafaxine immediate release (IR) or ER (Effexor, Effexor XR; generics) first.

    b) Levomilnacipran (Fetzima) and vortioxetine (Brintellix): For new users of Fetzima or Brintellix, patients are required to try a generic SSRI, duloxetine, SNRI (except milnacipran), tricyclic antidepressant, mirtazapine, bupropion, serotonin antagonist reuptake inhibitor (trazodone or nefazodone), or mononamine oxidase inhibitor first.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (15 for, 0 against, 0 absent, 1 abstain) 1) an effective date of the first Wednesday after a 90-day implementation period in all points of service (POS); and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is August 6, 2014.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

V. UF DRUG CLASS REVIEWS

A. Inhaled Corticosteroids/Long-Acting Beta Agonists (ICS/LABAs) Combinations

Background and Relative Clinical Effectiveness Conclusion—The P&T Committee evaluated the clinical effectiveness of the ICS/LABA combinations, which were last reviewed for UF

status in February 2009. Since the last review, one new drug, fluticasone/vilanterol (Breo Ellipta) has been marketed. Military Health System (MHS) expenditures for the class were $168 million in calendar year 2013. The P&T Committee agreed (16 for, 0 opposed, 0 abstained, 0 absent) with the following conclusions:

1. Fluticasone/salmeterol (Advair) and budesonide/formoterol (Symbicort) are highly therapeutically interchangeable for asthma. For asthma, head-to-head trials and systematic reviews show no significant differences in efficacy.
2. For chronic obstructive pulmonary disease (COPD), there is insufficient evidence to conclude that there are clinically relevant differences in efficacy between Advair and Symbicort.
3. Advair Diskus, Symbicort, and Breo Ellipta are all FDA-approved for maintenance treatment of COPD; however, only Advair Diskus and Breo Ellipta are specifically approved for decreasing COPD exacerbations. Symbicort does have data from observational studies showing decreases in COPD exacerbations.
4. For mometasone/formoterol (Dulera), there are no head-to-head trials with another ICS/LABA in asthma; clinically relevant differences in efficacy are not expected. Dulera is not approved for COPD; two trials have shown benefit in improving spirometric endpoints in COPD.
5. There is only limited data for Breo Ellipta in patients with asthma, and it is not FDA-approved for this indication.
6. Breo Ellipta offers the convenience of once-a-day dosing in COPD. However, the long-term safety of the LABA component vilanterol is not known. One large trial (SUMMIT) evaluating mortality as a primary endpoint is underway.
7. Advair Diskus in the only drug approved for treatment of asthma in children down to the age of four years; however, for this age range, a metered dose inhaler (MDI) with a spacer is more commonly used. It also has the advantage of availability in both a MDI [Advair hydrofluoroalkane (HFA)] and dry powder inhaler (Advair Diskus).
8. For safety, a systematic review did not show clinically relevant differences between Advair and Symbicort in asthma. Advair Diskus, Advair HFA, Symbicort, Dulera, and Breo Ellipta all contain the same black box warnings and precautions. All drugs containing a LABA carry a black box warning for the increased risk of death in asthma.
9. Breo Ellipta and Dulera have a lower degree of interchangeability with Advair and Symbicort, due to their limited FDA-approved indications.
10. The Pharmacy Outcomes Research Team (PORT) presented an analysis of the use of ICS/LABAs by indications and found that asthma represents the majority of MHS use (67% of beneficiaries had ICD-9 diagnosis codes indicative of asthma, while 37% had codes for COPD, and 17% had codes for neither diagnosis). However, there was considerable overlap between the COPD and asthma diagnosis codes.

Relative Cost-Effectiveness Analysis and Conclusion—A pharmacoeconommic analysis and budget impact analysis (BIA) were performed to evaluate the ICS/LABAs. The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following:

- The pharmacoeconomic analysis showed that fluticasone/salmeterol (Advair Diskus/Advair HFA) was the most cost-effective agent in this class, followed by mometasone/formoterol (Dulera), budesonide/formoterol (Symbicort), and fluticasone/salmeterol (Breo Ellipta).
- A BIA was performed to evaluate the potential impact of scenarios, with selected agents designated step-preferred and formulary or non-preferred and NF on the UF. BIA results showed that the scenario where Advair Diskus and Advair HFA are designated as step-preferred and formulary, with Dulera, Symbicort, and Breo Ellipta designated as non-preferred and NF, was the most cost-effective option for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) the following for the ICA/LABAs, based on clinical and cost effectiveness:
    - UF and step-preferred: fluticasone/salmeterol (Advair Diskus and Advair HFA)
    - NF and non-preferred: budesonide/formoterol (Symbicort), mometasone/formoterol (Dulera), and fluticasone/vilanterol (Breo Ellipta)
    - This recommendation includes step therapy, which requires a trial of Advair Diskus or Advair HFA in all new and current users of Symbicort, Dulera, and Breo Ellipta who are older than 12 years.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) that fluticasone/salmeterol (Advair Diskus and Advair HFA) remain on the BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Symbicort, Dulera, and Breo Ellipta. (See Appendix B for full MN criteria.)

4. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) automated (step therapy) and manual PA criteria in all new and current users of Symbicort, Dulera, and Breo Ellipta who are older than 12 years of age; a trial of Advair Diskus or Advair HFA is required before the non-step preferred drugs.

5. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—QLs currently apply to the ICS/LABAs. The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) QLs for Advair Diskus, Advair HFA, Symbicort, Dulera, and Breo Ellipta of 1 inhaler/30 days in the Retail Network and 3 inhaler/90 days in the Mail Order Pharmacy.

6. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 2 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision; and, 3) that the ICS/LABA Drug Class be added to the safety net program (Rapid Response Program). Based on the P&T Committee's recommendation, the effective date is July 9, 2014.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Gastrointestinal-1 (GI-1s) Drug Class: Oral Aminosalicylates Subclass

Background and Relative Clinical Effectiveness Conclusion—The P&T Committee evaluated the relative clinical effectiveness of the oral aminosalicylates, a subclass within the GI-1s Drug Class. The subclass is comprised of generic sulfasalazine and the 5-aminosalicylate (5-ASA) products [balsalazide (generic Colazal and Giazo), olsalazine (Dipentum), and mesalamine (Delzicol, Asacol HD, Pentasa, Lialda, and Apriso)].

The GI-1s were previously reviewed for UF placement in February 2011, and mesalamine delayed release (DR) tablets (Asacol), along with generic sulfasalazine, were recommended for BCF addition. Asacol was discontinued from the market in March 2013 due to safety concerns of dibutyl phthalate (DBP) present in the enteric coating of Asacol tablets. A new phthalate-free mesalamine DR formulation, Delzicol is now available. At the May 2013 meeting, Asacol was removed from the BCF, pending a re-review of the subclass. Currently, the only aminosalicylate on the BCF is sulfasalazine.

The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) the following conclusions for the aminosalicylates drug class:

1. Sulfasalazine remains the first-line oral aminosalicylate. For the induction of remission in active ulcerative colitis (UC), evidence from two systematic reviews found no clinically relevant differences in efficacy between sulfasalazine and the newer 5-ASA formulations.

2. For maintenance of remission in UC, another systematic review showed a therapeutic advantage of sulfasalazine over the 5-ASA formulations. This advantage was offset by an increase in adverse events observed with sulfasalazine, due to the sulfapyridine moiety.
3. The newer 5-ASA formulations employ different release mechanisms, which deliver the active drug to various sites in the GI tract. These differences in drug release and site of release do not confer additional benefits in terms of clinical response.
4. The mesalamine product Delzicol is the phthalate-free replacement for Asacol that is bioequivalent to its predecessor; no clinical trials were conducted to evaluate efficacy or safety.
5. Giazo is a new balsalazide product with a higher strength per unit than the other balsalazide formulations (1,100 mg versus 750 mg with Colazal). It is not approved for use in women, and it offers no compelling advantage to the other balsalazide products commercially available.
6. The safety profile is similar for the 5-ASA products, based on systematic reviews. In clinical trials, females treated with Giazo reported more adverse events than males.
7. Lialda and Apriso are dosed once daily, which provides patient convenience, but have not been shown to have clinically relevant benefits in terms of adherence compared to 5-ASAs dosed twice or three times daily. Lialda and Apriso also have the lowest tablet burden.
8. The 5-ASA products are highly therapeutically interchangeable for treating UC. The choice of 5-ASA for UC will depend on other factors, such as location and extent of disease, as well as patient preference in terms of tablet burden and frequency of dosing.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and BIA were performed to evaluate the GI-1s Aminosalicylate Subclass. The P&T Committee concluded (15 for, 0 opposed, 1 abstained, 0 absent) the following:

- CMA results showed that generic sulfasalazine was the most cost-effective agent in this subclass, followed by balsalazide 750 mg (Colazal, generics), olsalazine (Dipentum), and the branded mesalamine agents Apriso, Lialda, Delzicol, Asacol HD, and Pentasa. Giazo (branded balsalazide 1,100 mg) was not cost-effective relative to other agents in this class.

- BIA was performed to evaluate the potential impact of scenarios with selected agents designated formulary or NF on the UF. BIA results showed the scenario with Apriso, Delzicol, and Lialda designated as formulary on the UF, with Asacol HD and Pentasa designated as NF, was the most cost-effective for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) the following, based on the high degree of therapeutic interchangeability and cost-effectiveness:

    - UF: sulfasalazine, balsalazide 750 mg (Colazal, generics), olsalazine (Dipentum), and the mesalamine products Delzicol, Lialda, and Apriso
    - NF: Pentasa, Asacol HD and the balsalazide 1,100 mg product (Giazo)

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) retaining sulfasalazine on the BCF, and adding mesalamine multimatrix (Lialda) to the BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Pentasa, Asacol HD, and Giazo. (See Appendix B for full MN criteria.)

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is August 6, 2014.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Pancreatic Enzyme Products (PEPs)

Background and Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the PEPs. The class was previously an extended core formulary (ECF) class and last reviewed in February 2011. The PEPs were reviewed for the FDA-approved indication of exocrine pancreatic insufficiency (EPI) due to cystic fibrosis or other conditions; other uses (e.g., pain relief from pancreatitis) were not reviewed. Since the last review, three new products, Pertzye, Viokace, and Ultresa, have been marketed. The PEPs all contain various amounts of lipase, amylase, and protease.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (15 for, 1 opposed, 0 abstained, 0 absent) the following conclusions:

1. Based on clinical efficacy alone, Creon, Pancreaze, Zenpep, Viokace, Ultresa, and Pertzye are effective at increasing coefficient of fat absorption in patients with EPI, compared to placebo. Only limited clinical trial data is available.
2. Creon has the most indications and highest MHS utilization. Among the PEPs, Creon has an additional indication for EPI due to pancreatitis or pancreatetcomy, without requiring use of a proton pump inhibitor.
3. Zenpep has the most dosage strengths available.
4. Zenpep and Viokace have information for gastrostomy tube administration.
5. Viokace is an uncoated tablet that is not approved for use in pediatrics; it requires administration with a proton pump inhibitor, to prevent degradation in the stomach.
6. Creon, Pancreaze, and Zenpep have dosing recommendations for infants as young as 12 months of age while Pancreaze has dosing information in infants as young as 6 months.
7. Pertzye and Ultresa have limited data regarding efficacy in treating EPI and have limited dosage strengths available.
8. With regards to safety, the available evidence suggests there are no clinically relevant differences between any of the PEPs.
9. There is a high degree of therapeutic interchangeability among the class.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and BIA were performed to evaluate the PEP Drug Class. The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following:

- CMA results showed that Creon was the most cost-effective agent in this class, followed by Zenpep, Pancreaze, and Viokace. Ultresa and Pertzye were not cost-effective relative to other agents in this class.
- BIA was performed to evaluate the potential impact of scenarios with selected agents designated formulary or NF on the UF. BIA results showed the scenario with Creon, Zenpep, Pancreaze, and Viokace designated as formulary on the UF, with Ultresa and Pertzye designated as NF on the UF, was the most cost-effective for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (13 for, 2 opposed, 1 abstained, 0 absent) Creon, Pancreaze, Zenpep, and Viokace remain on the UF, and that Pertzye and Ultresa be designated as NF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) reclassifying the PEPs as a BCF class instead of an ECF class, and adding Creon to the BCF. As a result of this action, Pancreaze is removed from the ECF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Pertzye. (See Appendix B for the full MN criteria.)

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is August 6, 2014.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VI. RE-EVALUATION OF NF AGENTS: DULOXETINE (CYMBALTA)

On an ongoing basis, the DHA Pharmacoeconomic Branch monitors changes in the clinical information, current costs, and utilization trends to determine whether the UF status of agents designated as NF needs to be readdressed. The P&T Committee's process for reevaluating NF agents was established at the May 2007 meeting and approved by the Director, TMA, on June 24, 2007.

The P&T Committee reevaluated the UF status of duloxetine (Cymbalta) in light of recent price reductions in generic formulations across all three POS. Additionally, automated PA (step therapy) requires a trial of a generic formulary antidepressant or generic non-opioid pain syndrome drug before receiving Cymbalta. As of the meeting, the generic duloxetine products were not cost-effective relative to the price of branded Cymbalta.

1. ***COMMITTEE ACTION: DULOXETINE UF RECOMMENDATION AND IMPLEMENTATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) maintaining Cymbalta as NF and continuing the current step therapy. When generic formulations of Cymbalta become cost-effective relative to the step-preferred agents, generic duloxetine will move to UF status, become step-preferred (e.g., "in front of the step"), and existing PA criteria will be removed without further action by the P&T Committee, Beneficiary Advisory

Panel, or Director, DHA. A generic agent is cost-effective relative to step-preferred agents when the generic agent's total weighted average cost per day of treatment is less than or equal to the total weighted average cost per day of treatment for the step-preferred agent.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VII. UTILIZATION MANAGEMENT

A. PAs

1. **Overactive Bladder (OAB) Drugs: Mirabegron (Myrbetriq)**—Mirabegron was FDA-approved for OAB in June 2012 and launched in October 2013. It will be reviewed as a new drug at an upcoming meeting. Mirabegron is a beta-3 agonist, which is a unique mechanism compared to the antimuscarinic OAB drugs (darifenacin, fesoterodine, tolterodine, oxybutynin, solifenacin, and trospium). In placebo-controlled trials, the efficacy of mirabegron on OAB symptoms appears similar to that of the other OAB drugs; however, mirabegron causes less anticholinergic AEs (dry mouth, constipation). The OAB drugs were reviewed for UF placement in November 2012, and automated PA (step therapy) was implemented, requiring a trial of a generic OAB drug or Detrol LA in all new and current users of an OAB drug.

   a) ***COMMITTEE ACTION: MIRABEGRON (MYRBETRIQ) PA CRITERIA***
   The P&T Committee recommended (13 for, 1 opposed, 1 abstained, 1 absent) PA criteria for all new users of mirabegron (Myrbetriq) for OAB. (See Appendix C for full criteria.)

   b) ***COMMITTEE ACTION: MIRABEGRON (MYRBETRIQ) UF IMPLEMENTATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 30-day implementation period in all POS. The effective date is June 11, 2014.

2. **Phosphodiesterase-5 (PDE-5) Inhibitor: Avanafil (Stendra)**—Avanafil is a new PDE-5 inhibitor approved by the FDA in April 2012, but not launched until January 2014. It is only approved for erectile dysfunction (ED). Currently, automated PA (step therapy) applies to the class for ED; Viagra is the step-preferred PDE-5 for ED.

   a) ***COMMITTEE ACTION: AVANAFIL (STENDRA) PA CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) PA

criteria for all users of Avanafil (Stendra) for ED. A trial of sildenafil (Viagra) for ED is required prior to using Stendra. Uses other than ED, including benign prostatic hypertrophy, following prostatectomy, pulmonary arterial hypertension, or Raynaud's phenomenon are not allowed. (See Appendix C for full criteria.)

B. QLs

1. **Hepatitis C Drugs: Sofosbuvir (Sovaldi)**—Sofosbuvir (Sovaldi) is a new direct acting agent for hepatitis C approved on December 18, 2013. QLs currently apply to the hepatitis C drugs, including the direct acting antiviral agents. Sofosbuvir efficacy was established in patients with genotype 1, 2, 3, or 4 infection, including those with hepatocellular carcinoma awaiting liver transplantation and those co-infected with HIV. It can be used without interferon in patients with genotype 1, 2, or 3 hepatitis C virus.

   a) ***COMMITTEE ACTION: SOFOSBUVIR (SOVALDI) QLs***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) QLs for sofosbuvir of 28 tablets per 28 days in all POS [Medical Treatment Facility (MTF), Retail Network, and Mail Order Pharmacy], consistent with the FDA-approved product dosing of one tablet given once daily.

2. **PDE-5 Inhibitors: Avanafil (Stendra)**—QLs currently apply to the PDE-5 inhibitors. The P&T Committee evaluated QLs for avanafil for treatment of ED.

   a) ***COMMITTEE ACTION: AVANAFIL (STENDRA) QLs***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) QLs for Avanafil of 6 tablets per 30 days in the Retail Network and 18 tablets for 90 days in the Mail Order Pharmacy, consistent with the other PDE-5 inhibitors. This is a collective QL, a maximum of 6 tablets (Retail Network) or 18 tablets (Mail Order Pharmacy) of any PDE-5 is allowed.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VIII. OVERVIEWS

Overviews of the ICS and Nasal Allergy Drugs (nasal antihistamines, nasal corticosteroids, and nasal anticholinergics) drug classes were presented to the P&T Committee. The P&T

Committee provided expert opinion regarding those clinical outcomes considered most important for use in contract solicitation and for completing the clinical effectiveness review and developing the appropriate cost-effectiveness modes. The clinical and economic analyses of these classes will be presented at an upcoming meeting.

IX. ITEMS FOR INFORMATION

A. **Medication Adherence**—The PORT updated the P&T Committee regarding progress in formulating a process and algorithm for measuring medication adherence. The algorithm is intended for use as a DHA quality measure and in coordination with the DHA Health Information Technology Branch for potential inclusion in the Population Health Portal as a practical tool for clinicians and clinic managers at point of care. The overall DHA metrics follow recommendations from the Pharmacy Quality Alliance/National Committee for Quality Assurance and will allow comparison to Center for Medicare Services Star Rating measures for health plans.

X. ADJOURNMENT

The meeting adjourned at 1650 hours on February 12, 2014. The next meeting will be in May 2014.

Ms. Jennifer Miller via DCO	Lake Erie College of Osteopathic Medicine, School of Pharmacy student
Ms. Anna Humg via DCO	University of Maryland, School of Pharmacy student

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Budesonide/formoterol (Symbicort) • Mometasone/formoterol (Dulera) • Fluticasone/vilanterol (Breo Ellipta) **Inhaled Corticosteroids/ Long-Acting Beta Agonists (ICS/LABAs) Combinations**	• Use of Advair Diskus or Advair HFA is contraindicated • The patient has experienced or is likely to experience intolerable adverse effects to Advair Diskus or Advair HFA. • The patient has had an inadequate response to Advair Diskus or Advair HFA. • The patient previously responded to the nonformulary agent and changing to a formulary agent would incur unacceptable risk.
• Bupropion 450 mg XL (Forfivo XL) **Antidepressant-1s (AD-1s)**	• Use of formulary agents (bupropion, bupropion SR, bupropion XL) is contraindicated and treatment with other formulary antidepressants is not clinically appropriate. Provider must state why the patients cannot take generic bupropion, bupropion SR, or bupropion XL.
• desvenlafaxine ER (Khedezla) **Antidepressant-1s (AD-1s)**	• Use of the formulary agents venlafaxine IR or venlafaxine ER are contraindicated • The patient has experienced or likely to experience significant adverse effects from the formulary agents venlafaxine IR or venlafaxine ER. • Formulary agents resulted or are likely to result in therapeutic failure. • Patient previously responded to the nonformulary agent and changing to a formulary agent would incur unacceptable risk.
• Levomilnacipran (Fetzima) **Antidepressant-1s (AD-1s)**	• Use of formulary AD-1s are contraindicated • Patient has experienced or is likely to experience significant adverse effects from formulary AD-1s. • Formulary AD-1s resulted or are likely to result in therapeutic failure. • Patient previously responded to the nonformulary agent and changing to a formulary agent would incur unacceptable risk. • No alternative formulary agent **Formulary alternatives:** (selective serotonin reuptake inhibitors, serotonin/norepinephrine reuptake inhibitor (except milnacipran), tricyclic antidepressants, mirtazapine, bupropion, serotonin antagonist reuptake inhibitors, mononamine oxidase inhibitors)
• Brintellix (Vortioxetine) **Antidepressant-1s (AD-1s)**	• Use of formulary AD-1s are contraindicated • Patient has experienced or is likely to experience significant adverse effects from formulary AD-1s. • Formulary AD-1s resulted or are likely to result in therapeutic failure • Patient previously responded to the nonformulary agent and changing to a formulary agent would incur unacceptable risk • No alternative formulary agent **Formulary alternatives:** (selective serotonin reuptake inhibitors, serotonin/norepinephrine reuptake inhibitor (except milnacipran), tricyclic antidepressants, mirtazapine, bupropion, serotonin antagonist reuptake inhibitors, mononamine oxidase inhibitors)

Drug / Drug Class	Medical Necessity Criteria
• Balsalazide 1100 mg (Giazo) • Mesalamine high dose (Asacol HD) • Mesalamine (Pentasa) **Gastrointestinal-1 Drugs (GI-1s), aminosalicylates**	• Use of formulary oral aminosalicylates are contraindicated
• Pertzye • Ultresa **Pancreatic Enzyme Products (PEPs)**	• Use of formulary oral PEPs are contraindicated • No alternative formulary agent; patient requires a strength that is not available with the formulary PEPs

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• Budesonide/formoterol (Symbicort) • Mometasone/formoterol (Dulera) • Fluticasone furoate/vilanterol (Breo Ellipta) **Inhaled Corticosteroids/Long-Acting Beta Agonists (ICS/LABAs) Combinations**	PA criteria apply to all new and current users of Symbicort, Dulera, and Breo Ellipta who are older than 12 years of age. Automated PA criteria: The patient has filled a prescription for Advair or Advair HFA at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria—Symbicort, Dulera, or Breo Ellipta is approved (e.g., trial of Advair Diskus or Advair HFA is NOT required) if: • Patient has experienced any of the following issues with either Advair Diskus or Advair HFA, which is not expected to occur with the non-preferred ICS/LABA combination drug: o inadequate response to Advair Diskus or Advair HFA o intolerable adverse effects o contraindication o patient previously responded to nonformulary agent and changing to a formulary agent would incur unacceptable risk
• Desvenlafaxine ER (Khedezla) **Antidepressant1-s (AD-1s)**	PA criteria apply to all new users of Khedezla Automated PA criteria The patient has filled a prescription for venlafaxine IR or venlafaxine ER at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria—If automated criteria are not met, Khedezla is approved in new users (e.g., trial of venlafaxine IR or venlafaxine ER is NOT required) if: • Use of the formulary SNRI (venlafaxine) is contraindicated (e.g., hypersensitivity to a dye or other inert ingredient) and use of any other formulary antidepressant is not clinically appropriate. • The patient has previously responded to Khedezla, and changing to a formulary medication would incur unacceptable risk (e.g., the patient is currently stabilized on therapy with Khedezla and changing to a formulary medication would present a risk of destabilization). • The patient is being treated for depression, requires treatment with a SNRI (e.g., due to failure of SSRI therapy), and has failed an adequate trial of venlafaxine. Note: an adequate trial is generally considered to be at least 4–8 weeks in duration, due to the delay in achieving maximal benefit. • The patient requires treatment with a SNRI (e.g., due to failure of SSRI therapy), and has been unable to tolerate venlafaxine.

• Levomilnacipran (Fetzima) **Antidepressant1-s (AD-1s)**	PA criteria apply to all new users of Fetzima. Automated PA criteria • The patient has filled a prescription for a formulary SSRI, duloxetine, SNRIs (except milnacipran), TCA, mirtazapine, bupropion, trazodone or nefazodone, or an MAOI at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria—For new users, Fetzima is approved (e.g., trial of a formulary AD-1 listed above is NOT required) if: • Use of a formulary antidepressant (SSRI, duloxetine, SNRI (except milnacipran), TCA, mirtazapine, bupropion, trazodone or nefazodone, or, MAOI) is contraindicated (e.g., hypersensitivity to a dye or other inert ingredient) and use of any other formulary antidepressant is not clinically appropriate. • The patient has previously responded to Fetzima, and changing to a formulary medication would incur unacceptable risk (e.g., the patient is currently stabilized on therapy with Fetzima and changing to a formulary medication would present a risk of destabilization). • The patient is being treated for depression and has failed therapy with the formulary antidepressants (SSRI, duloxetine, SNRI (except milnacipran), TCA, mirtazapine, bupropion, trazodone or nefazodone, or, MAOI). Note: an adequate trial is generally considered to be at least 4–8 weeks in duration, due to the delay in achieving maximal benefit. • The patient is being treated for depression and has been unable to tolerate the formulary antidepressants (SSRI, duloxetine, SNRI (except milnacipran), TCA, mirtazapine, bupropion, trazodone or nefazodone, or, MAOI).

Drug / Drug Class	Prior Authorization Criteria
• Vortioxetine (Brintellix) **Antidepressant1-s (AD-1s)**	PA criteria apply to all new users of Brintellix. <u>Automated PA criteria</u> • The patient has filled a prescription for a formulary SSRI, duloxetine, SNRIs (except milnacipran), TCA, mirtazapine, bupropion, trazodone or nefazodone, or an MAOI at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND <u>Manual PA criteria</u>—For new users, Brintellix is approved (e.g., trial of a formulary AD-1 listed above is NOT required) if: • Use of a formulary antidepressant (SSRI, duloxetine, SNRI except milnacipran, TCA, mirtazapine, bupropion, trazodone or nefazodone, or, MAOI) is contraindicated (e.g., hypersensitivity to a dye or other inert ingredient) and use of any other formulary antidepressant is not clinically appropriate. • The patient has previously responded to Brintellix, and changing to a formulary medication would incur unacceptable risk (e.g., the patient is currently stabilized on therapy with Brintellix and changing to a formulary medication would present a risk of destabilization). • The patient is being treated for depression and has failed therapy with the formulary antidepressants (SSRI, duloxetine, SNRI except milnacipran, TCA, mirtazapine, bupropion, trazodone or nefazodone, or, MAOI). Note: an adequate trial is generally considered to be at least 4–8 weeks in duration, due to the delay in achieving maximal benefit. • The patient is being treated for depression and has been unable to tolerate the formulary antidepressants (SSRI, duloxetine, SNRI except milnacipran, TCA, mirtazapine, bupropion, trazodone or nefazodone, or, MAOI).

Drug / Drug Class	Prior Authorization Criteria
• Mirabegron (Myrbetriq) **Overactive Bladder (OAB) Drugs**	PA criteria apply to all new users of Myrbetriq Automated PA criteria • The patient has filled a prescription for tolterodine ER (Detrol LA), oxybutynin ER, oxybutynin IR, or generic trospium IR (Sanctuary) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. Manual PA criteria—If automated criteria are not met, Myrbetriq is approved if: • Coverage is only approved for the FDA-approved indication of OAB with symptoms of urge incontinence, urgency, and urinary frequency • Patient has failed a 12-week trial with at least one of the following step-preferred OAB drugs (Detrol LA, oxybutynin ER, oxybutynin IR, or trospium IR) due to a treatment failure or intolerable adverse effects. • Patient has experienced central nervous system (CNS) adverse effects with oral OAB medications or is at increased risk for such CNS effects due to comorbid conditions or other medications.
• Avanafil (Stendra) **Phosphodiesteraise-5 (PDE-5) Inhibitor**	PA applies to all new and current users of avanafil (Stendra). Automated PA criteria • The patient has received a prescription for sildenafil (Viagra) at any MHS point of service (MTFS, Retail Network or Mail Order) during the previous 180 days. • The patient is a male, aged 40 years of older with ED. Manual PA criteria—if automated criteria are not met. Stendra is approved if • The patient has tried sildenafil (Viagra) and has had an inadequate response or was unable to tolerate treatment due to adverse effects. • Treatment with Viagra is contraindicated. Note: Coverage is approved only for erectile dysfunction (ED). Use for benign prostatic hyperplasia (BPH), following prostatectomy, pulmonary arterial hypertension, and Raynaud's phenomenon is not allowed. Additionally, use is not allowed for treatment of ED in males younger than age 18, for ED due to psychogenic origin, or in women for female sexual dysfunction.

Appendix D—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2014	**Inhaled Corticosteroids/ Long-Acting Beta Agonists (ICS/LABAs) Combinations**	UF class review Previously reviewed	▪ Fluticasone/ salmeterol (Advair Diskus) ▪ Fluticasone/ salmeterol (Advair HFA)	▪ None (Advair Diskus and Advair HFA BCF)	▪ Budesonide/formoterol (Symbicort) ▪ Mometasone/formoterol (Dulera) ▪ Fluticasone/vilanterol (Breo Ellipta)	Pending singing of the minutes / 60 days	▪ Step therapy required; see comments ▪ Quantity Limits apply; see Minutes	▪ Must try Advair before Symbicort, Dulera, or Breo Ellipta in all current and new users older than 12 years. (See Appendix C)
Feb 2014	**GI-1s** **5-Amino Salicylate Subclass**	UF Class review Previously reviewed	▪ Sulfasalazine ▪ Mesalamine multimatrix (Lialda)	▪ Balsalazide 750 mg (Colazal, generic) ▪ Olsalazine (Dipentum) ▪ Mesalamine DR (Delzicol) ▪ Mesalamine (Apriso)	▪ Balsalazide 1100 mg (Giazo) ▪ Mesalamine high dose (Asacol HD) ▪ Mesalamine (Pentasa)	Pending signing of the minutes / 90 days	▪ None	▪ None

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

INTERIM MEETING

Addendum December 17, 2013

I. UNIFORM FORMULARY (UF) DRUG CLASS REVIEWS

A. Anti-Lipidemic-1s (LIP-1s)

Background—New lipid treatment guidelines were released on November 12, 2013, one day prior to the November Department of Defense (DoD) Pharmacy & Therapeutics (P&T) Committee meeting. An interim meeting was held to determine the clinical and cost-effectiveness, and UF status of the LIP-1 drugs, based on the new guidelines (found at http://content.onlinejacc.org/article.aspx?articleID=1770217). Military Treatment Facilities (MTFs) and Managed Care Support Contractors were surveyed on their opinions of the new guidelines and potential changes in statin prescribing in the Military Health System (MHS).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 3 absent) the following clinical effectiveness conclusions:

- New lipid guidelines from the American College of Cardiology/American Heart Association (ACC/AHA) released on November 12, 2013, recommend statin therapy for patients in the following four risk categories:
  - With clinical atherosclerotic cardiovascular disease (ASCVD)
  - Low-density lipoprotein (LDL) cholesterol ≥190 mg/dL
  - Type 2 diabetic mellitus patients age 40–75 without ASCVD and with LDL between 70–189 mg/dL
  - Patients age 40–75 with 10-year cardiovascular (CV) CV risk ≥7.5% and LDL between 70–189 mg/dL but without history of ASCVD
- Based on the four risk groups, the number of patients eligible to receive statin therapy will likely increase.
- A new risk assessment scoring tool based on gender, race, age, total cholesterol, and LDL is now recommended.
- Other changes from the previous Adult Treatment Panel 3 guideline are that treatment targets based on LDL or high-density lipoprotein (HDL) are no longer recommended, dose titration based on LDL is not recommended, and there is no differentiation in statins in terms of primary and secondary prevention.
- Statins are categorized into three groups—
  - High intensity (LDL lowering ≥50%): atorvastatin 40 mg, 80 mg; rosuvastatin (Crestor) 20 mg, 40 mg

- Moderate intensity (LDL lowering between 30% to <50%): atorvastatin 10 mg, 20 mg; rosuvastatin (Crestor) 5 mg, 10 mg; simvastatin 20 mg, 40 mg; pravastatin 40 mg, 80 mg; lovastatin 40 mg; fluvastatin ER (Lescol XL) 80 mg; fluvastatin 40 mg twice daily; pitavastatin (Livalo) 2 mg, 4 mg
- Low intensity (LDL lowering <30%): simvastatin 10 mg; pravastatin 10 mg, 20 mg; lovastatin 20 mg; fluvastatin 20 mg, 40 mg; pitavastatin (Livalo) 1 mg

- Non-statin therapies (ezetimibe, niacin, fibrates, bile acid salts), whether alone or in addition to statins, do not provide acceptable ASCVD risk reduction benefits compared to their potential for adverse effects in the routine prevention of ASCVD.
- Non-statin therapies can be considered for patients who experience adverse events from statins, less than anticipated responses, those with statin tolerability issues, or those with drug interactions.
- Based on the current guidelines, and to meet the needs of DoD beneficiaries, at least one statin from each of the statin intensity groups (low, moderate, and high intensity) is required on the Uniform Formulary.

Relative Cost-Effectiveness—Cost-effectiveness analysis (CEA) and budget impact analysis (BIA) were performed for the LIP-1s. For the BIAs, several of the model's key assumptions were varied, with corresponding sensitivity analyses conducted. The CEA was based in part on evidence and efficacy outcomes published in the 2013 ACC/AHA lipid guidelines. The CEA assessed LIP-1s based on the efficacy (i.e., intensity) of statin therapy, according to the average expected LDL lowering from low-, moderate-, or high-intensity statins. The CEA evaluated the following:

- statin monotherapy agents: atorvastatin, fluvastatin, fluvastatin ER (Lescol XL), lovastatin, lovastatin ER (Altoprev), pitavastatin (Livalo), pravastatin, rosuvastatin (Crestor), and simvastatin; and,
- fixed-dose combination therapy agents: amlodipine/atorvastatin, ezetimibe/atorvastatin (Liptruzet), ezetimibe/simvastatin (Vytorin), niacin/lovastatin (Advicor), and niacin/simvastatin (Simcor).

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 3 absent) the following:

- For low-intensity statins, generic simvastatin was the most cost-effective of this subgroup of drugs, based on the weighted average cost per day of treatment across all three points of service, followed by lovastatin, pravastatin, fluvastatin, and pitavastatin (Livalo) (ranked in order from most to least cost-effectiveness)
- For moderate-intensity statins, generic simvastatin was the most cost-effective agent in this subgroup of drugs followed by generic atorvastatin 10 mg and 20 mg, lovastatin, pravastatin, rosuvastatin (Crestor) 5 mg and 10 mg, fluvastatin,

pitavastatin (Livalo), amlodipine/atorvastatin, fluvastatin ER (Lescol XL), and lovastatin ER (Altoprev).

- For high-intensity statins, generic atorvastatin 40 mg and 80 mg was the most cost-effective of this subgroup of drugs, followed by rosuvastatin (Crestor) 20 mg and 40 mg.
- For branded fixed-dose combination agents, cost analysis results showed ezetimibe/simvastatin (Vytorin) to have the lowest average cost per day in this subgroup, followed by ezetimibe/atorvastatin (Liptruzet), niacin/lovastatin (Advicor), and niacin/simvastatin (Simcor).
- Among the formulary options examined, CEA and BIA results showed the most cost-effective scenario designated all generic statins UF and step-preferred, with rosuvastatin (Crestor) as the formulary non-preferred agent (all new users required to try generic statins with equivalent intensity), and all other branded statin agents with nonformulary (NF) status and non-preferred.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 1 opposed, 0 abstained, 3 absent) the following scenario for the UF, which is the most clinically and cost-effective option for the MHS:
    - atorvastatin, atorvastatin/amlodipine, simvastatin, pravastatin, fluvastatin, and lovastatin be designated UF and step-preferred (e.g., "in front of the step");
    - rosuvastatin remain designated UF and non step-preferred (e.g., "behind the step"); and,
    - atorvastatin/ezetimibe (Liptruzet), simvastatin/ezetimibe (Vytorin), pitavastatin (Livalo), fluvastatin ER (Lescol XL), lovastatin ER (Altoprev), lovastatin/niacin (Advicor), and simvastatin/niacin (Simcor) be designated NF and non step-preferred (e.g., "behind the step").
    - This recommendation includes step therapy, which requires a trial of a generic statin at similar LDL-lowering intensity in new users of rosuvastatin (Crestor) 20mg and 40 mg and the NF statins, and manual PA criteria for new users of rosuvastatin 5 mg and 10 mg.

    Note that this recommendation does not affect the formulary status of ezetimibe (Zetia) or niacin ER (Niaspan). Ezetimibe remains UF and non step-preferred and Niaspan remains on the Basic Core Formulary (BCF).

    MTF pharmacies are highly encouraged to switch patients currently receiving Vytorin to statin monotherapy at the appropriate LDL-lowering intensity.

    MTFs are also encouraged to reserve new prescriptions for Crestor 20 mg or 40 mg for patients who are unable to tolerate atorvastatin 40 mg or 80 mg, and to consider a generic statin at the equivalent LDL-lowering intensity for new prescriptions, instead of Crestor 5 mg or 10 mg.

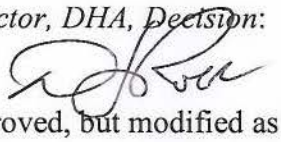
2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) maintaining simvastatin 10 mg, 20 mg, and 40 mg; atorvastatin; and, pravastatin on the BCF. Simvastatin 80 mg remains UF.

3. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) MN criteria for atorvastatin/ezetimibe (Litptruzet), simvastatin/ezetimibe (Vytorin), pitavastatin (Livalo), fluvastatin ER (Lescol XL), lovastatin ER (Altoprev), lovastatin/niacin (Advicor), and simvastatin/niacin (Simcor). (See Appendix B for full criteria.)

4. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) automated PA criteria (step therapy) and manual PA criteria for new users of rosuvastatin (Crestor) 20 mg and 40 mg, simvastatin/ezetimibe (Vytorin), atorvastatin/ezetimibe (Liptruzet), pitavastatin (Livalo), fluvastatin ER (Lescol XL), lovastatin ER (Altoprev), lovastatin/niacin (Advicor), and (simvastatin/niacin) Simcor, requiring a trial of a step-preferred statin with similar LDL-lowering intensity. The P&T Committee also recommended (11 for, 1 opposed, 1 abstained, 3 absent) manual PA criteria for new users of rosuvastatin (Crestor) 5 mg and 10 mg, requiring a trial of atorvastatin, simvastatin, and pravastatin. (See Appendix C for full criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service; 2) DHA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

Director, DHA, Decision: ☒ Approved ☐ Disapproved



Approved, but modified as follows:

II. UTILIZATION MANAGEMENT

A. MONTELUKAST (SINGULAIR) PA—PA criteria were recommended at the August 2011 meeting for montelukast (Singular), requiring automated PA criteria in patients with asthma, and requiring manual PA criteria for patients with seasonal allergic rhinitis or nasal polyps, based on professional treatment guidelines and cost. Generic montelukast tablets entered the market in August 2012 and, as of November 2013, there has been a significant decrease in the generic cost.

1. ***COMMITTEE ACTION: MONTELUKAST (SINGULAIR) PA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the PA requirements for montelukast be removed, effective upon signing of the minutes.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

III. SECTION 716 NATIONAL DEFENSE AUTHORIZATION ACT FISCAL YEAR 2013 PILOT PROGRAM FOR REFILLS OF MAINTENANCE MEDICATIONS FOR TRICARE FOR LIFE BENFICIARIES THROUGH THE TRICARE MAIL ORDER PROGRAM

A. Section 716 Revised Manual PA Criteria—After the November 2013 DoD P&T Committee meeting, the Interim Final Rule for the Section 716 Maintenance Medication Program was published in the Federal Register (http://www.gpo.gov/fdsys/pkg/FR-2013-12-11/pdf/2013-29434.pdf.) The Rule is effective February 14, 2014. PA criteria were recommended at the November 2013 DoD P&T Committee meeting.

1. ***COMMITTEE ACTION: SECTION 716 MANUAL PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) revising the manual PA criteria for maintenance medications for the following circumstances:

    a) Patient has barriers to receiving medications by mail (e.g., no permanent address, resides in rural setting).

    b) Patient is not on a stable dose of medication; the medication is currently being titrated.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Atorvastatin/ezetimibe (Liptruzet) • Simvastatin/ezetimibe (Vytorin) **Antilipidemic-1s**	• There is no alternative formulary agent: the patient requires high-intensity statin therapy (LDL lowering >50%) or moderate-intensity statin therapy (LDL lowering between 30%–50% for Vytorin 10/10 mg) and is receiving ezetimibe and atorvastatin or simvastatin therapy separately and has swallowing difficulties, requiring use of the fixed-dose combination.
• Fluvastatin ER (Lescol XL) • Pitavastatin (Livalo) **Antilipidemic-1s**	• Use of the formulary statins is contraindicated and the patient cannot take pravastatin. • The patient has experienced or likely to experience significant adverse effects from the formulary statins.
• Lovastatin ER (Altoprev) **Antilipidemic-1s**	• There is no alternative formulary agent; the patient requires treatment with lovastatin 60 mg.
• Lovastatin/niacin (Advicor) • Simvastatin/niacin (Simcor) **Antilipidemic-1s**	• There is no alternative formulary agent; the patient is receiving Niaspan and lovastatin or simvastatin separately, and has swallowing difficulties, requiring use of the fixed-dose combination.

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• Rosuvastatin (Crestor) 20 mg, 40 mg **Antilipidemic1-s (LIP-1s)**	All current users of Crestor are exempt from the PA criteria ("grandfathered"). New users of Crestor 20 mg, 40 mg must try a preferred statin at appropriate LDL lowering first. <u>Automated PA criteria</u> • The patient has filled a prescription for a preferred statin targeting similar LDL lowering >50% (generic atorvastatin 40 mg or 80 mg), at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND <u>Manual PA criteria</u>—If automated criteria are not met, Crestor 20 mg, 40 mg is approved in new users (e.g., trial of atorvastatin 40 mg, 80 mg is NOT required) if: • The patient requires a high-intensity statin (LDL lowering >50%) and has tried atorvastatin 40 mg or 80 mg and was unable to tolerate treatment due to adverse effects. • The patient requires a high-intensity statin (LDL lowering >50%) and is on a concurrent drug metabolized by the cytochrome p450 3A4 pathway.

• Rosuvastatin (Crestor) 5 mg, 10 mg **Antilipidemic1-s (LIP-1s)**	All current users of Crestor are exempt from the PA criteria ("grandfathered"). New users of Crestor 5 mg, 10 mg must try a preferred statin at appropriate LDL lowering first. <u>Manual PA criteria</u>—For new users, Crestor 5 mg or 10 mg is approved (e.g., trial of a generic statin at appropriate LDL lowering is NOT required) if: • The patient is taking a concurrent drug that is metabolized by CYP3A4 and cannot take pravastatin. The provider must state why the patient cannot take pravastatin. • The patient requires moderate LDL lowering (LDL decrease by 30% to 50%), and has tried all 3 of the following drugs: atorvastatin ≥10 mg, simvastatin ≥20 mg, and pravastatin ≥40 mg and could not tolerate treatment due to adverse effects. • Note that the previous requirements for step therapy are removed; all new users of Crestor 5 mg and 10 mg must have a manual ("hard copy") PA.
• Atorvastatin/ezetimibe (Liptruzet) • Simvastatin/ezetimibe (Vytorin) • Fluvastatin ER (Lescol XL) • Lovastatin ER (Altoprev) • Pitavastatin (Livalo) • Lovastatin/niacin (Advicor) • Simvastatin/niacin (Simcor) **Antilipidemic1-s (LIP-1s)**	All new users of Liptruzet, Vytorin, Lescol XL, Livalo, Altoprev, Advicor, and Simcor must try a preferred statin at appropriate LDL lowering first. <u>Automated PA criteria</u> • The patient has received a prescription for a preferred agent (generic atorvastatin, simvastatin, pravastatin, fluvastatin, lovastatin, or pravastatin) targeting similar LDL reduction (LDL lowering <50%, LDL lowering between 30% to 50%, LDL lowering <30%) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND <u>Manual PA criteria</u>—If automated criteria are not met, Liptruzet, Vytorin, Lescol XL, Livalo, Altoprev, Advicor, and Simcor is approved (e.g., trial of generic statin is NOT required) if: • For Vytorin: The patient requires a high-intensity statin and

Drug / Drug Class	Prior Authorization Criteria
	has tried atorvastatin ≥40 mg and was unable to tolerate treatment due to adverse effects. • For Vytorin or Liptruzet: The patient requires high-intensity therapy and is receiving ezetimibe and atorvastatin or simvastatin separately, and has swallowing difficulties (needs a fixed-dose combination product). • For Livalo, Lescol XL: o The patient has tried a preferred statin with similar LDL reduction (moderate or low intensity) and was unable to tolerate it due to adverse effects. o The patient is taking a drug that is metabolized by CYP3A4 . • For Altoprev: The patient requires treatment with lovastatin 60 mg and cannot take another statin with similar LDL lowering. • For Simcor, Advicor: The patient requires a drug that lowers LDL and raises HDL and cannot take two separate tablets (needs fixed-dose combination).

DECISION PAPER

DEPARMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

November 2013

I. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Dipeptidyl Peptidase-4 (DPP-4) Inhibitors—Alogliptin (Nesina), Alogliptin/Metformin (Kazano), and Alogliptin/Pioglitazone (Oseni)

Relative Clinical Effectiveness Conclusion—Alogliptin (Nesina) is the fourth DPP-4 inhibitor to reach the market. The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) that alogliptin exhibits similar lowering of hemoglobin A1c as the other DPP-4 inhibitors and has a similar safety profile. Although alogliptin is the only DPP-4 available in a fixed-dose combination with thiazolidinedione, it offers no additional clinical benefits, as alogliptin requires renal dosing, and the multiple tablets strengths available may limit use.

Relative Cost-Effectiveness Conclusion—A cost minimization analysis (CMA) was performed. Based on the CMA results, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) that alogliptin (Nesina), alogliptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni) are more costly than the current Uniform Formulary (linagliptin products), Basic Core Formulary (sitagliptin products), and Nonformulary (saxagliptin products) DPP-4-inhibitors.

1. ***COMMITTEE ACTION: UNIFORM FORMULARY (UF) RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) the following:

   - alogliptin (Nesina), aloglptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni) be designated nonformulary (NF) and non-preferred.

   - This recommendation includes step therapy, which requires a trial of a sitagliptin product (Januvia, Janumet, Janumet XR) (the preferred drugs) prior to using the other DPP4-inhibitors. Prior authorization for the DPP-4 inhibitors also requires a trial of metformin or sulfonylurea for new patients.

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for alogliptin (Nesina), alogliptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni). (See Appendix B for the full criteria.)

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***
Existing automated PA (step therapy) requires a trial of metformin or a sulfonylurea prior to use of a DPP-4 inhibitor. Additionally, sitagliptin-containing products (Januvia, Janumet, Janumet XR) are the preferred agents in the DPP-4 inhibitors subclass. New users must try a preferred sitagliptin product before trying linagliptin or saxagliptin-containing products. Juvisync has been voluntarily discontinued from the market as of October 2013, and will no longer be a preferred sitagliptin product on the UF.

The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) PA criteria should apply to alogliptin (Nesina), alogliptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni). (See Appendix C for the full criteria.)

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service (POS); and, 2) the Defense Health Agency (DHA) send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Osteoporosis Drugs—Bisphosphonate Subclass: Alendronate Effervescent Tablet (Binosto)

Relative Clinical Effectiveness Conclusion—Effervescent alendronate (Binosto) is a new effervescent formulation of alendronate (Fosamax, generics). The P&T Committee concluded (14 for, 0 opposed, 0 abstained, 2 absent) that although Binosto may be more convenient for patients by requiring less consumption of water and to those patients with swallowing difficulties, there is no data that Binosto is better tolerated or safer than other alendronate formulations. The high sodium content with Binosto is a disadvantage over other alendronate formulations. Binosto offers no clinically compelling advantages over current formulary bisphosphonate agents.

Relative Cost-Effectiveness Conclusion—CMA was performed. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) effervescent alendronate (Binosto) is the least cost-effective oral bisphosphonate compared to current UF agents.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) effervescent alendronate (Binosto) be designated NF.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for effervescent alendronate (Binosto). (See Appendix B for the full criteria.)

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***
The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

II. UF DRUG CLASS REVIEWS

A. Short-Acting Beta Agonists (SABAs) Metered Dose Inhalers (MDIs)

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that in terms of clinical effectiveness, there is little evidence to suggest there are clinically relevant differences between the albuterol hydrofluoroalkane (HFA) products (ProAir HFA, Proventil HFA, Ventolin HFA) and levalbuterol (Xoponex HFA) for their FDA approved indications. No new clinical conclusions were found since the previous review in November 2011. ProAir HFA now includes a dose counter. In order to meet the needs of Military Health System (MHS) patients, only one SABA is needed on the Basic Core Formulary (BCF).

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 3 absent) that among SABA HFA inhalers, ProAir HFA was the most cost-effective agent based on the weighted average cost per day of treatment across all three POS, followed by Xopenex HFA, Ventolin HFA, and Proventil HFA. Results from the CMA and budget impact analysis (BIA) showed that designating ProAir HFA as the sole UF agent in this class, with all other SABA HFA metered dose inhaler (MDIs) designated as NF, was the most cost-effective scenario for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 3 absent) that ProAir HFA remain designated formulary on the UF. The P&T Committee also recommended that Proventil HFA, Ventolin HFA, and Xopenex HFA be designated NF on the UF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 3 absent) that ProAir HFA should be added to the BCF and Ventolin HFA should be removed from the BCF. The P&T Committee also recommended that local Military Treatment Facility (MTF) P&T Committees rapidly convert patients to ProAir HFA and provide patient education on proper inhaler technique.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 3 absent) MN criteria for Proventil HFA, Ventolin HFA, and Xopenex HFA. (See Appendix B for full criteria.)

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 3 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is May 14, 2014.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Benign Prostatic Hyperplasia Agents—5-Alpha Reductase Inhibitors (5-ARIs) Subclass

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following for the 5-ARIs:

- Finasteride and dutasteride (Avodart) appear interchangeable with regard to efficacy in treating lower urinary tract symptoms associated with benign prostatic hypertrophy (BPH). Both agents result in similar decreases in prostate volume, increases in urinary flow rate, and improvement in symptoms. Similar reductions in risk of acute urinary retention and BPH-related surgery are seen with both agents.

- Finasteride and dutasteride (Avodart) exhibit a high degree of therapeutic interchangeability. Either finasteride or dutasteride is expected to meet the needs of the majority of patients in the MHS who have BPH. Neither drug offers a unique benefit. It is unlikely that a patient who did not have an adequate response with one 5-ARI would have an improved response with the other.
- The combination product dutasteride/tamsulosin (Jalyn) confers no additional benefit when compared with using the individual components together. As the 5-ARIs are highly interchangeable, it likely makes little clinical difference which 5-ARI is used in combination with an alpha-1 blocker.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) that the most cost-effective scenario designated finasteride (Proscar, generic) with formulary status on the UF, with dutasteride (Avodart) and dutasteride/tamsulosin (Jalyn) designated NF on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent,) the following:
    - finasteride (Proscar, generic) remain designated as formulary on the UF; and,
    - dutasteride (Avodart) and dutasteride/tamsulosin (Jalyn) be designated NF on the UF.
    - This recommendation includes step therapy, which requires a trial of a finasteride prior to using dutasteride (Avodart) in all current and new patients, or dutasteride/tamsulosin (Jalyn) in new users.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T recommended (15 for, 0 opposed, 1 abstained, 0 absent) finasteride remain designated as the BCF 5-ARI product.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) MN criteria for dutasteride (Avodart) and dutasteride/tamsulosin (Jalyn). (See Appendix B for the full criteria.)

4. ***COMMITTEE ACTION: PA CRITERIA***— The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) PA criteria should apply to the nonformulary 5-ARIs. A trial of finasteride is required prior to using dutasteride (Avodart) in all current and new patients, or dutasteride/tamsulosin (Jalyn) in all

new users. With the new requirement for use of finasteride prior to using Jalyn, the previous prior authorization criteria where a trial of alfuzosin or tamsulosin was required no longer apply. (See Appendix C for full criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (12 for, 0 opposed, 0 abstained, 4 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

III. UTILIZATION MANAGEMENT

A. PAs

1. **Multiple Sclerosis (MS) Drugs: Dimethyl Fumarate (Tecfidera)**—Dimethyl fumarate is an oral disease modifying drug for MS that was FDA-approved in March 2013. The drug has not yet been reviewed for UF status. The package insert recommends measuring the complete blood count (CBC) within six months prior to initiation of therapy, due to the risk of lymphopenia. PA criteria apply to the other MS drugs.

    a) ***COMMITTEE ACTION: DIMETHYL FUMARATE (TECFIDERA) PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) PA criteria for dimethyl fumarate (Tecfidera) for relapsing forms of MS, and CBC monitoring, consistent with the product labeling. (See Appendix C for full criteria.)

2. **Targeted Immunomodulatory Biologics (TIBs): Certolizumab (Cimzia), Tocilizumab (Actemra), and Ustekinumab (Stelara)**—PA criteria currently apply to the TIBs. Tocilizumab was previously limited to injection by health care professionals, but is now available in pre-filled syringes labeled for patient self administration for treatment of rheumatoid arthritis. The FDA recently approved new indications for certolizumab for treatment of ankylosing spondylitis (AS) and psoriatic arthritis (PsA), and ustekinumab for treatment of PsA.

a) ***COMMITTEE ACTION: CERTOLIZUMAB (CIMZIA), TOCILIZUMAB (ACTEMRA), AND USTEKINUMAB (STELARA) PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) PA criteria for certolizumab for AS and PsA, tocilizumab for rheumatoid arthritis, and ustekinumab for PsA, consistent with the products' labeling. (See Appendix C for full criteria.)

B. Quantity Limits (QLs)

1. **TIB: Tocilizumab (Actemra)**—QLs currently apply to the TIBs. The P&T Committee evaluated QLs for tocilizumab for treatment of rheumatoid arthritis.

   a) ***COMMITTEE ACTION: TOCILIZUMAB (ACTEMRA) QLs***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) QLs for Actemra (162 mg/0.9 mL), limiting use to 4 pre-filled syringes per 28 days in the Retail Network, and 8 pre-filled syringes per 56 days via Mail Order, consistent with FDA-approved product labeling.

C. Copayment Change

1. **Niacin ER (Niaspan)**—The P&T Committee reviewed pricing for niacin ER (Niaspan). AB-rated generics are available for this product, but the branded product has significantly lower pricing.

   a) ***COMMITTEE ACTION: COPAYMENT CHANGE***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the Tier 1 copayment be assigned for Niaspan.

   b) ***COMMITTEE ACTION: COPAYMENT IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the Tier 1 copayment change for Niaspan become effective upon signing of the minutes.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

IV. FY2008 NATIONAL DEFENSE AUTHORIZATION ACT, SECTION 703

A. **Section 703**—The P&T Committee reviewed drugs from manufacturers that were not included on a DoD Retail Refund Pricing Agreement; these drugs are not compliant with FY2008 National Defense Authorization Act, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated NF on the UF and will require pre-authorization prior to use in the Retail POS and medical necessity in MTFs. These NF drugs will remain available in the Mail Order POS without pre-authorization.

1. ***COMMITTEE ACTION: DRUGS DESIGNATED NF***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the products listed in Appendix D (listed by manufacturer) be designated nonformulary on the Uniform Formulary.

2. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) the following pre-authorization criteria for the drugs listed as nonformulary in Appendix D: 1) obtaining the product by home delivery would be detrimental to the patient; and, 2) for branded products with AB generic availability, use of the generic product would be detrimental to the patient. These pre-authorization criteria do not apply to any point of service other than retail network pharmacies.

3. ***COMMITTEE ACTION: IMPLEMENTATION PERIOD FOR PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the drugs listed in Appendix D have 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the these decisions. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

4. ***COMMITTEE ACTION: DRUGS DESIGNATED FORMULARY***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the products listed in Appendix E (listed by manufacturer) be designated with the drug's previous status on the UF because the manufacturer has become compliant with refund requirements.

5. ***COMMITTEE ACTION: REMOVAL OF PRE-AUTHORIZATION CRITERIA*** The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that pre-authorization criteria for the drugs listed in Appendix E be removed because the manufacturer has become compliant with refund requirements.

6. ***COMMITTEE ACTION: IMPLEMENTATION PERIOD FOR UF DESIGNATION AND REMOVAL OF PRE-AUTHORIZATION CRITERIA***—The P&T Committee

recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the formulary designation change and removal of pre-authorization criteria for drugs listed in Appendix E become effective upon signing of the minutes.

REMOVAL OF PRE-AUTHORIZATION CRITERIA
Effective upon my signature, when a manufacturer becomes compliant with FY2008 National Defense Authorization Act, Section 703, the previously imposed pre-authorization criteria are removed.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

V. SECTION 716 NDAA FY2013 PILOT PROGRAM FOR REFILLS OF MAINTENANCE MEDICATIONS FOR TRICARE FOR LIFE BENFICIARIES THROUGH THE TRICARE MAIL ORDER PROGRAM

The P&T Committee was briefed on pending legislation requiring TRICARE for Life beneficiaries (≥ 65 years) to obtain refills for maintenance medications for chronic conditions through the TRICARE mail order pharmacy or at MTFs. Beneficiaries would be able to opt out after one year, and waivers would be granted on an individual basis, if deemed appropriate. Waivers would allow refills from the retail pharmacy in certain circumstances, including when necessary due to personal needs or hardship, emergency, or other special circumstances. The pilot program would run through December 31, 2017.

A. Medication Drug List for the Pilot Program

Candidate drugs for the Maintenance Medication Program must meet the following requirements: the medication is prescribed for a chronic, long-term condition; it is clinically appropriate to dispense the medication from the Mail Order Pharmacy; the medication is generally available at MTF pharmacies for initial prescription fill and refills; the medication is available for refill through the Mail Order Pharmacy; and, it is cost effective to dispense from the Mail Order Pharmacy.

1. ***COMMITTEE ACTION: MAINTENANCE MEDICATION PROGRAM DRUG LIST***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) the list of covered maintenance medications for the Section 716 pilot program. (See Appendix F.)

B. Manual PA Criteria for Waivers

Manual PA criteria (waivers) allowing for refills at the Retail Network for other

circumstances were discussed by the P&T Committee.

1. ***COMMITTEE ACTION: SECTION 716 MANUAL PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) PA criteria for maintenance medications for the following circumstances:
    a) Patient resides in a long-term care facility.
    b) Patient has other health insurance.
    c) Patient has barriers to receiving medications by mail (e.g., no permanent address, resides in rural setting).
    d) Patient is not on a stable dose of medication; the medication is currently being titrated.

Note: See Addendum from December 17, 2013, interim meeting.

Director, DHA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

SUBMITTED BY:

John P. Kugler, M.D., MPH
DoD P&T Committee Chair

DECISION ON RECOMMENDATIONS

Director, DHA, decisions are as annotated above.

Douglas J. Robb, D.O., MPH
Lieutenant General, USAF, MC, CFS
Director

10 Feb 2014

Date

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE
MINUTES AND RECOMMENDATIONS

November 2013

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on November 13 and 14, 2013, at the Defense Health Agency (DHA) Pharmacoeconomic Branch, Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is listed in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of August Minutes**—Lt. Gen. Douglas J. Robb D.O.., MPH, Director, DHA , approved the minutes for the August 2013 DoD P&T Committee meeting on November 7, 2013.
2. **Correction to the August 2013 Minutes**—The August minutes were corrected to state the implementation period for the self-monitoring blood glucose test strips will be 180 days, instead of 120 days. The implementation date is May 7, 2014.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and Basic Core Formulary (BCF) recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Dipeptidyl Peptidase-4 (DPP-4) Inhibitors—Alogliptin (Nesina), Alogliptin/Metformin (Kazano), and Alogliptin/Pioglitazone (Oseni)

Relative Clinical Effectiveness Conclusion—Alogliptin (Nesina) is the fourth DPP-4 inhibitor to reach the market. Similar to the other DPP-4 inhibitors, it is combined with metformin (alogliptin/metformin; Kazano), but is the first DPP-4 inhibitor with a thiazolidinedione (TZD) combination [alogliptin/pioglitazone (Oseni)].

The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following with regard to the clinical efficacy and safety of the alogliptin-containing drugs:

- Alogliptin and the combinations with metformin and pioglitazone exhibit similar hemoglobin A1c (HbA1c) lowering effects compared to the other DPP-4 inhibitors. Dual therapy with alogliptin provided greater decreases in HbA1c from baseline in treatment naïve patients (HbA1c lowering of 1.22% to 1.71%) compared to patients previously treated with a DPP-4 inhibitor (HbA1c lowering of 0.39% to 0.6%). Triple therapy with alogliptin plus metformin and pioglitazone resulted in HbA1c changes from baseline ranging from 0.63% to 1.4%.
- Alogliptin, similar to the other DPP-4 inhibitors, is lipid- and weight-neutral and has minimal effects on blood pressure.
- The fixed-dose combinations of alogliptin with metformin or pioglitazone have the usual safety concerns (i.e., lactic acidosis, heart failure, fracture risk, edema, hepatic impairment, and bladder cancer).
- Alogliptin-containing products all require renal dosing.
- Although alogliptin is the only DPP-4 available in a fixed-dose combination with a TZD, it offers no additional clinical benefits, as alogliptin requires renal dosing and the multiple tablets strengths available may limit use.

Relative Cost-Effectiveness Conclusion—A cost minimization analysis (CMA) was performed. Based on the CMA results, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) that alogliptin (Nesina), alogliptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni) are more costly than the current UF (linagliptin products), BCF (sitagliptin products), and NF (saxagliptin products) DPP-4-inhibitors.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) the following:
    - alogliptin (Nesina), aloglptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni) be designated NF and non-preferred.
    - This recommendation includes step therapy, which requires a trial of a sitagliptin product (Januvia, Janumet, Janumet XR) (the preferred drugs) prior to using the other DPP4-inhibitors. Prior authorization for the DPP-4 inhibitors also requires a trial of metformin or sulfonylurea for new patients.
2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for alogliptin (Nesina),

alogliptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni). (See Appendix B for the full criteria.)

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***
Existing automated PA (step therapy) requires a trial of metformin or a sulfonylurea prior to use of a DPP-4 inhibitor. Additionally, sitagliptin-containing products (Januvia, Janumet, Janumet XR) are the preferred agents in the DPP-4 inhibitors subclass. New users must try a preferred sitagliptin product before trying linagliptin or saxagliptin-containing products. Juvisync has been voluntarily discontinued from the market as of October 2013, and will no longer be a preferred sitagliptin product on the UF.

   The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) PA criteria should apply to alogliptin (Nesina), alogliptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni). (See Appendix C for the full criteria.)

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service (POS); and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

B. Osteoporosis Drugs—Bisphosphonate Subclass: Alendronate Effervescent Tablet (Binosto)

Relative Clinical Effectiveness Conclusion—Effervescent alendronate (Binosto) is a new formulation of alendronate (Fosamax, generics). FDA approval was granted based on demonstrated bioequivalence to Fosamax 70 mg tablets. There are no clinical trials available with Binosto.

The P&T Committee concluded (14 for, 0 opposed, 0 abstained, 2 absent):

- Effervescent alendronate (Binosto) may be more convenient for patients by requiring less consumption of water (4 ounces with Binosto versus 6–8 ounces with the other bisphosphonates) and to those patients with swallowing difficulties. It requires the same dosing and administration concerns as the other bisphosphonates.
- There is no data that Binosto is better tolerated or safer than other alendronate formulations. The high sodium content with Binosto is a disadvantage over other alendronate formulations.

- Binosto offers no clinically compelling advantages over current formulary bisphosphonate drugs.

Relative Cost-Effectiveness Conclusion—CMA was performed. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) effervescent alendronate (Binosto) is the least cost-effective oral bisphosphonate compared to current UF agents.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) effervescent alendronate (Binosto) be designated NF.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for effervescent alendronate (Binosto). (See Appendix B for the full criteria.)

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***
The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

V. UF DRUG CLASS REVIEWS

A. Short-Acting Beta Agonists (SABAs)

Relative Clinical Effectiveness Conclusion—The SABAs administered via metered dose inhalers (MDIs) were evaluated by the P&T Committee. The drugs in the class include albuterol [ProAir hydrofluoroalkane (HFA), Proventil HFA, Ventolin HFA] and levalbuterol (Xoponex HFA). The nebulized products were not evaluated. No new clinical conclusions were made since the SABAs Drug Class was reviewed in November 2011. The P&T Committee agreed (15 for, 0 opposed, 0 abstained, 1 absent) with the following conclusions:

- There are no studies in either adults or children assessing efficacy of albuterol versus levalbuterol when administered via MDIs for treating asthma.
- In exercise-induced bronchospasm (EIB), albuterol administered via MDI taken 15–30 minutes before exercise prevents symptoms significantly better than placebo. Although Xopenex HFA is not currently approved by the FDA for EIB, phase III trials point to similar effect size as with albuterol.
- For chronic obstructive pulmonary disease, the SABAs are more efficacious than placebo. There is insufficient evidence to compare the efficacy of albuterol versus levalbuterol.

- Although there is a lack of comparative safety data between levalbuterol and albuterol MDIs, there is no evidence to suggest clinically relevant differences in safety between the drugs.
- Since the last UF review, ProAir HFA now includes a dose counter. Ventolin HFA also has a dose counter. Proventil HFA and Xopenex HFA do not have dose counters.
- Although the FDA states albuterol HFA products are separate entities and not substitutable, clinically there is a high degree of therapeutic interchangeability between ProAir HFA, Proventil HFA, Ventolin HFA, and Xoponex HFA.
- To meet the needs of Military Health System (MHS) patients, only one SABA is needed on the BCF.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 3 absent) that among SABA HFA metered dose inhalers, ProAir HFA was the most cost-effective agent based on the weighted average cost per day of treatment across all three POS, followed by Xopenex HFA, Ventolin HFA, and Proventil HFA. Results from the CMA and budget impact analysis (BIA) showed that designating ProAir HFA as the sole UF agent in this class, with all other SABA HFA MDIs designated as NF, was the most cost-effective scenario for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 3 absent) that ProAir HFA remain designated formulary on the UF. The P&T Committee also recommended that Proventil HFA, Ventolin HFA, and Xopenex HFA be designated NF on the UF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***— The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 3 absent) that ProAir HFA should be added to the BCF and Ventolin HFA should be removed from the BCF. The P&T Committee also recommended that local Military Treatment Facility (MTF) P&T Committees rapidly convert patients to ProAir HFA and provide patient education on proper inhaler technique.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 3 absent) MN criteria for Proventil HFA, Ventolin HFA, and Xopenex HFA. (See Appendix B for full MN criteria.)

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 3 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is May 14, 2014.

B. Benign Prostatic Hyperplasia Agents—5-Alpha Reductase Inhibitors (5-ARIs) Subclass

Relative Clinical Effectiveness Analysis and Conclusion—The 5-ARIs include finasteride (Proscar, generics), dutasteride (Avodart), and the combination product dutasteride/tamsulosin (Jalyn), which contains an alpha-1 blocker (A1B). The 5-ARIs were previously reviewed for UF placement in May 2007. Jalyn was previously reviewed as a new drug in the A1B subclass in May 2011. The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following for the 5-ARIs:

- The 5-ARIs finasteride and dutasteride (Avodart) improve lower urinary tract symptoms associated with benign prostatic hypertrophy (BPH), when compared to placebo. Because of the placebo effect in reducing symptoms, the magnitude of the effect due to treatment is small and may not be clinically significant.
- Finasteride and dutasteride (Avodart) appear interchangeable with regard to efficacy in treating lower urinary tract symptoms associated with BPH. Both agents result in similar decreases in prostate volume, increases in urinary flow rate, and improvement in symptoms. Similar reductions in risk of acute urinary retention and BPH-related surgery are seen with both agents.
- The 5-ARIs are most useful in men who have enlarged prostates, but show little efficacy in men with normal prostate volumes.
- Finasteride and dutasteride (Avodart) exhibit a high degree of therapeutic interchangeability. Either finasteride or dutasteride is expected to meet the needs of the majority of benign prostatic hyperplasia patients in the MHS. Neither drug offers a unique benefit. It is unlikely that a patient who did not have an adequate response with one 5-ARI would have an improved response with the other.
- The combination product dutasteride/tamsulosin (Jalyn) confers no additional benefit when compared with using the individual components together. As the 5-ARIs are highly interchangeable, it likely makes little clinical difference which 5-ARI is used in combination with an A1B.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and BIA were performed to evaluate the 5-ARI subclass. The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following:

- CMA results showed that finasteride was the most cost-effective agent in this class. Dutasteride (Avodart) and dutasteride/ tamsulosin (Jalyn) were not cost-effective when compared with finasteride alone or in combination with generic uroselective A1Bs (tamsulosin or alfuzosin).
- BIA was performed to evaluate the potential impact of scenarios with selected 5ARIs designated formulary or nonformulary on the UF. BIA results showed the scenario with finasteride designated as formulary on the UF, and dutasteride (Avodart) and

dutasteride/tamsulosin (Jalyn) designated as nonformulary on the UF was the most cost-effective for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) the following:

    - finasteride (Proscar, generic) remain designated with formulary status on the UF; and
    - dutasteride (Avodart) and dutasteride/tamsulosin (Jalyn) be designated NF.
    - This recommendation includes step therapy, which requires a trial of a finasteride prior to using dutasteride (Avodart) in all current and new patients, or dutasteride/tamsulosin (Jalyn) in new users.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T recommended (15 for, 0 opposed, 1 abstained, 0 absent) that finasteride remain as the designated 5-ARI product on the BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) MN criteria for dutasteride (Avodart) and dutasteride/tamsulosin (Jalyn). (See Appendix B for the full criteria.)

4. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) PA criteria should apply to the nonformulary 5-ARIs. A trial of finasteride is required prior to using dutasteride (Avodart) in all current and new patients, or dutasteride/tamsulosin (Jalyn) in all new users. With the new requirement for use of finasteride prior to using Jalyn, the previous prior authorization criteria where a trial of alfuzosin or tamsulosin was required no longer apply. (See Appendix C for full PA criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (12 for, 0 opposed, abstained, 4 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2) DHA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

VI. UTILIZATION MANAGEMENT

A. PAs

1. **Multiple Sclerosis (MS) Drugs: Dimethyl Fumarate (Tecfidera)**—Dimethyl fumarate is an oral disease modifying drug for MS that was FDA-approved in March 2013. The drug has not yet been reviewed for UF status. The package insert recommends measuring the complete blood count (CBC) within six months prior to initiation of therapy, due to the risk of lymphopenia. PA criteria apply to the other MS drugs.

    a) ***COMMITTEE ACTION: DIMETHYL FUMARATE (TECFIDERA) PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) PA criteria for dimethyl fumarate (Tecfidera) for relapsing forms of MS, and CBC monitoring, consistent with the product labeling. (See Appendix C for full criteria.)

2. **Targeted Immunomodulatory Biologics (TIBs): Certolizumab (Cimzia), Tocilizumab (Actemra), and Ustekinumab (Stelara)**—PA criteria currently apply to the TIBs. Tocilizumab was previously limited to injection by health care professionals, but is now available in pre-filled syringes labeled for patient self administration for treatment of rheumatoid arthritis. The FDA recently approved new indications for certolizumab for treatment of ankylosing spondylitis (AS) and psoriatic arthritis (PsA), and ustekinumab for treatment of PsA.

    a) ***COMMITTEE ACTION: CERTOLIZUMAB (CIMZIA), TOCILIZUMAB (ACTEMRA), AND USTEKINUMAB (STELARA) PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) PA criteria for certolizumab for AS and PsA, tocilizumab for rheumatoid arthritis, and ustekinumab for PsA, consistent with the products' labeling. (See Appendix C for full criteria.)

B. Quantity Limits (QLs)

1. **TIB: Tocilizumab (Actemra)**—QLs currently apply to the TIBs. The P&T Committee evaluated QLs for tocilizumab for treatment of rheumatoid arthritis.

    a) ***COMMITTEE ACTION: TOCILIZUMAB (ACTEMRA) QLs***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) QLs for Actemra (162 mg/0.9 mL), limiting use to 4 pre-filled syringes per 28 days in the Retail Network, and 8 pre-filled syringes per 56 days via Mail Order, consistent with FDA-approved product labeling.

C. Copayment Change

1. **Niacin ER (Niaspan)**—The P&T Committee reviewed pricing for niacin ER (Niaspan). AB-rated generics are available for this product, but the branded product has significantly lower pricing.

    a) ***COMMITTEE ACTION: COPAYMENT CHANGE***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the Tier 1 copayment be assigned for Niaspan.

    b) ***COMMITTEE ACTION: COPAYMENT IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the Tier 1 copayment change for Niaspan become effective upon signing of the minutes.

VII. FY2008 NATIONAL DEFENSE AUTHORIZATION ACT (NDAA), SECTION 703

A. Section 703—The P&T Committee reviewed drugs from manufacturers that were not included on a DoD Retail Refund Pricing Agreement; these drugs are not compliant with FY2008 National Defense Authorization Act, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated NF on the UF and will require pre-authorization prior to use in the Retail POS and medical necessity in MTFs. These NF drugs will remain available in the Mail Order POS without pre-authorization.

1. ***COMMITTEE ACTION: DRUGS DESIGNATED NF***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the products listed in Appendix D (listed by manufacturer) be designated nonformulary on the Uniform Formulary.

2. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) the following pre-authorization criteria for the drugs listed as nonformulary in Appendix D: 1) obtaining the product by home delivery would be detrimental to the patient; and, 2) for branded products with AB generic availability, use of the generic product would be detrimental to the patient. These pre-authorization criteria do not apply to any point of service other than retail network pharmacies.

3. ***COMMITTEE ACTION: IMPLEMENTATION PERIOD FOR PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the drugs listed in Appendix D have 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2)

DHA send a letter to beneficiaries affected by these decisions. Based on the P&T Committee's recommendation, the effective date is April 16, 2014.

4. ***COMMITTEE ACTION: DRUGS DESIGNATED FORMULARY***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the products listed in Appendix E (listed by manufacturer) be designated with the drug's previous status on the UF because the manufacturer has become compliant with refund requirements.

5. ***COMMITTEE ACTION: REMOVAL OF PRE-AUTHORIZATION CRITERIA*** The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that pre-authorization criteria for the drugs listed in Appendix E be removed because the manufacturer has become compliant with refund requirements.

6. ***COMMITTEE ACTION: IMPLEMENTATION PERIOD FOR UF DESIGNATION AND REMOVAL OF PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) that the formulary designation change and removal of pre-authorization criteria for drugs in Appendix E become effective upon signing of the minutes.

   REMOVAL OF PRE-AUTHORIZATION CRITERIA
   Effective upon signature of the Director, DHA, when a manufacturer becomes compliant with FY2008 National Defense Authorization Act, Section 703, the previously imposed pre-authorization criteria are removed.

VIII. SECTION 716 NDAA FY2013 PILOT PROGRAM FOR REFILLS OF MAINTENANCE MEDICATIONS FOR TRICARE FOR LIFE BENFICIARIES THROUGH THE TRICARE MAIL ORDER PROGRAM

The P&T Committee was briefed on pending legislation requiring TRICARE for Life beneficiaries ($\geq$ 65 years) to obtain refills for maintenance medications for chronic conditions through the TRICARE mail order pharmacy or at MTFs. Beneficiaries would be able to opt out after one year, and waivers would be granted on an individual basis, if deemed appropriate. Waivers would allow refills from the retail pharmacy in certain circumstances, including when necessary due to personal needs or hardship, emergency, or other special circumstances. The pilot program would run through December 31, 2017.

A. Medication Drug List for the Pilot Program

Candidate drugs for the Maintenance Medication Program must meet the following requirements: the medication is prescribed for a chronic, long-term condition; it is clinically appropriate to dispense the medication from the Mail Order Pharmacy; the medication is generally available at MTF pharmacies for initial prescription fill and refills; the medication is

available for refill through the Mail Order Pharmacy; and, it is cost effective to dispense from the Mail Order Pharmacy.

1. ***COMMITTEE ACTION: MAINTENANCE MEDICATION PROGRAM DRUG LIST***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) the list of covered maintenance medications for the Section 716 pilot program. (See Appendix F.)

B. Manual PA Criteria for Waivers

Manual PA criteria (waivers) allowing for refills at the Retail Network for other circumstances were discussed by the P&T Committee.

1. ***COMMITTEE ACTION: SECTION 716 MANUAL PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 3 absent) PA criteria for maintenance medications for the following circumstances:
   a) Patient resides in a long-term care facility.
   b) Patient has other health insurance.
   c) Patient has barriers to receiving medications by mail (e.g., no permanent address, resides in rural setting).
   d) Patient is not on a stable dose of medication; the medication is currently being titrated.

Note: See Addendum from December 17, 2013, interim meeting.

IX. ITEMS FOR INFORMATION

A. Zolpidem and Gender Dosing—The FDA recommended new dosing guidelines for zolpidem and zolpidem extended release (ER) in January 2013, limiting dosing in females to 5 mg and 6.25 mg, respectively. The new dosing recommendations are based on data showing blood levels in some patients may be high enough the morning after use to impair activities that require alertness, including driving. In February 2013, the P&T Committee recommended monitoring zolpidem prescribing practices in the MHS. A review of zolpidem prescribing in women in the MHS shows that utilization of the lower doses of zolpidem and zolpidem ER in women has increased since January 2013, particularly at the MTFs. The P&T Committee recommended continued monitoring.

B. Acthar Gel PA Implementation Date—PA criteria and a 30-day PA implementation period for Acthar Gel were recommended at the August 2013 Committee meeting. The implementation date will be December 18, 2013.

C. **Points of Service Analysis Update**— The Pharmacy Outcomes Research Team (PORT) updated the P&T Committee on comparative drug costs across all three POS. Data from the third quarter in Fiscal Year (FY) 2013 showed drug costs for branded non-specialty maintenance medications (i.e., medications used for chronic conditions and not specialty medications) would have been lower overall if all prescriptions dispensed in the retail network during that quarter had instead been dispensed at MTFs or in mail order. Higher drug costs for brand medications at retail were primarily responsible for the cost differences. Costs for generically available non-specialty medications would have slightly increased. Fourth quarter results from FY12 are comparable; however, improved availability of generics for widely-used medications at MTFs (e.g., clopidogrel, atorvastatin) and in mail order have generated greater cost avoidance for the MHS in FY2013.

D. **Drug Utilization & Costs**—The PORT reported preliminary results of specialty drug utilization and costs across the MHS. This analysis used a broad list of specialty medications and was adjusted for retail refunds. Specialty medications accounted for about 19% of expenditures in FY2013, but fewer than 1% of total 30-day equivalent prescriptions. Prescriptions dispensed from the retail network accounted for about 66% of specialty medication spend, followed by MTFs (18%), and mail order (16%). Top specialty classes by total cost included oral oncologic agents, TIBs, and MS agents. The PORT also reported total FY2013 expenditures for the top 25 drugs and drug classes by cost, across both specialty and non-specialty agents.

E. **Specialty Care Medications**—The P&T Committee was briefed on potential options for utilization management for specialty medications. The list of specialty medications for inclusion in specialty care programs is in the process of being updated, and will be presented at a future meeting.

F. **Bulk Chemicals in Compounded Medications**—The P&T Committee was presented with an update on the status of bulk chemicals in compounded medications. Future updates will be provided when a final recommendation is available.

X. ADJOURNMENT

The meeting adjourned at 1145 hours on November 14, 2013. The next meeting will be in February 2014.

Dr. Angela Allerman	DHA Pharmacoeconomic Branch
Dr. Shana Trice	DHA Pharmacoeconomic Branch
Dr. Dean Valibhai	DHA Pharmacoeconomic Branch
Dr. Jeremy Briggs	DHA Pharmacoeconomic Branch
Dr. Brian Beck	DHA Pharmacoeconomic Branch
Dr. Amy Lugo	DHA Pharmacoeconomic Branch
LT Kendra Jenkins, USPHS, via DCO	DHA Pharmacy Operations Division
Ms. Deborah Garcia	DHA Pharmacoeconomic Branch contractor
Dr. Esmond Nwokeji	DoD Pharmacoeconomic Branch contractor
Mr. Kirk Stocker	DoD Pharmacoeconomic Branch contractor
Maj Ellen Roska, BSC	University of Texas PhD student
Andrew Delgado	University of Texas Health Science Center/University of Texas College of Pharmacy student
Roderick Sanchez	University of Incarnate Word, Feik School of Pharmacy student
Ankita Patel	University of Incarnate Word, Feik School of Pharmacy student
James Flink	University of Incarnate Word, Feik School of Pharmacy student

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Alogliptin (Nesina) • Alogliptin/metformin (Kazano) • Alogliptin/pioglitazone (Oseni) **Dipeptidyl-Peptidase-4 (DPP-4) Inhibitors**	• Use of sitagliptin- or linagliptin-containing products is contraindicated. • The patient has experienced significant adverse effects from sitagliptin- or linagliptin-containing products. • There is no alternative formulary agent: the patient requires a thiazolidinedione but cannot take the 2 drugs separately.
• Effervescent alendronate (Binosto) **Osteoporosis Drugs – Bisphosphonates**	• There is no alternative formulary agent: the patient cannot swallow tablets or cannot consume 8oz. of water and has no sodium restrictions.
• Proventil HFA • Ventolin HFA • Xoponex HFA **Short-Acting Beta Agonist Metered Dose Inhalers**	• The patient previously responded to a nonformulary agent and changing to a formulary agent would incur unacceptable risk.
• Dutasteride (Avodart) **BPH Drugs – 5-Alpha Reductase Inhibitors (5-ARI)**	• Use of finasteride is contraindicated (e.g., hypersensitivity). • The patient has experienced significant adverse effects from finasteride.
• Dutasteride/tamsulosin (Jalyn) **BPH Drugs – 5-Alpha Reductase Inhibitors (5-ARI)**	• Use of finasteride is contraindicated (e.g., hypersensitivity) and the patient requires therapy with both an alpha-1 receptor blocker (A1B) and 5-ARI. • The patient has experienced significant adverse effects from finasteride, and requires therapy with both an A1B and 5-ARI. • There is no alternative formulary agent: the patient is unable to take finasteride (due to contraindication or adverse effect), requires therapy with both an A1B and a 5-ARI, and requires a fixed-dose combination due to, for example, swallowing difficulties.

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• Alogliptin (Nesina) • Alogliptin/metformin (Kazano) • Alogliptin/pioglitazone (Oseni) **Dipeptidyl-Peptidase-4 (DPP-4) Inhibitors**	All new and current users of a DPP-4 inhibitor are required to try metformin or a sulfonylurea before receiving a DPP-4 inhibitor. Additionally, sitagliptin-containing products (Januvia, Janumet, Janumet XR) are the preferred agents in the DPP-4 inhibitors subclass. New users of alogliptin must try a sitagliptin product first. Automated PA criteria • The patient has filled a prescription for metformin or a sulfonylurea at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. • The patient has received a prescription for a preferred DPP-4 inhibitor (Januvia, Janumet, or Janumet XR) at any MHS pharmacy POS (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria—If automated criteria are not met, alogliptin, alogliptin/metformin, or alogliptin/pioglitazone is approved (e.g., trial of metformin or a sulfonylurea is NOT required) if: • The patient has had an inadequate response to metformin or sulfonylurea. • The patient has experienced any of the following adverse events while receiving metformin: impaired renal function that precludes treatment with metformin or history of lactic acidosis [for alogliptin (Nesina) or alogliptin/pioglitazone (Oseni)]. • The patient has experienced the following adverse event while receiving a sulfonylurea: hypoglycemia requiring medical treatment. • The patient has a contraindication to metformin or a sulfonylurea. AND In addition to the above criteria regarding metformin and sulfonylurea, the following PA criteria would apply specifically to alogliptin (Nesina), alogliptin/metformin (Kazano), and alogliptin/pioglitazone (Oseni): • The patient has experienced an adverse event with sitagliptin-containing products, which is not expected to occur with alogliptin-containing products. • The patient has had an inadequate response to a sitagliptin-containing product. • The patient has a contraindication to sitagliptin.

Drug / Drug Class	Prior Authorization Criteria
• Dutasteride (Avodart) **BPH Drugs – 5-Alpha Reductase Inhibitors (5-ARIs)**	All new and current users of Avodart are required to try finasteride. Automated PA criteria • The patient has filled a prescription for finasteride at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria—If automated criteria are not met, Avodart is approved (e.g., trial of finasteride is NOT required) if: • Use of generic finasteride is contraindicated (e.g., due to hypersensitivity). • Patient has experienced or is likely to experience significant adverse effects from finasteride.
• Dutasteride/tamsulosin (Jalyn) **BPH Drugs – 5-Alpha Reductase Inhibitors (5-ARIs)**	All new users of Jalyn are required to try finasteride. With the new requirement for use of finasteride prior to using Jalyn, the previous prior authorization criteria where a trial of alfuzosin or tamsulosin was required no longer apply. Automated PA criteria • The patient has a previous step therapy (automated prior authorization) approval for dutasteride/tamsulosin (Jalyn), or • The patient has filled a prescription for finasteride at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria—If automated criteria are not met, Jalyn is approved (e.g., trial of finasteride is NOT required) if: • Use of finasteride is contraindicated and the patient requires therapy with both an alpha-1 receptor blocker (A1B) and a 5-ARI. • The patient has tried finasteride, was unable to tolerate it due to adverse effects, and requires therapy with both an A1B and a 5-ARI. • The patient is unable to take finasteride (due to a contraindication or adverse events), requires therapy with both an A1B and a 5-ARI, and requires a fixed-dose combination due to, for example, swallowing difficulties.

Drug / Drug Class	Prior Authorization Criteria
• Dimethyl fumarate (Tecfidera) **Multiple Sclerosis**	Coverage approved for patients with: • Documented diagnosis of relapsing forms of multiple sclerosis (MS). • Complete blood count drawn within six months prior to imitation of therapy, due to risk of lymphopenia. • Coverage NOT provided for concomitant use with other disease-modifying drugs of MS.
• Certolizumab (Cimzia) **Targeted Immunomodulatory Biologics (TIBs)**	Coverage approved for patients ≥ 18 years with: • **Active ankylosing spondylitis** • **Active psoriatic arthritis** • Moderately to severely active Crohn's disease refractory to conventional therapy • Moderately to severely active rheumatoid arthritis • Coverage NOT provided for concomitant use with other TIBs, Kineret, Enbrel, Remicade, Orencia, or Rituxan
• Tocilizumab (Actemra) **Targeted Immunomodulatory Biologics (TIBs)**	Coverage approved for patients ≥ 18 years with: • Moderate to severely active rheumatoid arthritis who have had an inadequate response to one or more disease-modifying antirheumatic drugs • Not approved for use in systemic or polyarticular juvenile idiopathic arthritis
• Ustekinumab (Stelara) **Targeted Immunomodulatory Biologics (TIBs)**	Coverage approved for patients ≥ 18 years with: • **Active psoriatic arthritis** • Moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy • Coverage NOT provided for concomitant use with other TIBs, Kineret, Enbrel, Remicade, Orencia, or Rituxan

Appendix D—Table of Drugs Designated Nonformulary due to Section 703

The drugs below are designated NF on the UF and pre-authorization is assigned.

Manufacturer	Drugs
LUPIN PHAR	ANTARA
MISSION PH	BINOSTO LITHOSTAT THIOLA TINDAMAX UROCIT-K (10 MEQ) UROCIT-K (15 MEQ) UROCIT-K (5 MEQ)

Second Addendum

I. UNIFORM FORMULARY (UF) DRUG CLASS REVIEWS—Self-Monitoring Blood Glucose System (SMBGS) Test Strips

The P&T Committee reviewed the clinical effectiveness of the SMBGS test strips at the May 2013 P&T Committee meeting. The cost effectiveness, UF recommendation, Basic Core Formulary (BCF) recommendation, Prior Authorization (PA) criteria, Medical Necessity (MN) criteria, quantity limits (QLs), and implementation period were presented at the August 2013 P&T Committee meeting. An implementation period for the final decisions of 180 days, effective May 7, 2014, was approved by the Director, DHA, on November 7, 2013.

All steps necessary for implementation of the SMBGS test strips decisions were delayed 100 days, due to a GAO protest, which was dismissed on March 5, 2014. Due to the delay, the implementation period was extended to August 6, 2014, to allow for adequate time for DHA to send a letter to beneficiaries affected by the UF and PA decisions. Following dismissal of the GAO protest, a protest was filed in the Court of Federal Claims (CoFC). That protest has not yet been resolved and is not expected to be resolved until on or after August 20, 2014. Therefore, the effective date for implementation of the final SMBGS test strips decisions is postponed indefinitely, pending resolution of the CoFC protest. All steps necessary for implementation of the SMBG test strip decision remain on hold.

There is no change to the other decisions for the SMBGS test strips.

DECISION PAPER

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

August 2013

I. UNIFORM FORMULARY DRUG CLASS REVIEWS

A. Corticosteroid Immune Modulators (Topical Steroids)

Background and Relative Clinical Effectiveness Conclusion—The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee evaluated the Corticosteroid Immune Modulators (Topical Steroids) Drug Class. The drugs were categorized into high- (classes 1 and 2), medium- (classes 3, 4, and 5), and low-potency agents (classes 6 and 7). Appendix B lists all products in the Topical Steroids Drug Class and their respective potency classifications, formulations, and generic availability.

Relative Clinical Effectiveness Conclusion—The full clinical effectiveness evaluation was presented at the May 2013 P&T Committee meeting. During the May 2013 meeting, the P&T Committee agreed (16 for, 0 opposed, 0 abstained, 1 absent) with the following conclusions:

- There is very limited generalizable data for all of the topical steroids. Heterogeneity of the data precludes direct and indirect comparisons. A product formulated for hair (e.g., foam, shampoo) from each potency class is desirable for inclusion on the UF.
- Safety issues are considered class effects.
- A Coopman Class C product (e.g., desoximetasone, clocortolone) is less likely to cause an allergic response, compared with Coopman Classes A (hydrocortisone, hydrocortisone acetate) and D1 (clobetasol, betamethasone, diflurasone, fluticasone, mometasone, aclometasone) agents, and is required for inclusion on the UF.
- For the high-potency topical steroids, none of the products offer unique advantages in terms of efficacy or safety over other agents in the high-potency class.
- The medium-potency topical steroid Pediaderm TA combination product co-packages triamcinolone with an emollient vehicle. There are no compelling advantages to using the co-packaged product versus using triamcinolone and a comparable emollient sold separately.

- For the low-potency topical steroids, there is no evidence to support clinically meaningful differences in efficacy or safety among the agents.
  - The Pediaderm HC combination product co-packages hydrocortisone with an emollient vehicle. There are no compelling advantages to using the co-packaged product versus using hydrocortisone and a comparable emollient sold separately.
  - Desonate Gel, Verdeso Foam, and Capex Shampoo all remain uniquely branded, without clinical advantages over the other generic low-potency topical steroids

Relative Cost-Effectiveness Conclusion—A pharmacoeconomic analysis, including cost minimization analysis (CMA), was performed for the topical steroids within each potency class (high, medium, and low). CMA results showed that designating cost-effective agents from within each potency class as formulary on the UF yielded the most cost-effective results for the MHS.

The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 1 absent) that, for each topical steroid potency class, there were specific agents, strengths, and dosage forms determined to be cost-effective based on the weighted average cost per day of treatment across all three points of service (POS).

1. ***COMMITTEE ACTION: UNIFORM FORMULARY (UF) RECOMMENDATION***—The P&T Committee recommended (9 for, 3 opposed, 1 abstained, 1 absent) all topical steroid products be designated formulary on the UF, with the exception of the products listed below that are designated nonformulary (NF) (See Appendix H):
   - **Nonformulary High Potency products:** amcinonide 0.1% ointment (Cyclocort, generics); diflorasone 0.05% cream and ointment (Apexicon, generics); fluocinonide 0.1% cream (Vanos); halcinonide 0.1% cream and ointment (Halog);
   - **NF Medium Potency products:** amcinonide 0.1% cream and lotion (Cyclocort, generics); betamethasone valerate 0.12% foam (Luxiq, generics); clocortolone 0.1% cream (Cloderm); desonide 0.05% lotion (Desowen, generics); hydrocortisone probutate 0.1% cream (Pandel); hydrocortisone butyrate 0.1% cream and lotion (Locoid); triamcinolone with emollient #45, 0.1% cream kit (Pediaderm TA);
   - **NF Low Potency Products:** desonide 0.05% foam (Verdeso) and 0.05% gel (Desonate); fluocinolone 0.01% shampoo (Capex);

hydrocortisone with emollient #45, 2% lotion kit (Pediaderm HC).

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) maintaining fluocinonide 0.05% cream and triamcinolone acetate 0.1% cream on the BCF. Additionally, the P&T Committee recommended adding fluocinonide 0.05% ointment, clobetasol 0.05% cream, clobetasol 0.05% ointment, and triamcinolone acetate 0.1% ointment to the BCF.

3. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) MN criteria for all topical steroids that were designated as NF. (See Appendix D for full MN criteria.)

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2) TMA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is January 8, 2014.

Director, DHA, Decision:  ☒Approved ☐ Disapproved

Approved, but modified as follows:

B. Self-Monitoring Blood Glucose System (SMBGS) Test Strips

Background and Relative Clinical Effectiveness—The P&T Committee reviewed the clinical effectiveness of the SMBGS test strips. Appendix C lists the products in the SMBGS Test Strips Drug Class. Candidates for inclusion on the UF met all minimum required technical standards and U.S. Federal Government contracting requirements.

Relative Clinical Effectiveness Conclusion—The full clinical effectiveness evaluation was presented at the May 2013 P&T Committee meeting. During the May 2013 meeting, the P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following for the SMBGS test strips.

- *U.S. Federal Government contracting requirements*: SMBGS test strips eligible for inclusion on the UF must be available at all three POS and must be compliant with the Trade Agreements Act. Corresponding SMBGS glucometers must also

be compliant with the Trade Agreements Act. Manufacturers of SMBGS glucometers will be required to provide DoD beneficiaries with a no-cost glucometer.

- *Minimum technical requirements*: Candidate SMBGS test strips eligible for inclusion on the UF must meet minimum technical requirements in the areas of accuracy, sample size, alternate site testing, result time, memory capacity, ease of use, customer support, downloading capabilities, and data management capabilities. See pages 15-16 for detailed technical requirements. During the August 2013 meeting, newly proposed ISO standards were presented to the P&T Committee. However, the current 2003 ISO 15197 standard remains effective and there is no change regarding this minimum technical requirement.
- *SMBG strips meeting the final technical and U.S. Federal Government contracting requirements*: The SMBG test strips meeting the final technical and U.S. Federal Government contracting requirements are FreeStyle Lite (Abbott), FreeStyle InsuLinx (Abbott), Precision Xtra (Abbott); ACCU-CHEK Aviva Plus (Roche); CONTOUR NEXT (Bayer); TRUEtest (Nipro Diagnostics); Nova Max (Nova); Glucocard 01-Sensor (Arkray), Glucocard Vital (Akray); and Prodigy No Coding (Prodigy).
- *Overall relative clinical effectiveness conclusion:* The Committee concluded that any of the 10 final SMBGS test strip candidates were acceptable for inclusion on the UF. There are no clinically relevant differences between the 10 SMBGS test strips meeting the final technical and U.S. Federal Government contracting requirements set forth by the P&T Committee.

Relative Cost-Effectiveness Analysis and Conclusion—The P&T Committee concluded (12 for, 0 opposed, 0 abstained, 2 absent) the Abbott test strips (FreeStyle Lite, FreeStyle InsuLinx, Precision Xtra) were the most cost-effective SMBGS products, based on the weighted average cost per strip across all three POS, followed by (ranked in order from most cost effective to least cost effective) Arkray (GLUCOCARD 01-SENSOR, GLUCOCARD Vital), Bayer (CONTOUR NEXT), Nipro (TRUEtest), Roche (ACCU-CHEK Aviva Plus), Prodigy (Prodigy No Coding), and Nova (Nova Max) products.

Among the formulary options evaluated, CMA and budget impact analysis (BIA) results showed the most cost-effective scenario designated Abbott test strips (FreeStyle Lite, FreeStyle InsuLinx, Precision Xtra) as the UF step-preferred test strip "suite" with all other SMBGS test strips designated NF and non-preferred, where all current and new users are required to first try an Abbott test strip.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) the following:
    - Formulary and step-preferred on the UF:
        - Precision Xtra (Abbott)
        - FreeStyle Lite (Abbott)
        - FreeStyle InsuLinx (Abbott)
    - Nonformulary and non-step preferred on the UF:
        - ACCU-CHEK Aviva Plus (Roche)
        - GLUCOCARD 01-Sensor (Arkray)
        - GLUCOCARD Vital (Arkray)
        - CONTOUR NEXT (Bayer)
        - NovaMax (Nova)
        - TRUEtest (Nipro Diagnostics)
        - Prodigy No Coding (Prodigy)
        - One Touch Verio
        - One Touch Ultra
        - All other test strips listed in Appendix C (with the exception of FreeStyle Lite, FreeStyle InsuLinx, Precision Xtra)
    - This recommendation includes step therapy, which requires a trial of one of the Abbott test strips (FreeStyle Lite, FreeStyle InsuLinx, or Precision Xtra) prior to use of a nonformulary test strip in all current and new users of a nonformulary test strip.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) designating FreeStyle Lite (Abbott) with BCF status, based on clinical and cost-effectiveness, and removing Precision Xtra (Abbott) from the BCF. Note: Precision Xtra (Abbott) is designated with Uniform Formulary status and is step-preferred on the UF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1abstained, 1 absent) manual PA criteria for all new and current users of a nonformulary SMBG test strip, requiring a trial of FreeStyle Lite, FreeStyle InsuLinx, or Precision Xtra prior to the use of a nonformulary SMBG test strip. (See Appendix E for full criteria).

4 ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) QLs/days

supply limits for the SMBGS test strips, limiting use to 150 strips/30-day supply in the Retail Network, and 450 strips/90-day supply via Mail Order.

5. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) MN criteria for the NF SMBGS test strips. (See Appendix D for full MN criteria.)

6. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD*** The P&T Committee recommended (11 for, 1 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 120-day implementation period in all POS; and 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is March 12, 2014.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

Considering the comments of the Beneficiary Advisory Panel, implementation period is 180 days. Effective date is May 7, 2014.

II. UTILIZATION MANAGEMENT

A. Prior Authorizations

1. **Injectable Corticotropin (HP Acthar Gel)**— The P&T Committee established manual PA criteria for all new and current users of HP Acthar Gel, limiting use to infantile spasms (West Syndrome) for patients less than 24 months old at initiation of treatment and not previously treated with corticotropin. Additional uses for acute exacerbations of multiple sclerosis and/or optic neuritis, acute gout, and protein-wasting nephropathies may be permitted on appeal.

   The following uses for Acthar Gel are considered unsupportable: dermatomyositis, polymyositis, psoriatic arthritis, rheumatoid arthritis (including juvenile rheumatoid arthritis and ankylosing spondylitis), sarcoidosis, serum sickness, Stevens-Johnson Syndrome (severe erythema multiforme), and systemic lupus erythematosis.

   a) ***COMMITTEE ACTION: HP ACTHAR GEL PA CRITERIA*** The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) manual PA criteria for all current and new users of HP Acthar

Gel, limiting use to the specific FDA-approved indication of infantile spasms (West Syndrome). Prior Authorization will expire after 30 days for infantile spasms; retreatment is not covered. Use for acute exacerbations of multiple sclerosis and/or optic neuritis, acute gout, and protein-wasting nephropathies will be on appeal only. Other uses of HP Acthar Gel are considered unsupportable and not covered. (See Appendix E for full criteria.)

b) ***COMMITTEE ACTION: HP ACTHAR GEL PA IMPLEMENTATION***—The P&T Committee recommended (8 for, 3 opposed, 1 abstained, 2 absent) an effective date of the first Wednesday after a 30-day implementation period in all POS; and 2) TMA send a letter to beneficiaries affected by this PA decision. Based on the P&T Committee's recommendation, the effective date is December 11, 2013.

2. **Doxylamine/Pyridoxine (Diclegis)**—Diclegis contains 10 mg of doxylamine and 10 mg of pyridoxine and is FDA-approved for treating pregnant women experiencing nausea and vomiting.

   a) ***COMMITTEE ACTION: PYRIDOXINE/DOXYLAMINE (DICLEGIS) PA CRITERIA***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) that manual PA criteria apply to new users of Diclegis who are being treated for nausea and vomiting during pregnancy. The PA will expire after nine months. (See Appendix E for full criteria.)

   b) ***COMMITTEE ACTION: PYRIDOXINE/DOXYLAMINE (DICLEGIS) PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is January 8, 2014.

3. **Targeted Immunomodulatory Biologics: Ustekinumab (Stelara) and Golimumab (Simponi)**—PA criteria currently apply to the Targeted Immunomodulatory Biologics (TIBs). Ustekinumab was previously limited to injection by health care professionals, but is now available in pre-filled syringes labeled for patient self administration for treatment of plaque psoriasis. Also, the FDA recently approved a new indication for golimumab for treatment of moderate to severe ulcerative colitis.

a) ***COMMITTEE ACTION: USTEKINUMAB (STELARA) AND GOLIMUMAB (SIMPONI) PA CRITERIA***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) PA criteria for ustekinumab for plaque psoriasis and golimumab for ulcerative colitis, consistent with the products' labeling. (See Appendix E for full criteria.)

b) ***COMMITTEE ACTION: USTEKINUMAB (STELARA) AND GOLIMUMAB (SIMPONI PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is January 8, 2014.

B. Quantity Limits

1. **Targeted Immunomodulatory Biologics: Ustekinumab (Stelara) and Golimumab (Simponi)**—QLs currently apply to the TIBs. The P&T Committee evaluated QLs for ustekinumab for the new indication of plaque psoriasis for patient self administration, and for golimumab for the new indication of ulcerative colitis.

   a) ***COMMITTEE ACTION: USTEKINUMAB (STELARA) AND GOLIMUMAB (SIMPONI) QLs***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) QLs for Stelara and Simponi, as outlined in Appendix F, consistent with FDA-approved product labeling.

2. **Oral Chemotherapy Drugs: Dabrafenib (Tafinlar), Trametinib (Mekinist), and Afatinib (Glotrif)**—The P&T Committee evaluated QLs for several oral chemotherapy drugs, including dabrafenib (Tafinlar), indicated for treatment of treatment of unresectable or metastatic melanoma with BRAF V600E or V600K mutations; trametinib (Mekinist) for treatment of unresectable or metastatic melanoma with BRAF V600E mutations; and afatinib (Glotrif) for first-line treatment of metastatic non-small cell lung cancer whose tumors have specific mutations. QLs exist for several other oral chemotherapy agents.

   a) ***COMMITTEE ACTION: TAFINLAR, MEKINST, AND GLOTRIF QLs***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) QLs for dabrafenib (Tafinlar), trametinib (Mekinist), and afatinib (Glotrif) as outlined in Appendix F, consistent with FDA-approved product labeling.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

III. Fiscal Year 2008 National Defense Authorization Act, Section 703

A. Section 703—The P&T Committee reviewed drugs from manufacturers that were not included on a DoD Retail Refund Pricing Agreement; these drugs are not compliant with Fiscal Year 2008 National Defense Authorization Act, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated NF on the UF and will require pre-authorization prior to use in the Retail POS and medical necessity in MTFs. These NF drugs will remain available in the Mail Order POS without pre-authorization.

1. ***COMMITTEE ACTION: DRUGS DESIGNATED NF***—The P&T Committee recommended (11 for, 0 opposed, 0 abstained, 3 absent) to designate the products in Appendix G (listed by manufacturer) as nonformulary on the Uniform Formulary.

2. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (11 for, 0 opposed, 0 abstained, 3 absent) the following Pre-Authorization Criteria for the drugs listed as nonformulary in Appendix G: 1) obtaining the product from home delivery would be detrimental to the patient; and 2) for branded products with AB generic availability, use of the generic product would be detrimental to the patient. These pre-authorization criteria do not apply to any point of service other than retail network pharmacies.

3. ***COMMITTEE ACTION: UF AND PRE-AUTHORIZATION PERIOD***—The P&T Committee recommended (11 for, 0 opposed, 0 abstained, 3 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and 2) TMA send a letter to beneficiaries affected by the these decisions. Based on the P&T Committee's recommendation, the effective date is January 8, 2014.

Director, DHA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

Patriot Pharmaceuticals has now signed a pricing agreement for all of its covered drugs. Qutenza patch and Zyclara cream are also now covered by a pricing agreement. Therefore, the Patriot Pharmaceuticals products listed in Appendix G, Qutenza patch, and Zyclara cream are excluded from this action.

SUBMITTED BY:

John P. Kugler, M.D., MPH
DoD P&T Committee Chair

DECISION ON RECOMMENDATIONS

Director, DHA, decisions are as annotated above.

Douglas J. Robb, DO, MPH

Date

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE MINUTES AND RECOMMENDATIONS

August 2013

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on August 14 and 15, 2013, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of May Minutes**—Jonathon Woodson M.D., Director, TRICARE® Management Activity (TMA), approved the minutes for the May 2013 DoD P&T Committee meeting on August 6, 2013.
2. **Changes to the May 2013 Minutes:**
    a) **Emergency Contraceptives**—The Director's decision was that due to over-the-counter availability of levonorgestrel 1.5 mg (Plan B One-Step) without age restrictions, no emergency contraceptives shall be included on the Basic Core Formulary (BCF). However, Military Treatment Facilities (MTFs) shall carry Plan B One-Step and provide it no cost.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and BCF recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. UF DRUG CLASS REVIEWS

A. Corticosteroid Immune Modulators (Topical Steroids)

Background and Relative Clinical Effectiveness—The P&T Committee evaluated the Corticosteroid Immune Modulators (Topical Steroids) Drug Class. The drug

class is comprised of 22 individual chemical entities, available in over 100 different formulations and vehicles. The Stoughton-Cornell classification system, which divides the drugs into seven classes based on their vasoconstrictive properties, was used to further divide the drugs into high- (classes 1 and 2), medium- (classes 3, 4, and 5), and low-potency agents (classes 6 and 7). Over-the-counter (OTC) products are excluded from the class. Appendix B lists all products in the Corticosteroid Immune Modulators (Topical Steroids) Drug Class and their respective potency classifications, formulations, and generic availability.

Relative Clinical Effectiveness Conclusion—The full clinical effectiveness evaluation was presented at the May 2013 P&T Committee meeting. During the May 2013 meeting, the P&T Committee agreed (16 for, 0 opposed, 0 abstained, 1 absent) with the following conclusions:

- For all of the topical steroids, there is very limited generalizable data. Heterogeneity of the data precludes direct and indirect comparisons. A product formulated for hair (e.g., foam, shampoo) from each potency class is desirable for inclusion on the UF.
- Safety issues are considered class effects.
- A Coopman Class C product (e.g., desoximetasone, clocortolone) is less likely to cause an allergic response, compared with Coopman Classes A (hydrocortisone, hydrocortisone acetate) and D1 (clobetasol, betamethasone, diflurasone, fluticasone, mometasone, aclometasone) agents, and is required for inclusion on the UF.
- For the high-potency topical steroids, none of the products offer unique advantages in terms of efficacy or safety over other agents in the high-potency class.
    - Clobetasol is offered in more vehicles and is more extensively studied than the other high-potency products.
    - Fluocinonide was frequently mentioned as required for inclusion on the UF in a survey of Military Health System (MHS) providers.
    - Flurandrenolide tape has several unique therapeutic uses.
    - Clobetasol, halobetasol, augmented betamethasone dipropionate, and fluocinonide 1% cream products have package-labeled weekly exposure limits.
- For the medium-potency topical steroids, the following conclusions were made:
    - Triamcinolone is offered in more vehicles, is more extensively studied, and more frequently mentioned as required for inclusion on the UF in the MHS

provider survey than the other medium-potency agents. It has a modest risk of skin atrophy.

- Triamcinolone (Kenalog Spray) is the only spray product in the medium-potency class.
- The Pediaderm TA combination product co-packages triamcinolone with an emollient vehicle. There are no compelling advantages to using the co-packaged product versus using triamcinolone and a comparable emollient sold separately.
- There is weak evidence that clocortolone may have less risk of hypothalamic-pituitary-adrenal axis suppression than other medium- potency steroids.
- Hydrocortisone butyrate and fluticasone propionate are the only medium-potency agents labeled for use in children as young as three months of age.
- Fluticasone propionate, mometasone, and prednicarbate have the most favorable therapeutic indices among the medium-potency steroids.
- Desonide ointment and lotion, betamethasone valerate, and hydrocortisone valerate were frequently favorably mentioned in the MHS provider survey as required for inclusion on the UF.

- For the low-potency topical steroids, there is no evidence to support clinically meaningful differences in efficacy or safety among the agents.
  - Hydrocortisone was more frequently favorably mentioned in the MHS provider survey than the other low-potency agents.
  - The Pediaderm HC combination product co-packages hydrocortisone with an emollient vehicle. There are no compelling advantages to using the co-packaged product versus using hydrocortisone and a comparable emollient sold separately.
  - Derma-Smoothe/FS, a fluocinolone acetonide shampoo product, has the theoretical risk of inducing a peanut allergy.
  - Desonate Gel, Verdeso Foam, and Capex Shampoo all remain uniquely branded, without clinical advantages over the other generic low-potency topical steroids.

Relative Cost-Effectiveness Analysis and Conclusion—A pharmacoeconomic analysis, including cost minimization analysis (CMA), was performed for the topical steroids within each potency class (high, medium, and low). CMA results showed that designating cost-effective agents from within each potency class as formulary on the UF yielded the most cost-effective results for the MHS.

The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 1 absent) that, for each topical steroid potency class, there were specific agents, strengths, and dosage forms determined to be cost-effective based on the weighted average cost per day of treatment across all three points of service (POS).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (9 for, 3 opposed, 1 abstained, 1 absent) all topical steroid products be designated formulary on the UF, with the exception of the products listed below that are designated NF (See Appendix G):

    - **NF High Potency products:** amcinonide 0.1% ointment (Cyclocort, generics); diflorasone 0.05% cream and ointment (Apexicon, generics); fluocinonide 0.1% cream (Vanos); halcinonide 0.1% cream and ointment (Halog);

    - **NF Medium Potency products:** amcinonide 0.1% cream and lotion (Cyclocort, generics); betamethasone valerate 0.12% foam (Luxiq, generics); clocortolone 0.1% cream (Cloderm); desonide 0.05% lotion (Desowen, generics); hydrocortisone probutate 0.1% cream (Pandel); hydrocortisone butyrate 0.1% cream and lotion (Locoid); triamcinolone with emollient #45, 0.1% cream kit (Pediaderm TA);

    - **NF Low Potency products:** desonide 0.05% foam (Verdeso) and 0.05% gel (Desonate); fluocinolone 0.01% shampoo (Capex); hydrocortisone with emollient #45, 2% lotion kit (Pediaderm HC).

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) maintaining fluocinonide 0.05% cream and triamcinolone acetate 0.1% cream on the BCF. Additionally, the P&T Committee recommended adding fluocinonide 0.05% ointment, clobetasol 0.05% cream, clobetasol 0.05% ointment, and triamcinolone acetate 0.1% ointment to the BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) MN criteria for all topical steroids that were designated as NF. (See Appendix D for full MN criteria.)

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and, 2) TMA send a letter to beneficiaries affected by the UF decision. Based on the P&T Committee's recommendation, the effective date is January 8, 2014.

B. Self-Monitoring Blood Glucose System (SMBGS) Test Strips

Background and Relative Clinical Effectiveness—The P&T Committee reviewed the clinical effectiveness of the SMBGS test strips, including the attributes of the test strips and glucometers. The SMBGS test strips were previously reviewed for UF placement in August 2008. The primary goal for this review is to ensure uniform availability of quality SMBGS test strips across the MHS (MTF, Retail, and Mail Order POS). SMBGS glucometers are not included as part of the TRICARE outpatient pharmacy benefit (they are included under the medical benefit) and are not the focus of the review; however, provisions have been made to provide SMBGS glucometers at no cost to MHS beneficiaries. Appendix C lists the products in the SMBGS Test Strips Drug Class.

The FDA classifies SMBGS test strips and glucometers as medical devices, rather than drugs, thus the focus of the clinical effectiveness review centers on differences in the technical aspects/attributes among the products. Candidates for inclusion on the UF must meet all minimum required technical standards and U.S. Federal Government contracting requirements. The P&T Committee reviewed the existing technical requirements approved in May 2007, and recommended updates to the criteria.

Relative Clinical Effectiveness Conclusion—The full clinical effectiveness evaluation was presented at the May 2013 P&T Committee meeting. During the May 2013 meeting, the P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following for the minimum technical requirements and U.S. Federal Government contracting requirements for the SMBGS test strips.

- *U.S. Federal Government contracting requirements*: SMBGS test strips eligible for inclusion on the UF must be available at all three POS and must be compliant with the Trade Agreements Act. Corresponding SMBGS glucometers must also be compliant with the Trade Agreements Act. Manufacturers of SMBGS glucometers will be required to provide DoD beneficiaries with a no-cost glucometer.
- *Minimum technical requirements*: Candidate SMBGS test strips eligible for inclusion on the UF must meet the following minimum technical requirements:
    - Accuracy: must meet FDA standards for accuracy based on the International Organization for Standardization (ISO) 15197 guidelines. During the August 2013 meeting, newly proposed ISO standards were

presented to the P&T Committee. However, the current 2003 ISO 15197 standard remains effective and there is no change regarding this minimum technical requirement.

- Sample size of $\leq$ 1 microliter
- Alternate site testing: more than one alternate site approved.
- Result time: $\leq$ 10 seconds
- Memory capacity: $\geq$ 250 readings
- Ease of use: glucometer must be easy to code/calibrate, have a large visual display, and be easy to handle for patients with dexterity issues.
- Customer support: 24-hour helpline available, for beneficiaries residing outside the continental United States.
- Downloading capabilities: results must be downloadable
- Data management capabilities: data management capabilities required (e.g., software, cloud computing).

- *SMBG strips meeting the final technical and U.S. Federal Government contracting requirements*: The SMBG test strips meeting the final technical and U.S. Federal Government contracting requirements are Abbott FreeStyle Lite, Abbbot FreeStyle InsuLinx, Abbott Precision Xtra; Roche ACCU-CHEK Aviva Plus; Bayer CONTOUR NEXT; Nipro Diagnostics TRUEtest; Nova Nova Max; Arkray Glucocard 01-Sensor, Akray Glucocard Vital; and Prodigy Prodigy No Coding.
- *MHS Provider Opinion*: MTF and Managed Care Support Contractors (MCSCs) were surveyed for their opinions on the SMBGS test strips and glucometers. The majority of the respondents ranked meter accuracy as the most important attribute. The majority of MTF respondents stated one glucometer was adequate to meet their needs, while the MCSCs requested availability of more than one glucometer to allow the patient options.
- *Overall relative clinical effectiveness conclusion:* The Committee concluded that any of the 10 final SMBGS test strip candidates were acceptable for inclusion on the UF. There are no clinically relevant differences between the 10 SMBGS test strips meeting the final technical and U.S. Federal Government contracting requirements set forth by the P&T Committee.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and budget impact analysis (BIA) were performed for SMBGS test strips that met all minimum required technical standards and U.S. Federal Government contracting requirements. CMA was performed for the following manufacturer's products: Abbott (FreeStyle Lite, FreeStyle InsuLinx, Precision Xtra), Roche (ACCU-CHEK Aviva Plus), Bayer

(CONTOUR NEXT), Nipro Diagnostics (TRUEtest), Nova (Nova Max), ARKRAY (GLUCOCARD 01-SENSOR, GLUCOCARD Vital), and Prodigy (Prodigy No Coding) test strips. For the BIAs, several of the model's key assumptions were varied, with corresponding sensitivity analyses conducted.

The P&T Committee concluded (12 for, 0 opposed, 0 abstained, 2 absent) the Abbott test strips (FreeStyle Lite, FreeStyle InsuLinx, Precision Xtra) were the most cost-effective SMBGS products, based on the weighted average cost per strip across all three POS, followed by (ranked in order from most cost effective to least cost effective). Arkray (GLUCOCARD 01-SENSOR, GLUCOCARD Vital), Bayer (CONTOUR NEXT), Nipro (TRUEtest), Roche (ACCU-CHEK Aviva Plus), Prodigy (Prodigy No Coding), and Nova (Nova Max) products.

Among the formulary options evaluated, CMA and BIA results showed the most cost-effective scenario designated Abbott test strips (FreeStyle Lite, FreeStyle InsuLinx, Precision Xtra) as the UF step-preferred test strip "suite" with all other SMBGS test strips designated NF and non-preferred, where all current and new users are required to first try an Abbott test strip.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) the following:
    - Formulary and step-preferred on the UF:
        - Precision Xtra (Abbott)
        - FreeStyle Lite (Abbott)
        - FreeStyle InsuLinx (Abbott)
    - Nonformulary and non-step preferred on the UF:
        - ACCU-CHEK Aviva Plus (Roche)
        - GLUCOCARD 01-Sensor (Arkray)
        - GLUCOCARD Vital (Arkray)
        - CONTOUR NEXT (Bayer)
        - NovaMax (Nova)
        - TRUEtest (Nipro Diagnostics)
        - Prodigy No Coding (Prodigy)
        - One Touch Verio
        - One Touch Ultra
        - All other test strips listed in Appendix C (with the exception of FreeStyle Lite, FreeStyle InsuLinx, Precision Xtra)
    - This recommendation includes step therapy, which requires a trial of one of the Abbott test strips (FreeStyle Lite, FreeStyle InsuLinx, or

Precision Xtra) prior to use of a nonformulary test strip in all current and new users of a nonformulary test strip.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) designating FreeStyle Lite (Abbott) with BCF status, based on clinical and cost-effectiveness, and removing Precision Xtra (Abbott) from the BCF. Note: Precision Xtra (Abbott) is designated with Uniform Formulary status and is step-preferred on the UF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1abstained, 1 absent) manual PA criteria for all new and current users of a nonformulary SMBG test strip, requiring a trial of FreeStyle Lite, FreeStyle InsuLinx, or Precision Xtra prior to the use of a nonformulary SMBG test strip. (See Appendix E for full criteria).

4 ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) QLs/days supply limits for the SMBGS test strips, limiting use to 150 strips/30-day supply in the Retail Network, and 450 strips/90-day supply via Mail Order.

5. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 1 absent) MN criteria for the NF SMBGS test strips. (See Appendix D for full MN criteria.)

6. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD*** The P&T Committee recommended (11 for, 1 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 120-day implementation period in all POS; 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is March 12, 2014.
See p 6. Considering the commentsof the Beneficiary Advisory Panel, implementation period is 180 days.

V. UTILIZATION MANAGEMENT

A. PAs

1. **Injectable Corticotropin (HP Acthar Gel)**—Injectable corticotrophin has been commercially available since 1952, but now is only marketed as a proprietary product, HP Acthar Gel. The P&T Committee established manual PA criteria for all new and current users of HP Acthar Gel, limiting use to infantile spasms (West Syndrome) for patients less than 24 months

old at initiation of treatment and not previously treated with corticotropin. Additional uses for acute exacerbations of multiple sclerosis and/or optic neuritis, acute gout, and protein-wasting nephropathies may be permitted on appeal.

The following uses for Acthar Gel are considered unsupportable: dermatomyositis, polymyositis, psoriatic arthritis, rheumatoid arthritis (including juvenile rheumatoid arthritis and ankylosing spondylitis), sarcoidosis, serum sickness, Stevens-Johnson Syndrome (severe erythema multiforme), and systemic lupus erythematosis.

a) ***COMMITTEE ACTION: HP ACTHAR GEL PA CRITERIA***
The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) manual PA criteria for all current and new users of HP Acthar Gel, limiting use to the specific FDA-approved indication of infantile spasms (West Syndrome). Prior Authorization will expire after 30 days for infantile spasms; retreatment is not covered. Use for acute exacerbations of multiple sclerosis and/or optic neuritis, acute gout, and protein-wasting nephropathies will be on appeal only. Other uses of HP Acthar Gel are considered unsupportable. (See Appendix E for full criteria.)

b) ***COMMITTEE ACTION: HP ACTHAR GEL PA IMPLEMENTATION***—The P&T Committee recommended (8 for, 3 opposed, 1 abstained, 2 absent) an effective date of the first Wednesday after a 30-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this PA decision. Based on the P&T Committee's recommendation, the effective date is December 11, 2013.

2. **Doxylamine/Pyridoxine (Diclegis)**—Diclegis contains 10 mg of doxylamine and 10 mg of pyridoxine and is FDA-approved for treating pregnant women experiencing nausea and vomiting. The P&T Committee recommended manual PA criteria for all new users of Diclegis. Diclegis is limited to use for management of nausea and vomiting during pregnancy (NVP) and excluded for the treatment of hyperemesis gravidarum. Patients must have tried at least one nonpharmacologic treatment (e.g., ginger, acupressure, high-protein bedtime snack) and OTC pyridoxine. An alternate antiemetic (e.g., ondansetron) should be considered prior to Diclegis.

   a) ***COMMITTEE ACTION: PYRIDOXINE/DOXYLAMINE (DICLEGIS) PA CRITERIA***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) that manual PA criteria apply to new users of

Diclegis who are being treated for nausea and vomiting during pregnancy. The PA will expire after nine months. (See Appendix E for full criteria.)

b) ***COMMITTEE ACTION: PYRIDOXINE/DOXYLAMINE (DICLEGIS) PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is January 8, 2014.

3. **Targeted Immunomodulatory Biologics: Ustekinumab (Stelara) and Golimumab (Simponi)**—PA criteria currently apply to the Targeted Immunomodulatory Biologics (TIBs). Ustekinumab was previously limited to injection by health care professionals, but is now available in pre-filled syringes labeled for patient self administration for treatment of plaque psoriasis. Also, the FDA recently approved a new indication for golimumab for treatment of moderate to severe ulcerative colitis.

   a) ***COMMITTEE ACTION: USTEKINUMAB (STELARA) AND GOLIMUMAB (SIMPONI) PA CRITERIA***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) PA criteria for ustekinumab for plaque psoriasis and golimumab for ulcerative colitis, consistent with the products' labeling. (See Appendix E for full criteria.)

   b) ***COMMITTEE ACTION: USTEKINUMAB (STELARA) AND GOLIMUMAB (SIMPONI PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is January 8, 2014.

B. QLs

1. **Targeted Immunomodulatory Biologics: Ustekinumab (Stelara) and Golimumab (Simponi)**—QLs currently apply to the TIBs. The P&T Committee evaluated QLs for ustekinumab for the new indication of plaque psoriasis for patient self administration, and for golimumab for the new indication of ulcerative colitis.

a) ***COMMITTEE ACTION: USTEKINUMAB (STELARA) AND GOLIMUMAB (SIMPONI) QLs***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) QLs for Stelara and Simponi, as outlined in Appendix F, consistent with FDA-approved product labeling.

2. **Oral Chemotherapy Drugs: Dabrafenib (Tafinlar), Trametinib (Mekinist), and Afatinib (Glotrif)**—The P&T Committee evaluated QLs for several oral chemotherapy drugs, including dabrafenib (Tafinlar), indicated for treatment of treatment of unresectable or metastatic melanoma with BRAF V600E or V600K mutations; trametinib (Mekinist) for treatment of unresectable or metastatic melanoma with BRAF V600E mutations; and afatinib (Glotrif) for first-line treatment of metastatic non-small cell lung cancer whose tumors have specific mutations. QLs exist for several other oral chemotherapy agents.

a) ***COMMITTEE ACTION: TAFINLAR, MEKINST, AND GLOTRIF QLs***—The P&T Committee recommended (11 for, 0 opposed, 1 abstained, 2 absent) QLs for dabrafenib (Tafinlar), trametinib (Mekinist), and afatinib (Glotrif) as outlined in Appendix F, consistent with FDA-approved product labeling.

VI. SECTION 703

A. Section 703—The P&T Committee reviewed drugs from manufacturers that were not included on a DoD Retail Refund Pricing Agreement; these drugs are not compliant with Fiscal Year 2008 National Defense Authorization Act, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated NF on the UF and will require pre-authorization prior to use in the Retail POS and medical necessity in MTFs. These NF drugs will remain available in the Mail Order POS without pre-authorization.

1. ***COMMITTEE ACTION: DRUGS DESIGNATED NF***—The P&T Committee recommended (11 for, 0 opposed, 0 abstained, 3 absent) to designate the products in Appendix G (listed by manufacturer) as nonformulary on the Uniform Formulary

2. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (11 for, 0 opposed, 0 abstained, 3 absent) the following Pre-Authorization Criteria for the drugs listed as nonformulary in Appendix G: 1) Obtaining the product from the home delivery would be detrimental to the patient and 2) For branded products with AB generic availability, use of the generic product would be detrimental to the patient.

These pre-authorization criteria do not apply to any point of service other than retail network pharmacies.

3. ***COMMITTEE ACTION: UF AND PRE-AUTHORIZATION PERIOD***—The P&T Committee recommended (11 for, 0 opposed, 0 abstained, 3 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS; and 2) TMA send a letter to beneficiaries affected by the these decisions. Based on the P&T Committee's recommendation, the effective date is January 8, 2014.

See p 10. Patriot Pharmaceuticals has now signed a pricing agreement for all of its covere drugs. Qutenza patch and Zyclara cream are excluded from this action.

VII. OVERVIEWS

Overviews of the following four drug class were presented to the P&T Committee: the Inhaled Corticosteroids/Long-Acting Beta Agonists, the Inhaled Short-Acting Beta Agonists, the Antilipidemic-1 Agents (LIP-1s), and the Benign Prostatic Hyperplasia drugs comprised of the 5-alpha-reductase inhibitors and alpha blockers. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in contract solicitation, and for completing the clinical effectiveness reviews and developing the appropriate cost-effectiveness models. The clinical and economic analyses of these classes will be presented at an upcoming meeting.

VIII. ITEMS FOR INFORMATION

A. Bulk Chemicals In Compounded Medications—The P&T Committee was presented with an update and will be given a full presentation at an upcoming meeting.

B. FY13 TRICARE Pharmacy Copayments—The P&T Committee was briefed on the initial impact of new pharmacy copayments implemented in February 2013 on pharmaceutical utilization in the Military Health System. The analysis included the first 5 months of data following copayment increases for Tier 2 products (preferred brands) and Tier 3 products (non-preferred brands) in the Retail Network and at Mail Order. The results showed preliminary evidence that the increase in copays (from $25 to $43 in Mail Order/$44 in the Retail Network) for Tier 3 medications appeared to be associated with declining use of these products, with about a 10% reduction over the first 5 months. However, the new copays did not appear to be associated with any major changes in use of medications overall (i.e., across all Tiers). Additional updates will be provided to the P&T Committee as data becomes available.

C. Angiotensin Receptor Blockers (ARBs)/Direct Renin Inhibitor—The P&T committee considered the merits of formulary action in the Angiotensin Receptor Blockers, Direct Renin Inhibitors and respective fixed dose combination products drug

classes. Based on current pricing agreements and pending availability of new generic entrants, the P&T committee opted not to take any formulary action at this time.

D. **Prior Authorization (PA) Implementation date for canagliflozin (Invokana)**—The implementation date for PA criteria applicable to canagliflozin (Invokana) was changed to September 25, 2013.

IX. ADJOURNMENT

The meeting adjourned at 1015 hours on August 15, 2013. The next meeting will be in November 2013.

Appendix A—Attendance: August 2013 P&T Committee Meeting

Appendix D—Table of Medical Necessity

Appendix E—Table of Prior Authorization Criteria

Appendix F—Table of Quantity Limits

Appendix G—Table of Drugs Designated NF due to Section 703

Appendix H—Table of Implementation Status of UF Recommendations/Decisions Summary

Appendix I—Table of Abbreviations

Appendix A—Attendance: August 2013 P&T Committee Meeting

Voting Members Present	
John Kugler, COL (Ret.), MC, USA	DoD P&T Committee Chair
CDR Joe Lawrence, MSC	Director, DoD Pharmacoeconomic Center (Recorder)
Col George Jones, BSC	Deputy Chief, Pharmaceutical Operations Directorate
COL John Spain, MS	Army, Pharmacy Officer
Col Mike Spilker, BSC	Air Force, Pharmacy Officer
CAPT Deborah Thompson, USCG	Coast Guard, Pharmacy Officer
CAPT Edward Norton, MSC	Navy, Pharmacy Officer (Pharmacy Consultant BUMED)
Col Lowell Sensintaffer, MC	Air Force, Physician at Large
CDR Brian King, MC	Navy, Internal Medicine Physician
LTC Jack Lewi, MC	Army, Internal Medicine Physician
CDR Shaun Carstairs, MC	Navy, Physician at Large
Lt Col William Hannah, MC	Air Force, Internal Medicine Physician
Dr. Miguel Montalvo	TRICARE Regional Office-South Chief of Clinical Operations Division and Medical Director
Mr. Joe Canzolino	U.S. Department of Veterans Affairs
Nonvoting Members Present	
Mr. David Hurt	Associate General Counsel, TMA
LCDR Tiffany Scott, MSC, via DCO	Defense Logistics Agency Troop Support
Capt Richard Caballero, via DCO	Defense Logistics Agency Troop Support
Capt Randall Sweeney, via DCO	Defense Logistics Agency Troop Support
Guests	
Mr. Bill Davies via DCO	TRICARE Management Activity, Pharmaceutical Operations Directorate
CDR Matthew Baker, USPHS, by phone	Indian Health Service
CAPT Jamie Kersten	Navy Medicine Training Support Center
LCDR David Sohl	University of Texas Masters Student

Appendix A—Attendance (continued)

Others Present	
LTC Chris Conrad, MS	DoD Pharmacoeconomic Center
LCDR Marisol Martinez, USPHS	DoD Pharmacoeconomic Center
LCDR Joshua Devine, USPHS	DoD Pharmacoeconomic Center
LCDR Bob Selvester, MC	DoD Pharmacoeconomic Center
LCDR Linh Quach, MSC	DoD Pharmacoeconomic Center
Lt Col Melinda Henne, MC	DoD Pharmacoeconomic Center
Maj David Folmar, BSC	DoD Pharmacoeconomic Center
MAJ Misty Cowan, MC	DoD Pharmacoeconomic Center
LT Kendra Jenkins, USPHS	DoD Pharmacoeconomic Center

Appendix D—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Amcinonide 0.1% ointment (Cyclocort, generics) • Diflorasone 0.05% cream and ointment (Apexicon, generics) • Fluocinonide 0.1% cream (Vanos) • Halcinonide 0.1% cream and ointment (Halog) **High Potency Topical Steroids**	• Use of the formulary agent is contraindicated • All other formulary agents have resulted in therapeutic failure. Formulary alternatives include the high potency topical steroids - clobetasol, augmented betamethasone dipropionate, desoximetasone, fluocinonide 0.05%, halobetasol propionate.
• Amcinonide 0.1% cream and lotion (Cyclocort, generics) • Betamethasone valerate 0.12% foam (Luxiq, generics) • Clocortolone 0.1% cream (Cloderm) • Desonide 0.05% lotion (Desowen, generics) • Hydrocortisone probutate 0.1% cream (Pandel) • Hydrocortisone butyrate 0.1% cream and lotion (Locoid) • Triamcinolone with emollient #45, 0.1% cream kit (Pediaderm TA) **Medium Potency Topical Steroids**	• Use of all other medium potency formulary agents is contraindicated, and using a high potency agent would incur unacceptable risk. • All other Mid Potency formulary agents have resulted in therapeutic failure and using a High Potency agent would incur unacceptable risk. • For clocortolone, the patient requires a Coopman Class C agent, and desoximetasone is contraindicated. Formulary alternatives include the high potency and medium potency topical steroids
• Desonide 0.05% foam (Verdeso) • Desoinde 0.05 gel (Desonate) • Fluocinolone 0.01% shampoo (Capex) • Hydrocortisone with emollient #45, 2% lotion kit (Pediaderm HC) **Low Potency Topical Steroids**	• Use of all other low potency formulary agents, including over-the-counter topical steroids are contraindicated and using a higher potency agent would incur unacceptable risk. • All other low potency formulary topical steroids have resulted in therapeutic failure and using a higher potency agent would incur unacceptable risk. • For Desonide 0.05% foam (Verdeso) and fluocinolone 0.01% shampoo (Capex), requires a trial of fluocinolone oil (Derma-Smoothe/FS) unless patient has a contraindication specifically to Derma-Smoothe/FS Formulary alternatives include high, medium, and low potency topical steroids
• ACCU-CHEL Aviva Plus (Roche) • GLUCOCARD 01-Sensor (Arkray) • GLUCOCARD Vital (Arkray) • CONTOUR NEXT (Bayer) • NovaMAx (Nova) • TRUEtest (Nipro Diagnostics) • Prodigy No Coding (Prodigy) • One Touch Ultra (Lifescan) • One Touch Verio (Lifescan) • All other test strips listed in Appendix C with the exception of FreeStyle Lite, FreeStyle InsuLinx, and Precision Xtra **SMBG System Test Strips**	• No alternative formulary agent. o Patient is blind/severely visually impaired and requires a test strip used in a talking meter - Prodigy Voice, Prodigy AutoCode, Advocate Redicode. o Patient uses an insulin pump and requires a specific test strip that communicates wirelessly with a specific meter. o The patient has a documented physical or mental health disability requiring a special strip meter. o Provider is concerned about the glucose dehydrogenase-pyrroloquinolinequinone interaction (GDH-PQQ) and the patient is taking IVIG Octagam.

Appendix E—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• ACCU-CHEK Aviva Plus (Roche) • GLUCOCARD 01-Sensor (Arkray) • GLUCOCARD Vital (Arkray) • CONTOUR NEXT (Bayer) • NovaMax (Nova) • TRUEtest (Nipro Diagnostics) • Prodigy No Coding (Prodigy) • One Touch Ultra (Lifescan) • One Touch Verio (Lifescan) • All other SMBG test strips listed in Appendix C, with the exception of FreeStyle Lite, FreeStyle InsuLinx, and Precision Xtra **Self-Monitoring Blood Glucose (SMBG) Test Strips**	New and current users of the nonformulary test strips are required to try FreeStyle Lite, FreeStyle InsuLinx, or Precision Xtra Manual PA Criteria—Non-Preferred test strip allowed if: • Patient is blind/severely visually impaired and requires a test strip used in a talking meter - Prodigy Voice, Prodigy AutoCode, Advocate Redicode • Patient uses an insulin pump and requires a specific test strip that communicates wirelessly with a specific meter o Contour NEXT strip with CONTOUR NEXT Link meter for Medtronic pump o NovaMax strip with NovaMax Link meter for Medtronic pump o OneTouch Ultra test strips with One Touch Ultra Link meter for Medtronic Mini Med Paradigm insulin pump o OneTouch Ultra test strips with One Touch Ping meter and using the One Touch Ping insulin pump • The patient has a documented physical or mental health disability requiring a special strip or meter. • The patient is receiving peritoneal dialysis or the intravenous immune globulin (IVIG) preparation Octagam and the provider is concerned about the glucose dehydrogenase-pyrroloquinolinequinone interaction (GDH-PQQ)
• Injectable Corticotropin (HP Acthar Gel)	All new and current users of HP Acthar Gel are required to undergo Prior Authorization. Manual PA Criteria • Coverage is approved for infantile spasms (West Syndrome) in the following patients: Patient is less than 24 months old at initiation of treatment, and has no previous treatment with corticotrophin. Prior Authorization will expire in 30 days. Retreatment is not covered. • Coverage for acute exacerbations of multiple sclerosis and/or optic neuritis, acute gout and protein-wasting nephropathies—may be permitted on appeal. Prior Authorization will expire in 21 days for multiple sclerosis; 14 days for acute gout; and 6 months for protein-wasting nephropathies. • Coverage is not provided for the following uses: dermatomyositis, polymyositis, psoriatic arthritis, rheumatoid arthritis (including juvenile rheumatoid arthritis and ankylosing spondylitis), sarcoidosis, serum sickness, Stevens-Johnson Syndrome (severe erythema multiforme), and systemic lupus erythematosis

Drug / Drug Class	Prior Authorization Criteria
• pyridoxine/doxylamine (Diclegis) **Antiemetics**	All new users of Diclegis are required to try a nonpharmacologic method for management of nausea and vomiting during pregnancy AND OTC pyridoxine before receiving pyridoxine/doxylamine (Diclegis). Manual PA criteria—Pyridoxine/doxylamine (Diclegis) is approved if: • The patient has not had relief of symptoms after trying a nonpharmacologic method to manage nausea and vomiting during pregnancy, AND • The patient has not had relief of symptoms after trying OTC pyridoxine for management of nausea and vomiting during pregnancy • Providers are encouraged to consider an alternate antiemetic (e.g., ondansetron) prior to prescribing pyrodixone/doxylamine. Prior Authorization will expire after 9 months.
• Ustekinumab (Stelara) **Targeted Immunomodulatory Biologics (TIBs)**	Coverage approved for patients ≥ 18 years with • Moderate to severe plaque psoriasis who are candidates for phototherapy or systemic therapy No expiration date for Prior Authorization
• Golimumab (Simponi) **Targeted Immunomodulatory Biologics (TIBs)**	Coverage approved for patients ≥ 18 years with • Moderate to severely active rheumatoid arthritis and active psoriatic arthritis, active ankylosing spondylitis • **Moderate to severely active ulcerative colitis that has not responded to other treatments or who require continuous steroids** • Coverage NOT provided for concomitant use with other TIBs, Kineret, Enbrel, Remicade, Orencia, or Rituxan No expiration date for Prior Authorization

Appendix F—Table of Quantity Limits

Drug / Drug Class	Quantity Limits
Self-Monitoring Blood Glucose Test Strips (all products)	▪ Retail: 150 strips/30-day supply ▪ Mail Order and MTF: 450 strips/90-day supply
• Ustekinumab (Stelara) **Targeted Immunomodulatory Biologics (TIBs)**	▪ Retail: 2 pre-filled syringes (45 mg/0.5 mL; 90 mg/1.0 mL) or 2 vials (45 mg; 90 mg) /30 days ▪ Mail: 2 pre-filled syringes (45 mg/0.5 mL; 90 mg/1.0 mL) or 2 vials (45 mg; 90 mg) /56 days
• Golimumab (Simponi) **Targeted Immunomodulatory Biologics (TIBs)**	▪ Retail: 3 syringes (3 mL) /30 days ▪ Mail: 4 syringes (4mL) /56 days
• Dabrafenib (Tafinlar) **Oral chemotherapy drug**	50 mg and 75 mg capsules ▪ Retail: 120 capsules/30 days ▪ Mail Order: 240 capsules/60 days
• Trametinib (Mekinist) **Oral chemotherapy drug**	2 mg tablets ▪ Retail: 30 tablets/30 days ▪ Mail Order: 60 tablets/60 days 0.5 mg ▪ Retail: 120 tablets/30 days ▪ Mail Order 240 tablets/60 days
• Afatinib (Giotrif) **Oral chemotherapy drug**	40mg, 30mg, 20mg tablets ▪ Retail: 30 tablets/30 days ▪ Mail Order: 60 tablets/60 days

Appendix G—Drugs Designated as NF due to Section 703

Manufacturer	Drugs
Bausch & Lomb Rx	Besivance ophthalmic suspension
Fougera	methscopolamine tablets
Graceway Pharma	Zyclara cream
Kedrion	Gammaked injection
Meda Pharma	Dymista nasal spray
Neurogesx, Inc	Qutenza patch
Novartis Consumer	Transderm Scop
Otsuka America	Pletal
Patriot Pharma	Haldol injection; Itraconazole tabs/caps; Ketoconazole Shampoo; Galantamine Tabs; Tramadol ER Tabs
Pharmaderm	Oxistat products; Cutivate lotion; Temovate products
Rhodes Pharm	Hydromorphone; Tramadol ER
Sandoz	Calcitonin Nasal Spray; Calcium Acetate; Carbamazepine XR; Lansoprazole; Losartan; Losartan/HCTZ; Oxcarbazepine Susp; Sumatriptan Nasal Spray; Valsartan/HCTZ; Metoprolol/HCTZ; Rivastigmine
Stiefel Labs	Veltin
United Research Lab	Glycopyrrolate Tabs; Nisoldipine ER
Viropharma Inc	Vancocin Caps

See p 10. Patriot Pharmaceuticals has now signed a pricing agreement for all of its covered drugs. Qutenza patch and Zyclara cream are excluded from this action.

Appendix H—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments

DECISION PAPER

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

May 2013

I. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Non-Insulin Diabetes Drugs: Sodium Glucose Co-Transporter 2 (SGLT2)Inhibitors—Canagliflozin (Invokana)

Relative Clinical Effectiveness Conclusion—Canagliflozin (Invokana) is a new diabetes drug with a novel mechanism of action and the first FDA-approved SGLT2 inhibitor. SGLT2 inhibitors are a new subclass of the Non-Insulin Diabetes Drug Class. The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee concluded (15 for, 1 opposed, 0 abstained, 1 absent) that despite its unique mechanism of action to increase urinary glucose excretion, canagliflozin (Invokana) does not offer a clinically compelling advantage over the other non-insulin drugs included on the Uniform Formulary (UF). Canagliflozin has several safety concerns in the setting of modest decreases in hemoglobin A1c.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that canagliflozin (Invokana) is not cost-effective compared to other non-insulin diabetes drugs currently available on the UF. Cost minimization analysis (CMA) showed canagliflozin is more costly than metformin, glyburide, pioglitazone (Actos, generic), sitagliptin (Januvia), and exenatide (Byetta), in terms of cost per day of therapy.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (13 for, 1 opposed, 1 abstained, 2 absent) canagliflozin (Invokana) be designated nonformulary (NF) due to the lack of compelling clinical advantages, safety concerns, lack of long-term outcomes and adverse event data, and cost disadvantage compared to UF products.

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***
The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) the following MN criteria for canagliflozin (Invokana): use of formulary agents is contraindicated. (See Appendix B for full criteria.)

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***
In the Non-Insulin Diabetes Drug Class, existing automated prior authorization (step therapy) requires a trial of metformin or a sulfonylurea, prior to the use of a dipeptidyl-dipeptidase-4 (DPP-4) inhibitor, a thiazolidinedione (TZD), or a glucagon-like peptide-1 receptor agonist (GLP1RA), based on positive efficacy and long-term outcomes data with metformin and the sulfonylureas.

The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) a trial of metformin, a sulfonylurea, or a DPP-4 inhibitor in all new and current users of SGLT2 inhibitors, canagliflozin (Invokana), due to the modest hemoglobin A1c lowering and safety concerns. (See Appendix C for full criteria.)

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) 1) an effective date of the first Wednesday after a 30-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is September 11, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

II. UF DRUG CLASS REVIEWS

A. Anti-Gout Drugs

Relative Clinical Effectiveness Conclusion—The P&T Committee evaluated the Anti-Gout Drug Class. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions:

- Colchicine is a very old drug that is available in one branded formulation, (Colcrys), which has a patent extending to 2029.
- For an acute gout attack, clinical practice guidelines support colchicine as first line treatment, along with non-steroidal anti-inflammatory drugs (NSAIDs) or prednisone. Treatment should be initiated within the first 24 hours of symptom onset.

- For chronic gout, urate lowering therapy (ULT) with allopurinol or febuxostat is recommended as first line. Based on head-to-head trials, febuxostat (Uloric) 40 mg and allopurinol 300 mg were equally efficacious in lowering serum uric acid (sUA) to less than 6mg/dL in one study (CONFIRMS). Febuxostat 80 mg was superior to allopurinol 300 mg in lowering sUA to less than 6mg/dL in two studies (FACT and APEX).
- Higher doses of allopurinol (doses > 300mg), although not well studied, may be required in some patients to decrease sUA.
- Systematic reviews from the Cochrane group, and evidence-based organizations from Canada, the United Kingdom, and Europe recommend febuxostat as an alternative ULT in patients who cannot tolerate allopurinol.
- In terms of clinical coverage, one anti-inflammatory agent (colchicine) and one xanthine oxidase inhibitor (allopurinol or febuxostat) is required on the UF to meet the needs of the majority of DoD beneficiaries.

Relative Cost-Effectiveness Conclusion—Pharmacoeconomic analyses were performed for the Anti-Gout Drug Class, including CMA and budget impact analysis (BIA). The class was subdivided into chronic drugs (allopurinol and febuxostat) and acute drugs (colchicine).

The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) generic allopurinol (Zyloprim) was the most cost-effective of the chronic drugs, followed by branded febuxostat (Uloric), based on the weighted average cost per day of treatment across all three POS. Branded colchicine (Colcrys) was the only acute agent examined in the analysis; a cost analysis was conducted. Results from the CMA and BIA showed that among available formulary options examined, scenarios where allopurinol (Zyloprim) is the Basic Core Formulary (BCF) step-preferred agent, febuxostat (Uloric) is the NF non-preferred agent (with all current and new users required to try allopurinol first), and colchicine (Colcrys) is UF presented a maximum cost-avoidance projection.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 4 opposed, 1 abstained, 0 absent) the following scenario for the UF, which is the most clinically and cost-effective option for the MHS:
    - allopurinol be designated UF and step-preferred (e.g., "in front of the step");
    - febuxostat (Uloric) be designated NF and non step-preferred (e.g., "behind the step"); and

- colchicine (Colcrys), probenecid, and the fixed dose combination of colchicine/probenecid be designated formulary on the UF and exempt from step therapy.
- This recommendation includes step therapy, which requires a trial of allopurinol prior to using febuxostat (Uloric) in all current and new users of febuxostat.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) maintaining allopurinol as BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for febuxostat (Uloric). (See Appendix B for full criteria.)

4. ***COMMITTEE ACTION: PA CRITERIA***—After extensive discussion, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) PA criteria for all current and new users of febuxostat (Uloric), requiring a trial of allopurinol prior to use of febuxostat. (See Appendix C for full criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Additional recommendations made by the P&T Committee were to provide messaging to retail pharmacies to designate that PA and step therapy is required, with a trial of allopurinol prior to febuxostat (Uloric); and that the Anti-Gout Drug Class be added to the Rapid Response Program for the Retail Network and Mail Order Pharmacy. Based on the P&T Committee's recommendation, the effective date is November 6, 2013.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Pulmonary II Drugs

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following at the February 2013 meeting:

- Aclidinium inhaler (Tudorza) is the second long-acting muscarinic agent (LAMA) on the market. Three clinical trials reported statistically significant improvement in spirometric endpoints, and two of the trials reported significantly fewer chronic obstructive pulmonary disease (COPD) exacerbations, compared to placebo.
- For aclidinium, the adverse event profile appears minimal, with primarily anticholinergic events reported. Longer duration and larger comparative trials are needed to determine aclidinium's place in therapy.
- Several trials have shown the LAMA tiotropium (Spiriva) is associated with clinically significant improvements in spirometric endpoints and reductions in risk for COPD exacerbations. Tiotropium is also reported to reduce the proportion of patients hospitalized for COPD exacerbations.
- Reports of a possible link between tiotropium and adverse cardiovascular events including death, stroke, and myocardial infarction have not been confirmed in prospective trials.
- Roflumilast (Daliresp) is the first oral selective inhibitor of phosphodiesterase type 4 (PDE-4) marketed in the United States. In two clinical trials, roflumilast was associated with statistically significant reductions in the rate of COPD exacerbations.
- For roflumilast, safety issues identified by the FDA included psychiatric events (including suicide), weight loss, gastrointestinal upset and severe diarrhea, and nasal tumors. However, the FDA did not require additional prospective safety studies.
- Albuterol/ipratropium soft mist inhaler (Combivent Respimat) is the new propellant-free inhaler that is replacing the ozone-depleting chlorofluorocarbon (CFC)-containing Combivent metered dose inhaler (MDI). The clinical trial used to obtain FDA approval showed Combivent Respimat was non-inferior to Combivent CFC MDI in terms of improvements in spirometric endpoints.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 2 absent) the following:

- CMA within the LAMA subclass showed that tiotropium (Spiriva) was more cost-effective than aclidinium (Tudorza). BIA results where Spiriva was designated BCF and Tudorza designated UF resulted in the greatest cost-avoidance to the MHS.

- CMA was conducted within the COPD subclass, which includes the short-acting muscarinic agents (SAMA), short-acting beta agonist (SABA)/SAMA combination drugs, and PDE-4 inhibitors. The results showed that ipratropium nebulized solution (Atrovent; generic) was the most cost-effective agent, followed by ipratropium/albuterol nebulized solution (DuoNeb; generic), ipratropium hydrofluoroalkane MDI (Atrovent HFA), ipratropium/albuterol soft mist inhaler (Combivent Respimat), and roflumilast (Daliresp). Ipratropium/albuterol (Combivent) was not included in the cost-effectiveness analysis due to market discontinuation by December 2013. BIA projections for all scenarios were very similar.

    1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 1 opposed, 2 abstained, 2 absent) aclidinium inhaler (Tudorza), tiotropium inhaler (Spiriva), ipratropium nebulized solution (Atrovent; generic), ipratropium/albuterol nebulized solution (DuoNeb; generic), ipratropium HFA MDI (Atrovent HFA), ipratropium/albuterol soft mist inhaler (Combivent Respimat), and roflumilast (Daliresp) remain designated Uniform Formulary. Ipratropium/albuterol MDI (Combivent) will remain designated UF, pending discontinuation in December 2013.

    2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (13 for, 0 opposed, 2 abstained, 2 absent) maintaining ipratropium HFA MDI (Atrovent HFA) and ipratropium/albuterol nebulized solution (DuoNeb; generic), on the BCF, and recommended adding tiotropium (Spiriva) to the BCF, upon signing of the minutes.

Director, TMA, Decision: ☒Approved □ Disapproved

Approved, but modified as follows:

C. Self-Monitoring Blood Glucose System (SMBGS) Test Strips

Background and Relative Clinical Effectiveness—The P&T Committee reviewed the clinical effectiveness of the SMBGS test strips, including the attributes of the test strips and glucometers. Candidates for inclusion on the UF must meet all minimum required technical standards and United States Federal Government contracting requirements.

The P&T Committee reviewed the existing technical requirements approved in May 2007, and recommended updates to the criteria.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following for the minimum technical requirements and U.S. Federal Government contracting requirements for the SMBGS test strips. The full clinical effectiveness conclusion will be presented at the August 2013 meeting:

- *U.S Federal Government contracting requirements*: SMBGS test strips eligible for inclusion on the Uniform Formulary must be available at all 3 POS and must be compliant with the Trade Agreements Act. Corresponding SMBGS glucometers must also be compliant with the Trade Agreements Act. Manufacturers of SMBGS glucometers will be required to provide DoD beneficiaries with a no-cost glucometer.
- *Minimum technical requirements*: Candidate SMBGS test strips eligible for inclusion on the Uniform Formulary must meet minimum technical requirements in the areas of accuracy, sample size, alternate site testing, results time, memory capacity, ease of use, customer support, downloading capabilities, and data management capabilities. See pages 19-20 for detailed technical requirements.

Relative Cost-Effectiveness Conclusion—The P&T Committee reviewed proposed condition sets for contract solicitation. The cost-effectiveness analysis and UF and BCF recommendations will be presented at an upcoming meeting.

D. Corticosteroid Immune Modulators (Topical Steroids)

The P&T Committee evaluated the Corticosteroid Immune Modulators (Topical Steroids) Drug Class. The class is comprised of 22 individual chemical entities, available in over 100 different formulations and vehicles. The Stoughton-Cornell classification system, which divides the drugs into seven classes based on their vasoconstrictive properties, was used to further divide the drugs into high- (classes 1 and 2 steroids), medium- (classes 3, 4, and 5), and low-potency agents (classes 6 and 7). Over-the-counter (OTC) products are excluded from the class.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (16 for, 0 opposed, 0 abstained, 1 absent) with the clinical effectiveness conclusion. The full clinical effectiveness evaluation will be reported in the August meeting minutes.

Relative Cost-Effectiveness Conclusion—The P&T Committee reviewed proposed condition sets for contract solicitation. The cost-effectiveness analysis and UF and BCF recommendations will be presented at an upcoming meeting.

III. BCF ISSUES

A. Emergency Contraceptives

The Emergency Contraceptives were last reviewed by the P&T Committee in August 2011. Levonorgestrel 0.75 mg (Next Choice, the generic for Plan B) was designated as BCF. Next Choice was discontinued by the manufacturer in early 2013. The currently available emergency contraceptives include levonorgestrel 0.75 mg available from a generic manufacturer; levonorgestrel 1.5 mg (Next Choice One Dose, Plan B One Step); and ulipristal (Ella). A prescription is required for all ages for Ella; and for patients under age 17 for generic levonorgestrel 0.75 mg, and levonorgestrel 1.5 mg (Next Choice One Dose). On April 15, 2013, the age restriction was lowered to under age 15 for Plan B One Step by the FDA. A cost analysis showed that Plan B One Step has the lowest cost of the currently available emergency contraceptives.

1. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee voted (15 for, 0 opposed, 2 abstained, 0 absent) upon signing of the minutes, to:
   a) remove levonorgestrel 0.75 mg (Next Choice) from the BCF; and
   b) add levonorgestrel 1.5 mg (Plan B One Step) to the BCF.
   c) No other changes to the Uniform Formulary are recommended; generic levonorgestrel 0.75 mg, levonorgestrel 1.5 mg (Next Choice One Dose, generic Plan B One Step), and ulipristal (Ella) remain UF.

2. ***COMMITTEE ACTION: QLs AND AGE LIMITS***—The P&T Committee voted (15 for, 0 opposed, 2 abstained, 0 absent) upon signing of the minutes, to:
   a) maintain the current QLs at all three POS of one fill per prescription, with no refills (new prescription required for every fill).
   b) For the current age limits, MTFs should follow their individual service policies, and for the Mail Order and Retail points of service, the FDA labeling should be followed.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

As the FDA has now approved emergency contraceptive Plan B One-Step to be available over the counter without restrictions, and as regulations required by section 702 of the FY13 NDAA to include OTCs on the uniform formulary have not yet been

prescribed, no emergency contraceptive shall be included on the BCF. Nevertheless, MTFs shall ~~treat~~ carry Plan B One-Step as ~~any other OTC in deciding whether to~~ provide it, and at no cost.

B. Gastrointestinal-1 (GI-1) Drug Class—Mesalamine (Asacol)

The GI-1 Drug Class was previously reviewed by the P&T Committee in February 2011. Mesalamine delayed release tablets (Asacol) were designated as BCF. In March 2013, Asacol tablets were discontinued by the manufacturer, Warner Chilcott, and supplies have been depleted. Warner Chilcott subsequently received FDA approval for a new formulation, Delzicol capsules, which is substantially more costly than Asacol. Several other mesalamine delayed release tablets are on the UF, including Asacol HD, Apriso, Lialda, and Pentasa. These products use different proprietary methods to delay release of the drug into the large intestine and, therefore, are not interchangeable and have different FDA-approved indications and dosing.

1. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee voted (16 for, 0 opposed, 1 abstained, 0 absent) upon signing of the minutes, to:
   a) remove mesalamine delayed release tablets (Asacol) from the BCF.
   b) The GI-1 Drug Class will not have a designated BCF product until the class can be re-reviewed for UF status. MTFs are advised to order what they need to meet local needs.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

IV. UTILIZATION MANAGEMENT

A. PA

1. **Injectable Gonadotropins**—The P&T Committee clarified the PA criteria to set a 60-day expiration date for the PA, to help ensure that an authorization memorandum is included with each assisted reproductive technology (ART) cycle. A 60-day expiration is sufficient for a patient to complete an ART cycle.

   a) ***COMMITTEE ACTION: INJECTABLE GONADOTROPINS***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) clarifying the existing PA criteria for the injectable gonadotropins to have a 60-day expiration date for the PA.

2. **Proton Pump Inhibitors: Pantoprazole Change from Non-Preferred to Step-Preferred Status**—In November 2012, the P&T Committee recommended reclassification of pantoprazole as formulary on the UF, due to availability of cost-effective generic formulations; pantoprazole remained non-preferred. The cost of generic pantoprazole tablets has continued to decline since November 2012. The P&T Committee recommended revising the PA criteria to designate pantoprazole as step preferred (i.e., in front of the step).

    a) ***COMMITTEE ACTION: PANTOPRAZOLE PA CRITERIA/ STEP-PREFERRED STATUS***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) designating pantoprazole as step-preferred (i.e., in front of the step) on the UF.

3. **Antilipidemics-2: Icosapent ethyl (Vascepa)**—Icosapent ethyl (Vascepa) is the second prescription fish oil product marketed. The P&T Committee recommended manual PA criteria for all current and new users of Vascepa, limiting use to the FDA-approved indication; the manual PA criteria for Vascepa will be the same as criteria for Lovaza.

    a) ***COMMITTEE ACTION: ICOSAPENT ETHYL (VASCEPA) PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) manual PA criteria for all current and new users of Vascepa, limiting use to the FDA-approved indication. (See Appendix C for full criteria.)

4. **Abiraterone (Zytiga)**—PA criteria for abiraterone (Zytiga) were recommended at the November 2012 meeting, consistent with the FDA labeling. The FDA has subsequently updated the approved labeling for patients with metastatic castration-resistant prostate cancer with concomitant prednisone.

    a) ***COMMITTEE ACTION: ABIRATERONE (ZYTIGA) PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) revising the abiraterone (Zytiga) PA criteria for use in patients with a documented diagnosis of metastatic castration-resistant prostate cancer on concomitant prednisone. The previous criterion for prior chemotherapy containing docetaxel is no longer required.

B. Quantity Limits (QLs)

1. **Oral tretinoin 10 mg capsules (Vesanoid)**—Oral tretinoin 10 mg capsules are approved for inducing remission in acute promyelocytic leukemia. Quantity limits are in place for several oral chemotherapy agents. The P&T Committee recommended QLs for oral tretinoin 10 mg capsules due to the high cost and adverse event profile.

   a) ***COMMITTEE ACTION: ORAL TRETINOIN 10MG CAPSULES (VESANOID) QLs***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) QLs/days supply limits for oral tretinoin 10 mg capsules (Vesanoid), based on FDA-approved labeling, limiting use to a 30-day supply in the Retail Network, and a 45-day supply in the Mail Order.

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE MINUTES AND RECOMMENDATIONS

May 2013

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on May 15, 2013, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of February 2013 Minutes**—Jonathon Woodson, M.D., Director, approved the minutes for the February 2013 DoD P&T Committee meeting on May 13, 2013.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and Basic Core Formulary (BCF) recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Non-Insulin Diabetes Drugs: Sodium Glucose Co-Transporter 2 (SGLT2) Inhibitors—Canagliflozin (Invokana)

Relative Clinical Effectiveness Conclusion—Canagliflozin (Invokana) is a new diabetes drug with a novel mechanism of action and the first FDA-approved SGLT2 inhibitor. SGLT2 inhibitors are a new subclass of the Non-Insulin Diabetes Drug Class, which was originally reviewed in November 2010. The Non-Insulin Diabetes Drug Class also includes the following subclasses: biguanides (metformin), sulfonylureas,

thiazolidinedione (TZD), dipeptidyl-dipeptidase-4 (DPP-4) inhibitors, glucagon-like peptide-1 receptor agonists (GLP1RAs), pramlintide, dopamine agonists, meglitinides, and alpha glucosidase inhibitors.

The P&T Committee concluded (15 for, 1 opposed, 0 abstained, 1 absent):

- Efficacy of canagliflozin is limited to eight clinical trials, showing moderate decreases in hemoglobin A1c from baseline ranging from 0.63% (with insulin) to 1.11% (monotherapy in treatment-naïve patients).
- Canagliflozin has safety concerns of hypotension, impaired renal function, hyperkalemia, hypermagnesemia, hyperphosphatemia, increases in low-density lipoprotein (LDL) cholesterol and hemoglobin, hypoglycemia, urinary tract infections in both men and women, and genital mycotic infections.
- There is limited safety information available and no long-term outcomes trials have been completed to date with canagliflozin.
- Despite its unique mechanism of action to increase urinary glucose excretion, canagliflozin (Invokana) does not offer a clinically compelling advantage over the other non-insulin drugs included on the UF.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that canagliflozin (Invokana) is not cost-effective compared to other non-insulin diabetes drugs currently available on the UF. Cost minimization analysis (CMA) showed canagliflozin is more costly than metformin, glyburide, pioglitazone (Actos, generic), sitagliptin (Januvia), and exenatide (Byetta), in terms of cost per day of therapy.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (13 for, 1 opposed, 1 abstained, 2 absent) canagliflozin (Invokana) be designated NF due to the lack of compelling clinical advantages, safety concerns, lack of long-term outcomes and adverse event data, and cost disadvantage compared to UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) the following MN criteria for canagliflozin (Invokana): use of formulary agents is contraindicated. (See Appendix B for full criteria.)

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***—In the Non-Insulin Diabetes Drug Class, existing automated prior authorization (step therapy) requires a trial of metformin or a

sulfonylurea, prior to the use of a DPP-4 inhibitor, a TZD, or a GLP1RA, based on positive efficacy and long-term outcomes data with metformin and the sulfonylureas.

The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) a trial of metformin, a sulfonylurea, or a DPP-4 inhibitor in all new and current users of SGLT2 inhibitors, canagliflozin (Invokana), due to the modest hemoglobin A1c lowering and safety concerns. (See Appendix C for full criteria.)

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) 1) an effective date of the first Wednesday after a 30-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is September 11, 2013.

V. UF DRUG CLASS REVIEWS

A. Anti-Gout Drugs

Background and Relative Clinical Effectiveness—The P&T Committee evaluated the Anti-Gout Drug Class. This class has not been previously reviewed for UF placement. Drugs in the class include allopurinol (Zyloprim, generic), probenecid, colchicine (Colcrys), colchicine/probenecid, and febuxostat (Uloric). Allopurinol is currently designated as a BCF product (pre-UF Rule decision).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions:

- Colchicine is a very old drug that is available in one branded formulation, (Colcrys), which has a patent extending to 2029.
- For an acute gout attack, clinical practice guidelines support colchicine as first line treatment, along with non-steroidal anti-inflammatory agents (NSAIDs) or prednisone. Treatment should be initiated within the first 24 hours of symptom onset.
- For chronic gout, urate-lowering therapy (ULT) with allopurinol or febuxostat is recommended as first line. Based on head-to-head trials, febuxostat (Uloric) 40 mg and allopurinol 300 mg were equally efficacious in lowering serum uric acid (sUA) to less than 6mg/dL in one study

(CONFIRMS). Febuxostat 80 mg was superior to allopurinol 300 mg in lowering sUA to less than 6mg/dL in two studies (FACT and APEX).

- Higher doses of allopurinol (doses > 300mg), although not well studied, may be required in some patients to decrease sUA.
- Systematic reviews from the Cochrane group, and evidence-based organizations from Canada, the UK, and Europe recommend febuxostat as an alternative ULT in patients who cannot tolerate allopurinol.
- Use of colchicine for prophylaxis helps prevent gout flares during initiation of ULT. However, in published trials, gout flares increased when prophylaxis was discontinued. Guidelines recommend administering colchicine or NSAID prophylaxis for up to 6 months.
- Head-to-head studies show similar rates of adverse events with febuxostat and allopurinol.
- Febuxostat warnings from the FDA include liver enzyme elevations. Liver function tests should be tested at initiation of therapy and monitored throughout treatment.
- Febuxostat warnings from the European Medicines Association (EMA) include the potential for increased cardiovascular (CV) events. According to the EMA, febuxostat should not be used in patients with ischemic heart disease or congestive heart failure, due to increased risk of CV events.
- In terms of clinical coverage, one anti-inflammatory agent (colchicine) and one xanthine oxidase inhibitor (allopurinol or febuxostat) are required on the UF to meet the needs of the majority of DoD beneficiaries.

Relative Cost-Effectiveness Analysis and Conclusion—Pharmacoeconomic analyses were performed for the Anti-Gout Drug Class, including CMA and budget impact analyses (BIAs). The class was subdivided into chronic drugs (allopurinol and febuxostat) and acute drugs (colchicine). For the BIAs, several of the model's key assumptions were varied, with corresponding sensitivity analyses conducted.

The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) generic allopurinol (Zyloprim) was the most cost-effective of the chronic drugs, followed by branded febuxostat (Uloric), based on the weighted average cost per day of treatment across all three POS. Branded colchicine (Colcrys) was the only acute agent examined in the analysis; a cost analysis was conducted. CMA and BIA results showed that among available formulary options examined, scenarios where allopurinol (Zyloprim) is the BCF step-preferred agent, febuxostat (Uloric) is the NF non-preferred agent (with all current and new users required to try allopurinol first), and colchicine (Colcrys) is UF presented a maximum cost-avoidance projection.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 4 opposed, 1 abstained, 0 absent) the following scenario for the UF, which is the most clinically and cost-effective option for the MHS:
    - allopurinol be designated UF and step-preferred (e.g., "in front of the step") ;
    - febuxostat (Uloric) be designated NF and non step-preferred (e.g., "behind the step"); and
    - colchicine (Colcrys), probenecid, and the fixed dose combination of colchicine/probenecid be designated formulary on the UF and exempt from step therapy.
    - This recommendation includes step therapy, which requires a trial of allopurinol prior to using febuxostat (Uloric) in all current and new users of febuxostat.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) maintaining allopurinol as BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for febuxostat (Uloric). (See Appendix B for full criteria.)

4. ***COMMITTEE ACTION: PA CRITERIA***—After extensive discussion, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) PA criteria for all current and new users of febuxostat (Uloric), requiring a trial of allopurinol prior to use of febuxostat. (See Appendix C for full criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS; 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Additional recommendations made by the P&T Committee were to provide messaging to retail pharmacies to designate that PA and step therapy is required, with a trial of allopurinol prior to febuxostat (Uloric) and that the Anti-Gout Drug Class be added to the Rapid Response Program for the Retail Network and Mail Order Pharmacy. Based on the P&T Committee's recommendation, the effective date is November 6, 2013.

B. Pulmonary II Drugs

Background and Relative Clinical Effectiveness—The Pulmonary II Drug Class is comprised of two subclasses, the long-acting muscarinic agents (LAMAs), aclidinium inhaler (Tudorza) and tiotropium inhaler (Spiriva), and the chronic obstructive pulmonary disease (COPD) drugs [comprised of the short-acting muscarinic agents (SAMAs), short-acting beta agonist (SAMA/SABA) combinations and the phosphodiesterase type 4 (PDE-4) inhibitors].

Combivent metered dose inhaler (MDI) is one of the last available chlorofluorocarbon (CFC) MDIs on the market and will have supplies exhausted by December 2013. Its replacement is Combivent Respimat, a new CFC- and propellant-free formulation.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following at the February 2013 meeting:

- Aclidinium inhaler (Tudorza) is the second LAMA on the market. The three clinical trials used to obtain FDA approval reported statistically significant improvement in spirometric endpoints, and two of the trials reported significantly fewer COPD exacerbations with aclidinium, compared to placebo.
- For aclidinium, the adverse event profile appears minimal, with primarily anticholinergic events reported. However, there is limited safety data with the 400 mcg approved dose. The FDA requires a prospective clinical trial to assess CV safety. Longer duration and larger comparative trials are needed to determine aclidinium's place in therapy.
- Several trials have shown the LAMA tiotropium (Spiriva) is associated with clinically significant improvements in spirometric endpoints and reductions in risk for COPD exacerbations. Tiotropium is also reported to reduce the proportion of patients hospitalized for COPD exacerbations.
- Reports of a possible link between tiotropium and adverse CV events including death, stroke, and myocardial infarction have not been confirmed in prospective trials.
- Roflumilast (Daliresp) is the first oral selective inhibitor of PDE-4 marketed in the United States. Its FDA indication is limited to reducing the incidence of COPD exacerbations in patients with severe COPD. In two clinical trials, roflumilast was associated with statistically significant reductions in the rate of COPD exacerbations.
- For roflumilast, safety issues identified by the FDA included psychiatric events (including suicide), weight loss, gastrointestinal upset and severe diarrhea, and

nasal tumors. However, the FDA did not require additional prospective safety studies. A risk evaluation and mitigation strategy program was not required.

- Albuterol/ipratropium inhaler (Combivent Respimat) is the new propellant-free inhaler that is replacing the ozone-depleting CFC-containing Combivent MDI. The clinical trial used to obtain FDA approval showed Combivent Respimat was non-inferior to Combivent CFC MDI in terms of improvements in spirometric endpoints.

Relative Cost-Effectiveness Analysis and Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 2 absent) the following:

- CMA within the LAMA subclass showed that tiotropium (Spiriva) was more cost-effective than aclidinium (Tudorza). BIA results where Spiriva was designated BCF and Tudorza designated UF resulted in the greatest cost-avoidance to the MHS.
- CMA was conducted within the COPD subclass, which includes the SAMAs, SABA/SAMA combination drugs, and PDE-4 inhibitors. The results showed ipratropium nebulized solution (Atrovent; generic) was the most cost-effective agent, followed by ipratropium/albuterol nebulized solution (DuoNeb; generic), ipratropium hydrofluoroalkane (HFA) MDI (Atrovent HFA), ipratropium/albuterol soft mist inhaler (Combivent Respimat), and roflumilast (Daliresp). Ipratropium/albuterol (Combivent) was not included in the cost-effectiveness analysis due to market discontinuation by December 2013. BIA projections for all scenarios were very similar.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 1 opposed, 2 abstained, 2 absent) aclidinium inhaler (Tudorza), tiotropium inhaler (Spiriva), ipratropium nebulized solution (Atrovent; generic), ipratropium/albuterol nebulized solution (DuoNeb; generic), ipratropium HFA MDI (Atrovent HFA), ipratropium/albuterol soft mist inhaler (Combivent Respimat), and roflumilast (Daliresp) remain designated UF. Ipratropium/albuterol MDI (Combivent) will remain designated UF, pending discontinuation in December 2013.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (13 for, 0 opposed, 2 abstained, 2 absent) maintaining ipratropium HFA MDI (Atrovent HFA) and ipratropium/albuterol nebulized solution (DuoNeb; generic) on the BCF, and recommended adding tiotropium (Spiriva) the BCF, upon signing of the minutes.

C. Self-Monitoring Blood Glucose System (SMBGS) Test Strips

Background and Relative Clinical Effectiveness—The P&T Committee reviewed the clinical effectiveness of the SMBGS test strips, including the attributes of the test strips and glucometers. The SMBGS test strips were previously reviewed for UF placement in August 2008. The primary goal for this review is to ensure uniform availability of quality SMBGS test strips across the MHS (MTF, Retail, and Mail Order points of service). SMBGS glucometers are not included as part of the TRICARE outpatient pharmacy benefit (they are included under the medical benefit) and are not the focus of the review; however, provisions have been made to provide SMBGS glucometers at no cost to MHS beneficiaries.

The FDA classifies SMBGS test strips and glucometers as medical devices, rather than drugs, thus the focus of the clinical effectiveness review centers on differences in the technical aspects/attributes among the products. Candidates for inclusion on the UF must meet all minimum required technical standards and United States Federal Government contracting requirements. The P&T Committee reviewed the existing technical requirements approved in May 2007, and recommended updates to the criteria.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following for the minimum technical requirements and U.S. Federal Government contracting requirements for the SMBGS test strips. The full clinical effectiveness conclusion will be presented at the August 2013 meeting:

- *U.S Federal Government contracting requirements*: SMBGS test strips eligible for inclusion on the Uniform Formulary must be available at all 3 POS and must be compliant with the Trade Agreements Act. Corresponding SMBGS glucometers must also be compliant with the Trade Agreements Act. Manufacturers of SMBGS glucometers will be required to provide DoD beneficiaries with a no-cost glucometer.
- *Minimum technical requirements*: Candidate SMBGS test strips eligible for inclusion on the Uniform Formulary must meet the following minimum technical requirements:
    - Accuracy: Must meet FDA standards for accuracy based on the International Organization for Standardization (ISO) 15197 guidelines.
    - Sample size of $\leq$ 1 microliter
    - Alternate site testing: more than one alternate site approved.
    - Result time: $\leq$ 10 seconds
    - Memory capacity: $\geq$ 250 readings

- Ease of use: glucometer must be easy to code/calibrate, have a large visual display, and be easy to handle for patients with dexterity issues.
- Customer support: 24-hour helpline available, for beneficiaries residing outside the continental United States.
- Downloading capabilities: results must be downloadable
- Data management capabilities: data management capabilities required (e.g., software, cloud computing).

Relative Cost-Effectiveness Conclusion—The P&T Committee reviewed proposed condition sets for contract solicitation. The cost-effectiveness analysis and UF and BCF recommendations will be presented at an upcoming meeting.

D. Corticosteroid Immune Modulators (Topical Steroids)

The P&T Committee evaluated the Corticosteroid Immune Modulators (Topical Steroids) Drug Class. The class is comprised of 22 individual chemical entities, available in over 100 different formulations and vehicles. The Stoughton-Cornell classification system, which divides the drugs into seven classes based on their vasoconstrictive properties, was used to further divide the drugs into high- (classes 1 and 2 steroids), medium- (classes 3, 4, and 5), and low-potency agents (classes 6 and 7). Over-the-counter (OTC) products are excluded from the class.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (16 for, 0 opposed, 0 abstained, 1 absent) with the clinical effectiveness conclusion. The full clinical effectiveness evaluation will be reported in the August meeting minutes.

Relative Cost-Effectiveness Conclusion—The P&T Committee reviewed proposed condition sets for contract solicitation. The cost-effectiveness analysis and UF and BCF recommendations will be presented at an upcoming meeting.

VI. BCF ISSUES

A. Emergency Contraceptives

The Emergency Contraceptives were last reviewed by the P&T Committee in August 2011. Levonorgestrel 0.75 mg (Next Choice, the generic for Plan B) was designated as BCF. Next Choice was discontinued by the manufacturer in early 2013. The currently available emergency contraceptives include levonorgestrel 0.75 mg available from a

generic manufacturer; levonorgestrel 1.5 mg (Next Choice One Dose, Plan B One Step); and ulipristal (Ella). A prescription is required for all ages for Ella; and for patients under age 17 for generic levonorgestrel 0.75 mg, and levonorgestrel 1.5 mg (Next Choice One Dose). On April 15, 2013, the age restriction was lowered to under age 15 for Plan B One Step by the FDA. A cost analysis showed that Plan B One Step has the lowest cost of the currently available emergency contraceptives.

1. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee voted (15 for, 0 opposed, 2 abstained, 0 absent) upon signing of the minutes, to:
   a) remove levonorgestrel 0.75 mg (Next Choice) from the BCF; and
   b) add levonorgestrel 1.5 mg (Plan B One Step) to the BCF.
   c) No other changes to the Uniform Formulary are recommended; generic levonorgestrel 0.75 mg, levonorgestrel 1.5 mg (Next Choice One Dose, generic Plan B One Step), and ulipristal (Ella) remain UF.

2. ***COMMITTEE ACTION: QLs AND AGE LIMITS***—The P&T Committee voted (15 for, 0 opposed, 2 abstained, 0 absent) upon signing of the minutes, to:
   a) maintain the current QLs at all three POS of one fill per prescription, with no refills (new prescription required for every fill).
   b) For the current age limits, MTFs should follow their individual service policies, and for the Mail Order and Retail points of service, the FDA labeling should be followed.

Note from Decision Paper on p 8: As the FDA has now approved emergency contraceptive Plan B One-Step to be available over the counter without restrictions, and as regulations required by section 702 of the FY13 NDAA to include OTCs on the uniform formulary have not yet been prescribed, no emergency contraceptive shall be included on the BCF. MTFs shall ~~treat~~ Plan B One-Step ~~as any other OTC in deciding~~ and ~~whether to~~ provide it at no cost. carry JPK nevertheless,

B. Gastrointestinal-1 (GI-1) Drug Class—Mesalamine (Asacol)

The GI-1 Drug Class was previously reviewed by the P&T Committee in February 2011. Mesalamine delayed release tablets (Asacol) were designated as BCF. In March 2013, Asacol tablets were discontinued by the manufacturer, Warner Chilcott, and supplies have been depleted. Warner Chilcott subsequently received FDA approval for a new formulation, Delzicol capsules, which is substantially more costly than Asacol.

Several other mesalamine delayed release tablets are on the UF, including Asacol HD, Apriso, Lialda, and Pentasa. These products use different proprietary methods to delay release of the drug into the large intestine and, therefore, are not interchangeable and have different FDA-approved indications and dosing.

1. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee voted (16 for, 0 opposed, 1 abstained, 0 absent) upon signing of the minutes, to:
   a) remove mesalamine delayed release tablets (Asacol) from the BCF.
   b) The GI-1 Drug Class will not have a designated BCF product until the class can be re-reviewed for UF status. MTFs are advised to order what they need to meet local needs.

VII. UTILIZATION MANAGEMENT

A. PA

1. **Injectable Gonadotropins**—In November 2012, PA criteria for the injectable gonadotropins was revised to allow for use in conjunction with a noncoital reproductive technology, as outlined in the ASD(HA) April 2012 "Policy for Assisted Reproductive Services for the Benefit of Seriously or Severely Ill/Injured (Category II or III) Active Duty Service Members." A Signed Authorization Memorandum from TMA must be included with the prescription, and a new prescription is required for each assisted reproductive technology (ART) cycle. The P&T Committee clarified the PA criteria to set a 60-day expiration date for the PA, to help ensure that an authorization memorandum is included with each ART cycle. A 60-day expiration is sufficient for a patient to complete an ART cycle.

   a) ***COMMITTEE ACTION: INJECTABLE GONADOTROPINS***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) clarifying the existing PA criteria for the injectable gonadotropins to have a 60-day expiration date for the PA.

2. **Proton Pump Inhibitors (PPIs): Pantoprazole Change from Non-Preferred to Step-Preferred Status**—The PPIs currently have PA criteria (step therapy) requiring a trial of omeprazole or esomeprazole (Nexium) prior to use of the other PPIs. Omeprazole and esomeprazole are BCF and step-preferred. In November 2012, the P&T Committee

recommended reclassification of pantoprazole as formulary on the UF, due to availability of cost-effective generic formulations; pantoprazole remained non-preferred. The other PPIs, lansoprazole (Prevacid), rabeprazole (Aciphex), and omeprazole/sodium bicarbonate (Zegerid), are NF and non-preferred. The cost of generic pantoprazole tablets has continued to decline since November 2012. The P&T Committee recommended revising the PA criteria to designate pantoprazole as step-preferred (i.e., in front of the step).

a) ***COMMITTEE ACTION: PANTOPRAZOLE PA CRITERIA/ STEP-PREFERRED STATUS***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) designating pantoprazole as step-preferred (i.e., in front of the step) on the UF.

3. **Antilipidemics-2: Icosapent ethyl (Vascepa)**—Icosapent ethyl (Vascepa) is the second prescription fish oil product marketed. Icosapent ethyl has the same FDA-approved labeling and dosing as omega-3-acid ethyl esters (Lovaza). Vascepa is not as effective as Lovaza at lowering triglycerides, but does not adversely affect LDL levels. PA criteria apply to Lovaza, limiting use to the FDA-approved indications, due to the large number of off-label, non-supportable uses. The P&T Committee recommended manual PA criteria for all current and new users of Vascepa, limiting use to the FDA-approved indication; the manual PA criteria for Vascepa will be the same as criteria for Lovaza.

   a) ***COMMITTEE ACTION: ICOSAPENT ETHYL (VASCEPA) PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) manual PA criteria for all current and new users of Vascepa, limiting use to the FDA-approved indication. (See Appendix C for full criteria.)

4. **Abiraterone (Zytiga)**— Zytiga is an inhibitor of CYP 17 (an enzyme expressed in testicular, adrenal, and prostatic tumor tissues that is required for androgen biosynthesis). PA criteria for abiraterone (Zytiga) were recommended at the November 2012 meeting, consistent with the FDA labeling. At that time, Zytiga was FDA-approved for treatment of patients with metastatic castration-resistant prostate cancer who had previously received docetaxel. The FDA has subsequently updated the approved labeling for patients with metastatic castration-resistant prostate cancer with concomitant prednisone.

a) ***COMMITTEE ACTION: ABIRATERONE (ZYTIGA) PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) revising the abiraterone (Zytiga) PA criteria for use in patients with a documented diagnosis of metastatic castration-resistant prostate cancer on concomitant prednisone. The previous criterion for prior chemotherapy containing docetaxel is no longer required.

B. Quantity Limits (QLs)

1. **Oral tretinoin 10 mg capsules (Vesanoid)**—Oral tretinoin 10 mg capsules are approved for inducing remission in acute promyelocytic leukemia. The product was previously available under the trade name Vesanoid, but now only generic formulations are available. Quantity limits are in place for several oral chemotherapy agents. The P&T Committee recommended QLs for oral tretinoin 10 mg capsules due to the high cost and adverse event profile.

a) ***COMMITTEE ACTION: ORAL TRETINOIN 10MG CAPSULES (VESANOID) QLs***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) QLs/days supply limits for oral tretinoin 10 mg capsules (Vesanoid), based on FDA-approved labeling, limiting use to a 30-day supply in the Retail Network, and a 45-day supply in the Mail Order.

VIII. ADJOURNMENT

The meeting adjourned at 1630 hours on May 15, 2013. The next meeting will be in August 2013.

Dr. Eugene Moore	DoD Pharmacoeconomic Center
Dr. Jeremy Briggs	DoD Pharmacoeconomic Center
Dr. Brian Beck	DoD Pharmacoeconomic Center
LT Kendra Jenkins, USPHS	Pharmacy Resident
Ms. Deborah Garcia	DoD Pharmacy Outcomes Research Team contractor
Dr. Esmond Nwokeji	DoD Pharmacy Outcomes Research Team contractor
Mr. Kirk Stocker	DoD Pharmacy Outcomes Research Team contractor

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Canagliflozin (Invokana) **Sodium-Glucose Co-Transporter 2 (SGLT2) Inhibitors**	• Use of the formulary agent is contraindicated
• Febuxostat (Uloric) **Anti-gout Drugs**	• Use of allopurinol is contraindicated. • The patient has experienced significant adverse effects from allopurinol that are not expected to occur with the non-formulary medication. • Use of allopurinol has resulted in therapeutic failure. • The patient previously responded to non-formulary agent and changing to allopurinol would incur unacceptable risk.

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• Canagliflozin (Invokana) **Sodium-Glucose Co-Transporter 2 (SGLT2) Inhibitors**	All new and current users of an SLGPT2 inhibitor are required to try metformin, a sulfonylurea (SU), or a DPP-4 inhibitor before receiving canagliflozin (Invokana). Automated PA criteria—The patient has filled a prescription for metformin, a SU, or a DPP-4 inhibitor at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA criteria—If automated criteria are not met, canagliflozin (SGLT2 inhibitor) is approved (e.g., trial of metformin or SU or DPP-4 inhibitor is NOT required) if: • The patient has experienced any of the following issues on metformin: o impaired renal function precluding treatment with metformin o history of lactic acidosis • The patient has experienced any of the following issues on a sulfonylurea: o hypoglycemia requiring medical treatment • The patient has had inadequate response to metformin or a SU or a DPP-4 inhibitor • The patient has a contraindication to metformin or a SU or DPP-4 inhibitor
• Febuxostat (Uloric) **Anti-gout Drugs**	New and current users of febuxostat (Uloric) are required to try allopurinol. Automated PA Criteria—The patient has received a prescription for allopurinol at any Military Health System pharmacy point service (Military Treatment Facilities, retail network pharmacies, or mail order) during the previous 180 days. AND Manual PA Criteria—If automated criteria are not met, febuxostat (Uloric) is approved (e.g., a trial of allopurinol is not required) if: • The patient has experienced any of the following issues with at least one of the following with allopurinol, which is not expected to occur with febuxostat (Uloric): o The patient has had an inadequate response to allopurinol (failure to achieve serum uric acid levels < 6 mg/day) after an adequate trial (at least 300 mg per day of allopurinol) o The patient has had intolerable adverse effects (e.g., hypersensitivity) to allopurinol o The patient has a contraindication to allopurinol (e.g., renal impairment)

• icosapent ethyl (Vascepa) **Antilipidemic-2s**	New and current users of Vascepa are required to undergo the PA process. <u>Manual PA Criteria</u>—Vascepa is approved if: • Patients Receiving Statins: o Patients with triglyceride (TG) Levels > 500 mg/dL AND o Inadequate TG-lowering response to a therapeutic trial of niacin (1-g/day), unable to tolerate niacin/fibrate or who are not a candidate for niacin/fibrate therapy * ** • Patients NOT Receiving Statins: o Patients with TG Levels > 500 mg/dL AND o Inadequate response to a therapeutic trial of monotherapy with both a fibrate and niacin (1-2 g/day), unable to tolerate a fibrate and niacin or who are not candidates for fibrates** and niacin therapy • Patients with TG <500 mg/dL or <500 mg/dL with an inadequate TG-lowering response to niacin or fibrates or who are unable to tolerate/are not candidates for niacin or fibrates • Coverage is not approved for the use of Vascepa for the treatment of other conditions, including: ADHD, Alzheimer's disease, bipolar disorder, Crohn's disease, cystic fibrosis, dementia, depression, inflammatory bowel disease, intermittent claudication, metabolic syndrome, osteoporosis, PTSD, renal disease (IgA nephropathy), rheumatoid arthritis, schizophrenia, Type 2 diabetes mellitus, and ulcerative colitis *Not candidates for niacin: patients with a history of confirmed PUD (perforation, ulceration, or upper GIB), gouty attacks (presence of intra-articular uric acid crystals in the affected joint), and/or poorly controlled diabetes **Not candidates for fibrates: patients with hepatic or severe renal dysfunction, including primary biliary cirrhosis and preexisting gallbladder disease
• abiraterone (Zytiga) **Oral Chemotherapy Drugs for Prostate Cancer**	<u>Manual PA Criteria</u>—Coverage approved for treatment of patients: • With a documented diagnosis of metastatic castration-resistant prostate cancer AND • Patient is receiving concomitant prednisone

Appendix D—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
May 2013	**Pulmonary II Drugs**	UF Class Review	▪ Ipratropium HFA MDI (Atrovent HFA) ▪ Ipratropium/ albuterol nebulized solution (DuoNeb) ▪ Tiotropium inhaler (Spiriva)	▪ Aclidinium inhaler (Tudorza) ▪ Ipratropium nebulized solution (Atrovent) ▪ Ipratropium / albuterol soft mist inhaler (Combivent Respimat) ▪ Roflumilast (Daliresp)	▪ None	Pending signing of the minutes	None	▪ Combivent Respimat added to the BCF
May 2013	**Anti-Gout Drugs**	UF class review	▪ Allopurinol	▪ colchicine (Colcrys) ▪ probenecid ▪ colchicine/probenecid	▪ Febuxostat (Uloric)	Pending signing of the minutes / 90 days	Step therapy (automated PA); requires a trial of allopurinol prior to use of Uloric in all new and current users of Uloric.	▪ Step therapy does not apply to colchicine, probenecid, or colchicine/ probenecid
May 2013	**Non-Insulin Diabetes Drugs: Sodium-Glucose Co-Transporter 2 (SGLT2) Inhibitors**	New Drug review	▪ None	▪ None	▪ **Canagliflozin (Invokana) recommended for NF May 2013**	Pending signing of the minutes / 30 days	Step therapy (automated PA); requires a trial of metformin, an SU, or a DPP-4 inhibitor in all new and current users of a SGLT2 inhibitor	BCF, UF, and NF drugs are designated for the non-insulin diabetes drugs for metformin, sulfonylureas, DPP-4 inhibitors, GLP1RA agonists, TZDs, meglitinides, and alpha glucosidase inhibitors (see Minutes November 2010, August 2012, and November 2012).

UF	Uniform Formulary

DECISION PAPER

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

February 2013

I. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Newer Sedative Hypnotic-1 (SED-1s) Agents—Zolpidem Sublingual Low-Dose Tablets (Intermezzo)

Relative Clinical Effectiveness Conclusion—Intermezzo is a new low-dose zolpidem sublingual (SL) formulation available in 1.75 mg and 3.5 mg tablets. The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that despite its unique FDA labeling for middle-of-the-night awakening compared to the other SED-1s and the potential for less next-day impairment, zolpidem SL low dose (Intermezzo) does not offer a clinically compelling advantage over the other SED-1s included on the Uniform Formulary (UF).

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that zolpidem SL low dose (Intermezzo) is not cost-effective when compared to other SED-1s included on the UF. The relative cost minimization analysis (CMA) ranking of the comparator SED-1s (ranked from most cost-effective to least cost-effective) revealed that zolpidem immediate release (IR) (Ambien IR, generics) < zaleplon (Sonata, generics) < zolpidem ER (Ambien CR, generics) < zolpidem SL (Edluar)< ramelteon (Rozerem) < zolpidem SL low dose (Intermezzo).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) zolpidem sublingual low dose (Intermezzo) be designated nonformulary (NF) due to the lack of compelling clinical advantages and cost disadvantage compared to UF products.

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***
The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) the following MN criteria for zolpidem SL low dose (Intermezzo): there is no alternative formulary agent—the patient has swallowing difficulties and requires a product for middle-of-the-night awakening.

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***
Existing automated prior authorization (step therapy) requires a trial of generic zolpidem IR or zaleplon, the step-preferred agents, prior to the other SED-1s in new users. The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) the following PA criteria should apply to Intermezzo. Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria: The patient has filled a prescription for zolpidem IR or zaleplon at any Military Health System (MHS) pharmacy point of service (POS) [military treatment facilities (MTFs), retail network pharmacies, or mail order] during the previous 180 days.

   b) Manual PA criteria: The patient has an inadequate response to, been unable to tolerate due to adverse effects, or has a contraindication to zolpidem IR or zaleplon.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is July 17, 2013.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

II. UF DRUG CLASS REVIEWS

A. Topical Pain Agents

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

- Lidocaine 5% patch (Lidoderm) is effective for the management of its orphan indication, postherpetic neuralgia (PHN). There is insufficient evidence supporting use of Lidoderm for other neuropathies (e.g., diabetic neuropathy, HIV-associated neuropathy, complex regional pain syndrome); however, several professional guidelines support its use. There is a paucity of data regarding use

of Lidoderm for other off-label conditions, including widespread or deep pain conditions such as fibromyalgia or chronic pain associated with osteoarthritis.

- A review of MHS prescribing trends showed a high discontinuation rate for Lidoderm, with a similar prevalence between unique user new starts and discontinuations. A Pharmacy Outcomes Research Team (PORT) analysis showed that Lidoderm is commonly prescribed in the MHS for off-label, non-supportable uses (e.g., musculoskeletal pain) that are not associated with neuropathic pain.
- There are no head-to-head trials comparing the topical diclofenac products (Voltaren gel, Pennsaid drops, and Flector patch) in terms of efficacy or safety. However, indirect evidence suggests the agents are highly interchangeable with regard to efficacy. Limited evidence suggests the agents are as effective as oral diclofenac.
- The incidence of gastrointestinal (GI) adverse events is lower with the topical diclofenac products compared to oral nonsteroidal anti-inflammatory drugs (NSAIDs), offering a potential advantage for patients with a history of GI bleeding or peptic ulcers.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that among topical diclofenac products, diclofenac gel (Voltaren) was the most cost-effective, based on the weighted average cost per day of treatment across all three POS, followed by diclofenac drops (Pennsaid) and diclofenac patch (Flector). Results from the CMA and budget impact analyses (BIAs) showed that the scenario where Lidocaine patch (Lidoderm) and diclofenac gel (Voltaren) were designated UF, with diclofenac drops (Pennsaid) and patch (Flector) designated NF, was the most cost-effective for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) lidocaine 5% patch (Lidoderm) and diclofenac 1% gel (Voltaren) remain designated with formulary status on the UF, and recommended NF status for diclofenac 1.5% solution (Pennsaid drops) and diclofenac 1.3% patch (Flector), based on clinical and cost effectiveness.
2. ***COMMITTEE ACTION: BASIC CORE FORMULARY (BCF) RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) that none of the topical pain agents be designated BCF. Because the topical pain agents are a subclass of the Pain Agents, there is no requirement to designate a topical agent with BCF status. Several pain agents (narcotic analgesics and oral NSAIDs) are included on the BCF. The cost-effectiveness analysis revealed no financial benefit to the MHS for placement of the topical pain agents on the BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) MN criteria for diclofenac 1.5% solution (Pennsaid drops) and diclofenac 1.3% patch (Flector). (See Appendix B for full MN criteria.)

4. ***COMMITTEE ACTION: PA CRITERIA***—After extensive discussion, the P&T Committee recommended (12 for, 4 opposed, 1 abstained, 0 absent) manual PA criteria apply to all current and new users of lidocaine 5% patch (Lidoderm). Coverage is approved for patients who have a diagnosis of postherpetic neuralgia, other peripheral neuropathic pain, and for patients with non-neuropathic pain where an occupational or clinical reason exists and other analgesics are contraindicated. Coverage is not approved for other uses of Lidoderm. (See Appendix C for full criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 1 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is August 14, 2013.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Pulmonary II Drugs

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

- Aclidinium inhaler (Tudorza) is the second long-acting muscarinic agent (LAMA) on the market. The three clinical trials used to obtain FDA approval reported statistically significant improvement in spirometric endpoints, and two of the trials reported significantly fewer chronic obstructive pulmonary disease (COPD) exacerbations with aclidinium, compared to placebo.
- For aclidinium, the adverse event profile appears minimal, with primarily anticholinergic events reported. However, there is limited safety data with the 400 mcg approved dose. The FDA is requiring a prospective clinical trial to

assess cardiovascular safety. Longer duration and larger comparative trials are needed to determine aclidinium's place in therapy.

- Several trials have shown the LAMA tiotropium (Spiriva) is associated with clinically significant improvements in spirometric endpoints and reductions in risk for COPD exacerbations. Tiotropium is also reported to reduce the proportion of patients hospitalized for COPD exacerbations.

- Reports of a possible link between tiotropium and adverse cardiovascular (CV) events including death, stroke, and myocardial infarction have not been confirmed in prospective trials.

- Roflumilast (Daliresp) is the first oral selective inhibitor of phosphodiesterase type 4 marketed in the United States. Its FDA indication is limited to reducing the incidence of COPD exacerbations in patients with severe COPD. In two clinical trials, roflumilast was associated with statistically significant reductions in the rate of COPD exacerbations.

- For roflumilast, safety issues identified by the FDA included psychiatric events (including suicide), weight loss, GI upset and severe diarrhea, and nasal tumors. However, the FDA did not require additional prospective safety studies. A risk evaluation and mitigation strategy program was not required.

- Albuterol/ipratropium inhaler (Combivent Respimat) is the new propellant-free inhaler that is replacing the ozone-depleting chlorofluorocarbon (CFC)-containing Combivent metered dose inhaler (MDI). The clinical trial used to obtain FDA approval showed Combivent Respimat was non-inferior to Combivent CFC MDI in terms of improvements in spirometric endpoints.

Relative Cost-Effectiveness Conclusion—The P&T Committee reviewed proposed condition sets for contract solicitation. The cost-effectiveness analysis and UF and BCF recommendations will be presented at an upcoming meeting.

C. Oral Anticoagulants

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following for warfarin, dabigatran (Pradaxa), and rivaroxaban (Xarelto). Apixaban (Eliquis) will be reviewed at an upcoming P&T meeting due to recent FDA approval in late 2012.

- The newer oral anticoagulants (NOACs) dabigatran and rivaroxaban have advantages of predictable anticoagulant effect, fixed dosing, and fewer drug interactions compared to warfarin (Coumadin, generic). Advantages of warfarin

include its long history of use, reliable reversal agent (vitamin K), and adverse effects that are predictable and manageable.

- The NOACs offer a convenience to patients; laboratory monitoring for efficacy and dietary restrictions are not required. More data is needed in patients with renal and hepatic impairment. No reversal agent is available with the NOACs.
- In non-valvular atrial fibrillation (Afib), dabigatran and apixaban were superior to poorly controlled warfarin at preventing stroke and systemic embolism, including hemorrhagic stroke; rivaroxaban was non-inferior to poorly controlled warfarin for these outcomes. Intracranial bleeding was lower with dabigatran, rivaroxaban, and apixaban compared to warfarin.
- For venous thromboembolism (VTE) prevention following orthopedic surgery, rivaroxaban was superior to enoxaparin at preventing symptomatic deep venous thrombosis (DVT), but at the cost of increased bleeding. For prevention of VTE recurrence following DVT or pulmonary embolism (PE), rivaroxaban in two trials was non-inferior to enoxaparin/warfarin for preventing recurrent VTE, with no difference in bleeding, and was superior to placebo in one trial for extended therapy for 6–12 months.
- Due to a lack of head-to-head trials, there is insufficient evidence to determine if one NOAC has advantages over the others.
- Patients require education and clinical monitoring to ensure appropriate use and avoid adverse reactions with the NOACs. Bleeding is a concern with all the NOACs, and dabigatran is associated with dyspepsia and major GI bleeding. For warfarin, a high risk of falls is not associated with risk of subsequent major bleeding.
- It remains to be determined whether the NOACs will increase the numbers of patients currently undertreated for stroke prevention in Afib. Also unknown is whether NOACs will improve persistence rates for anticoagulation therapy.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

- Anticoagulant agents for stroke prevention in non-valvular AFib—CMA results showed that, in all scenarios, warfarin, including drug monitoring costs, was the least costly agent. Cost-effectiveness analysis (CEA) results showed that the incremental cost-effectiveness ratios per life year gained with dabigatran and rivaroxaban in relation to warfarin were in a range that could be considered cost-effective to the MHS.
- Anticoagulant agents for DVT/PE prophylaxis in hip and knee replacement surgery—CMA results demonstrated that rivaroxaban was a cost-effective

alternative compared to enoxaparin, based on analysis of the average weighted price per day of therapy at all three POS.

- BIA results—Scenarios where all drugs remain on the UF resulted in the greatest cost-avoidance to the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) warfarin (Coumadin, generic), dabigatran (Pradaxa), and rivaroxaban (Xarelto) remain formulary on the UF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) maintaining warfarin (Coumadin, generic) on the BCF. MTFs are highly encouraged to purchase the contracted warfarin generic product.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

III. UTILIZATION MANAGEMENT

A. PA

1. **Tretinoin Age Limits**—The P&T Committee reviewed the current age limits for tretinoin, which does not allow use in patients older than 35 years. While treatment for acne is covered by TRICARE benefits, cosmetic services and supplies are excluded from the benefit, including treatments for photoaging of the skin.

   a) ***COMMITTEE ACTION: TRETINOIN AGE LIMITS***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) removing the age limit for tretinoin products that are not exclusively labeled for cosmetic use at all 3 MHS POS (MTF, Mail Order, and the Retail Network). Acne can occur beyond age 35. Treatment for acne is covered by TRICARE benefits and low-cost tretinoin generic formulations are available. Tretinoin products/derivatives specifically indicated for cosmetic use as a result of the aging process (e.g., Renova, Refissa, Avage) remain excluded from the Pharmacy benefit.

2. **Zolpidem Gender-Based Dosing**—The P&T Committee discussed whether PA criteria are needed for zolpidem products, given new recommendations from the FDA in January 2013 regarding dosing in women. For women, lower dosing is recommended, as blood levels in some patients may be high enough the morning after use to impair activities that require alertness, including driving. A review of MHS prescriptions in the last six months of 2012 showed significant use of the higher zolpidem dosages in women.

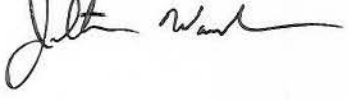
    a) ***COMMITTEE ACTION: ZOLPIDEM GENDER-BASED DOSING*** The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) to not institute gender-based dosing PA criteria for zolpidem products, and to instead educate providers of the new recommendations, and notify patients via beneficiary newsletters of the concerns regarding impaired driving and activities requiring mental alertness the morning after use. The P&T Committee recommended re-evaluating this issue in six months to review MHS prescribing trends and whether additional measures are necessary.

B. Quantity Limits (QLs)

1. The P&T Committee reviewed quantity limit proposals for four products: aclidinium oral inhaler (Tudorza) for COPD, beclomethasone dipropionate nasal inhaler (Qnasl) for seasonal and perennial allergic rhinitis, ponatinib (Iclusig) tablets for treatment of patients with chronic myelogenous leukemia (CML), and cabozantinib (Cometriq) for patients with progressive, metastatic medullary thyroid cancer. QLs are recommended due to either existing QLs in the class to prevent wastage (inhalers) or due to high cost/adverse event profiles with subsequent need for dosage changes.

    a) ***COMMITTEE ACTION: ACLIDINIUM (TUDORZA), BECLOMETHASONE (QNASAL), PONATINIB (ICLUSIG) and CABOZANTINIB (COMETRIQ) QLs***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) QLs for aclidinium oral inhaler (Tudorza), beclomethasone dipropionate nasal inhaler (Qnasl), ponatinib tablets (Iclusig), and cabozantinib (Cometriq), based on FDA-approved labeling. (See Appendix D.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved



Approved, but modified as follows:

VI. ITEMS FOR INFORMATION

A. Options for Future DoD P&T Committee Meetings—Given the current budget restrictions regarding travel, the P&T Committee discussed options for future meetings, including Defense Connect Online (DCO) web conferences. Items of concern voiced by the P&T Committee if DCO teleconferences were implemented in lieu of in-person meetings included maintaining confidentiality of the contracted pricing solicitations, likelihood of interruption/inattention, decreased engagement by P&T Committee members, and potential lost opportunities for cost-avoidance, which would ultimately negatively impact TRICARE beneficiaries.

B. Cost-Effectiveness Modeling Review—The P&T Committee reviewed an analysis of previous UF economic evaluations that compared the performance of cost modeling projections and budget impact analyses to actual observed costs in the MHS. Overall, the evaluated cost-effectiveness models performed suitably, demonstrating expenditure and utilization trends that were similar between modeled outcomes and actual results. Possible factors contributing to variance between the modeled outcomes and actual results were discussed. Potential improvements identified during the review will be incorporated into future cost modeling scenarios and processes.

C. Smoking Cessation Program Final Rule—As of the meeting date, the Smoking Cessation Final Rule has not yet been published in the Code of Federal Regulations. The Proposed Rule provides that smoking cessation pharmaceutical agents, including FDA-approved over-the-counter pharmaceutical agents, will be available through the TRICARE Mail Order Pharmacy or the MTF. Until publication of the Final Rule, all UF/BCF recommendations for smoking cessation products from the May 2012 DoD P&T Committee meeting remain on hold.

D. POS Analysis Update—The PORT provided an update on MHS prescribing trends by point of service. The results showed that for branded medications considered maintenance products (e.g., used for chronic conditions and not specialty medications), drug costs (30-day equivalent prescriptions) would have been about 27%–31% lower, if all prescriptions that were filled and dispensed in the Retail Network had instead been dispensed at the MTFs or at the Mail Order. In contrast, drug costs would have been about 13%–18% higher if generic drugs dispensed in the Retail Network had instead been dispensed in the MTFs or Mail Order.

E. **New TRICARE Pharmacy Copayments**—The P&T Committee was briefed on new pharmacy co-pays that were implemented in February 2013. At the Mail Order POS, co-pays for Tier 1 drugs (generics) remain $0, with co-pays of $13 for Tier 2 products (preferred brands) and $43 for Tier 3 products (non-preferred brands). The new co-pays in the Retail Network are $5 (Tier 1), $17 (Tier 2) and $44 (Tier 3). In the Mail Order, one co-pay applies for up to a 90-day supply, and one co-pay applies for up to a 30-day supply in the Retail Network.

F. **Step Therapy Safety Net**—The P&T Committee was briefed on the Rapid Response Step Therapy "Safety Net" Program implemented in September 2012. The program was initiated to educate beneficiaries affected by a step therapy reject and to educate providers regarding step-preferred drugs. The program targets beneficiaries who have not received a prescription fill for either a step-preferred or non step-preferred drug, after the initial reject. Since implementation, the MHS successful cases averaged 38.30%, which is similar to successful cases reported in commercial programs. Updates on the program will be periodically provided to the P&T Committee.

DECISION ON RECOMMENDATIONS

Director, TMA, decisions are as annotated above.

Jonathan Woodson, M.D.
Director

13 May 2013
Date

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE MINUTES AND RECOMMENDATIONS

February 2013

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on February 20 and 21, 2013, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of November 2012 Minutes**—Jonathon Woodson M.D., Director, approved the minutes for the November 2012 DoD P&T Committee meeting on February 13, 2013.
2. **Clarification to the November 2012 Minutes—Prior Authorization (PA) Implementation Date for enzalutamide (Xtandi) and abiratone (Zytiga):** The November minutes were clarified to state March 20, 2013, is the effective implementation date for PA criteria applicable to enzalutamide (Xtandi) and abiratone (Zytiga).

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and Basic Core Formulary (BCF) recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Newer Sedative Hypnotic-1 (SED-1s) Agents—Zolpidem Sublingual Low Dose Tablets (Intermezzo)

Relative Clinical Effectiveness—Intermezzo is a new low-dose zolpidem sublingual

(SL) formulation available in 1.75 mg and 3.5 mg tablets. Women should not receive Intermezzo doses larger than 1.75 mg. Intermezzo is specifically approved for treatment of insomnia characterized by middle-of-the-night waking followed by difficulty returning to sleep. In one study, there was a statistically significant improvement in sleep latency and total sleep time with Intermezzo versus placebo for middle-of-the-night awakening, but another placebo-controlled trial found no differences in total sleep time. No studies have been completed with an active comparator.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) despite its unique FDA labeling for middle-of-the-night awakening compared to the other SED-1s and the potential for less next-day impairment, zolpidem SL low dose (Intermezzo) does not offer a clinically compelling advantage over the other SED-1s included on the UF.

Relative Cost-Effectiveness Analysis and Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that zolpidem SL low dose (Intermezzo) is not cost-effective when compared to other SED-1s included on the UF. The relative cost minimization analysis (CMA) ranking of the comparator SED-1s (ranked from most cost-effective to least cost-effective) revealed that zolpidem immediate release (IR) (Ambien IR, generics) < zaleplon (Sonata, generics) < zolpidem ER (Ambien CR, generics) < zolpidem SL (Edluar)< ramelteon (Rozerem) < zolpidem SL low dose (Intermezzo).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) zolpidem sublingual low dose (Intermezzo) be designated NF due to the lack of compelling clinical advantages and cost disadvantage compared to UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) the following MN criteria for zolpidem SL low dose (Intermezzo): there is no alternative formulary agent—the patient has swallowing difficulties and requires a product for middle-of-the-night awakening.

3. ***COMMITTEE ACTION: PA CRITERIA***—Existing automated prior authorization (step therapy) requires a trial of generic zolpidem IR or zaleplon, the step-preferred agents, prior to the other SED-1s in new users. The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) the following PA criteria should apply to Intermezzo. Coverage would be approved if the patient met any of the following criteria:

a) Automated PA criteria: The patient has filled a prescription for zolpidem IR or zaleplon at any Military Health System (MHS) pharmacy point of service (POS) [military treatment facilities (MTFs), retail network pharmacies, or mail order] during the previous 180 days.

b) Manual PA criteria: The patient has an inadequate response to, been unable to tolerate due to adverse effects, or has a contraindication to zolpidem IR or zaleplon.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is July 17, 2013.

V. UF DRUG CLASS REVIEWS

A. Topical Pain Agents

Background and Relative Clinical Effectiveness—The P&T Committee evaluated the Topical Pain agents subclass, which is comprised of lidocaine 5% patch (Lidoderm), diclofenac 1% gel (Voltaren), diclofenac 1.5% solution (Pennsaid), and diclofenac 1.3% patch (Flector).

The Topical Pain agents are a subclass of the Pain Agents UF drug class, which includes the Narcotic Analgesics and oral Non-Steroidal Anti-Inflammatory drugs (NSAIDs).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

- Extensive review of the literature provided limited evidence regarding efficacy and safety of the topical pain agents.
- Lidoderm is effective as first line and/or combination therapy for the management of its orphan indication—postherpetic neuralgia (PHN). There is insufficient evidence supporting use of Lidoderm for other neuropathies (e.g., diabetic neuropathy, HIV-associated neuropathy, complex regional pain syndrome); however, several professional guidelines support its use. There is a paucity of data regarding use of Lidoderm for other off-label conditions, including widespread or deep pain conditions such as fibromyalgia or chronic pain associated with osteoarthritis.

- A review of MHS prescribing trends showed a high discontinuation rate for Lidoderm, with a similar prevalence between unique user new starts and discontinuations.
- Topical diclofenac formulations (Voltaren gel, Pennsaid drops, and Flector patch) are effective in managing superficial pain associated with osteoarthritis of the knee and wrist, and superficial pain associated with sprains, strains, and contusions.
- There are no head-to-head trials comparing the topical diclofenac products in terms of efficacy or safety. However, indirect evidence suggests the agents are highly interchangeable with regard to efficacy. Limited evidence suggests the agents are as effective as oral diclofenac.
- The incidence of gastrointestinal (GI) adverse events is lower with the topical diclofenac products compared to oral NSAIDs, offering a potential advantage for patients with a history of GI bleeding or peptic ulcers.
- Systemic side effects are uncommon and the most common adverse events are application site reactions, including pruritis with Lidoderm, and dry skin, erythema and pruritis with the topical diclofenac products.
- Flector is indicated for short-term use associated with acute musculoskeletal injury and is likely to be used in a younger population than Voltaren gel or Pennsaid drops.
- Pennsaid is indicated only for osteoarthritis of the knee and clinical usefulness may be limited by multiple daily dosing (four times daily).
- A Pharmacy Outcomes Research Team (PORT) analysis reviewing ICD-9 codes associated with Lidoderm prescriptions in the MHS revealed significant overlap for diagnoses associated with neuropathic and musculoskeletal pain. Only 3% of prescriptions were written for patients with the FDA-approved PHN indication. Up to 49% of patients receiving Lidoderm prescriptions had no neuropathic diagnosis: 39% had musculoskeletal diagnoses without neuropathic diagnoses and 10% had neither neuropathic nor musculoskeletal diagnostic codes. This suggests that Lidoderm is commonly used in the MHS for off-label use that is not associated with neuropathic pain.

Relative Cost-Effectiveness Analysis and Conclusion—Pharmacoeconomic analyses were performed for the Topical Pain Agent subclass, including CMA and budget impact analyses (BIAs). For the BIAs, several of the model's key assumptions were varied, with corresponding sensitivity analyses conducted.

The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that among topical diclofenac products, diclofenac gel (Voltaren) was the most cost-effective, based

on the weighted average cost per day of treatment across all three POS, followed by diclofenac drops (Pennsaid), and diclofenac patch (Flector). Results from the CMA and BIAs showed that the scenario where Lidocaine patch (Lidoderm) and diclofenac gel (Voltaren) were designated UF, with diclofenac drops (Pennsaid) and patch (Flector) designated NF, was the most cost-effective for the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) lidocaine 5% patch (Lidoderm) and diclofenac 1% gel (Voltaren) remain designated with formulary status on the UF, and recommended NF status for diclofenac 1.5% solution (Pennsaid drops) and diclofenac 1.3% patch (Flector), based on clinical and cost effectiveness.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) that none of the topical pain agents be designated BCF. Because the topical pain agents are a subclass of the Pain Agents, there is no requirement to designate a topical agent with BCF status. Several pain agents (narcotic analgesics and oral NSAIDs) are included on the BCF. The cost-effectiveness analysis revealed no financial benefit to the MHS for placement of the topical pain agents on the BCF.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) MN criteria for diclofenac 1.5% solution (Pennsaid drops) and diclofenac 1.3% patch (Flector). (See Appendix B for full MN criteria.)

4. ***COMMITTEE ACTION: PA CRITERIA***—After extensive discussion, the P&T Committee recommended (12 for, 4 opposed, 1 abstained, 0 absent) manual PA criteria apply to all current and new users of lidocaine 5% patch (Lidoderm). Coverage is approved for patients who have a diagnosis of postherpetic neuralgia, other peripheral neuropathic pain, and for patients with non-neuropathic pain where an occupational or clinical reason exists and other analgesics are contraindicated. Coverage is not approved for other uses of Lidoderm. (See Appendix C for full criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 1 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by the UF and PA decisions. Based on the P&T Committee's recommendation, the effective date is August 14, 2013.

B. Pulmonary II Drugs

Background and Relative Clinical Effectiveness—The Pulmonary II Drug Class is comprised of aclidinium inhaler (Tudorza), tiotropium inhaler (Spiriva), roflumilast tablets (Daliresp), ipratropium (Atrovent HFA inhaler; Atrovent nebulized solution), and ipratropium/albuterol (Combivent, Combivent Respimat and DuoNeb nebulized solution). The two inhalation solutions, ipratropium (Atrovent) and ipratropium/ albuterol (DuoNeb), are available in generic formulations.

Combivent metered dose inhaler (MDI) is one of the last available chlorofluorocarbon (CFC) MDIs on the market and will have supplies exhausted by December 2013. Its replacement is Combivent Respimat, a new CFC- and propellant-free formulation.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following clinical effectiveness conclusions:

- With regard to the long-acting muscarinic agents (LAMAs), aclidinium (Tudorza) and tiotropium (Spiriva), and the short-acting muscarinic agent (SAMA), ipratropium (Atrovent HFA), the P&T Committee concluded the following:
  - Aclidinium (Tudorza) is a dry powder inhaler (DPI) administered twice daily. The three clinical trials used to obtain FDA approval reported statistically significant improvement in lung function/spirometric endpoints [forced expiratory volume in 1 second (FEV_1)] compared with placebo at 12 weeks. Two of the trials reported statistically significant reductions in chronic obstructive pulmonary disease (COPD) exacerbations versus placebo.
  - In a small-dose ranging trial with 30 participants lasting for 15 days, there was no significant difference between aclidinium and tiotropium in terms of improvements in spirometric endpoints (FEV_1).
  - For aclidinium, the adverse event profile appears minimal, with primarily anticholinergic events reported. However, there is limited safety data with the approved 400 mcg dose. The FDA is requiring a prospective clinical trial to assess cardiovascular (CV) safety. Longer duration and larger comparative trials are needed to determine aclidinium's place in therapy.
  - Tiotropium is formulated as a DPI administered once daily. Several trials have documented tiotropium is associated with clinically significant improvements in FEV_1 and forced vital capacity compared with placebo or ipratropium. Additional benefits include reductions in the risk for COPD exacerbations as well as reduced hospitalizations due to COPD exacerbations.
  - Reports of a possible link between tiotropium and adverse CV events including death, stroke, and myocardial infarction (MI) were first raised in

2008, based on meta-analysis and retrospective analyses of health claims data. New data based on a large 4-year prospective trial (UPLIFT) and other analyses does not support an association with tiotropium and CV adverse events.

  - The other common adverse effects of tiotropium are anticholinergic in nature. There are reports of incorrect administration of the inhaler, with patients swallowing the capsule, instead of administering it via the HandiHaler device.
  - Ipratropium has been marketed since 1995. Review of the clinical literature for efficacy did not add substantial new information. For safety, while there may be a possible signal between ipratropium use and CV adverse events, the data is limited due to study design (cohort studies), influence of underlying CV disease, and presence of underlying pulmonary cancers.

- With regard to the SAMA/LAMA combination products, Combivent Respimat demonstrated similar improvements in FEV_1 as Combivent CFC MDI in the clinical trial used to obtain FDA approval. Some older patients or those with hand joint problems may require assistance for the initial assembly of the Combivent Respimat inhaler and cartridge. Combining bronchodilators may improve efficacy and decrease the risk of side effects, as compared to maximizing the dose of a single bronchodilator, and also provide a convenience to the patient. The safety profile of Combivent Respimat is similar to Combivent CFC MDI.
- Roflumilast (Daliresp) is the first oral phosphodiesterase type 4 inhibitor marketed in the United States, and is administered once daily. It has a narrow FDA indication, limited to reducing the incidence of COPD exacerbations in patients with severe COPD associated with chronic bronchitis and a history of exacerbations.
- Roflumilast should not be used to treat acute bronchospasm, as it has modest effects on FEV_1, is not a bronchodilator, and instead has anti-inflammatory actions. Combining roflumilast with a long-acting bronchodilator [salmeterol (Serevent) or tiotropium] results in improvements in FEV_1. The two trials used to obtain FDA approval reported roflumilast reduced COPD exacerbation rates by 15%–19% compared to placebo.
- For roflumilast, safety issues identified by the FDA included psychiatric events (including suicide), weight loss, GI upset and severe diarrhea, and nasal tumors. However, the FDA did not require additional prospective safety studies. A risk evaluation and mitigation strategy program was not required.

Relative Cost-Effectiveness Analysis, Relative Cost-Effectiveness Conclusion, UF Recommendation, BCF Recommendation—The P&T Committee reviewed proposed

condition sets for contract solicitation. The cost-effectiveness analysis and UF and BCF recommendations will be presented at an upcoming meeting.

C. Oral Anticoagulants

Background and Relative Clinical Effectiveness—The Oral Anticoagulant Drug Class is comprised of warfarin (Coumadin, generic), and the newer oral anticoagulants (NOACs) dabigatran (Pradaxa) and rivaroxaban (Xarelto). Another NOAC, apixaban (Eliquis) was approved in December 2012, and will be evaluated as a new drug at an upcoming meeting. Warfarin has been designated a BCF drug since before 1998, prior to implementation of the Uniform Formulary Rule in 2005.

Dabigatran, rivaroxaban, and apixaban are approved for stroke prevention in patients with non-valvular atrial fibrillation (Afib). Rivaroxaban has additional indications for prophylaxis of venous thromboembolism (VTE) in patients following hip or knee replacement surgery, and is also indicated to prevent recurrent VTE in patients with deep vein thrombosis (DVT) or pulmonary embolism (PE).

A PORT analysis showed that MHS users of dabigatran have a mean age of 76 years and 91% of patients have an ICD-9 diagnosis code for Afib. MHS users of rivaroxaban have a mean age of 70 years and 41% of patients have an ICD-9 diagnosis code for Afib versus 39% of patients with a diagnosis code for hip of knee replacement surgery.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following clinical effectiveness conclusions:

- The NOACs dabigatran and rivaroxaban have advantages of predictable anticoagulant effect, fixed dosing, and fewer drug interactions compared to warfarin (Coumadin, generic). Advantages of warfarin include its long history of use, reliable reversal agent (vitamin K), and adverse effects that are predictable and manageable.
- The NOACs offer a convenience to patients; laboratory monitoring for efficacy and dietary restrictions are not required. More data is needed in patients with renal and hepatic impairment. No reversal agent is available with the NOACs.
- In non-valvular Afib, dabigatran and apixaban were superior to poorly controlled warfarin (time in therapeutic range < 65.5%) at preventing stroke and systemic embolism, including hemorrhagic stroke; rivaroxaban was non-inferior to poorly controlled warfarin for these outcomes. Intracranial bleeding was lower with dabigatran, rivaroxaban, and apixaban compared to warfarin.
- For VTE prevention following orthopedic surgery, rivaroxaban was superior to enoxaparin at preventing symptomatic DVT, but at the cost of increased bleeding. Dabigatran and apixaban were similar to enoxaparin at VTE

prevention; no difference in bleeding was noticed with dabigatran, but a lower risk of bleeding was shown with apixaban versus enoxaparin.

- For prevention of VTE recurrence following DVT or PE, rivaroxaban in two trials was non-inferior to enoxaparin/warfarin for preventing recurrent VTE, with no difference in bleeding, and was superior to placebo in one trial for extended therapy. Dabigatran in one trial was non-inferior to enoxaparin/warfarin for preventing recurrent VTE, with no difference in bleeding. Apixaban was superior to placebo for prevention of recurrent VTE over 12 months (extended therapy) in one trial.
- Due to a lack of head-to-head trials, there is insufficient evidence to determine if one NOAC has advantages over the others for stroke prevention in non-valvular Afib, prophylaxis of VTE following hip or knee replacement surgery, or for prevention of VTE recurrence following DVT or PE.
- Patients require education and clinical monitoring to ensure appropriate use and avoid adverse reactions with the NOACs. Bleeding is a concern with all the NOACs, and dabigatran is associated with dyspepsia and major GI bleeding. For warfarin, a high risk of falls is not associated with risk of subsequent major bleeding.
- It remains to be determined whether the NOACs will increase the numbers of patients currently undertreated for stroke prevention in Afib. Also unknown is whether NOACs will improve persistence rates for anticoagulation therapy.

Relative Cost-Effectiveness Analysis and Conclusion—The P&T Committee evaluated the relative cost-effectiveness of the anticoagulant agents for stroke prevention in non-valvular Afib and for prophylaxis of VTE in patients undergoing knee or hip replacement surgery. CMAs were performed for both indications. Additionally, a cost-effectiveness analysis (CEA) evaluated the agents for stroke prevention in Afib.

- For the anticoagulant drugs, CMAs were used to compare the anticoagulant drug costs including relevant drug monitoring costs (e.g., international normalized ratio testing for warfarin and office visits).
- The CEA model was constructed based on comparisons of relevant clinical trial data from systematic reviews. The CEA model assessed the potential impact of anticoagulant treatment on the occurrence of stroke, bleeding, MI, and mortality. Results were reported as an incremental cost-effectiveness ratio (ICER) comparing the additional costs per life year gained with the NOACs dabigatran (Pradaxa) and rivaroxaban (Xarelto) in relation to warfarin.
- For the BIAs, several of the model's key assumptions were varied, with corresponding sensitivity analyses conducted. BIA results were presented to

the P&T Committee. The MHS projected budgetary impact varied depending on which medication was selected for BCF, UF, or NF status.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 against, 0 abstained, 0 absent) the following:

- Anticoagulant agents for stroke prevention in non-valvular AFib—CMA results showed that, in all scenarios, warfarin (Coumadin, generic), including drug monitoring costs, was the least costly agent. CEA results showed that the ICERs per life year gained with dabigatran and rivaroxaban in relation to warfarin were in a range that could be considered cost-effective to the MHS.
- Anticoagulant agents for DVT/PE prophylaxis in hip and knee replacement surgery—CMA results demonstrated that rivaroxaban (Xarelto) was a cost-effective alternative compared to enoxaparin (Lovenox), based on analysis of the average weighted price per day of therapy at all three POS.
- BIA results—Scenarios where all drugs remain on the UF resulted in the greatest cost-avoidance to the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) warfarin (Coumadin, generic), dabigatran (Pradaxa), and rivaroxaban (Xarelto) remain formulary on the UF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) maintaining warfarin (Coumadin, generic) on the BCF. MTFs are highly encouraged to purchase the contracted warfarin generic product.

VI. UTILIZATION MANAGEMENT

A. PAs

1. **Tretinoin Age Limits**—The P&T Committee reviewed the current age limits for tretinoin, which does not allow use in patients older than 35 years. While treatment for acne is covered by TRICARE benefits, cosmetic services and supplies are excluded from the benefit, including treatments for photoaging of the skin.

a) ***COMMITTEE ACTION: TRETINOIN AGE LIMITS***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) removing the age limit for tretinoin products that are not exclusively labeled for cosmetic use at all 3 MHS POS (MTF, Mail Order, and the Retail Network). Acne can occur beyond age 35 years. Treatment for acne is covered by TRICARE benefits and low-cost tretinoin generic formulations are available. Tretinoin products/derivatives specifically indicated for cosmetic use as a result of the aging process (e.g., Renova, Refissa, Avage) remain excluded from the Pharmacy benefit.

2. **Zolpidem Gender-Based Dosing**—The P&T Committee discussed whether PA criteria are needed for zolpidem products, given new recommendations from the FDA in January 2013 regarding dosing in women. For women, lower dosing is recommended, as blood levels in some patients may be high enough the morning after use to impair activities that require alertness, including driving. A review of MHS prescriptions in the last six months of 2012 showed significant use of the higher zolpidem dosages in women.

   a) ***COMMITTEE ACTION: ZOLPIDEM GENDER-BASED DOSING*** The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 0 absent) to not institute gender-based dosing PA criteria for zolpidem products, and to instead educate providers of the new recommendations, and notify patients via beneficiary newsletters of the concerns regarding impaired driving and activities requiring mental alertness the morning after use. The P&T Committee recommended re-evaluating this issue in six months to review MHS prescribing trends and whether additional measures are necessary.

B. Quantity Limits (QLs)

1. The P&T Committee reviewed quantity limit proposals for four products: aclidinium oral inhaler (Tudorza) for COPD, beclomethasone dipropionate nasal inhaler (Qnasl) for seasonal and perennial allergic rhinitis, ponatinib (Iclusig) tablets for treatment of patients with chronic myelogenous leukemia (CML), and cabozantinib (Cometriq) for patients with progressive, metastatic medullary thyroid cancer. QLs are recommended due to either existing QLs in the class to prevent wastage (inhalers) or due to high cost/adverse event profiles with subsequent need for dosage changes.

a) ***COMMITTEE ACTION: ACLIDINIUM (TUDORZA), BECLOMETHASONE (QNASAL) PONATINIB (ICLUSIG) and CABOZANTINIB (COMETRIQ) QLs***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 1 absent) QLs for aclidinium oral inhaler (Tudorza), beclomethasone dipropionate nasal inhaler (Qnasl), ponatinib tablets (Iclusig), and cabozantinib (Cometriq), based on FDA-approved labeling. (See Appendix D.)

VII. ITEMS FOR INFORMATION

A. Options for Future DoD P&T Committee Meetings—Given the current budget restrictions regarding travel, the P&T Committee discussed options for future meetings, including Defense Connect Online (DCO) web conferences. Items of concern voiced by the P&T Committee if DCO teleconferences were implemented in lieu of in-person meetings included maintaining confidentiality of the contracted pricing solicitations, likelihood of interruption/inattention, decreased engagement by P&T Committee members, and potential lost opportunities for cost-avoidance, which would ultimately negatively impact TRICARE beneficiaries.

B. Cost-Effectiveness Modeling Review—The P&T Committee reviewed an analysis of previous UF economic evaluations that compared the performance of cost modeling projections and budget impact analyses to actual observed costs in the MHS. Overall, the evaluated cost-effectiveness models performed suitably, demonstrating expenditure and utilization trends that were similar between modeled outcomes and actual results. Possible factors contributing to variance between the modeled outcomes and actual results were discussed. Potential improvements identified during the review will be incorporated into future cost modeling scenarios and processes.

C. Smoking Cessation Program Final Rule—As of the meeting date, the Smoking Cessation Final Rule has not yet been published in the Code of Federal Regulations. The Proposed Rule provides that smoking cessation pharmaceutical agents, including FDA-approved over-the-counter pharmaceutical agents, will be available through the TRICARE Mail Order Pharmacy or the MTF. Until publication of the Final Rule, all UF/BCF recommendations for smoking cessation products from the May 2012 DoD P&T Committee meeting remain on hold.

D. POS Analysis Update—The PORT provided an update on MHS prescribing trends by point of service. The results showed that for branded medications considered maintenance products (e.g., used for chronic conditions and not specialty

medications), drug costs (30-day equivalent prescriptions) would have been about 27%–31% lower, if all prescriptions that were filled and dispensed in the Retail Network had instead been dispensed at the MTFs or at the Mail Order. In contrast, drug costs would have been about 13%–18% higher if generic drugs dispensed in the Retail Network had instead been dispensed in the MTFs or Mail Order.

E. **New TRICARE Pharmacy Copayments**—The P&T Committee was briefed on new pharmacy co-pays that were implemented in February 2013. At the Mail Order POS, co-pays for Tier 1 drugs (generics) remain $0, with co-pays of $13 for Tier 2 products (preferred brands) and $43 for Tier 3 products (non-preferred brands). The new co-pays in the Retail Network are $5 (Tier 1), $17 (Tier 2) and $44 (Tier 3). In the Mail Order, one co-pay applies for up to a 90-day supply, and one co-pay applies for up to a 30-day supply in the Retail Network.

F. **Step Therapy Safety Net**—The P&T Committee was briefed on the Rapid Response Step Therapy "Safety Net" Program implemented in September 2012. The program was initiated to educate beneficiaries affected by a step therapy reject and to educate providers regarding step-preferred drugs. The program targets beneficiaries who have not received a prescription fill for either a step-preferred or non step-preferred drug, after the initial reject. Since implementation, the MHS successful cases averaged 38.30%, which is similar to successful cases reported in commercial programs. Updates on the program will be periodically provided to the the P&T Committee.

VIII. ADJOURNMENT

The meeting adjourned at 1145 hours on February 21, 2013. The next meeting will be in May 2013.

Appendix A—Attendance: February 2013 P&T Committee Meeting

Voting Members Present	
John Kugler, COL (Ret.), MC, USA	DoD P&T Committee Chair
CDR Joe Lawrence, MSC	Director, DoD Pharmacoeconomic Center (Recorder)
Col George Jones, BSC	Deputy Chief, Pharmaceutical Operations Directorate
COL Peter Bulatao, MS for COL John Spain, MS	Army, Pharmacy Officer
Col Mike Spilker, BSC	Air Force, Pharmacy Officer
CAPT Deborah Thompson, USCG	Coast Guard, Pharmacy Officer
CAPT Edward Norton, MSC	Navy, Pharmacy Officer (Pharmacy Consultant BUMED)
COL Ted Cieslak, MC	Army, Physician at Large
Col Lowell Sensintaffer, MC	Air Force, Physician at Large
CDR Brian King, MC for CAPT Walter Downs, MC	Navy, Internal Medicine Physician
LTC Jack Lewi, MC	Army, Internal Medicine Physician
CDR Shaun Carstairs, MC	Navy, Physician at Large
COL Bruce Lovins, MC	Army, Family Practice Physician
Lt Col William Hannah, MC	Air Force, Internal Medicine Physician
Maj Jeremy King, MC	Air Force, OB/GYN Physician
CDR Eileen Hoke, MC	Navy, Pediatrics
Dr. Miguel Montalvo	TRICARE Regional Office-South Chief of Clinical Operations Division and Medical Director
Nonvoting Members Present	
Mr. David Hurt	Associate General Counsel, TMA
COL Todd Williams, MS	Defense Medical Materiel Program Office
CDR Jay Peloquin, MSC via DCO	Defense Logistics Agency Troop Support
Guests	
Mr. Bill Davies via DCO	TRICARE Management Activity, Pharmaceutical Operations Directorate
CDR Matthew Baker, USPHS	Indian Health Service

Appendix A—Attendance (continued)

Guests	
Stephani Folts	Student, University of Incarnate Word Feik School of Pharmacy
Brian Hettler	Student, University of Incarnate Word Feik School of Pharmacy
Others Present	
LTC Chris Conrad, MS	DoD Pharmacoeconomic Center
LCDR Marisol Martinez, USPHS	DoD Pharmacoeconomic Center
LCDR Joshua Devine, USPHS	DoD Pharmacoeconomic Center
LCDR Bob Selvester, MC	DoD Pharmacoeconomic Center
Lt Col Melinda Henne, MC	DoD Pharmacoeconomic Center
LCDR Ola Ojo, MSC	DoD Pharmacoeconomic Center
LCDR Linh Quach, MSC	DoD Pharmacoeconomic Center
Maj David Folmar, BSC	DoD Pharmacoeconomic Center
MAJ Misty Cowan, MC	DoD Pharmacoeconomic Center
Dr. David Meade	DoD Pharmacoeconomic Center
Dr. Angela Allerman	DoD Pharmacoeconomic Center
Dr. Shana Trice	DoD Pharmacoeconomic Center
Dr. Amy Lugo via DCO	DoD Pharmacoeconomic Center
Dr. Teresa Anekwe via DCO	DoD Pharmacoeconomic Center
Dr. Eugene Moore	DoD Pharmacoeconomic Center
Dr. Jeremy Briggs	DoD Pharmacoeconomic Center
Dr. Dean Valibhai	DoD Pharmacoeconomic Center
Dr. Brian Beck	DoD Pharmacoeconomic Center
LT Kendra Jenkins, USPHS	Pharmacy Resident

Dr. Esmond Nwokeji	DoD Pharmacy Outcomes Research Team contractor
Mr. Kirk Stocker	DoD Pharmacy Outcomes Research Team contractor

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Zolpidem sublingual low dose (Intermezzo) **Newer Sedative Hypnotic-1 (SED-1s)**	• No alternative formulary agent – patient has swallowing difficulties and requires a product for middle-of-the-night awakening.
• Diclofenac 1.5% solution (Pennsaid) **Topical Pain Medications**	• Patient has experienced significant adverse effects from ALL of the formulary medications that are not expected to occur with the nonformulary topical pain medication (e.g., patient had intolerable dry skin with use of diclofenac gel and has gastrointestinal or cardiovascular risk factors that preclude use of oral NSAIDs). • Formulary agents result or are likely to result in therapeutic failure (e.g., patient had intolerable dry skin with use of diclofenac gel and has gastrointestinal or cardiovascular risk factors that preclude use of oral NSAIDs). • No alternative formulary agent – patient requires topical agent with dimethyl sulfoxide (DMSO) to aid in skin absorption.
• Diclofenac 1.3% patch (Flector) **Topical Pain Medications**	• Patient has experienced significant adverse effects from ALL of the formulary medications that are not expected to occur with the nonformulary topical pain medication (e.g., patient experienced intolerable dry skin with use of diclofenac gel and has gastrointestinal or cardiovascular risk factors that preclude use of oral NSAIDs). • No alternative formulary agent – patient requires use of patch for treatment of pain associated with acute strain/sprain and cannot use oral NSAIDs or diclofenac gel products.

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
▪ Zolpidem sublingual low dose (Intermezzo) **Newer Sedative Hypnotics-1 (SED-1s)**	A trial of generic zolpidem IR or zaleplon is required for new users of Intermezzo. Automated PA criteria – The patient has filled a prescription for zolpidem IR or zaleplon at any MHS pharmacy POS (MTFs, retail network pharmacies, or mail order) during the previous 180 days. Manual PA criteria – The patient has an inadequate response to, been unable to tolerate due to adverse effects, or has a contraindication to zolpidem IR or zaleplon.
▪ Lidocaine 5% patch (Lidoderm) **Topical Pain Medications**	New and current users of Lidoderm are required to undergo the PA process. Manual PA criteria Lidoderm is approved if: – The patient has a diagnosis of postherpetic neuropathy – The patient has a diagnosis of another form of peripheral neuropathy – The patient has a diagnosis of other pain (non-neuropathic) and an occupational or clinical reason exists and other analgesics are contraindicated • Coverage for other uses of Lidoderm is not approved.

Appendix D—Table of Quantity Limits

Drug / Drug Class	Quantity Limits
• aclidinium oral inhaler (Tudorza) **Pulmonary Disease II Drugs – Long-Acting Muscarinic Agent**	• Retail: 1 inhalers/30 days • Mail Order and MTF: 3 inhalers/90 days
• beclomethasone dipropionate aerosol nasal inhaler (Qnasl) **Nasal Allergy Drugs**	• Retail: 1 inhalers/30 days • Mail Order and MTF: 3 inhalers/90 days
• ponatinib (Iclusig) **Oral Chemotherapy Agents for chronic myelogenous leukemia**	• 15 mg tablets: – Retail: 90 tabs/30 days – Mail Order and MTF: 135 tabs/45 days • 45 mg tablets: – Retail: 30 tabs/30 days – Mail order and MTF: 45 tabs/45 days
• cabozantinib (Cometriq) **Oral Chemotherapy Agents for metastatic medullary thyroid cancer**	• 140, 100 and 60 mg daily dose cartons – Retail: 4 packs/30 days – Mail Order: 8 packs /45 days

Appendix E—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2013	**Topical Pain Medications**	UF Class Review	None	▪ Lidocaine 5% patch (Lidoderm) ▪ Diclofenac 1% gel (Voltaren)	▪ Diclofenac 1.3% patch (Flector) ▪ Diclofenac 1.5% solution (Pennsaid)	Pending signing of the minutes/ 90 days	PA applies	PA for Lidoderm applies to new and current users (see Appendix C)
Feb 2013	**Oral Anticoagulants**	UF Class review	Warfarin	▪ Dabigatran (Pradaxa) ▪ Rivaroxaban (Xarelto)	▪ N/A (no drugs designated nonformulary	Pending signing of the minutes	-	-

DECISION PAPER

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

November 2012

I. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. High Potency Narcotic Analgesics—Oxycodone Immediate Release (IR) (Oxecta)*Relative Clinical Effectiveness Conclusion*—The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that Oxecta is the first abuse deterrent IR oxycodone formulation marketed. There is no evidence to suggest oxycodone IR (Oxecta) has a compelling clinical advantage over the other high potency narcotic analgesics included on the Uniform Formulary (UF).

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that oxycodone IR (Oxecta) was not cost-effective when compared to other high potency narcotic analgesics included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) oxycodone IR (Oxecta) be designated nonformulary (NF) due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***
The P&T Committee recommended (15 for, 1 opposed, 1 abstained, 0 absent) MN criteria for Oxecta: there are no formulary alternatives and the patient requires a tamper resistant formulation of oxycodone IR.

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service (POS), and TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is April 17, 2013.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

II. UNIFORM FORMULARY DRUG CLASS REVIEWS

A. Non-Insulin Diabetes Drugs—Glucagon-Like Peptide-1 Receptor Agonists (GLP1RAs)

Relative Clinical Effectiveness Conclusion—Step therapy implemented in April 2011 requires that new GLP1RA users try metformin or sulfonylurea first, and that new GLP1RA users try exenatide twice daily (BID) (Byetta) before TRICARE® will cover the other agents in this drug subclass. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

- Exenatide BID injection (Byetta), liraglutide once daily injection (Victoza), and exenatide once weekly injection (Bydureon) all decrease hemoglobin A1c ~ 1%–2% from baseline when used as monotherapy or in combination with other oral agents.
- When compared head-to-head, overall there are no clinically relevant differences between the three GLP1RAs with regard to effect on glycemic control.
- Bydureon offers additional patient convenience given its once weekly dosing regimen and does not require titration compared to Byetta, but is not available in a pre-filled syringe.
- There are no studies evaluating adherence with the three GLP1RAs.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that exenatide BID (Byetta) was the most cost-effective GLP1RA, based on the weighted average cost per day of treatment across all three POS, followed by exenatide once weekly (Bydureon) and liraglutide (Victoza). Results from the cost minimization and budget impact analyses showed scenarios where exenatide BID (Byetta), exenatide once weekly (Bydureon) and liraglutide (Victoza) are all designated UF presented a cost avoidance projection comparable to the current UF scenario where all GLP1RAs are UF. Data was not available to assess the potential pharmacoeconomic impact of longer-acting GLP1RA formulations on medication adherence and health-related outcomes in this cost-effectiveness evaluation.

1. ***COMMITTEE ACTION: UF/BASIC CORE FORMULARY (BCF) RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following:

- Designating exenatide BID (Byetta), liraglutide once daily (Victoza), and exenatide once weekly (Bydureon) as formulary on the UF;
- Excluding Byetta, Victoza, and Bydureon GLP1RAs from the BCF; and,
- Removing the current requirement for a trial of Byetta prior to the other GLP1RAs (removing the subclass step therapy requirement). As a result, there would no longer be a preferred GLP1RA product.

2. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) maintaining the current PA requiring a trial of metformin or a sulfonylurea prior to the use of exenatide BID (Byetta), liraglutide once daily (Victoza), or exenatide once weekly (Bydureon). A trial of metformin or a sulfonylurea would not be required for patients with an adverse event, contraindication to, or inadequate response with metformin or sulfonylurea. Use of a GLP1RA product is approved only for patients with type 2 diabetes mellitus. Automated PA criteria (step-therapy) and manual PA criteria remain the same as recommended at the November 2010 P&T Committee meeting, and implemented in April 2011. (See Appendix C for full criteria.)

3. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 30-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is March 20, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Overactive Bladder Drugs (OABs)

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

- Review of the clinical literature for efficacy, safety, and tolerability data since the last P&T Committee review in 2008 did not add substantial new information.
- Persistence rates within the Military Health System (MHS) remain low at 12% for all the OAB drugs. As needed use of the OAB drugs is 26% in the MHS.

- There are no studies evaluating clinical outcomes, such as reduced fall risk or delayed nursing home placement with the OAB drugs.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 against, 0 abstained, 0 absent) that for preferred formulary placement status, oxybutynin IR (Ditropan, generics) was the least costly agent based on the weighted average cost per day of treatment across all three POS, followed by oxybutynin ER (Ditropan XL, generics), tolterodine ER (Detrol LA), solifenacin (Vesicare), oxybutynin 10% gel (Gelnique), fesoterodine (Toviaz), oxybutynin transdermal delivery system (Oxytrol), trospium IR (Sanctura, generics), trospium ER (Sanctura XR, generics), darifenacin (Enablex), and tolterodine IR (Detrol, generics).

Results from the cost minimization analysis (CMA) and budget impact analysis (BIA) showed that among available formulary options examined, the scenario where oxybutynin IR, oxybutynin ER, and Detrol LA were designated as step-preferred, with step therapy applied to all current and new users of non-preferred OAB products, was most cost-effective.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following:
    - UF and step-preferred ("in front of the step"): tolterodine extended release (ER) (Detrol LA), oxybutynin IR (Ditropan, generics), and oxybutynin ER (Ditropan XL, generics). Prior authorization would require that all patients try Detrol LA, oxybutynin IR, or oxybutynin ER before TRICARE will cover the other agents in this drug class.
    - UF and non step-preferred ("behind the step"): trospium IR (Sanctura, generics), trospium ER (Sanctura XR, generics), tolterodine IR (Detrol, generics) and solifenacin (Vesicare)
        - When the generics to Sanctura, Sanctura XR, and Detrol become cost-effective relative to the step-preferred agents, the generics will become step-preferred without further action by the P&T Committee, Beneficiary Advisory Panel, or Director, TMA. A generic agent is cost-effective relative to step-preferred agents when the generic agent's total weighted average cost per day of treatment is less than or equal to the total weighted average cost per day of treatment for the step-preferred agent.
    - NF and non step-preferred: darifenacin (Enablex), fesoterodine (Toviaz), oxybutynin transdermal delivery system (Oxytrol), and oxybutynin 10% gel (Gelnique).

- Step therapy would apply to all users (current and new) of the OAB drugs.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) maintaining Detrol LA and oxybutynin ER on the BCF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) PA criteria for all current and new users of the OAB drugs, requiring a trial of Detrol LA, oxybutynin IR, or oxybutynin ER prior to the use of the other OAB drugs. A trial of the step-preferred OAB drugs would not be required in patients with an adverse event, inadequate response, or contraindication to Detrol LA, oxybutynin ER, or oxybutynin IR. (See Appendix C for full criteria.)

4. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Enablex, Toviaz, Oxytrol, and Gelnique 10%. (See Appendix B for full MN criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 90-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is May 15, 2013.

Addendum to the UF recommendation: During a post meeting bid review, it was determined that after-step bids should not be accepted and modeled due to verbiage in the bid solicitation. As a result of this determination, the cost analysis was recalculated. This new cost model was presented to the DoD P&T committee via electronic means. An electronic vote was taken to determine a) whether to accept the new cost review, maintain the current scenario and maintain current UF recommendations, or b) withdraw the UF recommendation, rebid the class and present results at the Feb 2013 meeting.

6. ***COMMITTEE ACTION: ADDENDUM TO UF RECOMMENDATION***
The P&T Committee recommended (9 for, 5 opposed, 0 abstained, 3 absent) to approve the current scenario, which maintains the UF recommendation, step therapy requirements for all new and current users of OAB drugs, and PA criteria.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Gastrointestinal-2 Oral Antibiotic Drugs (GI-2)

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

- For hepatic encephalopathy (HE), rifaximin is superior to lactulose in improving symptoms. While rifaximin is approved for monotherapy, it is commonly used in combination with lactulose, and is better tolerated than lactulose.
- For *Clostridium difficile* infection (CDI):
  - Metronidazole is equally effective as vancomycin in treating mild to moderate CDI, but for severe CDI vancomycin results in higher clinical cure rates.
  - Fidaxomicin and vancomycin provide similar clinical cure rates for CDI; however, fidaxomicin decreases recurrence and increases global cure rates to a greater extent than vancomycin.
  - Comparative efficacy for nitazoxanide and rifaximin for CDI cannot be assessed, given the small numbers of trials.
- For travelers' diarrhea (TD), practice guidelines and a systematic review recommend fluoroquinolones (e.g., levofloxacin, ciprofloxacin) as first line treatment. Rifaximin is FDA-approved for TD but is limited to TD caused by noninvasive strains of *Escherichia coli*.
- Rifaximin is not FDA-approved for irritable bowel syndrome (IBS), and there is insufficient evidence to support its use for IBS. Other non-supportable uses of rifaximin include inflammatory bowel disease, chronic abdominal pain, hepatitis, diabetes, rosacea, and any other non FDA-approved indication.

Relative Cost-Effectiveness Conclusion—Pharmacoeconomic analyses, including CMA, were performed for the GI-2 Drug Class. Cost analyses were based on the disease states discussed in the clinical section. Comparative costs for agents from other drug classes were considered (e.g., lactulose, fluoroquinolones), due to the conclusions from the clinical effectiveness review. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following: for HE, lactulose was the least costly agent, followed by lactulose in combination with neomycin, and then rifaximin (Xifaxan). For CDI, metronidazole was the least costly agent, followed by vancomycin, with

fidaxomicin (Dificid) as the most costly agent. For TD, ciprofloxacin was the least costly agent followed by rifaximin (Xifaxan) and nitazoxanide (Alinia).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 2 opposed, 1 abstained, 0 absent) the following scenario for the UF, which is the most clinically and cost-effective option for the MHS.
    - UF: metronidazole, vancomycin, neomycin, rifaximin (Xifaxan), nitazoxanide (Alinia), and fidaxomicin (Dificid)
    - Fidaxomicin (Dificid) is available solely in the retail network. Availability of Dificid from mail order is not recommended due to the time constraints for treating acute *C. difficile* infection. Additionally, due to noncompliance with the Trade Agreements Act, Dificid is excluded from mail order and military treatment facilities (MTFs). Efforts to allow availability of Dificid at the MTFs are ongoing at this time.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) maintaining metronidazole 250 mg and 500 mg tablets on the BCF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (15 for, 1 opposed, 1 abstained, 0 absent) PA criteria for rifaximin (Xifaxan) 200 mg for TD. Automated PA criteria would require use of a fluoroquinolone prior to use of rifaximin 200 mg for travelers' diarrhea, unless the patient is under age 18, has a documented allergy to a fluoroquinolone, or is returning from an area with high fluoroquinolone resistance. The P&T Committee also recommended (14 for, 2 opposed, 1 abstained, 0 absent) PA criteria for rifaximin (Xifaxan) 550 mg for hepatic encephalopathy, consistent with the FDA-approved labeling. Other uses of rifaximin are not covered, including *C. difficile* infection, irritable bowel syndrome, inflammatory bowel disease, chronic abdominal pain, hepatitis, diabetes, and rosacea. (See Appendix C for full criteria.)

4. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (15 for, 1 opposed, 1 abstained, 0 absent) QLs for the following GI-2 drugs:
    - Fidaxomicin (Dificid): 20 tablets with no refill in all POS, consistent with the product labeling
    - Rifaximin (Xifaxan) 200 mg: For travelers' diarrhea, if prior authorization is approved, a 3-day supply (9 tablets) in all three POS is

recommended, consistent with the product labeling. For hepatic encephalopathy, if prior authorization is approved, overrides will be allowed.

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 90-day implementation period in all POS. Based in the P&T Committee's recommendation, the effective date is May 15, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

D. Hepatitis C Drugs*Relative Clinical Effectiveness Conclusion*—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

- Triple therapy with a direct acting antiviral agent (boceprevir or telaprevir), PEG-interferon, and ribavirin increases sustained viral response (SVR) rates to a greater extent than dual therapy with PEG-interferon and ribavirin (PR).
- There is insufficient evidence to conclude whether boceprevir (Victrelis) or telaprevir (Incivek) is superior to the other, due to the lack of direct comparative trials. Telaprevir offers patient convenience due to its shorter treatment course than boceprevir (12 weeks versus 44 weeks), but this has not resulted in higher SVR rates.
- There is insufficient evidence to support a preference of Pegasys over PEG-Intron, but there do not appear to be clinically relevant differences in efficacy.
- Response-guided therapy for clinically appropriate patient populations maintains high levels of efficacy while shortening drug exposure times and treatment course duration.
- Compared with PR dual therapy, boceprevir triple therapy increases the risk for anemia and telaprevir triple therapy increases the risk for anemia and rash.

Relative Cost-Effectiveness Conclusion—CMA results of the direct acting antiviral agents (DAAs) showed response-guided therapy could be less costly with boceprevir than with telaprevir, based on current dosing recommendations. However, when each

agent was taken over its full treatment duration, telaprevir was less costly than boceprevir. The cost-effectiveness analysis concluded that combination use of DAAs plus PEG-interferon alfa and ribavirin was a cost-effective option for the treatment of chronic hepatitis C. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that the most cost-effective scenario placed ribavirin (generics), PEG-interferon alfa-2a (Pegasys), interferon alfa-2b (Intron A), PEG-interferon alfa-2b (PEG-Intron), boceprevir (Victrelis), and telaprevir (Incivek) as formulary on the UF, and ribavirin (Ribapak) and interferon alfacon-1 (Infergen) as NF on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following:
    - UF status for boceprevir (Victrelis), telaprevir (Incivek), PEG-interferon alfa-2a (Pegasys), PEG-interferon alfa-2b (PEG-Intron), interferon alfa-2b (Intron A), and ribavirin (except for the Ribapak formulation); and,
    - NF status for interferon alfacon-1 (Infergen) and the ribavirin Ribapak formulation, due to the lack of compelling clinical advantages and cost disadvantages when compared to the UF products.

2. ***COMMITTEE ACTION: EXTENDED CORE FORMULARY (ECF) RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) designating telaprevir (Incivek), PEG-interferon alfa-2a (Pegasys), and ribavirin 200 mg capsules (generics) as ECF products, based on clinical and cost-effectiveness.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) PA criteria for boceprevir (Victrelis) and telaprevir (Incivek), consistent with the FDA-approved labeling. Prior authorization will expire after 12 weeks for telaprevir and 44 weeks for boceprevir. (See Appendix C for full criteria.)

4. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following QLs:
    - For boceprevir and telaprevir: a 28-day supply per prescription at all three POS, with no multiple fills for multiple co-pays; and,
    - For all the interferon and ribavirin products: a 90-day supply in MTFs and Mail Order, and a 30-day supply in the retail network.

5. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for

interferon alfacon-1 (Infergen) and Ribapak. (See Appendix B for full MN criteria.)

6. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is April 17, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

III. RE-EVALUATION OF NF AGENTS

On an ongoing basis, the DoD Pharmacoeconomic Center monitors changes in the clinical information, current costs, and utilization trends to determine whether the UF status of agents designated as NF needs to be readdressed. The P&T Committee's process for the re-evaluation of NF agents established at the May 2007 meeting was approved by the Director, TMA on June 24, 2007, and is outlined in Appendix E.

The P&T Committee reevaluated the UF status of Lexapro (escitalopram) and pantoprazole (Protonix) in light of recent price reductions in the generic formulations across all three POS.

1. ***COMMITTEE ACTION: ESCITALOPRAM UF RECOMMENDATION AND IMPLEMENTATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) reclassification of escitalopram (Lexapro, generic) as formulary on the UF, as cost-effective generic formulations are now available in all three POS. Implementation will occur upon signing of the minutes.

2. ***COMMITTEE ACTION: PANTOPRAZOLE UF RECOMMENDATION AND IMPLEMENTATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) reclassification of pantoprazole (Protonix, generic) as formulary on the UF, as cost-effective generic formulations are now available in all three POS. Implementation will occur upon signing of the minutes.

Director, TMA, Decision: ☒ Approved □ Disapproved

Approved, but modified as follows:

IV. UTILIZATION MANAGEMENT

A. PAs

1. **Phosphodiesterase-5 (PDE-5) Inhibitors**—The PA criteria for the PDE-5 Inhibitor Drug Class was reviewed. Prior authorization allows use of a PDE-5 inhibitor following prostatectomy for preservation/restoration of erectile function for one year. There is no published evidence suggesting benefit if the PDE-5 inhibitor is initiated beyond one year after surgery. Recommendations were to clarify the existing PA criteria to state that prostatectomy surgery must have occurred less than 365 days from the date the PA form is signed.

   The additional recommendations were:

   - For Cialis: that existing criteria that apply to patients with benign prostatic hyperplasia (BPH) also apply to patients with BPH and erectile dysfunction (ED); and,
   - For sildenafil used for primary pulmonary hypertension (PPH): that the sildenafil dosage formulation specifically state 20 mg tablets to discourage use of sildenafil 20 mg tablets for ED.

   a) ***COMMITTEE ACTION: PDE-5 INHIBITOR PA CRITERIA***
   The P&T Committee recommended (14 for, 1 opposed, 2 abstained, 0 absent) PA criteria for the PDE-5 inhibitors (1) clarifying the existing PA criteria to state that prostatectomy surgery must have occurred less than 365 days from the date the PA form is signed; (2) for Cialis, that the existing criteria also apply to patients with BPH and ED; and, (3) for sildenafil for PPH, that the sildenafil dosage formulation will specifically state 20 mg tablets. (See Appendix C for full criteria.)

2. **Testosterone Replacement Therapy (TRT)**—PA criteria for the TRT Drug Class were developed at the August 2012 meeting and signed by the Director, TMA on November 8, 2012. The P&T Committee reviewed the PA criteria for use of TRT in women, which was based on level A evidence from the American College of Obstetrics and Gynecology, as outlined in a 2011 Clinical Bulletin. The Clinical Bulletin specifically mentions that

there is little evidence to support long-term TRT use (longer than 6 months) in women.

a) ***COMMITTEE ACTION: TRT USE IN WOMEN PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) revising the PA criteria for use of TRT in women to limit use to six months. (See Appendix C for full criteria.)

3. **Injectable Gonadotropins**—PA criteria currently apply to the injectable gonadotropins (fertility agents). Injectable gonadotropins are not covered under the TRICARE pharmacy benefit if they are being used in conjunction with a noncoital reproductive technology. In 2010, the Assistant Secretary of Defense for Health Affairs (ASD(HA)) authorized in vitro fertilization services for the benefit of severely or seriously ill/injured active duty service members. Implementation guidance for these services was developed in an April 2012 ASD(HA) policy.

a) ***COMMITTEE ACTION: INJECTABLE GONADOTROPINS PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 2 abstained, 0 absent) revising the PA criteria for the injectable gonadotropins (fertility agents), to allow for use in conjunction with a noncoital reproductive technology, as outlined in the ASD(HA) April 2012 "Policy for Assisted Reproductive Services for the Benefit of Seriously or Severely Ill/Injured (Category II or III) Active Duty Service Members." A Signed Authorization Memorandum from TMA must be included with the prescription. (See Appendix C for full criteria.)

4. **Adalimumab (Humira)**—The FDA recently approved a new indication for Humira, the designated ECF agent in the targeted immunomodulatory biologics (TIBs) Drug Class. Humira is now indicated for the treatment of moderately to severely active ulcerative colitis following inadequate response to immunosuppressants such as corticosteroids, azathioprine, and 6-mercaptopurine.

a) ***COMMITTEE ACTION: ADALIMUMAB (HUMIRA) PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) revising the existing PA criteria for Humira to incorporate the new indication for ulcerative colitis, consistent with the FDA-approved product labeling. (See Appendix C for full criteria.)

5. **Enzalutamide (Xtandi) and Abiratone (Zytiga)**—Two new drugs for metastatic castration-resistant prostate cancer were recently approved. Xtandi and Zytiga are costly agents with specific FDA-indications, requiring use of prior docetaxel-containing regimens.

    a) ***COMMITTEE ACTION: ENZALUTAMIDE (XTANDI) AND ABIRATONE (ZYTIGA) PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) PA criteria for enzalutamide (Xtandi), and abiratone (Zytiga), consistent with the FDA-approved product labeling. (See Appendix C for full criteria.)

B. QLs

1. **Ipratropium/albuterol (Combivent Respimat)**—Ipratropium/albuterol (Combivent Respimat) oral inhaler is a non chlorofluorocarbon-containing reformulation of ipratropium and albuterol. The current chlorofluorocarbon (CFC) formulation, Combivent, will be phased out and replaced by Combivent Respimat. Combivent supplies are to be exhausted by December 31, 2013. The entire chronic obstructive pulmonary disease drug class will be reviewed formally for UF placement, including the BCF, at an upcoming meeting. Quantity limits currently apply to all oral inhalers.

    a) ***COMMITTEE ACTION: IPRATROPIUM/ALBUTEROL (COMBIVENT RESPIMAT) QL***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) QLs for Combivent Respimat, restricting the maximum allowable quantity at the retail point of service to 2 inhalers in 30 days and 5 inhalers in 90 days at Mail Order and MTFs, consistent with recommended dosing. (See Appendix D.)

2. **Azelastine/fluticasone propionate (Dymista), adalimumab (Humira), enzalutamide (Xtandi), and abiratone (Zytiga)**—The P&T Committee evaluated QLs for several other drugs, including azelastine/fluticasone propionate nasal inhaler (Dymista) (Nasal Allergy Drug Class), Humira for the new indication ulcerative colitis (TIBs Drug Class), and Xtandi and Zytiga (oral chemotherapy drugs for prostate cancer).

    a) ***COMMITTEE ACTION: DYMISTA, HUMIRA, XTANDI, AND ZYTIGA QL***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) QLs for Dymista, Humira for ulcerative colitis, Xtandi, and Zytiga, as outlined in Appendix D, consistent with FDA-approved product labeling.

Director, TMA, Decision: ☒ Approved □ Disapproved

Approved, but modified as follows:

V. SECTION 703

A. Section 703—The P&T Committee reviewed Kaon (branded potassium gluconate) and Pamine (branded methscopolamine) to determine MN and pre-authorization criteria. These two products were identified as not fulfilling refund requirements required in section 703 of the 2008 National Defense Authorization Act. These drugs were designated NF on the UF at previous P&T Committee meetings.

1. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following should apply to Kaon and Pamine. Coverage at retail network pharmacies would be approved if the patient met all of the following criteria:

   a) Manual Pre-Authorization Criteria:

      (1) Obtaining the product from home delivery would be detrimental to the patient.

      (2) For branded products with AB generic availability, use of the generic product would be detrimental to the patient.

   b) Implementation will occur upon signing of the minutes.

   The pre-authorization criteria listed above do not apply to any point of service other than retail network pharmacies.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VI. OVERVIEWS

Two drug class overviews were presented to the P&T Committee, the oral anticoagulants (vitamin K antagonists, direct thrombin inhibitors, Factor Xa inhibitors), and the drugs for chronic obstructive pulmonary disease (COPD). Neither drug class has previously been reviewed for UF status. The clinical and economic analyses of these classes will be presented at an upcoming meeting.

VII. ITEMS FOR INFORMATION

A. Joint Forces Pharmacy Seminar (JFPS) Presentation—The P&T Committee was briefed on spends and trends in MHS drug utilization, which was presented at the JFPS in October.

SUBMITTED BY:

John P. Kugler, M.D., MPH
DoD P&T Committee Chair

DECISION ON RECOMMENDATIONS

Director, TMA, decisions are as annotated above.

Jonathan Woodson, M.D.
Director

Feb 13, 2013
Date

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE MINUTES AND RECOMMENDATIONS

November 2012

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on November 14 and 15, 2012, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of August Minutes**—Jonathon Woodson M.D., Director, approved the minutes for the August 2012 DoD P&T Committee meeting on November 8, 2012.
2. **Correction to the May 2012 Minutes**—The May minutes were corrected to state the quantity limits for the smoking cessation products, nicotine gum and nicotine lozenge, are limited to 600 pieces per 60-day claim, rounded to the nearest multiple of the package size (e.g., boxes of 75 or 100). The QL recommendations are contingent on publication of the Final Rule.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and Basic Core Formulary (BCF) recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. High Potency Narcotic Analgesics—Oxycodone Immediate Release (IR) (Oxecta)

Relative Clinical Effectiveness—Oxecta is a formulation of oxycodone IR that is tamper resistant but not tamper proof. FDA approval was based on demonstrated bioequivalence to the Roxycodone proprietary formulation of oxycodone IR. One small

"drug liking" study showed a reduced "liking" for Oxecta versus Roxycodone, but the widespread clinical applicability of these results is unknown.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that Oxecta is the first abuse deterrent IR oxycodone formulation marketed. There is no evidence to suggest oxycodone IR (Oxecta) has a compelling clinical advantage over the other high potency narcotic analgesics included on the UF.

Relative Cost-Effectiveness Analysis and Conclusion—A pharmacoeconomic analysis was performed. The weighted average cost per tablet at all three points of service (POS) was evaluated for oxycodone IR (Oxecta) in relation to the other drugs in the high potency narcotic subclass. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that Oxecta was not cost-effective when compared to other high potency narcotics included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) oxycodone IR (Oxecta) be designated NF due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (15 for, 1 opposed, 1 abstained, 0 absent) MN criteria for Oxecta. (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service (POS), and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is April 17, 2013.

V. UF DRUG CLASS REVIEWS

A. Non-Insulin Diabetes Drugs—Glucagon-Like Peptide-1 Receptor Agonists (GLP1RAs)

Background and Relative Clinical Effectiveness—The GLP1RAs are a subclass of the Non-Insulin Diabetes Drug Class, which is comprised of exenatide twice daily (BID) injection (Byetta), liraglutide once daily injection (Victoza), and exenatide once weekly injection (Bydureon). Bydureon is the newest entrant to the class.

The GLP1RA class was previously reviewed for UF placement in November 2010.

Step therapy implemented in April 2011 requires a trial of metformin or a sulfonylurea prior to use of a GLP1RA. An additional step therapy/prior authorization (PA) requirement has been in effect for the GLP1RAs subclass since April 2011, requiring that new GLP1RA users try exenatide BID (Byetta) before TRICARE® will cover the other agents in this drug subclass. The Pharmacy Outcomes Research Team (PORT) provided the P&T Committee detailed analyses of current MHS prescription patterns. The data presented were factored into the relative clinical and cost-effectiveness determinations.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following clinical effectiveness conclusions:

- Metformin is the most cost-effective agent and remains the first line treatment in all patients with type 2 diabetes mellitus, unless contraindications exist, due to positive outcomes data from the United Kingdom Prospective Diabetes Study.
- When used as monotherapy or in combination with other oral agents, GLP1RAs decrease hemoglobin A1c approximately 1%–2% from baseline. When compared head-to-head, overall there are no clinically relevant differences between the three GLP1RAs with regard to effect on glycemic control.
- Bydureon and Victoza have a greater effect than Byetta on fasting blood glucose due to a longer duration of action. Byetta has a greater effect on post-prandial glucose than the other two GLP1RAs.
- Gastrointestinal issues are the most common adverse effect with the GLP1RAs. Bydureon has a lower incidence of nausea (14.4%) compared to Victoza (20.7%) or Byetta (34.7%). Injection site reactions are more common with Bydureon (17.1%) than Byetta (12.7%), insulin glargine (1.8%), or placebo (6.4%–13%).
- Bydureon offers additional patient convenience given its once weekly dosing regimen and does not require titration compared to Byetta, but is not available in a pre-filled syringe.
- There are no studies evaluating adherence with the three GLP1RAs.
- There are no published trials that assess long-term outcomes; however, the LEADER and EXSCEL studies evaluating long-term cardiovascular safety are currently ongoing.

Relative Cost-Effectiveness Analysis and Conclusion—Pharmacoeconomic analyses were performed for the GLP1RA subclass, including cost minimization analysis (CMA) and budget impact analysis (BIA). For the BIAs, several of the model's key

assumptions were varied, with corresponding sensitivity analyses conducted. Methods used for CMA and BIAs were based on current step therapy requiring a trial of metformin or a sulfonylurea prior to a patient receiving a GLP1RA.

The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that exenatide BID (Byetta) was the most cost-effective GLP1RA, based on the weighted average cost per day of treatment across all three POS, followed by exenatide once weekly (Bydureon) and liraglutide (Victoza) (ranked in order from most to least cost-effective). Results from the CMA and BIA showed scenarios where exenatide BID (Byetta), exenatide once weekly (Bydureon), and liraglutide (Victoza) are all designated UF presented a cost avoidance projection comparable (i.e., within a margin of error) to the current UF scenario where all GLP1RAs are UF. Data was not available to assess the potential pharmacoeconomic impact of longer-acting GLP1RA formulations on medication adherence and health-related outcomes in this cost-effectiveness evaluation.

1. ***COMMITTEE ACTION: UF/BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following:

    - Designating exenatide BID (Byetta), liraglutide once daily (Victoza), and exenatide once weekly (Bydureon) as formulary on the UF;
    - Excluding Byetta, Victoza, and Bydureon GLP1RAs from the BCF; and,
    - Removing the current requirement for a trial of Byetta prior to the other GLP1RAs (removing the subclass step therapy requirement). As a result, there would no longer be a preferred GLP1RA product.

2. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) maintaining the current PA requiring a trial of metformin or a sulfonylurea prior to the use of exenatide BID (Byetta), liraglutide once daily (Victoza), or exenatide once weekly (Bydureon). A trial of metformin or a sulfonylurea would not be required for patients with an adverse event, contraindication to, or inadequate response with metformin or sulfonylurea. Use of a GLP1RA product is approved only for patients with type 2 diabetes mellitus. Automated PA criteria (step-therapy) and manual PA criteria remain the same as recommended at the November 2010 P&T Committee meeting, and implemented in April 2011. (See Appendix C for full criteria.)

3. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 30-day

implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is March 20, 2013.

B. Overactive Bladder Drugs (OABs)

Background and Relative Clinical Effectiveness—The Overactive Bladder (OAB) Drug Class is comprised of darifenacin (Enablex), fesoterodine (Toviaz), oxybutynin IR (Ditropan, generics), oxybutynin extended release (ER) (Ditropan XL, generics), oxybutynin transdermal delivery system (TDS) (Oxytrol), oxybutynin 10% gel (Gelnique), solifenacin (Vesicare), tolterodine IR (Detrol, generics), tolterodine ER (Detrol LA), trospium IR (Sanctura, generics), and trospium ER (Sanctura XR, generics). Generic formulations of Detrol IR, Sanctura IR and Sanctura XR recently entered the market. The OAB drug class has been previously reviewed for UF placement in August 2008, and May and November 2009.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following clinical effectiveness conclusions:

- Review of the clinical literature for efficacy, safety, and tolerability data since the last P&T Committee review in 2008 did not add substantial new information.
- The OAB agents are statistically superior to placebo, but the placebo response rates are high for the class, ranging from 30% to 50%.
- There is insufficient evidence to suggest whether one OAB drug is superior to another. Small studies of low quality evidence reported fesoterodine (Toviaz) was statistically superior to tolterodine, and solifenacin (Vesicare) was statistically superior to tolterodine, but the clinical effect is small, relating to a reduction in urge episodes/incontinent episodes of approximately one episode/day.
- No OAB agent has a superior safety profile. Oxybutynin TDS (Oxytrol) causes less dry mouth than tolterodine ER, but has higher withdrawal rates. There is scant safety data for the oxybutynin 10% gel (Gelnique) formulation, but the effects are likely to be similar to oxybutynin TDS with regards to dry mouth.
- Overall, adverse drug effects are lower with the ER formulations than IR formulations. The newer agents do not have significantly lower incidence of dry mouth or constipation than the older OAB drugs.
- Persistence rates within the MHS remain low at 12% for all the OAB drugs. As needed use of the OAB drugs is 26% in the MHS.
- There are no studies evaluating clinical outcomes, such as reduced fall risk or delayed nursing home placement with the OAB drugs.
- There is a high degree of therapeutic interchangeability within the class.

Relative Cost-Effectiveness Analysis and Conclusion—Pharmacoeconomic analyses were performed for the OABs, including CMA and BIA. For the BIAs, several of the model's key assumptions were varied, with corresponding sensitivity analyses conducted. The P&T Committee concluded (17 for, 0 against, 0 abstained, 0 absent) that for preferred formulary placement status, oxybutynin IR (Ditropan, generics) was the least costly agent based on the weighted average cost per day of treatment across all three POS, followed by oxybutynin ER (Ditropan XL, generics), tolterodine ER (Detrol LA), solifenacin (Vesicare), oxybutynin 10% gel (Gelnique), fesoterodine (Toviaz), oxybutynin TDS (Oxytrol), trospium IR (Sanctura, generics), trospium ER (Sanctura XR, generics), darifenacin (Enablex), and tolterodine IR (Detrol, generics).

BIA results were presented to the P&T Committee and indicated that step therapy scenarios were more cost-effective compared to the current baseline (non step therapy). The MHS projected budgetary impact varied depending on which medication was selected for step-preferred status. CMA and BIA results showed that among available formulary options examined, the scenario where oxybutynin IR, oxybutynin ER, and Detrol LA were designated as step-preferred, with step therapy applied to all current and new users of non-preferred OAB products, was most cost-effective.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following:

    - UF and step-preferred ("in front of the step"): tolterodine ER (Detrol LA), oxybutynin IR (Ditropan, generics), and oxybutynin ER (Ditropan XL, generics). Prior authorization would require that all patients try Detrol LA, oxybutynin IR, or oxybutynin ER before TRICARE will cover the other agents in this drug class.
    - UF and non step-preferred ("behind the step"): trospium IR (Sanctura, generics), trospium ER (Sanctura XR, generics), tolterodine IR (Detrol, generics) and solifenacin (Vesicare)
        - When the generics to Sanctura, Sanctura XR, and Detrol become cost-effective relative to the step-preferred agents, the generics will become step-preferred without further action by the P&T Committee, Beneficiary Advisory Panel, or Director, TMA. A generic agent is cost-effective relative to step-preferred agents when the generic agent's total weighted average cost per day of treatment is less than or equal to the total weighted average cost per day of treatment for the step-preferred agent.
    - NF and non step-preferred: darifenacin (Enablex), fesoterodine (Toviaz), oxybutynin TDS (Oxytrol), and oxybutynin 10% gel (Gelnique).

- Step therapy would apply to all users (current and new) of the OAB drugs.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) maintaining Detrol LA and oxybutynin ER on the BCF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) PA criteria for all current and new users of the OAB drugs, requiring a trial of Detrol LA, oxybutynin IR, or oxybutynin ER prior to the use of the other OAB drugs. (See Appendix C for full criteria.)

4. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Enablex, Toviaz, Oxytrol, and Gelnique 10%. (See Appendix B for full MN criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 90-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is May 15, 2013.

   Addendum to the UF recommendation: During a post meeting bid review, it was determined that after-step bids should not be accepted and modeled due to verbiage in the bid solicitation. As a result of this determination, the cost analysis was recalculated. This new cost model was presented to the DoD P&T committee via electronic means. An electronic vote was taken to determine a) whether to accept the new cost review, maintain the current scenario and maintain current UF recommendations, or b) withdraw the UF recommendation, rebid the class and present results at the Feb 2013 meeting.

6. ***COMMITTEE ACTION: ADDENDUM TO UF RECOMMENDATION***
   The P&T Committee recommended (9 for, 5 opposed, 0 abstained, 3 absent) to approve the current scenario, which maintains the UF recommendation, step therapy requirements for all new and current users of OAB drugs, and PA criteria.

C. Gastrointestinal-2 Oral Antibiotic Drugs (GI-2)

Background and Relative Clinical Effectiveness—The Gastrointestinal-2 Oral Antibiotics (GI-2) Drug Class includes metronidazole (Flagyl, generics), vancomycin (Vancocin, generics), rifaximin (Xifaxan), fidaxomicin (Dificid), nitazoxanide (Alinia) and neomycin (Neo-Fradin, generics). This review focused on clinical effectiveness with regard to hepatic encephalopathy, *Clostridium difficile* infection, travelers' diarrhea, and non FDA-approved (off-label) uses. The class has not been previously reviewed for UF placement. The PORT provided the P&T Committee detailed analyses of current MHS prescription patterns. The data presented were factored into the relative clinical and cost-effectiveness determinations.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following concerning the GI-2 Drug Class:

- **Hepatic Encephalopathy (HE)**
  - Practice guidelines recommend lactulose as first line therapy for treatment of HE.
  - A Cochrane analysis found antibiotics, including rifaximin, were superior to lactulose in improving HE symptoms.
  - While rifaximin is approved for monotherapy, it is commonly used in combination with lactulose, and is better tolerated than lactulose.
- ***Clostridium difficile* Infection (CDI)**
  - Metronidazole is equally effective as vancomycin in treating mild to moderate CDI, but for severe CDI vancomycin results in higher clinical cure rates.
  - Fidaxomicin and vancomycin provide similar clinical cure rates for CDI; however, fidaxomicin decreases recurrence and increases global cure rates to a greater extent than vancomycin.
  - Comparative efficacy for nitazoxanide and rifaximin for CDI cannot be assessed, given the small numbers of trials.
- **Travelers' Diarrhea (TD)**
  - Practice guidelines recommend fluoroquinolones (e.g., levofloxacin, ciprofloxacin) as first line treatment for TD, unless contraindications exist.
  - A systematic review found ciprofloxacin more effective than rifaximin for prevention of TD.
  - Rifaximin's labeled indication is limited to treatment of TD caused by noninvasive strains of *Escherichia coli*. It is not effective for TD caused by Campylobacter, Shigella, and Salmonella species.
- **Off-label Uses**

- Rifaximin has been evaluated for irritable bowel syndrome (IBS) but is not approved by the FDA for IBS. In two studies, rifaximin showed modest (9%–12%) improvements in response rates compared to placebo; however, there was a significant placebo effect.
- Unanswered questions regarding use of rifaximin for IBS include the durability of response, efficacy for retreatment, prevention of recurrence, *C. difficile* emergence, bacterial resistance, and long-term side effects.
- Nonsupportable uses for rifaximin include CDI, inflammatory bowel disease, chronic abdominal pain, hepatitis, diabetes, rosacea, and any other non FDA-approved indication.

Relative Cost-Effectiveness Analysis and Conclusion—Pharmacoeconomic analyses, including CMA, were performed for the GI-2 Drug Class. Cost analyses were based on the disease states discussed in the clinical section. Comparative costs for agents from other drug classes were considered (e.g., lactulose, fluoroquinolones), due to the conclusions from the clinical effectiveness review. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following: for HE, lactulose was the least costly agent, followed by lactulose in combination with neomycin, and then rifaximin (Xifaxan). For CDI, metronidazole was the least costly agent, followed by vancomycin, with fidaxomicin (Dificid) as the most costly agent. For TD, ciprofloxacin was the least costly agent followed by rifaximin (Xifaxan) and nitazoxanide (Alinia).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (14 for, 2 opposed, 1 abstained, 0 absent) the following scenario for the UF, which is the most clinically and cost-effective option for the MHS.
    - UF: metronidazole, vancomycin, neomycin, rifaximin (Xifaxan), nitazoxanide (Alinia), and fidaxomicin (Dificid)
    - Fidaxomicin (Dificid) is available solely in the retail network. Availability of Dificid from mail order is not recommended due to the time constraints for treating acute *C. difficile* infection. Additionally, due to noncompliance with the Trade Agreements Act, Dificid is excluded from mail order and military treatment facilities (MTFs). Efforts to allow availability of Dificid at the MTFs is ongoing at this time.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) maintaining metronidazole 250 mg and 500 mg tablets on the BCF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (15 for, 1 opposed, 1 abstained, 0 absent) PA criteria for rifaximin (Xifaxan) 200 mg for TD. Automated PA criteria would require use of a fluoroquinolone prior to use of rifaximin 200 mg for travelers' diarrhea, unless the patient is under age 18, has a documented allergy to a fluoroquinolone, or is returning from an area with high fluoroquinolone resistance. The P&T Committee also recommended (14 for, 2 opposed, 1 abstained, 0 absent) PA criteria for rifaximin (Xifaxan) 550 mg for hepatic encephalopathy, consistent with the FDA-approved labeling. Other uses of rifaximin are not covered, including *C. difficile* infection, irritable bowel syndrome, inflammatory bowel disease, chronic abdominal pain, hepatitis, diabetes, and rosacea. (See Appendix C for full criteria.)

4. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (15 for, 1 opposed, 1 abstained, 0 absent) QLs for the following GI-2 drugs:

    - Fidaxomicin (Dificid): 20 tablets with no refill in all POS, consistent with the product labeling
    - Rifaximin (Xifaxan) 200 mg: For travelers' diarrhea, if prior authorization is approved, a 3-day supply (9 tablets) in all three POS is recommended, consistent with the product labeling. For hepatic encephalopathy, if prior authorization is approved, overrides will be allowed.

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 90-day implementation period in all POS. Based in the P&T Committee's recommendation, the effective date is May 15, 2013.

D. Hepatitis C Drugs

Background and Relative Clinical Effectiveness—The Hepatitis C Drug Class includes the direct acting antiviral agents (DAAs) boceprevir (Victrelis) and telaprevir (Incivek); the interferon products PEG-interferon alfa-2a (Pegasys), PEG-interferon alfa-2b (PEG-Intron), and interferon alfacon-1(Infergen); and, various ribavirin products, including generics. Interferon alfa-2b (Intron A) is no longer used for treating hepatitis C virus infection and will not be discussed further. The PORT provided the P&T Committee detailed analyses of current MHS prescription patterns. The data presented were factored into the relative clinical and cost-effectiveness determinations.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) on the following:

- Triple therapy with a direct acting antiviral agent (boceprevir or telaprevir), PEG-interferon, and ribavirin increases sustained viral response (SVR) rates to a greater extent than dual therapy with PEG-interferon and ribavirin (PR).
- There is insufficient evidence to conclude whether boceprevir (Victrelis) or telaprevir (Incivek) is superior to the other, due to the lack of direct comparative trials. Telaprevir offers patient convenience due to its shorter treatment course than boceprevir (12 weeks versus 44 weeks), but this has not resulted in higher SVR rates.
- There is insufficient evidence to support a preference of Pegasys over PEG-Intron, but there do not appear to be clinically relevant differences in efficacy.
- Interferon alfacon-1 (Infergen) has poor efficacy and is not included in current clinical practice guidelines. It no longer holds a niche in the treatment of prior null responders.
- Ribavirin is ineffective as monotherapy, but is critical to prevent relapse of hepatitis C virus infection.
- Compared with PR dual therapy, boceprevir triple therapy increases the risk for anemia and telaprevir triple therapy increases the risk for anemia and rash.
- Response-guided therapy for clinically appropriate patient populations maintains high levels of efficacy while shortening drug exposure times and treatment course duration.
- Overall drug discontinuations due to adverse events ranged from 8%–14% with telaprevir triple therapy versus 3% with PR dual therapy, and was 13% with boceprevir triple therapy versus 12% with PR dual therapy.
- With boceprevir, unique adverse events include dysgeusia, neutropenia, and psychiatric events, compared to anorectal adverse events (hemorrhoids, burning, itching) with telaprevir.

Relative Cost-Effectiveness Analysis and Conclusion—CMA was performed to compare each regimen for hepatitis C treatment (ribavirin, PEG-interferons, and DAAs). A cost-effectiveness analysis (CEA) was also performed comparing triple therapy (DAAs, PEG-interferon, and ribavirin) with dual therapy (PEG-interferon alfa and ribavirin). Additionally, a BIA was performed to compare competing formulary scenarios.

CMA results for the evaluated agents showed most dosage forms of ribavirin were generic and cost-effective. However, Ribapak was deemed not cost-effective compared with other ribavirin dosage forms. Both PEG-interferon alfa products (Pegasys and

PEG-Intron) had comparable costs. Interferon alfacon-1 (Infergen) was identified as not cost-effective when compared with the PEG-interferon agents. CMA results for the DAAs showed response-guided therapy could be less costly with boceprevir than with telaprevir, based on current dosing recommendations. However, when each agent was taken over its full treatment duration, telaprevir was less costly than boceprevir.

While insufficient evidence existed to establish a meaningful clinical difference in efficacy between the DAAs, the clinical effectiveness evaluation demonstrated that DAAs plus PEG-interferon alfa and ribavirin were more effective in combination than PEG-interferon alfa and ribavirin alone in inducing a SVR. The CEA concluded that combination use of DAAs plus PEG-interferon alfa and ribavirin was a cost-effective option for the treatment of genotype 1 chronic hepatitis C in adults with compensated liver disease who were previously untreated or for whom previous treatment had failed.

The BIA results suggested that designating ribavirin (Ribapak) and interferon alfacon-1 (Infergen) as NF on the UF was the most favorable scenario for the MHS.

The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that the most cost-effective scenario placed ribavirin (generics), PEG-interferon alfa-2a (Pegasys), interferon alfa-2b (Intron A), PEG-interferon alfa-2b (Peg-Intron), boceprevir (Victrelis), and telaprevir (Incivek) as formulary on the UF, and ribavirin (Ribapak) and interferon alfacon-1 (Infergen) as NF on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following:
    - UF status for boceprevir (Victrelis), telaprevir (Incivek), PEG-interferon alfa-2a (Pegasys), PEG-interferon alfa-2b (PEG Intron), interferon alfa-2b (Intron A), and ribavirin (except for the Ribapak formulation); and,
    - NF status for interferon alfacon-1 (Infergen) and the ribavirin Ribapak formulation, due to the lack of compelling clinical advantages and cost disadvantages when compared to the UF products.

2. ***COMMITTEE ACTION: EXTENDED CORE FORMULARY (ECF) RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) designating telaprevir (Incivek), PEG-interferon alfa-2a (Pegasys), and ribavirin 200 mg capsules (generics) as ECF products, based on clinical and cost-effectiveness.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) PA criteria for boceprevir (Victrelis) and telaprevir (Incivek), consistent with the FDA-approved labeling. Prior

authorization will expire after 12 weeks for telaprevir and 44 weeks for boceprevir. (See Appendix C for full criteria.)

4. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following QLs:

   - For boceprevir and telaprevir: a 28-day supply per prescription at all three POS, with no multiple fills for multiple co-pays; and,
   - For all the interferon and ribavirin products: a 90-day supply in MTFs and Mail Order, and a 30-day supply in the retail network.

5. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for interferon alfacon-1 (Infergen) and Ribapak. (See Appendix B for full MN criteria.)

6. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is April, 17, 2013.

VI. RE-EVALUATION OF NF AGENTS

On an ongoing basis, the DoD PEC monitors changes in the clinical information, current costs, and utilization trends to determine whether the UF status of agents designated as NF needs to be readdressed. The P&T Committee's process for the re-evaluation of NF agents established at the May 2007 meeting was approved by the Director, TMA on June 24, 2007, and is outlined in Appendix E.

The P&T Committee reevaluated the UF status of Lexapro (escitalopram) and pantoprazole (Protonix) in light of recent price reductions in the generic formulations across all three POS.

1. ***COMMITTEE ACTION: ESCITALOPRAM UF RECOMMENDATION AND IMPLEMENTATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) reclassification of escitalopram (Lexapro, generic) as formulary on the UF, as cost-effective generic formulations are now available in all three POS. Implementation will occur upon signing of the minutes.

2. ***COMMITTEE ACTION: PANTOPRAZOLE UF RECOMMENDATION AND IMPLEMENTATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) reclassification of pantoprazole (Protonix, generic) as formulary on the UF, as cost-effective generic formulations are now available in all three POS. Implementation will occur upon signing of the minutes.

VII. UTILIZATION MANAGEMENT

A. PAs

1. **Phosphodiesterase-5 (PDE-5) Inhibitors**—The PA criteria for the PDE-5 Inhibitor Drug Class was reviewed. Prior authorization allows use of a PDE-5 inhibitor following prostatectomy for preservation/restoration of erectile function for one year. There is no published evidence suggesting benefit if the PDE-5 inhibitor is initiated beyond one year after surgery. Recommendations were to clarify the existing PA criteria to state that prostatectomy surgery must have occurred less than 365 days from the date the PA form is signed.

   The additional recommendations were:

   - For Cialis: that existing criteria that apply to patients with benign prostatic hyperplasia (BPH) also apply to patients with BPH and erectile dysfunction (ED); and,
   - For sildenafil used for primary pulmonary hypertension (PPH): that the sildenafil dosage formulation specifically state 20 mg tablets to discourage use of sildenafil 20 mg tablets for ED.

   a) ***COMMITTEE ACTION: PDE-5 INHIBITOR PA CRITERIA***
   The P&T Committee recommended (14 for, 1 opposed, 2 abstained, 0 absent) PA criteria for the PDE-5 inhibitors (1) clarifying the existing PA criteria to state that prostatectomy surgery must have occurred less than 365 days from the date the PA form is signed; (2) for Cialis, that the existing criteria also apply to patients with BPH and ED; and, (3) for sildenafil for PPH, that the sildenafil dosage formulation will specifically state 20 mg tablets. (See Appendix C for full criteria.)

2. **Testosterone Replacement Therapy (TRT)**—PA criteria for the TRT Drug Class were developed at the August 2012 meeting and signed by the Director, TMA on November 8, 2012. The P&T Committee reviewed the PA criteria for use of TRT in women, which was based on level A evidence from the American College of Obstetrics and Gynecology, as outlined in a

2011 Clinical Bulletin. The Clinical Bulletin specifically mentions that there is little evidence to support long-term TRT use (longer than 6 months) in women.

a) ***COMMITTEE ACTION: TRT USE IN WOMEN PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) revising the PA criteria for use of TRT in women to limit use to six months. (See Appendix C for full criteria.)

3. **Injectable Gonadotropins**—PA criteria currently apply to the injectable gonadotropins (fertility agents). Injectable gonadotropins are not covered under the TRICARE pharmacy benefit if they are being used in conjunction with a noncoital reproductive technology. In 2010, the Assistant Secretary of Defense for Health Affairs (ASD(HA)) authorized in vitro fertilization services for the benefit of severely or seriously ill/injured active duty service members. Implementation guidance for these services was developed in an April 2012 ASD(HA) policy.

   a) ***COMMITTEE ACTION: INJECTABLE GONADOTROPINS PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 2 abstained, 0 absent) revising the PA criteria for the injectable gonadotropins (fertility agents), to allow for use in conjunction with a noncoital reproductive technology, as outlined in the ASD(HA) April 2012 "Policy for Assisted Reproductive Services for the Benefit of Seriously or Severely Ill/Injured (Category II or III) Active Duty Service Members." A Signed Authorization Memorandum from TMA must be included with the prescription. (See Appendix C for full criteria.)

4. **Adalimumab (Humira)**—The FDA recently approved a new indication for Humira, the designated ECF agent in the targeted immunomodulatory biologics (TIBs) Drug Class. Humira is now indicated for the treatment of moderately to severely active ulcerative colitis following inadequate response to immunosuppressants such as corticosteroids, azathioprine, and 6-mercaptopurine.

   a) ***COMMITTEE ACTION: ADALIMUMAB (HUMIRA) PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) revising the existing PA criteria for Humira to

incorporate the new indication for ulcerative colitis, consistent with the FDA-approved product labeling. (See Appendix C for full criteria.)

5. **Enzalutamide (Xtandi) and Abiratone (Zytiga)**—Two new drugs for metastatic castration-resistant prostate cancer were recently approved. Xtandi and Zytiga are costly agents with specific FDA-indications, requiring use of prior docetaxel-containing regimens.

    a) ***COMMITTEE ACTION: ENZALUTAMIDE (XTANDI) AND ABIRATONE (ZYTIGA) PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) PA criteria for enzalutamide (Xtandi), and abiratone (Zytiga), consistent with the FDA-approved product labeling. (See Appendix C for full criteria.)

B. QLs

1. **Ipratropium/albuterol (Combivent Respimat)**—Ipratropium/albuterol (Combivent Respimat) oral inhaler is a non chlorofluorocarbon-containing reformulation of ipratropium and albuterol. The current chlorofluorocarbon (CFC) formulation, Combivent, will be phased out and replaced by Combivent Respimat. Combivent supplies are to be exhausted by December 31, 2013. The entire chronic obstructive pulmonary disease drug class will be reviewed formally for UF placement, including the BCF, at an upcoming meeting. Quantity limits currently apply to all oral inhalers.

    a) ***COMMITTEE ACTION: IPRATROPIUM/ALBUTEROL (COMBIVENT RESPIMAT) QL***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) QLs for Combivent Respimat, restricting the maximum allowable quantity at the retail point of service to 2 inhalers in 30 days and 5 inhalers in 90 days at Mail Order and MTFs, consistent with recommended dosing. (See Appendix D.)

2. **Azelastine/fluticasone propionate (Dymista), adalimumab (Humira), enzalutamide (Xtandi), and abiratone (Zytiga)**—The P&T Committee evaluated QLs for several other drugs, including azelastine/fluticasone propionate nasal inhaler (Dymista) (Nasal Allergy Drug Class), Humira for the new indication ulcerative colitis (TIBs Drug Class), and Xtandi and Zytiga (oral chemotherapy drugs for prostate cancer).

    a) ***COMMITTEE ACTION: DYMISTA, HUMIRA, XTANDI, AND ZYTIGA QL***—The P&T Committee recommended (16 for, 0 opposed, 1

abstained, 0 absent) QLs for Dymista, Humira for ulcerative colitis, Xtandi, and Zytiga, as outlined in Appendix D, consistent with FDA-approved product labeling.

VIII. SECTION 703

A. Section 703—The P&T Committee reviewed Kaon (branded potassium gluconate) and Pamine (branded methscopolamine) to determine MN and pre-authorization criteria. These two products were identified as not fulfilling refund requirements required in section 703 of the 2008 National Defense Authorization Act. These drugs were designated NF on the UF at previous P&T Committee meetings.

1. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following should apply to Kaon and Pamine. Coverage at retail network pharmacies would be approved if the patient met all of the following criteria:

   a) Manual Pre-Authorization Criteria:

      (1) Obtaining the product from home delivery would be detrimental to the patient.

      (2) For branded products with AB generic availability, use of the generic product would be detrimental to the patient.

   b) Implementation will occur upon signing of the minutes.

   The pre-authorization criteria listed above do not apply to any point of service other than retail network pharmacies.

VIII. OVERVIEWS

Two drug class overviews were presented to the P&T Committee, the oral anticoagulants (vitamin K antagonists, direct thrombin inhibitors, Factor Xa inhibitors), and the drugs for chronic obstructive pulmonary disease (COPD). Neither drug class has previously been reviewed for UF status. The clinical and economic analyses of these classes will be presented at an upcoming meeting.

IX. ITEMS FOR INFORMATION

A. Joint Forces Pharmacy Seminar (JFPS) Presentation—The P&T Committee was briefed on spends and trends in MHS drug utilization, which was presented at the JFPS in October.

VIII. ADJOURNMENT

The meeting adjourned at 1130 hours on November 15, 2012. The next meeting will be in February 2013.

Appendix A—Attendance: November 2012 P&T Committee Meeting

Appendix B—Table of Medical Necessity Criteria

Appendix C—Table of Prior Authorization Criteria

Appendix D—Table of Quantity Limits

Appendix E—Criteria for Re-evaluation of Nonformulary Drugs for Uniform Formulary Status

Appendix F—Table of Implementation Status of UF Recommendations/Decisions Summary

Appendix G—Table of Abbreviations

Appendix A—Attendance: November 2012 P&T Committee Meeting

Voting Members Present	
John Kugler, COL (Ret.), MC, USA	DoD P&T Committee Chair
CDR Joe Lawrence, MSC	Director, DoD Pharmacoeconomic Center (Recorder)
Col George Jones, BSC	Deputy Chief, Pharmaceutical Operations Directorate
COL Octavio C. Mont, MS for COL John Spain, MS	Army, Pharmacy Officer
Col Mike Spilker, BSC	Air Force, Pharmacy Officer
CDR Aaron Middlekauf for CAPT Deborah Thompson, USCG	Coast Guard, Pharmacy Officer
CAPT Edward Norton, MSC	Navy, Pharmacy Officer (Pharmacy Consultant BUMED)
Col Lowell Sensintaffer, MC	Air Force, Physician at Large
CAPT Walter Downs, MC	Navy, Internal Medicine Physician
COL Doreen Lounsbery, MC	Army, Internal Medicine Physician
CAPT David Tanen, MC	Navy, Physician at Large
COL Bruce Lovins, MC	Army, Family Practice Physician
Lt Col William Hannah, MC	Air Force, Internal Medicine Physician
Maj Jeremy King, MC	Air Force, OB/GYN Physician
CDR Eileen Hoke, MC	Navy, Pediatrics
Dr. Miguel Montalvo	TRICARE Regional Office-South Chief of Clinical Operations Division and Medical Director
Mr. Joe Canzolino	U.S. Department of Veterans Affairs
Nonvoting Members Present	
Mr. David Hurt	Associate General Counsel, TMA
Maj Dan Castiglia, USAF	Defense Logistics Agency Troop Support

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
• Oxycodone IR (Oxecta) **High Potency Narcotic Analgesics**	• No formulary alternative: the patient requires a tamper resistant formulation of oxycodone IR
• Darifenacin (Enablex) • Fesoterodine (Toviaz) **Overactive Bladder (OAB) Drugs**	• Patient has experienced significant adverse effects from ALL of the formulary OAB medications (Detrol, oxybutynin IR/ER, Detrol IR, Sanctura IR/XR) that are not expected to occur with Enablex or Toviaz.
• Oxybutynin transdermal delivery system (Oxytrol) • Oxybutynin 10% gel (Gelnique) **Overactive Bladder (OAB) Drugs**	• Use of formulary agents is contraindicated. • Patient has experienced significant adverse effects from ALL of the formulary OAB medications that are not expected to occur with Oxytrol or Gelnique 10% (e.g., patient has experienced central nervous system adverse effects with the OAB drugs, but is expected to tolerate Oxytrol or Gelnique 10%). • There is no formulary alternative (e.g., patient requires an OAB drug and is unable to take oral medications).
• Interferon alfacon-1 (Infergen) **Hepatitis C Drugs**	• Use of ALL formulary PEG-interferon alfa-2 products is contraindicated (e.g., due to hypersensitivity), and treatment with Interferon alfacon-1 is not contraindicated. • The formulary agents have resulted in therapeutic failure.
• Ribavirin (Ribapak) **Hepatitis C Drugs**	• Use of ALL formulary ribavirin products is contraindicated (e.g., due to hypersensitivity), and treatment with Ribapak is not contraindicated.

Appendix C—Table of Prior Authorization (PA) Criteria

Drug / Drug Class	Prior Authorization Criteria
• exenatide twice daily (Byetta) • exenatide once weekly (Bydureon) • liraglutide once daily (Victoza) **Glucagon-Like Peptide-1 Receptor Agonists (GLP1RAs)**	New GLP1RA users are required to try metformin or a sulfonylurea (SU) before receiving Byetta, Bydureon, or Victoza. Automated PA criteria: The patient has received a prescription for metformin or SU at any Military Health System pharmacy point of service (Military Treatment Facilities, retail network pharmacies, or mail order) during the previous 180 days, AND Manual PA criteria, if automated criteria are not met: Byetta, Bydureon, or Victoza is approved (e.g., trial of metformin or SU is NOT required) if: 1) The patient has a confirmed diagnosis of Type 2 Diabetes Mellitus 2) The patient has experienced any of the following adverse events while receiving metformin: impaired renal function that precludes treatment with metformin or history of lactic acidosis. 3) The patient has experienced the following adverse event while receiving a SU: hypoglycemia requiring medical treatment. 4) The patient has a contraindication to both metformin and a SU. 5) The patient has had an inadequate response to metformin and a SU.
• boceprevir (Victrelis) • telaprevir (Incivek) **Hepatitis C Drugs**	New users of boceprevir or telaprevir are required to undergo the PA process. Manual PA Criteria: • Age ≥ 18 • Has laboratory evidence of chronic hepatitis C—a quantified viral load (above undetectable) • Has laboratory evidence of genotype-1 hepatitis C infection • Is not co-infected with the human immunodeficiency virus (HIV) or Hepatitis B virus • Boceprevir or telaprevir will be co-administered with both a PEG-interferon alfa-2a or PEG-interferon alfa-2b product AND ribavirin • The patient has not previously used boceprevir or telaprevir. • For boceprevir, the patient will begin with a 4-week lead-in of both a PEG-Interferon alfa-2a or PEG-interferon alfa-2b product and ribavirin. Prior authorization will expire after 12 weeks for telaprevir and 44 weeks for boceprevir.

Appendix C—Table of PA Criteria (continued)

Drug / Drug Class	Prior Authorization Criteria
• tolterodine IR (Detrol, generics) • trospium IR (Sanctura, generics) • trospium ER (Sanctura XR, generics) • darifenacin (Enablex) • fesoterodine (Toviaz) • oxybutynin transdermal delivery system (Oxytrol) • oxybutynin 10% gel (Gelnique) • solifenacin (Vesicare) **Overactive Bladder (OAB) Drugs**	All new and current OAB drug users are required to try Detrol LA, oxybutynin ER, or oxybutynin IR before receiving Enablex, Toviaz, Detrol, Sanctura, Sanctura XR, Oxytrol, Gelnique 10%, or Vesicare. Automated PA criteria: The patient has received a prescription for Detrol LA, oxybutynin IR or oxybutynin ER at any Military Health System pharmacy point of service (Military Treatment Facilities, retail network pharmacies, or mail order) during the previous 180 days, AND Manual PA criteria, if automated criteria are not met (e.g., a trial of Detrol LA, oxybutynin IR, or oxybutynin ER is not required) if: 1) The patient has experienced any of the following issues while receiving Detrol LA, oxybutynin IR, or oxybutynin ER, which is not expected to occur with Detrol IR, Sanctura, Sanctura XR, Vesicare, Enablex, Toviaz, Oxytrol, or Gelnique 10%: – inadequate response; – intolerable adverse effects (e.g., the patient requires Sanctura due to intolerable dry mouth with Detrol LA); or, – contraindication. Coverage is only approved for the following FDA-approved indications: 1) The patient has a confirmed diagnosis of OAB with symptoms of urge incontinence, urgency, and urinary frequency (for all 11 OAB drugs). 2) The patient is older than 6 years with symptoms of detrusor overactivity associated with a neurological condition (e.g., spina bifida), for oxybutynin ER. Other uses, including stress incontinence, will not be approved.

Appendix C—Table of PA Criteria (continued)

Drug / Drug Class	Prior Authorization Criteria
• Rifaximin (Xifaxan) 200 mg **Gastrointestinal-2 Oral Antibiotics (GI-2)**	New users of Xifaxan 200 mg for travelers' diarrhea are required to undergo the PA process. Automated PA Criteria: The patient has received a prescription for a fluoroquinolone at any Military Health System pharmacy point of service (Military Treatment Facilities, retail network pharmacies, or mail order) during the previous 60 days, AND Manual PA Criteria: • 200 mg tablets are approved for the following: – Documented use in travelers' diarrhea caused by noninvasive strains of *Escherichia coli* – Patient is between 12 and 18 years of age – Documented trial of a fluoroquinolone for patients > 18 years of age – Documented contraindication or allergy to fluoroquinolone antibiotics in last 60 days – Returning from area with high fluoroquinolone resistance – 200 mg tablets are being used to treat hepatic encephalopathy • 200 mg tablets are not approved for the following: – Diarrhea complicated by fever or bloody stool – Treatment of dysentery – Diarrhea associated with use of antibiotics – Diarrhea caused by bacteria other than *E. coli* – *C. difficile* infection, irritable bowel syndrome, inflammatory bowel disease, chronic abdominal pain, hepatitis, diabetes, rosacea, and any other non-FDA approved use If prior authorization is approved for travelers' diarrhea, the quantity is limited to a 3-day supply (200mg TID = 9 tablets) at all 3 points of service.
• Rifaximin (Xifaxan) 550 mg **Gastrointestinal-2 Oral Antibiotics (GI-2)**	New users of Xifaxan 550 mg for hepatic encephalopathy are required to undergo the PA process. Manual PA Criteria: • 550 mg tablets are approved for the following: – Documented use in hepatic encephalopathy • 550 mg tablets are not approved for the following: – Travelers' diarrhea, *C. difficile* infection, irritable bowel syndrome, inflammatory bowel disease, chronic abdominal pain, hepatitis, diabetes, rosacea, and any other non-FDA approved use Prior authorization will expire after 365 days.

Appendix C—Table of PA Criteria (continued)

Drug / Drug Class	Prior Authorization Criteria
• sildenaril (Viagra) • tadalafil (Cialis) • vardenaril (Levitra; Staxyn) **Phosphodiesterase-5 (PDE-5) Inhibitors**	**Post-Prostatectomy:** Coverage IS provided for: • Sildenafil (Viagra), vardenafil (Levitra), or tadalafil (Cialis) for preservation and/or restoration of erectile function post-prostatectomy **Prostatectomy surgery must have occurred less than 365 days from the date the PA form is signed.** ***(recommended at Nov 2012 meeting)*** **BPH or BPH with ED:** Coverage IS provided for: • Tadalafil 5 mg (Cialis 5mg) for patients with benign prostatic hyperplasia (BPH) or **BPH with erectile dysfunction (ED)** meeting prior authorization criteria requiring use of an alpha blocker, unless there is a contraindication, inadequate response, or intolerable adverse effects with the alpha blocker. ***(recommended at Nov 2012 meeting)*** **Primary Pulmonary Hypertension:** Coverage IS provided for: • Sildenafil **20 mg** (Revatio) or tadalafil (Adcirca) for any patient with primary pulmonary hypertension ***(recommended at Nov 2012 meeting)***
• transdermal 2% gel pump (Fortesta) • transdermal solution (Axiron) • transdermal patch (Androderm) • transdermal 1.62% gel pump (Androgel 1.62%) • transdermal 1% gel pump and gel packets (Androgel 1%) • transdermal gel tubes (Testim) • testosterone buccal tablets (Striant) **Testosterone Replacement Therapy (TRT)**	PA criteria required for all topical/buccal TRT products • Men: diagnosis of hypogonadism evidenced by 2 or more AM testosterone levels in presence of symptoms • Children – under age of 17 – not approved – appeal only • Women: – Treatment of hypoactive sexual desire in menopausal women (natural or surgical) – Treatment of menopausal symptoms in women also receiving FDA-approved estrogen products (with or without concomitant progesterone) – **Treatment limited to 6 months** ***(recommended at Nov 2012 meeting)*** – TRT not approved for osteoporosis or urinary incontinence – Coverage for women upon appeal
• Enzalutamide (Xtandi) **Oral Chemotherapy Drugs for Prostate Cancer**	Coverage approved for treatment of patients: ▪ With a documented diagnosis of metastatic castration-resistant prostate cancer, AND ▪ Previous treatment with docetaxel
• Abiratone (Zytiga) **Oral Chemotherapy Drugs for Prostate Cancer**	Coverage approved for treatment of patients: ▪ With a documented diagnosis of metastatic castration-resistant prostate cancer, AND ▪ Prior chemotherapy with docetaxel, AND ▪ Patient is receiving concomitant therapy with prednisone

Appendix C—Table of PA Criteria (continued)

Drug / Drug Class	Prior Authorization Criteria
• follitropin alfa (Gonal-F) • follitropin beta (Follistim, Follistim AQ) • menotropins (Humegon, Pergonal, Repronex) • urofollitropin (Fertinex, Bravelle) **Injectable Gonadotropins (Fertility Agents)**	These drugs are not covered under the TRICARE pharmacy benefit if they are being prescribed for use in conjunction with a noncoital reproductive technology, including but not limited to artificial insemination, in vitro fertilization, or gamete intrafallopian transfer The TRICARE family planning benefit outlined in the Code of Federal Regulations does not include services and supplies related to noncoital reproductive technologies. • **Coverage for fertility drugs is allowed for use in conjunction with a noncoital reproductive technology, as outlined in the April 2012 ASD (Health Affairs) "Policy for Assisted Reproductive Services for the Benefit of Seriously or Severally Ill/Injured (Category II or III) Active Duty Service Members." A Signed Authorization Memorandum from TMA must be included with the prescription *(recommended at Nov 2012 meeting).***
• Adalimumab (Humira) **Targeted Immunomodulatory Biologics (TIBs)**	Coverage approved for patients ≥ 18 years with: ▪ Moderate to severely active rheumatoid arthritis and psoriasis, active psoriatic arthritis, and active ankylosing spondylitis ▪ Moderate to severely active polyarticular juvenile idiopathic arthritis (pediatric patients: 4 to 17 years of age) ▪ Moderate to severely active Crohn's disease following an inadequate response to conventional therapy, loss of response to infliximab or an inability to tolerate infliximab ▪ **Moderately to severely active ulcerative colitis following inadequate response to immunosuppressants (e.g., corticosteroids, azathioprine and 6-mercaptopurine) *(recommended at Nov 2012 meeting)*** Coverage NOT approved for: ▪ Concomitant use with other TIBs (anakinra, abatacept, certolizumab pegol, etanercept, infliximab, and golimumab)

Appendix D—Table of Quantity Limits

Drug / Drug Class	Quantity Limits
• fidaxomicin (Dificid) **Gastrointestinal-2 Oral Antibiotics (GI-2)**	• Retail, Mail Order, and MTF: 20 tablets with no refills
• rifaximin (Xifaxan) 200 mg tablets **Gastrointestinal-2 Oral Antibiotics (GI-2)**	If Prior Authorization is approved: • Retail, Mail Order and MTF: 3-day supply (9 tablets) for travelers' diarrhea; overrides allowed for hepatic encephalopathy
• boceprevir (Victrelis) • telaprevir (Incivek) **Hepatitis C Agents**	• Retail, Mail Order, and MTF: 28-day supply, with no multiple fills for multiple co-pays
• ribavirin (all products, including generics, Copegus, Rebetol, Ribasphere, Ribapak) • Interferon alfa-2b (Intron A) • Interferon alfacon-1 (Infergen) • PEG-interferon alfa-2a (Pegasys) • PEG-interferon alfa-2b (PEG-Intron) **Hepatitis C Agents**	• Retail Network: 30-day supply • Mail Order and MTF: 90-day supply
• ipratropium/albuterol oral inhaler (Combivent Respimat) **Chronic Obstructive Pulmonary Disease (COPD) Drugs**	• Retail: 2 inhalers/30 days • Mail Order and MTF: 5 inhalers/90 days
• azelastine/fluticasone propionate nasal inhaler (Dymista) **Nasal Allergy Drugs**	• Retail: 1 inhalers/30 days • Mail Order and MTF: 3 inhalers/90 days
• adalimumab (Humira) **Targeted Immunomodulatory Biologics (TIBs)**	Ulcerative Colitis • Initiation of therapy: o Retail, Mail Order, and MTF: 6 syringes • Maximum quantity dispensed at any one time: o Retail: 4-week supply (2 packs of 2 syringes) o Mail order and MTF: 6-week supply (3 packs of 2 syringes)
• enzalutamide (Xtandi) **Oral Chemotherapy Drugs for Prostate Cancer**	• Retail: 30-day supply (120 capsules) • Mail Order and MTF: 45-day supply (180 capsules)
• abiratone (Zytiga) **Oral Chemotherapy Drugs for Prostate Cancer**	• Retail: 30-day supply (120 tablets) • Mail Order and MTF: 45-day supply (180 tablets)

Appendix E—Criteria for Re-evaluation of Nonformulary Drugs for Uniform Formulary Status

The P&T Committee's process for the re-evaluation of nonformulary (NF) agents established at the May 2007 meeting was approved by the Director, TMA on June 24, 2007, according to the criteria below:

1) The NF agent becomes generically available and
   a) The generic product is "A-rated" as therapeutically equivalent to the brand name product according to the FDA's classification system.
   b) The generic market supply is stable and sufficient to meet the DoD Military Health System supply demands.
2) The NF agent is cost-effective relative to similar agents on the Uniform Formulary (UF). A NF agent becomes cost-effective when:
   a) The NF agent's total weighted average cost per day of treatment is less than or equal to the total weighted average cost per day of treatment for the UF class to which they were compared.
   b) The NF agent's total weighted average cost based on an alternate measure used during the previous review is less than or equal to that for the UF class to which they were compared. For example, antibiotics may be compared on the cost per course of therapy used to treat a particular condition.

Appendix F—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Nov 2012	**Glucagon-Like Peptide-1 Receptor Agonists (GLP1RAs)**	UF Class Review	None	▪ exenatide BID injection (Byetta) ▪ exenatide once weekly injection (Bydureon) ▪ liraglutide once daily injection (Victoza)	N/A	Pending signing of the minutes/ 30 days	PA apply	▪ Current requirement for trial of metformin or a sulfonylurea prior to a GLP1RA still applies. ▪ Byetta is no longer the preferred GLP1RA (the previous step therapy requiring use of Byetta prior to another GLP1RA has been removed).
Nov 2012	**Overactive Bladder Drugs (OABs)**	UF Class Review	▪ Tolterodine ER (Detrol LA)* ▪ Oxybutynin ER (Ditropan XL, generics)* *step-preferred	▪ oxybutynin IR (Ditropan, generics)* ▪ solifenacin (Vesicare) ▪ trospium IR (Sanctura, generics) ▪ trospium ER (Sanctura ER, generics) ▪ tolterodine IR (Detrol IR, generics) *step-preferred	▪ fesoterodine (Toviaz) ▪ darifenacin (Enablex) ▪ oxybutynin transdermal delivery system (Oxytrol) ▪ oxybutynin 10% gel (Gelnique)	Pending signing of the minutes/ 90 days	Step therapy (Automated PA); requires trial of Detrol LA, oxybutynin IR, or oxybutynin ER (step-preferred drugs) prior to another OAB drug.	▪ When generic formulations of trospium IR (Sanctura), trospium ER (Sanctura ER), and tolterodine IR (Detrol) become cost-effective relative to the step-preferred drugs, they will become step-preferred.

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Nov 2012	**Gastrointestinal-2 Oral Antibiotics (GI-2s)**	UF Class Review	▪ metronidazole 250 mg & 500 mg tabs (Flagyl, generics)	▪ fidaxomicin (Dificid)* ▪ metronidazole 375 mg, 750 mg ER tabs (Flagyl, Flagyl ER, generics) ▪ neomycin (Neo-Fradin, generics) ▪ nitazoxanide (Alinia) ▪ rifaximin (Xifaxan) ▪ vancomycin 125 mg, 250 mg oral tabs (Vancocin, generics) *Dificid not available at Mail or MTFs	N/A	Pending signing of the minutes/ 90 days	▪ PA recommendation for rifaximin, limiting use to hepatic encephalopathy (365 days) & traveler's diarrhea (3 days) (See Appendix C) ▪ QLs recommendation for fidaxomicin and rifaximin	▪ QLs for fidaxomicin #20 tabs with no refill ▪ QLs for rifaximin 200 mg #9 tabs with no refills ▪ fidaxomicin (Dificid) not available at Mail Order or MTFs
Nov 2012	**Hepatitis C Drugs**	UF Class Review	Extended Core Formulary (ECF)*: ▪ telaprevir (Incivek) ▪ PEG-interferon alfa-2a (Pegasys) ▪ ribavirin 200 mg capsules (generics); excludes Ribapak formulation	▪ boceprevir (Victrelis) ▪ interferon alfa-2b (Intron A) ▪ PEG-interferon alfa-2b (PEG-Intron) ▪ ribavirin (Copegus, Rebetol, Ribasphere)	▪ interferon alfacon-1 (Infergen) ▪ ribavirin Ribapak formulation	Pending signing of the minutes/60 days	▪ PA recommendation for boceprevir and telaprevir (See Appendix C) ▪ QL recommendation for boceprevir, telaprevir, interferon products, and ribavirin	▪ QLs for boceprevir & telaprevir: 28-day supply at all 3 POS; no multiple fills for multiple co-pays ▪ QL recommendation for interferon products and ribavirin: 90-day supply in MTFs and Mail Order; 30-day supply at retail

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Nov 2012	**Narcotic Analgesics** **Subclass: High potency Single Analgesic Agents**	New Drugs in Already Reviewed Class	High potency single analgesic agents ▪ Morphine sulfate 12 hours ER (MS Contin, generics) ▪ Morphine sulfate IR	Previous Decisions ▪ Hydromorphone ER (Exalgo) ▪ Fentanyl buccal soluble film (Onsolis) ▪ Fentanyl transdermal system, transmucosal tablet (Fentora); and, transmucosal lozenge ▪ Hydromorphone (Dilaudid) ▪ Levorphanol ▪ Meperidine ▪ Methadone ▪ Morphine products (other than BCF), Kadian and Avinza (ER products) ▪ Morphine sulfate ER / naltrexone (Embeda) ▪ Opium tincture ▪ Opium/belladonna alkaloids(suppositories) ▪ Oxycodone IR ▪ Oxycodone ER (Oxycontin) ▪ Oxymorphone (Opana) ▪ Oxymorphone ER (Opana ER) ▪ Tapentadol extended release (Nucynta ER) (Feb 2012)	**oxycodone IR (Oxecta)** Tapentadol immediate release (Nucynta) (Nov 2009)	Pending signing of the minutes/ 60 days	-	-

* **Extended Core Formulary (ECF):** includes medications in therapeutic classes that are used to support more specialized scopes of practice than those on the BCF. MTFs may choose whether or not to include an ECF therapeutic class on formulary, based on the clinical needs of its patients. However, if an MTF chooses to have an ECF therapeutic class on formulary, it must have all ECF medications in that class on formulary.

TRICARE Formulary Search tool: http://www.pec.ha.osd.mil/formulary_search.php

Appendix G—Table of Abbreviations

ASD(HA)	Assistant Secretary of Defense for Health Affairs
BCF	Basic Core Formulary
BIA	budget impact analysis
BID	twice daily
BPH	benign prostatic hyperplasia
CEA	cost-effectiveness analysis
CFC	chlorofluorocarbon
CDI	*Clostridium difficile* infection
CMA	cost minimization analysis
COPD	chronic obstructive pulmonary disease
DAAs	direct acting antiviral agent
DoD	Department of Defense
E. coli	*Escherichia coli*
ECF	Extended Core Formulary
ED	erectile dysfunction
ER	extended release
FDA	U.S. Food and Drug Administration
GI-2	Gastrointestinal-2 Oral Antibiotics Drug Class
GLP1RAs	glucagon-like peptide-1 receptor agonists
HE	hepatic encephalopathy
IBS	irritable bowel syndrome
IR	immediate release
MHS	Military Health System
MN	medical necessity
MTF	Military Treatment Facility
NF	nonformulary
OAB	Overactive Bladder Drug Class
P&T	Pharmacy and Therapeutics
PA	prior authorization
PDE-5	phosphodiesterase-5

TD	travelers' diarrhea
TDS	transdermal delivery system
TRTs	transdermal and buccal testosterone replacement therapies
UF	Uniform Formulary

DECISION PAPER

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

August 2012

I. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Targeted Immunomodulatory Biologics (TIBs)—Abatacept Subcutaneous (SC) Injection (Orencia SC)

Relative Clinical Effectiveness Conclusion—The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that although abatacept SC (Orencia SC) provides an alternative to the tumor necrosis factor (TNF) alpha inhibitors used for treatment of rheumatoid arthritis and offers patient convenience over the abatacept intravenous formulation, there is currently insufficient data to conclude that Orencia SC offers improved efficacy, safety, or tolerability compared to the TNF alpha inhibitors in the TIBs class.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that abatacept SC (Orencia SC) was not cost-effective when compared to other TIBs included on the Uniform Formulary (UF).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) abatacept SC (Orencia SC) be designated nonformulary (NF) due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***
Based on the clinical evaluations for abatacept SC (Orencia SC) and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for abatacept SC (Orencia SC). (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 9, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Glaucoma Drugs: Prostaglandin Analogs—Tafluprost Ophthalmic Solution (Zioptan)

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) that tafluprost (Zioptan) offers no compelling clinical advantages over the other prostaglandins available on the UF.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that tafluprost (Zioptan) was not cost-effective when compared to the other ophthalmic prostaglandins currently included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) tafluprost (Zioptan) be designated NF because it has no compelling clinical advantages over the other ophthalmic prostaglandin analogues and is not cost-effective compared to latanoprost, the most utilized drug in the Military Health System (MHS).

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for tafluprost (Zioptan) and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for tafluprost (Zioptan). (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 9, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Oral Non-steroidal Anti-inflammatory Drugs (NSAIDs)—Ibuprofen/Famotidine (Duexis)

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) ibuprofen/famotidine (Duexis) offers no distinct clinical advantages to the combination NSAID/gastroprotective agents already on the UF.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that ibuprofen/famotidine (Duexis) was not cost-effective when compared to other oral NSAIDs agents included on the UF; it was also more costly than the individual components, ibuprofen and famotidine.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) ibuprofen/famotidine (Duexis) be designated NF due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for ibuprofen/famotidine (Duexis) and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for ibuprofen/famotidine (Duexis). (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 9, 2013

Director, TMA, Decision: ☒Approved ☐ Disapproved

Approved, but modified as follows:

D. Oral NSAIDs—Ketorolac Nasal Spray (Sprix)

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) there is no evidence to suggest ketorolac nasal spray

(Sprix) has a compelling clinical advantage over the other oral NSAIDs already on the Basic Core Formulary (BCF) and UF.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that ketorolac nasal spray (Sprix) was more costly, based on an average weighted cost per day of therapy at all three points of service (POS), than the other oral NSAIDs and low-potency narcotic analgesics currently on the BCF and UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (16 for, 0 opposed, 1 abstained, 0 absent) ketorolac nasal spray (Sprix) be designated NF due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for ketorolac nasal spray (Sprix) and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for ketorolac nasal spray (Sprix). (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: QUANTITY LIMITS***—The P&T Committee recommended (16 for, 0 opposed, 1 abstain, 0 absent) restricting the maximum allowable quantity to 5 nasal spray bottles/30 days in the mail order pharmacy and retail network, which is consistent with the recommended dosing from the package labeling.

4. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 9, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

E. Non-Insulin Diabetes Drugs: Dipeptidyl Dipeptidase-4 (DPP-4) Inhibitors—Sitagliptin/Metformin ER (Janumet XR) and Linagliptin/ Metformin (Jentadueto)

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) there is no evidence to suggest either sitagliptin/ metformin ER (Janumet XR) or linagliptin/metformin (Jentadueto) have a compelling clinical advantage over the other DPP-4 inhibitor/metformin fixed-dose combinations included on the UF.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that Janumet XR and Jentadueto were cost-effective when compared to other DPP-4 inhibitors included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (15 for, 0 opposed, 1 abstained, 1 absent) the following:

    - sitagliptin/metformin ER (Janumet XR) be designated step-preferred and formulary on the UF; and
    - linagliptin/metformin (Jentadueto) be designated non-preferred and formulary on the UF.
    - This recommendation includes step therapy, which requires a trial of sitagliptin (Januvia), sitagliptin/metformin (Janumet), sitagliptin/ simvastatin (Juvisync), or sitagliptin/metformin ER (Janumet XR) (the preferred drugs) prior to using other DPP-4 inhibitors. Prior authorization for the DPP-4 inhibitors also requires a trial of metformin or sulfonylurea for new patients.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee, recommended (14 for, 1 opposed, 1 abstained, 1 absent) sitagliptin/metformin ER (Janumet XR) be designated with BCF status.

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***
The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) the following PA criteria should apply to the DPP-4 inhibitors subclass. Coverage would be approved if the patient met any of the following criteria

    a) Automated PA criteria:

        (1) The patient has filled a prescription for metformin or a sulfonylurea at any MHS pharmacy POS [Military Treatment Facilities (MTFs), retail network pharmacies, or mail order] during the previous 180 days.

(2) The patient has received a prescription for a DPP-4 inhibitor (Januvia, Janumet, Juvisync, Janumet XR, Tradjenta, Jentadueto, Onglyza, or Kombiglyze XR) at any MHS pharmacy POS (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

b) Manual PA criteria, if automated criteria are not met:

The fixed-dose combination product Janumet XR or Jentadueto is approved (eg, a trial of sulfonylurea is not required if):

(1) The patient has had an inadequate response to metformin or sulfonylurea.

(2) The patient has experienced the following adverse event while receiving a sulfonylurea: hypoglycemia requiring medical treatment.

(3) The patient has a contraindication to a sulfonylurea.

c) In addition to the above criteria regarding metformin and sulfonylurea, the following PA criteria would apply specifically to linagliptin/metformin metformin (Jentadueto):

(1) The patient has experienced an adverse event with sitagliptin-containing products, which is not expected to occur with linagliptin-containing products.

(2) The patient has had an inadequate response to a sitagliptin-containing product.

(3) The patient has a contraindication to sitagliptin.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENATION PERIOD***
The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is January 9, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

II. UNIFORM FORMULARY DRUG CLASS REVIEWS

A. Anticoagulants—Heparin and Related Products

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (15 for, 0 opposed, 0 abstained, 2 absent) on the following clinical effectiveness conclusions:

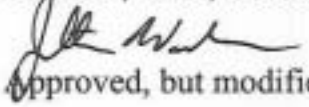
- Enoxaparin (Lovenox, generic) has the widest clinical utility of the subclass, due to its long history of use and largest number of FDA-approved indications.
- Fondaparinux (Arixtra, generic) has fewer FDA-approved indications than enoxaparin. It has a therapeutic niche for patients with a history of heparin-induced thrombocytopenia (HIT).
- The major limitation with dalteparin (Fragmin) is the lack of an FDA-approved indication for treating deep venous thrombosis and pulmonary embolism. The package insert also cautions against use in patients with a history of HIT.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that generic enoxaparin was the most cost-effective agent based on a weighted average cost per unit across all three POS, followed by branded dalteparin (Fragmin), and generic fondaparinux. Budget impact analysis (BIA) results showed that scenarios where generic enoxaparin is included on the BCF and dalteparin (Fragmin) and generic fondaparinux are included on the UF generated the greatest cost-avoidance projection.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (15 for, 0 opposed, 1 abstained, 1 absent) enoxaparin, dalteparin (Fragmin), and fondaparinux remain designated as formulary on the UF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) generic enoxaparin be designated with BCF status, based on clinical and cost effectivness. The BCF recommendation will be implemented upon signing of the minutes.

Director, TMA, Decision: ☒ Approved ☐ Disapproved



Approved, but modified as follows:

B. Androgens Anabolic Steroids—Transdermal and Buccal Testosterone Replacement Therapies (TRTs)

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) the following concerning the TRT agents:

- Although high-quality comparative data is lacking, there appear to be no clinically relevant differences in efficacy between products.
- Transdermal and buccal testosterone replacement products effectively raise testosterone levels in hypogonadal men to the normal range when used in accordance with product labeling.
- Skin-to-skin transfer of transdermal testosterone to women and children should be minimized due to risk of virilization or premature onset of puberty. Testosterone buccal tablets (Striant) carry the lowest risk while the topically applied products carry the highest risk.
- Transdermal and buccal TRTs have a low overall incidence of systemic adverse events, which are not considered to differ clinically across products.
- The most frequent adverse events are dermal application site reactions for the transdermal products and oral application site reactions for buccal tablets; most are mild or transient in nature.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that transdermal 2% gel pump (Fortesta) was the least costly agent, followed by transdermal solution (Axiron), transdermal patch (Androderm), transdermal 1.62% gel pump (Androgel 1.62%), transdermal 1% gel pump and gel packets (Androgel 1%), transdermal gel tubes (Testim), and testosterone buccal tablets (Striant).

BIA results showed the scenario where transdermal 2% gel (Fortesta) is step-preferred on the UF, all other TRTs are designated non-preferred on the UF or NF, and step therapy is applied to all current and new users of TRTs, was determined to be the most cost-effective scenario.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (13 for, 3 opposed, 1 abstained, 0 absent) the following scenario for the UF, which is the most clinically and cost-effective option for the MHS:
    - testosterone transdermal 2% gel pump (Fortesta) be designated step-preferred and formulary on the UF;
    - testosterone transdermal patch (Androderm), testosterone transdermal gel tubes (Testim), and testosterone buccal tablets (Striant) be designated non-preferred and formulary on the UF; and
    - testosterone transdermal 1% gel pump and gel packets (Androgel 1%), testosterone transdermal 1.62% gel pump (Androgel 1.62%), and

testosterone transdermal solution (Axiron) be designated non-preferred and NF on the UF.

- This recommendation includes step therapy, which requires a trial of testosterone transdermal 2% gel pump (Fortesta) prior to using other transdermal and buccal TRTs.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) testosterone transdermal 2% gel pump (Fortesta) be designated BCF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 4 absent) that the following manual PA criteria should apply to all current and new users of the testosterone replacement therapies. Coverage would be approved if the patient met any of the following criteria:

   a) Manual PA criteria for all transdermal and buccal testosterone replacement products:

      - Patient is male and has a diagnosis of hypogonadism evidenced by 2 or more morning testosterone levels in the presence of symptoms usually associated with hypogonadism.
      - Patient is a female and receiving testosterone for the following uses:
        - Treatment of hypoactive sexual desire in menopausal women (whether natural or surgical); or
        - Treatment of menopausal symptoms in women also receiving FDA-approved estrogen products (with or without concomitant progesterone).
        - Note that coverage of transdermal or buccal testosterone replacement therapies is not approved for osteoporosis or urinary incontinence.
        - Note that coverage for use in women will be by appeal only.
      - Note that use in adolescents under the age of 17 is not approved and will be by appeal only.

   b) In addition to the above criteria, the following PA criteria would apply specifically to transdermal gel tubes (Testim), transdermal patch (Androderm), buccal tablets (Striant), transdermal 1% gel pump and gel

packets (Androgel 1%), transdermal 1.62% gel pump (Androgel 1.62%), and transdermal solution (Axiron):

- The patient requires a testosterone replacement therapy that has a low risk of skin-to-skin transfer between family members (for Striant and Androderm only).
- The patient has tried transdermal 2% gel pump (Fortesta) for a minimum of 90 days AND failed to achieve total testosterone levels above 400ng/dL (lab must be drawn 2 hours after Fortesta application) AND denied improvement in symptoms.
- The patient has a contraindication or relative contraindication to Fortesta (e.g., hypersensitivity to a component [including alcohol]; concomitant disulfiram use) that does not apply to Testim, Androderm, Striant, Androgel 1%, Androgel 1.62%, or Axiron.
- The patient has experienced a clinically significant skin reaction to Fortesta that is not expected to occur with Testim, Androderm, Striant, Androgel 1%, Androgel 1.62%, or Axiron.

4. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for transdermal 1.62% gel pump (Androgel 1.62%), transdermal 1% gel pump and gel packets (Androgel 1%), the transdermal solution (Axiron), and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Androgel 1.62%, Androgel 1%, and Axiron. (See Appendix B for full MN criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is February 6, 2013.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

III. SECTION 703

A. Section 703—The P&T Committee reviewed a list of products—Amicar (branded aminocaproic acid), Kineret (anakinra), Phoslo (branded calcium acetate), Rheumatrex (branded methotrexate), Oxadrin (branded oxandrolone), Denavir (penciclovir), and Transderm-Scop (scopolamine patch)—to determine MN and pre-authorization criteria. These products were identified as not fulfilling refund requirements as required in section 703 of the 2008 National Defense Authorization Act. These drugs were made NF on the UF at previous P&T Committee meetings.

1. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 4 absent) the following should apply to the drugs listed above. Coverage at retail network pharmacies would be approved if the patient met all the following criteria:

    a) Manual Pre-Authorization Criteria:

    (1) Obtaining the product from home delivery would be detrimental to the patient.

    (2) For branded products with AB generic availability, use of the generic product would be detrimental to the patient.

The Pre-Authorization criteria listed above do not apply to any point of service other than retail network pharmacies.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

SUBMITTED BY:

John P. Kugler, M.D., MPH
DoD P&T Committee Chair

DECISION ON RECOMMENDATIONS

Director, TMA, decisions are as annotated above.

Jonathan Woodson, M.D.
Director

NOV 8 2012

Date

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE MINUTES AND RECOMMENDATIONS

August 2012

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on August 15 and 16, 2012, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of May Minutes**—Jonathon Woodson M.D., Director, approved the minutes for the May 2012 DoD P&T Committee meeting on August 8, 2012.
2. **Clarification to the February 2012 Minutes**—The February minutes were clarified to state, for the Sedative Hypnotics-1 class, zolpidem IR is the sole Basic Core Formulary (BCF) drug.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1). All Uniform Formulary (UF) and BCF recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Targeted Immunomodulatory Biologics (TIBs)—Abatacept Subcutaneous Injection (Orencia SC)

Relative Clinical Effectiveness—Abatacept (Orencia) inhibits the activation of T-cells and is approved for treating moderate to severe active rheumatoid arthritis (RA) in adults. It was first marketed in 2005 as an intravenous (IV) infusion, which is only available through the TRICARE medical benefit. A new subcutaneous (SC) abatacept

formulation intended for self-injection is now available. FDA-approval of abatacept SC was based on its demonstrated non-inferiority to abatacept IV. Prior authorization criteria and quantity limits apply to the TIBs and were placed on abatacept SC in November 2011, which are consistent with the FDA-approved package labeling.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that although abatacept SC (Orencia SC) provides an alternative to the tumor necrosis factor (TNF) alpha inhibitors used for treatment of RA and offers patient convenience over the abatacept IV formulation, there is currently insufficient data to conclude that Orencia SC offers improved efficacy, safety, or tolerability compared to the TNF alpha inhibitors in the TIBs class.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—A pharmacoeconomic analysis was performed. The weighted average cost per month at all three points of service (POS) was evaluated for abatacept SC (Orencia SC) in relation to the other drugs in the TIBs class indicated for treatment of RA. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that Orencia SC was not cost-effective when compared to other TIBs included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) abatacept SC (Orencia SC) be designated NF due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for abatacept SC (Orencia SC) and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for abatacept SC (Orencia SC). (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 9, 2013.

B. Glaucoma Drugs: Prostaglandin Analogs—Tafluprost Ophthalmic Solution (Zioptan)

Relative Clinical Effectiveness—Tafluprost ophthalmic solution (Zioptan) is a preservative-free prostaglandin analog indicated for the reduction of elevated intraocular pressure (IOP) in patients with glaucoma or ocular hypertension. In one head-to-head comparison, tafluprost proved inferior to latanoprost in lowering IOP, failing to meet the pre-specified margin for non-inferiority. Whether preservative-free tafluprost is associated with decreased adverse events compared to preservative-containing tafluprost remains to be determined.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 0 absent) that tafluprost (Zioptan) offers no compelling clinical advantages over the other prostaglandins available on the UF.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—A pharmacoeconomic analysis was performed. The weighted average cost per day at all three POS was evaluated for tafluprost (Zioptan) in relation to the other ophthalmic prostaglandin analogues. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that Zioptan was not cost-effective when compared to the other ophthalmic prostaglandins currently included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) tafluprost (Zioptan) be designated NF because it has no compelling clinical advantages over the other ophthalmic prostaglandin analogues and is not cost-effective compared to latanoprost, the most utilized drug in the Military Health System (MHS).

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for tafluprost (Zioptan) and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for tafluprost (Zioptan). (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 9,

2013.

C. Oral Non-steroidal Anti-inflammatory Drugs (NSAIDs)—Ibuprofen/Famotidine (Duexis)

Relative Clinical Effectiveness—Ibuprofen/famotidine (Duexis) is the first fixed-dose combination of a non-selective NSAID with an H2 antagonist. Ibuprofen and famotidine are currently on the BCF and UF, respectively, and are available over-the-counter. Other combination NSAID/gastroprotective agents on the UF include esomeprazole/enteric-coated naproxen (Vimovo), diclofenac/misoprostol (Arthrotec), and the COX-2 inhibitor celecoxib (Celebrex). No studies with Duexis have evaluated clinically important upper GI events (bleeding, perforation, obstruction). Although the fixed-dose combination of famotidine and ibuprofen offers the convenience of a gastroprotective agent with an NSAID, the three-times daily dosing regimen may affect patient compliance. Systematic reviews and national professional guidelines state a preference for NSAID with proton pump inhibitor or NSAID with misoprostol versus an NSAID with H2 antagonist for reducing GI ulcers.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) ibuprofen/famotidine (Duexis) offers no distinct clinical advantages to the combination NSAID/gastroprotective agents already on the UF.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—A pharmacoeconomic analysis was performed. The weighted average cost per day at all three POS was evaluated for ibuprofen/famotidine (Duexis) in relation to the other oral gastroprotective NSAIDs. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that Duexis was not cost-effective when compared to other oral NSAIDs agents included on the UF; it was also more costly than the individual components, ibuprofen and famotidine.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) ibuprofen/famotidine (Duexis) be designated NF due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for ibuprofen/famotidine (Duexis) and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for ibuprofen/famotidine (Duexis). (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 9, 2013.

D. Oral NSAIDs—Ketorolac Nasal Spray (Sprix)

Relative Clinical Effectiveness—Ketorolac nasal spray (Sprix) is the first NSAID administered by the intranasal route. There is no direct comparative data with ketorolac nasal spray or other oral NSAIDs or low potency narcotic analgesics. The studies used to obtain FDA-approval were conducted using a placebo control in the in-patient setting where concomitant morphine or rescue analgesia was administered. Reduced morphine requirements were seen at 24 hours in some studies with Sprix—whether these results are clinically relevant is difficult to determine. Opioid-sparing drugs on the UF include other NSAIDs and tramadol. Sprix is limited by a five-day duration of use, and warnings not seen with other NSAIDs, including contraindications for use in patients with a history of GI bleeding or renal dysfunction.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) there is no evidence to suggest ketorolac nasal spray (Sprix) has a compelling clinical advantage over the other oral NSAIDs already on the BCF and UF.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—A pharmacoeconomic analysis was performed. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that ketorolac nasal spray (Sprix) was more costly, based on an average weighted cost per day of therapy at all three POS, than the other oral NSAIDs and low-potency narcotic analgesics currently on the BCF and UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (16 for, 0 opposed, 1 abstained, 0 absent) ketorolac nasal spray (Sprix) be designated NF due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for ketorolac nasal spray (Sprix) and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained,

0 absent) MN criteria for ketorolac nasal spray (Sprix). (See Appendix B for full MN criteria.)

3. ***COMMITTEE ACTION: QUANTITY LIMITS***—The P&T Committee recommended (16 for, 0 opposed, 1 abstain, 0 absent) restricting the maximum allowable quantity to 5 nasal spray bottles/30 days in the mail order pharmacy and retail network, which is consistent with the recommended dosing from the package labeling.

4. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD*** The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 9, 2013.

E. Non-Insulin Diabetes Drugs: Dipeptidyl Dipeptidase-4 (DPP-4) Inhibitors—Sitagliptin/Metformin ER (Janumet XR) and Linagliptin/Metformin (Jentadueto)

Relative Clinical Effectiveness—Janumet XR and Jentadueto are fixed-dose combination products containing metformin in either an extended release (ER) formulation with sitagliptin (Janumet XR) or an immediate release (IR) formulation with linagliptin (Jentadueto). Sitagliptin is also available in a fixed-dose combination product with metformin IR (Janumet).

Both Janumet XR and Jentadueto were approved via the FDA 505(b)(2) process, requiring only proof of bioequivalence to their respective individual components. There are no efficacy studies with either agent. The combination of sitagliptin with metformin IR reduces hemoglobin A1c by 0.51% to 0.67%, while the combination of linagliptin with metformin IR decreases A1c by 0.4% to 0.5%. No studies evaluating clinical outcomes (e.g., cardiovascular death, myocardial infarction, and stroke) are available for the DPP-4 inhibitors, but trials are underway.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) there is no evidence to suggest either sitagliptin/ metformin ER (Janumet XR) or linagliptin/metformin (Jentadueto) have a compelling clinical advantage over the other DPP-4 inhibitor/metformin fixed-dose combinations included on the UF.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—A pharmacoeconomic analysis was performed. The weighted average cost per day at all three POS was evaluated for sitagliptin/metformin ER (Janumet XR) and linagliptin/ metformin (Jentadueto) in relation to the other drugs in the DPP-4 inhibitors subclass. The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that Janumet XR and Jentadueto were cost-effective when compared to other DPP-4 inhibitors included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (15 for, 0 opposed, 1 abstained, 1 absent) the following:

    - sitagliptin/metformin ER (Janumet XR) be designated step-preferred and formulary on the UF; and
    - linagliptin/metformin (Jentadueto) be designated non-preferred and formulary on the UF.
    - This recommendation includes step therapy, which requires a trial of sitagliptin (Januvia), sitagliptin/metformin (Janumet), sitagliptin/ simvastatin (Juvisync), or sitagliptin/metformin ER (Janumet XR) (the preferred drugs) prior to using other DPP-4 inhibitors. Prior authorization for the DPP-4 inhibitors also requires a trial of metformin or sulfonylurea for new patients.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee, recommended (14 for, 1 opposed, 1 abstained, 1 absent) sitagliptin/metformin ER (Janumet XR) be designated with BCF status, as sitagliptin-containing products have the majority of the current DPP-4 inhibitor utilization and are the most cost-effective agents.

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***
   Existing automated prior authorization (step therapy) requires a trial of metformin or a sulfonylurea prior to use of a DPP-4 inhibitor. Additionally, sitagliptin-containing products (Januvia, Janumet, Janumet XR, and Juvisync) are the preferred agents in the DPP-4 inhibitors subclass. New users must try a preferred product before trying linagliptin or saxagliptin-containing products.

   The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) the following PA criteria should apply to the DPP-4 inhibitors subclass. Coverage would be approved if the patient met any of the following criteria

    a) Automated PA criteria:

(1) The patient has filled a prescription for metformin or a sulfonylurea at any MHS pharmacy POS [Military Treatment Facilities (MTFs), retail network pharmacies, or mail order] during the previous 180 days.

(2) The patient has received a prescription for a DPP-4 inhibitor (Januvia, Janumet, Juvisync, Janumet XR, Tradjenta, Jentadueto, Onglyza, or Kombiglyze XR) at any MHS pharmacy POS (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

b) Manual PA criteria, if automated criteria are not met:

The fixed-dose combination product Janumet XR or Jentadueto is approved (eg, a trial of sulfonylurea is not required if):

(1) The patient has had an inadequate response to metformin or sulfonylurea.

(2) The patient has experienced the following adverse event while receiving a sulfonylurea: hypoglycemia requiring medical treatment.

(3) The patient has a contraindication to a sulfonylurea.

c) In addition to the above criteria regarding metformin and sulfonylurea, the following PA criteria would apply specifically to linagliptin/metformin metformin (Jentadueto):

(1) The patient has experienced an adverse event with sitagliptin-containing products, which is not expected to occur with linagliptin-containing products.

(2) The patient has had an inadequate response to a sitagliptin-containing product.

(3) The patient has a contraindication to sitagliptin.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENATION PERIOD***
The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is January 9, 2013.

V. UF DRUG CLASS REVIEWS

A. Anticoagulants—Heparin and Related Products

Background and Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the Heparin and Related Products subclass of the anticoagulants. (The newer oral anticoagulants, including the Factor Xa inhibitors and direct thrombin inhibitors will be discussed at a later date.) The drugs in this subclass include unfractionated heparin, which is available in many generic formulations and will not be discussed further, enoxaparin (Lovenox), dalteparin (Fragmin), and fondaparinux (Arixtra). Two products, tinzaparin (Innohep) and ardeparin (Normiflow), were voluntarily discontinued by their manufacturers due to nonsafety reasons. The subclass has not previously been reviewed for UF placement. Generic biologic formulations of enoxaparin and fondaparinux are available; both are FDA AP-rated (therapeutically equivalent parenteral products) to Lovenox and Arixtra, respectively.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (15 for, 0 opposed, 0 abstained, 2 absent) on the following clinical effectiveness conclusions:

- Enoxaparin has the widest clinical utility of the subclass, due to its long history of use, largest number of FDA-approved indications, availability in several dosage strengths, and recommendations by the American College of Chest Physicians for use in special populations (pregnancy, pediatrics). The package labeling cautions against use in patients with a history of heparin-induced thrombocytopenia (HIT).
- Fondaparinux has fewer FDA-approved indications than enoxaparin. It has a therapeutic niche for patients with a history of HIT. The risk of bleeding is increased in patients with low body weight (<50 kg), the elderly, and in patients with decreased renal function.
- The major limitation with dalteparin is the lack of an FDA-approved indication for treating deep venous thrombosis and pulmonary embolism. The package insert also cautions against use in patients with a history of HIT.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—Cost minimization (CMA) and budget impact analyses (BIA) were used to evaluate the drugs in this subclass, with corresponding sensitivity analyses. Due to recent availability of generic fondaparinux (Arixtra), an estimated generic drug price was used in the cost analyses. The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that generic enoxaparin was the most cost-effective agent based on a weighted average cost per unit across all three POS, followed by branded dalteparin (Fragmin), and generic fondaparinux (ranked in order from most cost-effective to least cost-effective). BIA results showed that, among currently available formulary options, scenarios where generic enoxaparin is included on the BCF and dalteparin (Fragmin) and generic fondaparinux are included on the UF generated the greatest cost-avoidance projection.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (15 for, 0 opposed, 1 abstained, 1 absent) enoxaparin, dalteparin (Fragmin), and fondaparinux remain designated as formulary on the UF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 1 absent) generic enoxaparin be designated with BCF status, based on clinical and cost effectivness. This clarifies the previous BCF listing for the low-molecular weight heparins stating that MTFs could choose between dalteparin (Fragmin), enoxaparin, or tinzaparin (Innohep). The BCF recommendation will be implemented upon signing of the minutes.

B. Androgens Anabolic Steroids—Transdermal and Buccal Testosterone Replacement Therapies

Background and Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the transdermal and buccal testosterone replacement therapies (TRTs), which are used for treating adult male hypogonadism. The TRT class is comprised of the following formulations of topical or buccal testosterone: transdermal patch (Androderm), transdermal 1% gel pump and gel packets (Androgel 1%), transdermal 1.62% gel pump (Androgel 1.62%), transdermal solution (Axiron), transdermal 2% gel pump (Fortesta), buccal tablets (Striant), and transdermal gel tubes (Testim).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) the following concerning the TRT agents:

- Although high-quality comparative data is lacking, there appear to be no clinically relevant differences in efficacy between products.
- Transdermal and buccal testosterone replacement products effectively raise testosterone levels in hypogonadal men to the normal range when used in accordance with product labeling.
- Skin-to-skin transfer of transdermal testosterone to women and children should be minimized due to risk of virilization or premature onset of puberty. Testosterone buccal tablets (Striant) carry the lowest risk while the topically applied products carry the highest risk.
- Transdermal and buccal TRTs have a low overall incidence of systemic adverse events, which are not considered to differ clinically across products.

- The most frequent adverse events are dermal application site reactions for the transdermal products and oral application site reactions for buccal tablets; most are mild or transient in nature.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion
Pharmacoeconomic analyses were performed for the topical and buccal testosterone class, including CMA and BIA. The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that transdermal 2% gel pump (Fortesta) was the least costly agent, followed by transdermal solution (Axiron), transdermal patch (Androderm), transdermal 1.62% gel pump (Androgel 1.62%), transdermal 1% gel pump and gel packets (Androgel 1%), transdermal gel tubes (Testim), and testosterone buccal tablets (Striant).

The analyses also evaluated the potential budgetary impact of cost scenarios where selected TRTs were designated with preferred product status (step therapy) on the UF; i.e., a trial of a preferred TRT would be required before using other TRTs. BIA results showed scenarios implementing step therapy were more cost-effective than scenarios without step therapy. The scenario where transdermal 2% gel (Fortesta) is step-preferred on the UF, all other TRTs are designated non-preferred on the UF or NF, and step therapy is applied to all current and new users of TRTs, was determined to be the most cost-effective scenario.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (13 for, 3 opposed, 1 abstained, 0 absent) the following scenario for the UF, which is the most clinically and cost-effective option for the MHS:
    - testosterone transdermal 2% gel pump (Fortesta) be designated step-preferred and formulary on the UF;
    - testosterone transdermal patch (Androderm), testosterone transdermal gel tubes (Testim), and testosterone buccal tablets (Striant) be designated non-preferred and formulary on the UF; and
    - testosterone transdermal 1% gel pump and gel packets (Androgel 1%), testosterone transdermal 1.62% gel pump (Androgel 1.62%), and testosterone transdermal solution (Axiron) be designated non-preferred and NF on the UF.
    - This recommendation includes step therapy, which requires a trial of testosterone transdermal 2% gel pump (Fortesta) prior to using other transdermal and buccal TRTs.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) testosterone transdermal 2% gel pump (Fortesta) be designated BCF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 4 absent) that the following manual PA criteria should apply to all current and new users of the testosterone replacement therapies. Coverage would be approved if the patient met any of the following criteria:

    a) Manual PA criteria for all transdermal and buccal testosterone replacement products:

        - Patient is male and has a diagnosis of hypogonadism evidenced by 2 or more morning testosterone levels in the presence of symptoms usually associated with hypogonadism;
        - Patient is a female and receiving testosterone for the following uses:
            - Treatment of hypoactive sexual desire in menopausal women (whether natural or surgical); or
            - Treatment of menopausal symptoms in women also receiving FDA-approved estrogen products (with or without concomitant progesterone).
            - Note that coverage of transdermal or buccal testosterone replacement therapies is not approved for osteoporosis or urinary incontinence.
            - Note that coverage for use in women will be by appeal only.
        - Note that use in adolescents under the age of 17 is not approved and will be by appeal only.

    b) In addition to the above criteria, the following PA criteria would apply specifically to transdermal gel tubes (Testim), transdermal patch (Androderm), buccal tablets (Striant), transdermal 1% gel pump and gel packets (Androgel 1%), transdermal 1.62% gel pump (Androgel 1.62%), and transdermal solution (Axiron):

        - The patient requires a testosterone replacement therapy that has a low risk of skin-to-skin transfer between family members (for Striant and Androderm only).

- The patient has tried transdermal 2% gel pump (Fortesta) for a minimum of 90 days AND failed to achieve total testosterone levels above 400ng/dL (lab must be drawn 2 hours after Fortesta application) AND denied improvement in symptoms.
- The patient has a contraindication or relative contraindication to Fortesta (e.g., hypersensitivity to a component [including alcohol]; concomitant disulfiram use) that does not apply to Testim, Androderm, Striant, Androgel 1%, Androgel 1.62%, or Axiron.
- The patient has experienced a clinically significant skin reaction to Fortesta that is not expected to occur with Testim, Androderm, Striant, Androgel 1%, Androgel 1.62%, or Axiron.

4. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluations for transdermal 1.62% gel pump (Androgel 1.62%), transdermal 1% gel pump and gel packets (Androgel 1%), the transdermal solution (Axiron), and the conditions for establishing MN for NF medications, the P&T Cominittee recommended (16 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Androgel 1.62%, Androgel 1%, and Axiron. (See Appendix B for full MN criteria.)

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is February 6, 2013.

VI. SECTION 703

A. Section 703—The P&T Committee reviewed a list of products—Amicar (branded aminocaproic acid), Kineret (anakinra), Phoslo (branded calcium acetate), Rheumatrex (branded methotrexate), Oxadrin (branded oxandrolone), Denavir (penciclovir), and Transderm-Scop (scopolamine patch)—to determine MN and pre-authorization criteria. These products were identified as not fulfilling refund requirements as required in section 703 of the 2008 National Defense Authorization Act. These drugs were made NF on the UF at previous P&T Committee meetings.

1. ***COMMITTEE ACTION: PRE-AUTHORIZATION CRITERIA***—The P&T Committee recommended (12 for, 0 opposed, 1 abstained, 4 absent) the following should apply to the drugs listed above. Coverage at retail network pharmacies would be approved if the patient met all the following criteria:

a) Manual Pre-Authorization Criteria:

(1) Obtaining the product from home delivery would be detrimental to the patient.

(2) For branded products with AB generic availability, use of the generic product would be detrimental to the patient.

The Pre-Authorization criteria listed above do not apply to any point of service other than retail network pharmacies.

VII. ITEMS FOR INFORMATION

A. Pharmacy Outcomes Research Team (PORT)—The PORT updated the P&T Committee on their various activities and research initiatives, and presented data on utilization patterns and effects of formulary changes in four drug classes:

- Antiplatelet agents—This class was reviewed in February 2012, with clopidogrel (Plavix) remaining on the BCF. A key element of the cost-effectiveness evaluation was the anticipated generic availability of clopidogrel. As of July 2012, generic clopidogrel accounted for more than 98% of all use in the retail network, accompanied by an approximately 72% decrease in the average cost per unit compared to April 2012. At least one clopidogrel generic formulation is available to MTFs under a Federal Supply Schedule contract. The P&T Committee acknowledged that MTFs may encounter delayed availability of clopidogrel generics through their prime vendors, but encouraged perseverance, given the volume of use and the potential for cost avoidance.
- Antilipidemics-1—An automated step therapy program/PA was implemented in October 2010, requiring use of the preferred statin agents (atorvastatin, lovastatin, pravastatin, simvastatin) prior to treatment with non-preferred agents (e.g., rosuvastatin, ezetimibe/simvastatin, etc). The P&T Committee noted that step therapy is working, as evidenced by a gradual decline in the use of non-preferred agents (particularly the lower dosage strengths) in the retail and mail POS, and the low percentage (<3%) of rejected claims under the step therapy program relative to total claims (paid claims plus rejected claims).
- Leukotriene Antagonists—A PA requirement for montelukast (Singulair) was implemented in March 2012. The PA allows for the treatment of asthma, but limits use for treatment of allergic rhinitis, unless the patient has failed or experienced an adverse event with nasal corticosteroids. The P&T Committee noted an overall decline in Singulair use, particularly in the retail and mail order POS. Additionally, there was no spike in usage in April 2012, which historically was noticeable and attributed to seasonal usage of Singulair, likely for allergic rhinitis. No information was available at the time of the meeting

concerning impact of the very recent generic approval of montelukast in August 2012.

- Phosphodiesterase-5 inhibitors for Erectile Dysfunction—In November 2011, sildenafil (Viagra) replaced vardenafil (Levitra) on the BCF (effective February 2012) and as the preferred agent under the existing step therapy/PA program (effective April 2012). MTFs are rapidly switching from Levitra to Viagra. It is too early to determine the full effect on relative market share of these agents at retail and mail.

B. TRICARE Formulary Search Tool—Information regarding updates to the TRICARE Formulary Search Tool was provided to the P&T Committee and is available at *http://pec.ha.osd.mil/formulary_search.php*.

VIII. ADJOURNMENT

The meeting adjourned at 1100 hours on August 16, 2012. The next meeting will be in November 2012.

Dr. Amy Lugo via DCO	DoD Pharmacoeconomic Center
Ms. Deborah Garcia	DoD Pharmacy Outcomes Research Team contractor
Dr. Esmond Nwokeji	DoD Pharmacy Outcomes Research Team contractor

Appendix B—Table of Medical Necessity Criteria for Newly-Approved Drugs

Drug / Drug Class	Medical Necessity Criteria
• Testosterone transdermal solution pump; 30 mg/actuation; (Axiron) • Testosterone 1%; 25 mg/2.5 gm, 50 mg/5 gm transdermal gel packets, and 12.5 mg /actuation gel pump (Androgel 1%) • Testosterone 1.62% transdermal gel pump; 20.25 mg/actuation (Androgel 1.62%) **Testosterone Replacement Therapies**	• Use of ALL formulary testosterone replacement products is contraindicated (e.g., due to hypersensitivity), and treatment with Axiron, Androgel 1%, or Androgel 1.62% is not contraindicated. • Patient has experienced or is likely to experience significant adverse effects from the formulary agents. • The formulary agents have resulted in therapeutic failure.
• Ibuprofen/famotidine (Duexis) **Non-steroidal Anti-Inflammatory Drugs (NSAIDS)**	• Use of formulary agents is contraindicated.
• Ketorolac nasal spray (Sprix) **Non-steroidal Anti-Inflammatory Drugs (NSAIDS)**	• Use of formulary agents is contraindicated. • The patient requires a nasal NSAID formulation and cannot take NSAIDs via any other route.
• Tafluprost ophthalmic solution (Zioptan) **Ophthalmic Prostaglandins**	• The use of formulary alternatives is contraindicated. • The patient has experienced or is likely to experience significant adverse effects from the formulary agents.
• Abatacept SQ (Orencia) **Targeted Immunomodulatory Biologics (TIBs)**	• The use of formulary alternatives is contraindicated. • The patient has experienced or is likely to experience significant adverse effects from the formulary agents. • The formulary agents have resulted or are likely to result in therapeutic failure. • The patient previously responded to a non-formulary agent, and changing to a formulary agent would incur unacceptable risk. • The patient is currently receiving abatacept IV and is switching to abatacept SQ.

Appendix C—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Aug 2012	**Testosterone Replacement Therapies** **Topical and Buccal products subclass**	UF Review	• testosterone transdermal 2% gel pump; 10 mg/actuation (Fortesta)	• testosterone 50 mg/5 gm transdermal gel tubes (Testim) • testosterone 2 mg/24 hr, 4 mg/24 hr transdermal patches (Androderm) • testosterone 30 mg buccal tablets (Striant)	• testosterone transdermal solution pump; 30 mg/actuation; (Axiron) • testosterone 1%; 25 mg/2.5 gm, 50 mg/ 5 gm transdermal gel packets, and 12.5 mg/ actuation gel pump (Androgel 1%) • testosterone 1.62% transdermal gel pump; 20.25 mg/actuation (Androgel 1.62%)	Pending signing of minutes/ 90 days	PA required; see Comments	• All current and new users of topical and buccal testosterone replacement products must go through the PA process to ensure diagnosis of hypogonadism • Fortesta 2% gel pump is the preferred product; all users of topical and buccal testosterone replacement products must have trial of Fortesta 2% gel prior to other products
Aug 2012	**Anticoagulants** **Heparin and related products subclass**	UF Review	• enoxaparin (generic)	• dalteparin (Fragmin) • fondaparinux (generic)	• Not applicable (no products designated as nonformulary)	Pending signing of minutes	-	• enoxaparin generic designated BCF

DECISION PAPER

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

May 2012

I. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Gabapentin enacarbil (Horizant) and gabapentin (Gralise)

Relative clinical effectiveness conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) the following: gabapentin enacarbil (Horizant) and gabapentin (Gralise) are once-daily formulations of gabapentin (Neurontin, generics). There is no evidence to suggest either drug has a compelling clinical advantage over the other drugs for non-opioid pain syndromes included on the Uniform Formulary (UF).

Relative cost- effectiveness conclusion (15 for, 0 opposed, 0 abstained, 0 absent) Gabapentin enacarbil (Horizant) and gabapentin (Gralise) were not cost-effective when compared to other non-opioid pain syndrome agents included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (14 for, 0 opposed, 1 abstained, 0 absent) gabapentin enacarbil (Horizant) and gabapentin (Gralise) be designated nonformulary (NF) due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***
Existing step therapy/PA requires a trial of generic gabapentin prior to pregabalin (Lyrica) in new users. The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) that both gabapentin enacarbil (Horizant) and gabapentin (Gralise) be designated non-step-preferred, requiring a trial of generic gabapentin in new users. Coverage would be approved if the patient met any of the following step therapy/PA criteria:

   a) Automated PA criteria: The patient has filled a prescription for gabapentin at any Military Health System (MHS) pharmacy point of service [Military Treatment Facilities (MTFs), retail network pharmacies, or mail order] during the previous 180 days.

   b) Manual PA criteria: The patient has a contraindication to or experienced adverse events with gabapentin or the formulary non-opioid pain syndrome agents which is not expected to occur with Horizant or Gralise.

3. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following MN criteria for Horizant and Gralise: the patient has a contraindication to or has experienced an adverse effect from gabapentin or the formulary non-opioid pain syndrome agents.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 30-day implementation period in all points of service (POS), and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is September 19, 2012.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

II. UNIFORM FORMULARY DRUG CLASS REVIEWS

Relative clinical effectiveness conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) the newer sedative hypnotic agents all improve sleep latency (onset) compared to placebo. Sleep maintenance is improved with zolpidem IR (Ambien, generic), zolpidem CR (Ambien CR, generic), eszopiclone (Lunesta), and doxepin (Silenor). Based on an indirect comparison, there do not appear to be clinically relevant differences between zolpidem CR and Lunesta in terms of objective sleep measures.

Relative cost effectiveness conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) zolpidem IR was the least costly agent, followed by zaleplon, zolpidem CR, eszopiclone (Lunesta), doxepin (Silenor), zolpidem SL (Edluar), and ramelteon (Rozerem). BIA results showed minimal differences between scenarios, but the projected budgetary impact in the MHS did vary depending on market movement of zolpidem CR when designated step-preferred versus non-step-preferred, rate of price decline of generic zolpidem CR, and market migration of generic drugs versus branded products

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 1 opposed, 2 abstained, 0 absent) the following scenario for the UF, which includes a drug for sleep onset (zolpidem IR), a drug for sleep maintenance (zolpidem CR and Lunesta), and a non-controlled drug (Silenor), and is the most cost-effective option for the MHS:

- zolpidem IR and zaleplon be designated formulary on the UF and step-preferred. This recommendation incorporates step therapy, which requires a trial of zolpidem IR or zaleplon (step-preferred drugs) in new users before use of another newer sedative hypnotic drug;
- zolpidem CR, doxepin (Silenor), and eszopiclone (Lunesta) be designated formulary on the UF and non-step-preferred;
- ramelteon (Rozerem) and zolpidem SL (Edluar) remain NF and non-step-preferred (behind the step);
- zolpidem oral spray (Zolpimist) is not covered by a written agreement by the manufacturer to honor the pricing standards required by 10 United States Code 1074g(f). Pursuant to 32 Code of Federal Regulations (C.F.R.) 199.21(q)(2)(A), Zolpimist is designated NF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) zolpidem IR maintain BCF status on the UF.

3. ***COMMITTEE ACTION: PA CRITERIA***—Existing step therapy/PA requires a trial of generic zolpidem IR prior to the other newer sedative hypnotics in new users. The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following PA criteria should apply to the newer sedative hypnotics drug class. Coverage would be approved if the patient met any of the following criteria:
   a) Automated PA criteria: The patient has filled a prescription for zolpidem IR or zaleplon at any MHS pharmacy POS (MTFs, retail network pharmacies, or mail order) during the previous 180 days.
   b) Manual PA criteria: The patient has an inadequate response to, been unable to tolerate due to adverse effects, or has a contraindication to zolpidem IR or zaleplon.

4. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) retaining the current MN criteria for zolpidem SL (Edluar) and ramelteon (Rozerem): the patient has had an inadequate response to, been unable to tolerate due to adverse effects, or has contraindications to zolpidem IR or zaleplon, or there is no alternative formulary agent.

5. ***COMMITTEE ACTION: PRE-AUTHORIZATION AND MN CRITERIA FOR ZOLPIDEM ORAL SPRAY (ZOLPIMIST)***—Pursuant to 32 Code of Federal Regulations (C.F.R.) 199.21(q)(2)(B), the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following pre-authorization criteria should apply to availability of Zolpimist through retail network pharmacies. Coverage at retail network pharmacies would be approved if the patient met any of the following criteria:

   a) Manual Pre-Authorization Criteria:

      (1) Use of the formulary agent is contraindicated.

      (2) Obtaining the product for home delivery would be detrimental to the patient.

   The PA criteria listed above do not apply to any point of service other than retail network pharmacies.

   (b) Medical Necessity Criteria:

      (1) Use of the formulary agent is contraindicated.

COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is October 17, 2012.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

All recommended actions pertaining to Zolpimist are to be held in abeyance until verification is received from the Department of Veterans Affairs that Zolpimist is a covered drug under the Veterans Health Care Act.

III. SPECIAL PROGRAMS

A. Smoking Cessation Program

Background Relative Clinical Effectiveness—Drugs for smoking cessation [varenicline (Chantix), bupropion SR 150 mg (Zyban), and nicotine patch, gum, lozenge, nasal spray (Nicotrol NS), and inhaler (Nicotrol)] are currently excluded from the TRICARE® benefit by regulation (32 C.F.R 199.4(g)(65)). The Duncan Hunter National Defense Authorization Act for Fiscal Year 2009 requires the availability, at no cost to the beneficiary, of pharmaceuticals used for smoking cessation to select

beneficiary groups with a limitation on the availability of such pharmaceuticals to the national mail order pharmacy program under the TRICARE program if appropriate. The Proposed Rule, which provides that smoking cessation pharmaceutical agents, including FDA-approved over-the-counter pharmaceutical agents, are available through the TRICARE Mail Order Pharmacy or the MTF, has been published in the Federal Register (76 FR 58199), comments have been received, and the Final Rule is pending publication.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) the following: varenicline (Chantix), bupropion SR, and nicotine replacement therapy (NRT) are efficacious versus placebo for improving long-term smoking abstinence. Combination therapy, in particular nicotine patch plus gum, is more efficacious than monotherapy. Varenicline (Chantix) is the most efficacious monotherapy for smoking cessation. Safety concerns exist with varenicline, including adverse neuropsychiatric effects (behavioral changes, agitation, suicide/suicidal ideation, and depression). In patients with pre-existing stable cardiovascular (CV) disease, generally the benefit of abstinence outweighs the increased adverse CV risk with varenicline. Local MTFs remain at liberty to design their own smoking cessation program, defining which elements will be included in that program.

Relative Cost-Effectiveness Analysis and Conclusion—The P&T Committee concluded (15 for, 0 against, 0 abstained, 0 absent) the following:

- Cost-minimization results showed that nicotine patch and gum were the least costly products among the NRTs, and bupropion SR was the least costly non-NRT option.
- Cost-effectiveness analyses results demonstrated that, in adult patients who smoke more than 10 cigarettes a day, combination therapy (nicotine patch plus gum) was the most cost-effective treatment for tobacco dependence offering the greatest improvement in rates of long-term smoking abstinence. Although less cost-effective than combination therapy, varenicline was recognized as a cost-effective option when evaluating abstinence rates with monotherapy.
- Budget impact analysis showed inclusion of all 7 smoking cessation products in the Smoking Cessation Programs was the most favorable scenario for the MHS.

1. ***COMMITTEE ACTION: COVERAGE RECOMMENDATION***—The P&T Committee recommended (13 for, 1 opposed, 1 abstained, 0 absent) varenicline (Chantix), bupropion SR 150 mg, and nicotine (as patch, gum, lozenge, nasal spray, and inhaler) be covered agents in the TRICARE Smoking Cessation Program, contingent on publication of the Final Rule. This coverage recommendation allows for several treatment modalities to

accommodate patient preference and provide optimal access and opportunity for successful abstinence. No smoking cessation drugs were recommended to be excluded from the program.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) bupropion SR 150 mg; nicotine patch 7 mg, 14 mg, and 21 mg; and, nicotine gum 2 mg and 4 mg be designated BCF on the UF, contingent on publication of the Final Rule.

3. ***COMMITTEE ACTION: VARENICLINE PA***—The P&T Committee rejected (6 in favor of prior authorization for varenicline, 8 opposed, 1 abstained, 0 absent) the proposal that PA criteria should apply to varenicline (Chantix). PA criteria for varenicline were proposed for safety concerns, primarily neuropsychiatric AEs. While the P&T Committee recognized the potential for safety concerns with varenicline, they also concluded that a PA was not required to ensure safe prescribing with the medication because the risks with varenicline are understood by prescribing providers and can be successfully managed without PA criteria.

4. ***COMMITTEE ACTION: COVERED BENEFICIARY CRITERIA AND PA FOR A 3rd QUIT ATTEMPT***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following coverage criteria should apply to all seven smoking cessation products [varenicline (Chantix), bupropion SR 150 mg, nicotine gum, patch, lozenge, nasal spray, and inhaler)], consistent with the requirements in the Proposed Rule, and contingent on publication of the Final Rule. Coverage not approved for patients under the age of 18 or for Medicare-eligible beneficiaries. Coverage for a 3rd quit attempt within one year may be pre-approved if the provider has verified that the patient would benefit from a 3rd quit attempt.

5. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (14 for, 0 opposed, 1 abstain, 0 absent) QLs/days supply limits, restricting the maximum allowable smoking cessation quantity to a 60-day supply per claim at the TRICARE Mail Order POS, with a maximum 240-day supply per rolling 365-day period. Additionally, nicotine gum and nicotine lozenge would be limited to 300 pieces per 60-day claim, rounded to the nearest multiple of the package size (e.g., boxes of 75 or 100). The QL recommendations are contingent on publication of the Final Rule.

6. ***COMMITTEE ACTION: IMPLEMENTATION PERIOD***

The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in the MTF and mail order POS, following publication of the Final Rule.

SUBMITTED BY:

John P. Kugler, M.D., MPH
DoD P&T Committee Chair

DECISION ON RECOMMENDATIONS

Director, TMA, decisions are as annotated above.

Jonathan Woodson, M.D.
Director

August 8, 2012
Date

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE MINUTES AND RECOMMENDATIONS

May 2012

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on May 16, 2012, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of November Minutes**—Jonathon Woodson M.D., Director, approved the minutes for the February 2012 DoD P&T Committee meeting on May 7, 2012. A 6–12 month follow-up of safety for tapentadol ER (Nucynta ER) was requested by the Director.
2. **Correction of November 2011 Minutes—BCF Clarification for Short-Acting Beta Agonists:** The August 2011 P&T Committee minutes were clarified to state the Basic Core Formulary (BCF) listing for nebulized albuterol is the 0.083% 2.5 mg/3 mL formulation—not the 0.5% 2.5 mg/5mL vial—for the short-acting beta agonists.
3. **Correction of August 2011 Minutes—Prior Authorization (PA) Implementation Date for Singulair:** The PA implementation date for montelukast (Singulair) was changed from February 1, 2012, to March 21, 2012.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations (C.F.R.) 199.21(e)(1). All Uniform Formulary (UF) and BCF recommendations considered the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors. Medical necessity (MN) criteria were based on the clinical and cost evaluations, and the conditions for establishing MN for a nonformulary (NF) medication.

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Gabapentin enacarbil (Horizant) and gabapentin (Gralise)

Relative Clinical Effectiveness—Gabapentin enacarbil (Horizant) and gabapentin (Gralise) are once-daily formulations of gabapentin (Neurontin, generics). At the time of the May 2012 meeting, Horizant was FDA-approved for treating restless leg syndrome (RLS), but was undergoing FDA review for post-herpetic neuralgia. The Depression/Non-opioid Pain Syndrome Drug Class was reviewed for UF status at the November 2011 DoD P&T Committee meeting. Gabapentin (Neurontin, generics) is currently on the BCF. Step therapy/PA requires a trial of generic gabapentin prior to pregabalin (Lyrica) in new users.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) for both Horizant and Gralise, although the two drugs are dosed once daily versus multiple daily dosing required with generic gabapentin, there is no evidence to suggest either drug has a compelling clinical advantage over the other drugs for non-opioid pain syndromes included on the UF. Dosing conversion guidelines between Horizant, Gralise, and generic gabapentin are not available and these agents are not interchangeable due to differing pharmacokinetic properties. Gralise requires a large tablet burden to reach recommended dosing. Both drugs may cause significant somnolence and sedation, and Horizant carries a warning for adversely impairing driving ability.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—A pharmacoeconomic analysis was performed. The weighted average cost per day at all three points of service (POS) was evaluated for gabapentin enacarbil (Horizant) and gabapentin (Gralise) in relation to the other drugs for non-opioid pain syndromes. The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) that Horizant and Gralise were not cost-effective when compared to other non-opioid pain syndrome agents included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee, recommended (14 for, 0 opposed, 1 abstained, 0 absent) gabapentin enacarbil (Horizant) and gabapentin (Gralise) be designated NF due to the lack of compelling clinical advantages and cost disadvantages compared to the UF products.

2. ***COMMITTEE ACTION: GABAPENTIN ENACARBIL (HORIZANT) AND GABAPENTIN (GRALISE) PA CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) that both gabapentin enacarbil (Horizant) and gabapentin (Gralise) be designated non-step-preferred, requiring a trial of generic gabapentin in new users. Coverage would be approved if the patient met any of the following step therapy/PA criteria:

    a) Automated PA criteria:

(1) The patient has filled a prescription for gabapentin at any Military Health System (MHS) pharmacy POS [Military Treatment Facilities (MTFs), retail network pharmacies, or mail order] during the previous 180 days.

b) Manual (paper) PA criteria, if automated criteria are not met:

(1) The patient has a contraindication to gabapentin or the formulary non-opioid pain syndrome agents, which is not expected to occur with Horizant or Gralise.

(2) The patient has experienced adverse events (AEs) with gabapentin or the formulary non-opioid pain syndrome agents, which is not expected to occur with Horizant or Gralise.

3. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following MN criteria for Horizant and Gralise:

a) The patient has a contraindication to gabapentin or the formulary non-opioid pain syndrome agents.

b) The patient has experienced AE with gabapentin or the formulary non-opioid pain syndrome agents.

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***
The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 30-day implementation period in all POS, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is September 19, 2012

V. UF DRUG CLASS REVIEWS

A. Newer Sedative Hypnotics Drugs

Background Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the Newer Sedative Hypnotics (SED-1s), which are used for treating insomnia. The SED-1s class is comprised of the following: zolpidem

immediate-release (IR) (Ambien; generics), zolpidem extended-release (CR) (Ambien CR; generics), zolpidem oral spray (Zolpimist), zolpidem sublingual (SL) (Edluar), eszopiclone (Lunesta), zaleplon (Sonata; generics), ramelteon (Rozerem), and doxepin (Silenor).

A step therapy/PA requirement has been in effect for the SED-1s class since August 2007, requiring that new SED-1s users try the preferred agent, zolpidem IR, before TRICARE® will cover the other agents in this drug class.

Zolpidem oral spray (Zolpimist) is not covered by a written agreement by the manufacturer to honor the pricing standards required by 10 United States Code (U.S.C.) 1074g(f).

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (15 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions:

- The SED-1s all improve sleep latency (onset) compared to placebo. Sleep maintenance is improved with zolpidem IR, zolpidem CR, eszopiclone, and doxepin.
- Based on an indirect comparison, there do not appear to be clinically relevant differences between zolpidem CR and eszopiclone in terms of objective sleep measures.
- Doxepin improves insomnia by improving sleep maintenance; no comparative data exists with other drugs in the class.
- Zolpidem oral spray does not have comparative clinical trials with other SED-1s. FDA approval was granted based on the data originally submitted with Ambien. Zolpimist may pose additional risk for abuse given its dosage form.
- A recently published trial (Kripke, 2012) documented an increased risk of death with insomnia drugs. The interpretation of the results is hampered by several limitations in study design. No further recommendations regarding sedative hypnotic drug prescribing can be made at this time.
- The potential for abuse/misuse exists with the newer sedative hypnotics, with the exception of ramelteon and doxepin.
- The Pharmacy Outcomes Research Team (PORT) presented the results of several analyses assessing the outcomes of step therapy over the last four years. There was a decline in the number of step therapy rejections over time and an increase in utilization of the preferred product, zolpidem IR, suggesting that prescribers were aware of the step therapy requirement. The step therapy requirement did not move market share away from the MTFs, as 26% of the zolpidem IR prescriptions originated from civilian providers.

Relative Cost-Effectiveness Analysis and Conclusion—Pharmacoeconomic analyses were performed for the SED-1s class, including cost minimization analysis (CMA) and budget impact analyses (BIA). The P&T Committee concluded (15 for, 0 against, 0 abstained, 0 absent) zolpidem IR was the least costly agent, followed by zaleplon, zolpidem CR, eszopiclone (Lunesta), doxepin (Silenor), zolpidem SL (Edluar), and ramelteon (Rozerem). BIA results showed minimal differences between scenarios, but the projected budgetary impact in the MHS did vary depending on market movement of zolpidem CR when designated step-preferred versus non-step-preferred, rate of price decline of generic zolpidem CR, and market migration of generic drugs versus branded products.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—The P&T Committee recommended (12 for, 1 opposed, 2 abstained, 0 absent) the following:

    - zolpidem IR and zaleplon be designated formulary on the UF and step-preferred. This recommendation incorporates step therapy, which requires a trial of zolpidem IR or zaleplon (step-preferred drugs) in new users before use of another SED-1s drug;
    - zolpidem CR, doxepin (Silenor), and eszopiclone (Lunesta) be designated formulary on the UF and non-step-preferred;
    - ramelteon (Rozerem) and zolpidem SL (Edluar) remain NF and non-step-preferred (behind the step);
    - zolpidem oral spray (Zolpimist) is not covered by a written agreement by the manufacturer to honor the pricing standards required by 10 United States Code 1074g(f). Pursuant to 32 Code of Federal Regulations (C.F.R.) 199.21(q)(2)(A), Zolpimist is designated NF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) zolpidem IR maintain BCF status on the UF.

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following PA criteria should apply to the SED-1s class. Coverage would be approved if the patient met any of the following criteria:

    a) Automated PA criteria: The patient has received a prescription for zolpidem IR or zaleplon at any MHS pharmacy POS (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

    b) Manual (paper) PA criteria, if automated criteria are not met: The patient has had an inadequate response to, been unable to tolerate due to adverse

effects, or has contraindications to zolpidem IR or zaleplon (e.g., hypersensitivity, aberrant behaviors, or intolerable rebound insomnia).

4. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) retaining the current MN criteria for zolpidem SL (Edluar) and ramelteon (Rozerem):

   a) The patient has had an inadequate response to, been unable to tolerate due to adverse effects, or has contraindications to zolpidem IR or zaleplon (e.g., hypersensitivity, aberrant behaviors, or intolerable rebound insomnia).

   b) There is no alternative formulary agent. For zolpidem SL (Edluar), the patient is unable to swallow or has swallowing difficulties. For ramelteon (Rozerem), patient requires a non-controlled agent due to potential for abuse and cannot take doxepin (Silenor).

5. ***COMMITTEE ACTION: PRE-AUTHORIZATION AND MN CRITERIA FOR ZOLPIDEM ORAL SPRAY (ZOLPIMIST)***—Pursuant to 32 Code of Federal Regulations (C.F.R.) 199.21(q)(2)(B), the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following pre-authorization criteria should apply to availability of Zolpimist through retail network pharmacies. Coverage at retail network pharmacies would be approved if the patient met any of the following criteria:

   a) Manual Pre-Authorization Criteria:

      (1) Use of the formulary agent is contraindicated.

      (2) Obtaining the product for home delivery would be detrimental to the patient.

   The PA criteria listed above do not apply to any point of service other than retail network pharmacies.

   (b) Medical Necessity Criteria:

      (1) Use of the formulary agent is contraindicated.

6. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD*** The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all POS. Based on the P&T Committee's recommendation, the effective date is October 17, 2012.

VI. SPECIAL PROGRAM REVIEW

A. Smoking Cessation Program

Background Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the FDA-approved agents for smoking cessation. These agents include: varenicline (Chantix), bupropion SR 150 mg (Zyban), and nicotine, provided in five unique routes of administration (patch, gum, lozenge, nasal spray, and inhaler). Nicotine, via the patch, gum, and lozenge are available over-the-counter but are considered for coverage, by prescription, as part of this program.

Presently, the smoking cessation agents are not part of the TRICARE benefit, but are provided locally at most MTFs. The P&T Committee has not previously reviewed the smoking cessation drugs, as they were excluded from the TRICARE benefit by regulation (32 C.F.R. 199.4(g)(65)). The Duncan Hunter National Defense Authorization Act for Fiscal Year 2009 requires the availability, at no cost to the beneficiary, of pharmaceuticals used for smoking cessation to select beneficiary groups with a limitation on the availability of such pharmaceuticals to the national mail order pharmacy program under the TRICARE program if appropriate. The Proposed Rule has been published in the Federal Register (76 FR 58199), comments have been received, and the Final Rule is pending publication.

The Proposed Rule would limit coverage of smoking cessation products to the MTFs and TRICARE Mail Order Pharmacy POS, and to select beneficiary groups. The Proposed Rule allows two quit attempts, defined as 120-day periods, to be available annually to eligible beneficiaries. Medication coverage for a third attempt may be offered with prior authorization.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (15 for, 0 opposed, 0 abstained, 0 absent) to accept the following clinical effectiveness conclusions:

- Varenicline (Chantix), bupropion SR, and nicotine replacement therapy (NRT) are efficacious versus placebo for improving long-term smoking abstinence. There is additive efficacy when the smoking cessation drugs are combined with behavioral therapy.
- For combination therapy, nicotine patch plus gum or nasal spray is the most efficacious smoking cessation therapy. Use of the nasal spray is limited by poor tolerability.
- Varenicline (Chantix) is the most efficacious monotherapy for smoking cessation.
- Safety concerns exist for varenicline (Chantix). Although the available data has limitations in study design and shows conflicting results, overall there appears to

be an association between varenicline and adverse neuropsychiatric events to include behavioral changes, agitation, suicide/suicidal ideation, and depression.

- Caution should be exercised if varenicline is prescribed to patients with active psychiatric comorbidities.
- Varenicline has shown efficacy in patients with cardiovascular (CV) disease and chronic obstructive pulmonary disease. There is conflicting data as to whether varenicline is associated with a higher risk of adverse CV events, including non-fatal myocardial infarction, need for coronary revascularization, hospitalization for angina, and peripheral vascular disease. However, the benefits of smoking cessation with varenicline are felt to outweigh the risks in patients with pre-existing, stable CV disease.
- Varenicline is more efficacious in terms of abstinence at 52 weeks than bupropion SR. Bupropion SR is more efficacious than the NRT patch. There is additive efficacy if bupropion SR is added on to NRT (either gum or patch). However, the combination is no better than bupropion monotherapy if the bupropion is initiated first.
- When varenicline is compared to bupropion SR in randomized, controlled trials, the most commonly reported AEs are nausea (29%), insomnia (14%), abnormal dreams (13%), and headache (13%). The most common AEs with bupropion include insomnia (21%), nausea (7%), and dry mouth (10%).
- Bupropion carries a black box warning for changes in behavior, depressed mood, hostility, and suicidal ideation.
- All smoking cessation drugs show poor rates of compliance in both effectiveness and efficacy trials. Patient preference for a particular medication modality will determine compliance. Long-term abstinence may occur in cases of incomplete compliance. The typical long-term abstainer will make four or more serious quit attempts before finding success.
- Local MTFs remain at liberty to design their own smoking cessation program, defining which elements will be included in that program.

Relative Cost-Effectiveness Analysis and Conclusion—CMA and cost-effectiveness analyses (CEAs) were used to compare the different treatment options for smoking cessation, as efficacy and safety differences between the agents were noted in the clinical review. BIA was also performed to compare several program scenarios. The P&T Committee concluded (15 for, 0 against, 0 abstained, 0 absent) the following:

- CMA results showed that nicotine patch and gum were the least costly products among available NRTs, and bupropion SR was the least costly non-NRT option.

- CEA results demonstrated that, in adult patients who smoke more than 10 cigarettes a day, combination therapy (nicotine patch plus gum) was the most cost-effective treatment for tobacco dependence offering the greatest improvement in rates of long-term smoking abstinence. Although less cost-effective than combination therapy, varenicline was recognized as a cost-effective option when evaluating abstinence rates with monotherapy.
- BIA results showed that inclusion of bupropion SR, varenicline, and nicotine (as patch, gum, lozenge, nasal spray, and inhaler) in the TRICARE Smoking Cessation Program was the most favorable scenario for the MHS.

1. ***COMMITTEE ACTION: COVERAGE RECOMMENDATION***—The P&T Committee recommended (13 for, 1 opposed, 1 abstained, 0 absent) varenicline (Chantix), bupropion SR 150 mg, and nicotine (as patch, gum, lozenge, nasal spray, and inhaler) be covered agents in the TRICARE Smoking Cessation Program, contingent on publication of the Final Rule. No smoking cessation drugs were recommended to be excluded from the program.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) bupropion SR 150 mg; nicotine patch 7 mg, 14 mg, and 21 mg; and, nicotine gum 2 mg and 4 mg be designated BCF on the UF, contingent on publication of the Final Rule.

3. ***COMMITTEE ACTION: VARENICLINE PA***—The P&T Committee rejected (6 in favor of prior authorization for varenicline, 8 opposed, 1 abstained, 0 absent) the proposal that PA criteria should apply to varenicline (Chantix). PA criteria for varenicline were proposed for safety concerns, primarily neuropsychiatric AEs. While the P&T Committee recognized the potential for safety concerns with varenicline, they also concluded that a PA was not required to ensure safe prescribing with the medication because the risks with varenicline are understood by prescribing providers and can be successfully managed without PA criteria.

4. ***COMMITTEE ACTION: COVERED BENEFICIARY CRITERIA AND PA FOR A 3rd QUIT ATTEMPT***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following coverage criteria should apply to all seven smoking cessation products [varenicline (Chantix), buproprion SR 150 mg, nicotine gum, patch, lozenge, nasal spray, and inhaler], consistent with the requirements in the Proposed Rule, and contingent on publication of the Final Rule. Coverage not approved for patients under the age of 18 or for Medicare-eligible beneficiaries. Coverage for a 3rd quit attempt within one year may be

pre-approved if the provider has verified that the patient would benefit from a 3rd quit attempt.

5. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (14 for, 0 opposed, 1 abstain, 0 absent) QLs/days supply limits, restricting the maximum allowable smoking cessation quantity to a 60-day supply per claim at the TRICARE Mail Order POS, with a maximum 240-day supply per rolling 365-day period. Additionally, nicotine gum and nicotine lozenge would be limited to 300 pieces per 60-day claim, rounded to the nearest multiple of the package size (e.g., boxes of 75 or 100). The QL recommendations are contingent on publication of the Final Rule.

6. ***COMMITTEE ACTION: IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in the MTF and mail order POS, following publication of the Final Rule.

VII. ITEMS FOR INFORMATION

A. Weight Loss Drugs Update—Currently C.F.R. 199.4 states that weight loss control medications are not a covered TRICARE pharmacy benefit. A brief overview of weight loss medications was provided, due to increasing awareness by the White House of the childhood obesity epidemic and recent actions by the FDA Endocrinologic and Metabolic Drugs Advisory Committee, which recommended three investigational weight loss drugs for approval. The P&T Committee will review the clinical and cost-effectiveness of the weight loss drugs if the regulation changes.

B. Non-approved drugs—The P&T Committee was briefed on the dispensing of non-FDA-approved drugs from the retail POS and the C.F.R. requirements for TRICARE coverage of prescription medications. Recommendations were made to develop an internal process to identify and review nonapproved products, determine the beneficiary impact of excluding these products, and work with the retail network contractor to potentially exclude coverage of these nonapproved products.

C. Compounded Medications under the TRICARE Benefit—The P&T Committee was briefed on compounded medications dispensed from the retail and mail order POS. MHS expenditures for compounded medications are significant and increasing, and compounded medications have a high potential for inappropriate use. Further updates and initiatives in the area of compounded medications will be provided to the P&T Committee.

D. PORT—The PORT provided the P&T Committee with an update and review of findings on various topics.

E. **Prescription Omega-3-Acid Esters (Lovaza) PA Update**—An update on the results of the PA for Lovaza was provided. Since implementation of the PA in July 2011, there was an initial steep decline in the numbers of Lovaza prescriptions filled, which has stabilized.

F. **Renin Angiotension Antihypertensive Agents (RAAs) PA Update**—The P&T Committee was briefed on recent developments in the RAAs class. Two products are now available in generic formulations, eprosartan (Teveten) and irbesartan (Avapro). No recommendations were made to change the existing step therapy/PA. The class is slated for re-review following generic availability of additional proprietary products and publication of updated hypertension guidelines from the National Heart Lung and Blood Institute.

VIII. ADJOURNMENT

The meeting adjourned at 1645 hours on May 16, 2012. The next meeting will be in August 2012.

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
February 2012

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on February 16 and 17, 2012, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of November Minutes**—Jonathon Woodson M.D., Director, approved the minutes for the November 2011 DoD P&T Committee meeting on February 7, 2012.
2. **Correction of August 2011 Minutes—BCF Clarification for Non-steroidal Anti-inflammatory Drugs:** The August 2011 P&T Committee minutes were clarified to state the BCF listing is naproxen 125 mg/5 mL suspension—not ibuprofen suspension—for the oral non-steroidal anti-inflammatory drugs.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations (CFR) 199.21(e)(1).

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Ophthalmic-1 Class—Alcaftadine Ophthalmic Solution 0.25% (Lastacaft)

Relative Clinical Effectiveness—Alcaftadine (Lastacaft) is a dual action ophthalmic antihistamine/mast cell stabilizer. It is dosed once daily to prevent symptoms associated with allergic conjunctivitis (AC). The Ophthalmic-1 Class was evaluated for Uniform Formulary (UF) placement in February 2010. The current Basic Core Formulary (BCF) product is olopatadine 0.1% (Patanol); there are no nonformulary (NF) Ophthalmic-1 drugs.

There are no head-to-head trials with alcaftadine and the other dual action ophthalmic antihistamines. Alcafatidine was superior to placebo in preventing ocular itching

associated with AC, but was not superior in relieving conjunctival redness. Alcaftadine's safety profile appears similar to the other ophthalmic antihistamines.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 2 absent) there is no evidence to suggest alcaftadine ophthalmic solution has a compelling clinical advantage over the other dual action agents for AC on the UF.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—Cost minimization analysis (CMA) was performed. The weighted average cost per day at all three points of service (POS) was evaluated for alcaftadine ophthalmic solution in relation to other currently available Ophthalmic-1 agents. Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 2 absent) that alcaftadine ophthalmic solution was cost-effective when compared to other agents on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1abstained, 2 absent) alcaftadine ophthalmic 0.25% solution (Lastacaft) remain designated with formulary status on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Narcotic Analgesics—Tapentadol Extended Release Tablets (Nucynta ER)

Tapentadol extended release (Nucynta ER) is an opioid analgesic with dual modes of action; it is a mu receptor agonist with norepinephrine reuptake inhibition properties. Tapentadol ER is a Schedule II narcotic, and is classified as a high potency analgesic in the Narcotic Analgesics Drug Class. The class was last reviewed for UF placement in February 2007. Tapentadol immediate release (IR) (Nucynta) was reviewed in November 2009 and is currently NF. Tapentadol ER is indicated for moderate to severe pain when continuous, around-the-clock opioid analgesia is needed chronically. In two trials, tapentadol ER demonstrated greater reductions in pain scores compared to placebo, and produced similar reductions in pain scores as oxycodone ER (Oxycontin).

The safety profile of tapentadol ER is typical of the other high potency long-acting opioids. The adrenergic properties of the drug create additional safety concerns with respect to serotonin syndrome and interactions with monoamine oxidase inhibitors. When indirectly compared to oxycodone ER in clinical trials, the frequency of gastrointestinal (GI) adverse events (constipation, nausea, and vomiting) was observed less frequently in the Nucynta ER treatment groups. However, there were more central nervous system (CNS) disorders seen in the Nucynta ER groups.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) that tapentadol extended release (Nucynta ER) offers another long-acting, high-potency narcotic analgesic treatment option that may have less GI adverse events but more CNS adverse events than oxycodone ER. There is no evidence that pain control with tapentadol ER is superior to oxycodone ER.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—CMA was performed. Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) that tapentadol ER (Nucynta ER) was more costly on an average weighted cost per day of therapy basis than several other comparators in the high potency narcotic analgesics currently on the UF, including generic morphine sulfate IR and fentanyl patches. Tapentadol ER was less costly than morphine sulfate ER (Avinza and Kadian), oxymorphone ER (Opana ER), oxycodone ER (OxyContin), and hydromorphone ER (Exalgo).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (9 for, 8 opposed, 1abstained, 0 absent) tapentadol extended release (Nucynta ER) remain formulary on the UF. UF status was designated due to the potential for decreased GI intolerance as compared to oxycodone ER, despite the concerns of potential undesirable drug interactions due to norepinephrine reuptake inhibition properties.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

V. UF DRUG CLASS REVIEWS

A. Antiplatelet Agents

Background Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the antiplatelet drugs, which are used for treating acute coronary syndromes, stroke, and peripheral artery disease. The Antiplatelet Drug Class is comprised of the following: clopidogrel (Plavix), prasugrel (Effient), ticagrelor (Brilinta), ticlopidine (Ticlid, generics), aspirin/dipyridamole ER (Aggrenox), dipyridamole (Persantine, generics), cilostazol (Pletal, generics), and pentoxifylline (Trental, generics). Aspirin is available over-the-counter and is not part of the TRICARE® benefit.

Clopidogrel was designated with BCF status on the UF in 2002, prior to implementation of the UF Rule. Generic formulations of clopidogrel are expected in May 2012. Military Health System (MHS) expenditures for antiplatelet agents exceed $260 million annually.

Relative Clinical Effectiveness Conclusion—The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 1 absent) to accept the following clinical effectiveness conclusions:

1. With regard to efficacy, the following conclusions were made:
    - Acute coronary syndrome (ACS):
        - Several large clinical trials have shown the effectiveness of clopidogrel in decreasing the incidence of major cardiovascular (CV) events in patients with ACS.
        - Prasugrel and ticagrelor have a faster onset of action and exhibit more complete platelet inhibition, compared to clopidogrel.
        - Guidelines from professional cardiology groups recommend clopidogrel, prasugrel, or ticagrelor as first-line options for treating ACS patients requiring percutaneous coronary intervention (PCI).
        - Prasugrel and ticagrelor are approved solely for ACS; however, prasugrel is limited to patients whose coronary anatomy is known and suitable for PCI.
        - In the TRITON-TIMI 38 trial, prasugrel was more effective than clopidogrel in reducing the composite endpoint of cardiovascular death, non-fatal myocardial infarction (MI), and stroke in ACS patients undergoing PCI. There was no significant difference between prasugrel and clopidogrel for the single endpoint of CV death.

- In the TRITON-TIMI 38 trial, a subgroup analysis showed prasugrel was superior to clopidogrel in patients who are diabetic, those with prior stent thrombosis, and those younger than 65 years.
- In the PLATO trial, ticagrelor was more effective than clopidogrel in reducing the composite endpoint of CV death, non-fatal MI, and stroke in ACS. Ticagrelor was more effective than clopidogrel in reducing the single endpoints of CV death and non-fatal MI, although the trial was not designed to assess differences in mortality.
- In the PLATO trial, a subgroup analysis of the 1,413 U.S. patients found no significant difference between ticagrelor and clopidogrel for major coronary events. This was attributed to the higher aspirin dose utilized in North America versus the rest of the world. Ticagrelor should only be used with aspirin doses lower than 100 mg.
- Definitive statements about comparative clinical effectiveness between prasugrel and ticagrelor are difficult to make because there are no head-to-head studies.

- Stroke
  - A systematic review from the Oregon Drug Effectiveness Review Project (DERP) concluded there was no significant difference between aspirin/dipyridamole ER and clopidogrel for all-cause mortality, CV mortality, and recurrent stroke, in patients with ischemic stroke, based on the PROFESS trial.
  - The DERP review concluded there was no significant difference between ticlopidine and clopidogrel on outcomes of all-cause mortality, CV death, or cerebral infarction in stroke patients.
- Peripheral artery disease (PAD)
  - Cilostazol is the recommended first-line agent to improve walking distance in patients with PAD, while pentoxifylline is the second-line alternative, based on professional guidelines.
  - Clopidogrel and aspirin are recommended to reduce the risk of MI, stroke or vascular death in patients with symptomatic PAD.

2. With regards to safety/tolerability, the following conclusions were made:
   - In the TRITON-TIMI 38 trial, prasugrel had a significantly higher rate of bleeding, including non-coronary artery bypass grafting (CABG) related bleeding and fatal bleeding, compared to clopidogrel.

Additional risk factors that increase the bleeding risk with prasugrel include low weight (<60 kg), age greater than 75 years, and prior history of stroke and transient ischemic attack (TIA).

- In the PLATO trial, ticagrelor had a similar rate of major and fatal bleeding compared to clopidogrel; however, the rate of non-CABG-related major bleeding was significantly higher with ticagrelor than clopidogrel. Ticagrelor was associated with a higher rate of non-hemorrhagic adverse events (AEs), including dyspnea, and increases in serum creatinine and uric acid levels.
- Unlike clopidogrel and ticagrelor, prasugrel is contraindicated in patients with previous stroke or TIA.
- Ticlopidine's therapeutic use is greatly limited by its AE profile, including risk of neutropenia and aplastic anemia.
- In stroke patients, clopidogrel had a lower rate of major bleeding and withdrawal due to AEs, compared with aspirin/dipyridamole ER.

3. With regards to other factors
   - Prasugrel and ticagrelor are less susceptible to genetic variation and drug-drug interactions with proton pump inhibitors (PPIs), compared to clopidogrel.
   - The Pharmacy Outcomes Research Team (PORT) conducted an analysis to define a typical MHS Aggrenox user. A total of 13,341 users with an average age of 76 years were identified. Over 82% of patients had received Aggrenox in the last 180 days, with a new user rate of 13%–18%, suggesting that patients had been on Aggrenox for extended periods.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the antiplatelet agents for secondary prevention in ACS, for secondary prevention in stroke, and for PAD. CMAs were performed for the antiplatelet drugs used for stroke and PAD (aspirin/dipyridamole ER, ticlopidine, cilostazol, dipyridamole, and pentoxifylline). Cost-effectiveness analyses (CEAs) and CMAs were used to analyze antiplatelet agents for ACS (clopidogrel, prasugrel, and ticagrelor), as efficacy differences between the agents were noted in the clinical review.

- CMA and BIA were used to assess the potential impact of cost scenarios where selected antiplatelet agents were designated with formulary or NF status on the UF. The impact of generic clopidogrel availability was modeled in the BIA scenarios.

- For the antiplatelet drugs prescribed following ACS, CEAs and CMAs were used to assess the potential impact of the occurrence rates of CV and bleeding events, based on differences highlighted in the clinical review.
- Two separate cost-effectiveness models were constructed in the analyses of antiplatelet agents for ACS secondary prevention: prasugrel (Effient) versus clopidogrel and ticagrelor (Brilinta) versus clopidogrel. Analysis was based on direct comparisons of relevant trial data. The models compared the annual cost per CV event avoided (the composite of nonfatal MI, nonfatal stroke, and death from CV cause).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 against, 0 abstained, 2 absent) the following:

- **Antiplatelet agents for ACS**—CEA results showed that prasugrel (Effient) and ticagrelor (Brilinta) provide reasonable clinical benefit for the increase in treatment cost, as shown by their incremental cost-effectiveness ratios (ICERs) of $28,083 and $58,358 per cardiovascular event avoided, respectively.

- **Antiplatelet agents for stroke**—CMA results showed that aspirin/dipyridamole ER (Aggrenox) was the least cost-effective agent, based on analysis of the average weighted price per day of therapy at all three POS.

- **Antiplatelet agents for PAD**—CMA results showed that pentoxifylline and cilostazol are similarly cost-effective therapy options.

- **All antiplatelet agents**—BIA results showed the scenario where all current BCF agents were retained on the BCF, all current UF agents were retained on the UF, and aspirin/dipyridamole ER (Aggrenox) and ticagrelor (Brilinta) were designated NF resulted in the lowest projected cost compared to current MHS expenditures.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 3 opposed, 0 abstained, 1 absent) clopidogrel (Plavix), prasugrel (Effient), ticagrelor (Brilinta), ticlopidine (Ticlid, generics), aspirin/dipyridamole ER (Aggrenox), dipyridamole (Persantine, generics), cilostazol (Pletal, generics) and pentoxifylline (Trental, generics) remain formulary on the UF. Although the cost-effectiveness review showed aspirin/dipyridamole ER was the least cost-

effective drug for stroke, the P&T Committee recommended that it remain formulary on the UF due to the low new user rate and the advanced age of the patient population. Ticagrelor was also recommended to remain formulary on the UF due its ICER, compared to clopidogrel.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

☐ Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 0 abstained, 1 absent) clopidogrel (Plavix) maintain BCF status on the UF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

☐ Approved, but modified as follows:

B. Dipeptidyl Peptidase-4 (DPP-4) Inhibitors

The P&T Committee evaluated the relative clinical effectiveness of the DPP-4 inhibitors, which include:

- sitagliptin (Januvia), sitagliptin/metformin (Janumet), sitagliptin/simvastatin (Juvisync);
- saxagliptin (Onglyza), saxagliptin/metformin ER (Kombiglyze XR);
- linagliptin (Tradjenta).

Two new products, sitagliptin/metformin ER (Janumet XR) and linagliptin/metformin (Jentadueto) will be reviewed at an upcoming meeting. The DPP-4 inhibitors were previously reviewed in November 2010 as a subclass of the Non-insulin Diabetes Drug Class. Prior Authorization (PA) criteria and step therapy require a trial of metformin or sulfonylurea (SU) prior to using a DPP-4 inhibitor.

MHS expenditures exceed $119 million annually for DPP-4 inhibitors. In terms of overall utilization at all POS, sitagliptin and sitagliptin/metformin are the most utilized agents and are currently designated with BCF status on the UF.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (18 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions for the DPP-4 inhibitors:

1. Clinical practice guidelines, including the DoD/Veterans Affairs guidelines for diabetes mellitus, do not currently recommend DPP-4 inhibitors for a specific place in therapy but list the class as alternative agents. Metformin remains the recommended first line agent for most patients who do not have a contraindication for metformin therapy.
2. There are no completed long-term studies assessing CV outcomes with sitagliptin, saxagliptin, and linagliptin, although three studies are under way, with results expected in 2014–2018.
3. One head-to-head trial did not show clinically relevant differences in efficacy or safety between sitagliptin and saxagliptin.
4. Sitagliptin, saxagliptin, and linagliptin show similar effects of lowering hemoglobin A1c when used as monotherapy, ranging from 0.4% to 0.9%. When a DPP-4 inhibitor is combined with metformin, the mean decrease in A1c from baseline ranges from 0.4% to 2.5%; when combined with a thiazolidinedione (TZD), the mean decrease in A1c ranges from 0.7% to 1.06%; and when combined with a SU, the mean decrease in A1c ranges from 0.5% to 0.6%.
5. DPP-4 inhibitors are weight neutral, lipid neutral, and have minimal impact on blood pressure.
6. Linagliptin has not been directly compared with saxagliption or sitagliptin in a clinical trial. A meta-analysis showed the A1c-lowering effect of linagliptin plus metformin was non-inferior to sitagliptin plus metformin. Linagliptin is the only DPP-4 inhibitor that does not require dose adjustments due to renal or hepatic impairment.
7. Juvisync is a fixed-dose combination product containing sitagliptin with the cholesterol-lowering drug simvastatin. There are no clinical trials evaluating Juvisync; it obtained FDA approval based on bioequivalence with the individual components. Juvisync may provide a dosing convenience in patients who require both sitagliptin and a statin.
8. In terms of commonly reported adverse events, there are no clinically relevant differences between sitagliptin, saxagliptin, and linagliptin. Drug interaction profiles are also similar between agents. Pancreatitis has been reported with both sitagliptin and saxagliptin. Acute renal failure has been reported with sitagliptin.

9. There is a high degree of therapeutic interchangeability between sitagliptin, saxagliptin, and linagliptin.
10. The PORT conducted an analysis of the changes in DPP-4 inhibitor utilization following the November 2010 P&T Committee Meeting. At that meeting, sitagliptin and sitagliptin/metformin were designated BCF and step therapy (automated PA) was implemented, requiring a trial of metformin or a SU prior to use of a DPP-4 inhibitor. An increase in DPP-4 utilization has been noted at the MTF and Mail Order POS. Utilization increase at the Mail Order POS may also be due to the change in co-pay structure implemented in October 2011. There has also been a concurrent decline in TZD utilization, which is likely due to safety concerns.
11. The PORT also examined the effects of step therapy at the three POS.
    - **MTFs**—Out of 48,097 patients receiving their first DPP-4 prescription in the period from December 2010 to November 2011, 32% were new users of DPP-4 inhibitors; of these new users, 19%–21% had no evidence of prior use of metformin or SU.
    - **Retail and Mail Order**—In the 8-month evaluation period, 848 DPP-4 inhibitor prescriptions were rejected due to no evidence of prior metformin or SU use. However, 67% of these rejected prescriptions did show that a DPP-4 inhibitor prescription was received within 240 days of the reject, and 52% showed a later prescription for metformin of SU. There was no evidence of a prescription fill for any oral non-insulin diabetes drug in 12% of the rejected claims ("no fill" rate).

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—CMAs and budget impact analyses (BIA) were used to evaluate the relative cost-effectiveness of the DPP-4 inhibitors. Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) the following:

- BIA was used to assess the potential impact of cost scenarios where selected DPP-4 inhibitors were designated with formulary, BCF, or NF status on the UF. The analysis included an evaluation of the potential impact of cost scenarios where DPP-4 inhibitors were designated with preferred product status (step therapy) on the UF; i.e., a trial of a preferred DPP-4 inhibitor would be required before using other DPP-4 inhibitors on the UF.
- BIA results showed the scenario where sitagliptin (Januvia), sitagliptin/metformin (Janumet), and sitagliptin/simvastatin (Juvisync) are step-preferred on the UF, linagliptin (Tradjenta) is non-preferred on the UF, and saxagliptin

(Onglyza) and saxagliptin/metformin (Kombiglyze XR) are non-preferred and NF was determined to be the most cost-effective.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 1 opposed, 1 abstained, 0 absent):

   - sitagliptin (Januvia), sitagliptin/metformin (Janumet), and sitagliptin/simvastatin (Juvisync) be designated step-preferred and formulary on the UF;
   - linagliptin (Tradjenta) be designated non-preferred and formulary on the UF;
   - saxagliptin (Onglyza) and saxagliptin/metformin ER (Kombiglyze XR) be designated non-preferred and NF.

   This recommendation implements step therapy, which requires a trial of Januvia, Janumet, or Juvisync (the preferred drugs) prior to using other DPP-4 inhibitors. Prior authorization for the DPP-4 inhibitors would require a trial of metformin or sulfonylurea for new patients.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***— Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) sitagliptin (Januvia) and sitagliptin/metformin (Janumet) maintain BCF status on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluations for saxagliptin (Onglyza) and saxagliptin/metformin ER (Kombiglyze XR) and the conditions for establishing MN for NF medications, the P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) MN criteria for saxagliptin (Onglyza) and saxagliptin/metformin ER (Kombiglyze XR). (See Appendix C for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) the following PA criteria should apply to the DPP-4 inhibitors subclass. Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for metformin or SU at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

      (2) The patient has received a prescription for a DPP-4 inhibitor (Januvia, Janumet, Juvisync, Onglyza, Kombiglyze XR, or Tradjenta) at any MHS pharmacy POS (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual PA criteria for Januvia, Janumet, Juvisync, Onglyza, Kombiglyze XR, or Tradjenta, if automated criteria are not met:

      (1) The patient has experienced any of the following adverse events while receiving metformin: impaired renal function that precludes treatment with metformin or history of lactic acidosis.

(2) The patient has experienced the following adverse event while receiving a SU: hypoglycemia requiring medical treatment.

(3) The patient has a contraindication to both metformin and a SU.

c) In addition to the above criteria regarding metformin and SU, the following PA criteria would apply specifically to saxagliptin (Onglyza), saxagliptin/ metformin ER (Kombiglyze XR), and linagliptin (Tradjenta):

(1) The patient has experienced an adverse event with sitagliptin-containing products, which is not expected to occur with saxagliptin- or linagliptin-containing products.

(2) The patient has had an inadequate response to a sitagliptin-containing product.

(3) The patient has a contraindication to sitagliptin.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***— The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the P&T Committee's recommendation, the effective date is July 11, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Attention Deficit Hyperactivity Disorder (ADHD)/Wakefulness-Promoting Agents

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the ADHD and Wakefulness-Promoting Agents Class, which was previously reviewed in November 2006. The drugs in this class are comprised of the following three subclasses: 1) ADHD stimulants, 2) ADHD non-stimulants, and 3) wakefulness-promoting agents.

The ADHD stimulants include lisdexamphetamine (Vyvanse), and long- and short-acting formulations of methylphenidate, amphetamine, and mixed amphetamine salt products. The full list of the drugs in the subclass and the classification of long- and short-acting stimulants are found in Appendix D. Since the November 2006 review, dexmethylphenidate IR (Focalin), mixed amphetamine salts ER and IR (Adderall XR; Adderall), and methylphenidate long-acting (LA) (Ritalin LA) are now available in generic formulations. There is one authorized generic for methylphenidate osmotic-controlled release oral delivery system (OROS), which is produced by the manufacturer of Concerta.

The ADHD non-stimulants subclass is comprised of atomoxetine (Strattera), clonidine ER (Kapvay), and guanfacine ER (Intuniv). The wakefulness-promoting subclass includes modafinil (Provigil), armodafinil (Nuvigil), and sodium oxybate (Xyrem). Generic formulations of modafinil are expected in the 2nd quarter of 2012. Prior Authorization is currently required for modafinil and armodafinil.

The current BCF agents include mixed amphetamine salts ER (Adderall XR, generics), methylphenidate IR (Ritalin, generic) and methylphenidate OROS (Concerta). The current NF products include dexmethylphenidate ER (Focalin XR), dexmethylphenidate IR (Focalin), lisdexamfetamine (Vyvanse), and methylphenidate transdermal system (Daytrana).

Relative Clinical Effectiveness Conclusion

1. The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 1 absent) on the following conclusions regarding the ADHD stimulants and non-stimulants:
    a) Methylphenidate IR is more effective than placebo in improving ADHD symptoms in preschool-aged children (4–5 years of age) who do not respond to parental behavior training.
    b) Based on a DERP systematic review, the following conclusions apply in children and adolescents aged 6–17 years:
        - There are no clinically relevant differences between the IR stimulant formulations.
        - There are no clinically relevant differences between IR stimulant formulations when compared to sustained release (SR) stimulants (Ritalin SR, Metadate CD).
        - There is conflicting evidence when methylphenidate IR is compared with methylphenidate OROS (Concerta). Two double-blinded studies showed no difference in efficacy, while two open-label studies favored methylphenidate OROS.

- There are no clinically relevant differences when SR stimulant formulations are compared to other SR formulations. Minor differences include that methylphenidate CD (Metadate CD) and dexmethylphenidate ER (Focalin XR) show greater response in the morning, while methylphenidate OROS (Concerta) shows greater response in the evening.
- Lisdexamphetamine (Vyvanse) treatment resulted in similar scores on AHDH rating scales when compared to mixed amphetamine salts ER (Adderall XR).
- Transdermal methylphenidate (Daytrana) produced similar scores on investigator, teacher, and parent rating scales when compared to methylphenidate OROS (Concerta) over a 7-week period.

c) In adults (18 years of age and older), there are no clinically relevant differences in efficacy when switching to methylphenidate OROS (Concerta) versus continuing with methylphenidate IR.

d) With regards to safety, package labeling for all stimulants contains a black box warning for potential abuse and dependency.

e) Use of mixed amphetamine salts (Adderall IR, generic) is associated with a higher incidence of weight loss and insomnia than methylphenidate IR.

f) One large randomized controlled trial, the Multimodal Therapy Study of ADHD, reported stimulants caused a decrease in growth velocity in children at 36 months.

g) Stimulants do not significantly increase the risk of serious cardiovascular events in children, adolescents, or adults (up to age 64), based on two large cohort studies.

h) The stimulants with the lowest potential for abuse/diversion are Vyvanse, Daytrana, and Concerta. In adolescents, American Academy of Pediatrics guidelines recommend prescribing non-stimulants or stimulants with the lowest potential for abuse/diversion, compared to the other stimulant products.

i) For patients with swallowing difficulties, Vyvanse is dissolvable in water. Ritalin LA, Metadate CD, Adderall XR, and Focalin XR are formulated in capsules that can be opened and sprinkled on food.

j) The PORT analyzed ADHD prescription use in the MHS for the first 4 months of the school year.

(1) Use of any ADHD medication is highest among 6–12 year olds (33%) and 13–17 year olds (20%), and declines with age. Use of a

specific long-acting stimulants varies by age group, with Concerta predominating in patients younger than 18, and Adderall XR or its generic predominating in patients older than 18.

(2) Overall, 62% of usage is for a long-acting stimulant alone without another ADHD drug. About 14% of ADHD prescriptions were for a long-acting stimulant with a short-acting stimulant, which varied from 9% with Vyvanse, 11% with Concerta, and up to 27% with Ritalin LA.

2. The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 1 absent) on the following conclusions regarding the ADHD non-stimulants:

a) The DERP systematic review concluded atomoxetine (Strattera) is associated with efficacy outcomes similar to methylphenidate IR. Methylphenidate OROS (Concerta) and mixed amphetamine salts ER (Adderall XR, generic) are superior to atomoxetine in terms of response rates.

b) There are no head-to-head trials comparing clonidine ER (Kapvay) or guanfacine ER (Intuniv) with other ADHD drugs. Placebo-controlled studies with clonidine ER showed modest benefit when used as add-on or monotherapy. Placebo-controlled studies with guanfacine ER (Intuniv) showed modest benefit up to 8 hours after dosing.

c) With regards to safety, the package labeling for atomoxetine (Strattera) contains a black box warning for suicidal ideation. Atomoxetine has a higher incidence of vomiting, nausea, and somnolence compared to stimulants.

d) Clonidine ER (Kapvay) and guanfacine ER (Intuniv) are associated most commonly with somnolence and fatigue, although there are no comparative data with other ADHD drugs.

3. The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 1 absent) on the following conclusions regarding the wakefulness-promoting drugs:

a) A large percentage (estimated 90%) of modafinil (Provigil) and armodafinil (Nuvigil) MHS prescriptions are for non-FDA approved indications.

b) There is one head-to-head trial comparing modafinil 200 mg with armodafinil 150 mg in patients with excessive sleepiness due to shift work sleep disorder. There was no significant difference between the two drugs in terms of percentage of responders at 12 weeks.

c) There are no head-to-head trials comparing modafinil with armodafinil in patients with narcolepsy or obstructive sleep apnea.

d) The manufacturer of armodafinil (Nuvigil) submitted data to the FDA requesting approval for patients with jet lag, but the application was denied.

e) The manufacturer of sodium oxybate (Xyrem) sought FDA approval for use in fibromyalgia, but was denied due to abuse potential and safety concerns.

f) With regards to safety and tolerability, there are no clinically relevant differences in the safety profiles between modafinil and armodafinil.

g) Sodium oxybate (Xyrem) has a black box warning for abuse/misuse/diversion potential. A restricted distribution program limits dispensing to one centralized pharmacy.

h) The PORT analyzed usage of modafinil (Provigil) and armodafinil (Nuvigil) in the MHS. For the patients who received armodafinil, 32% were new users; of these new users, only 6% of patients had a previous prescription for modafinil in the previous 180 days, suggesting that the majority of new armodafinil users do not first receive a trial of modafinil.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of ADHD long-acting stimulants, short-acting stimulants, and non-stimulants, and the wakefulness-promoting agents. CMAs were performed to compare average daily cost of therapy for all branded and generic drugs within each of the respective subclasses. BIAs of varying formulary scenarios where various agents moved between BCF, UF, and NF status were performed for the long-acting stimulants, the non-stimulants, and the wakefulness-promoting drugs.

- *ADHD*—BIA was used to evaluate the long-acting stimulants, with corresponding sensitivity analyses. For relative comparison with the long-acting stimulants, a composite average daily cost for the short-acting stimulants was also calculated.

- *Wakefulness-promoting agents*—CMA and BIAs were used to evaluate the drugs in this subclass, with corresponding sensitivity analyses. BIAs also considered the potential impact of cost scenarios where current armodafinil (Nuvigil) users were grandfathered (and prior authorization would only apply to new users) versus a no-grandfathering scenario with prior authorization applicable to all users. Sodium oxybate (Xyrem) was not included in the CMA or BIAs due to restricted distribution from one pharmacy. Generic pricing estimates for

modafinil (Provigil) were used in the cost analyses based on its anticipated generic availability.

Relative Cost-Effectiveness Conclusion—Based on the results of the economic analysis and other clinical and cost considerations, the P&T Committee concluded the following for the ADHD and wakefulness-promoting agents:

1. The P&T Committee agreed (17 for, 0 opposed, 1 abstained, 0 absent) on the following conclusions regarding the long-acting stimulants: CMA results showed the following ranking, from least costly to most costly: mixed amphetamine salts ER < Ritalin LA < Vyvanse < Focalin XR < Concerta < Daytrana. BIAs results showed that scenarios where the current branded NF long-acting stimulants remained NF generated greatest cost avoidance.
2. The P&T Committee agreed (17 for, 0 opposed, 1 abstained, 0 absent) on the following conclusions regarding the short-acting stimulants: CMA results showed the following ranking, from least costly to most costly: methylphenidate IR (Ritalin generic) < dextroamphetamine tablets (Dexedrine generic) < mixed amphetamine salts (Adderall generic) < dexmethylphenidate (Focalin generic) < methylphenidate SR (Ritalin SR generic) < Metadate CD < Methylin chewable tablet < dextroamphetamine spansules (Dexedrine generic) < Procentra liquid < Desoxyn. Composite costs results showed the short-acting stimulants were more cost-effective than the long-acting stimulants.
3. The P&T Committee agreed (18 for, 0 opposed, 0 abstained, 0 absent) on the following: for the non-stimulants, Strattera was most cost-effective, followed by Intuniv; Kapvay was least cost-effective. BIAs results showed minimal differences in cost-avoidance between branded NF and UF non-stimulants.
4. The P&T Committee agreed (18 for, 0 opposed, 0 abstained, 0 absent) on the following: for the wakefulness-promoting agents, CMA showed the estimated generic modafinil was most cost-effective, followed by Provigil; Nuvigil was least cost-effective. BIAs results showed that scenarios where Nuvigil changes to NF status and all current and new users of Nuvigil undergo the PA process (e.g., not grandfathered) generated greatest cost-avoidance; this scenario also included maintaining the existing PA for Provigil.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following:

Drugs designated with formulary status on UF	For	Opposed	Abstain	Absent
Stimulants: dextroamphetamine (Dexedrine, Dextrostat, Procentra solution, generics) methamphetamine HCl (Desoxyn, generic) methylphenidate CD (Metadate CD) methylphenidate IR (Ritalin, generic) methylphenidate LA (Ritalin LA, generic) methylphenidate ER (Metadate ER, Methylin ER, generics) methylphenidate chewable tablets, solution (Methylin, generic) methylphenidate OROS (Concerta) methylphenidate SR (Ritalin SR, generic) mixed amphetamine salts IR (Adderall, generic) mixed amphetamine salts ER (Adderall XR, generic)	15	1	1	1
Non-Stimulants:* atomoxetine (Strattera) clonidine ER (Kapvay) guanfacine ER (Intuniv)	16	0	1	1
Wakefulness-Promoting Agents: modafinil (Provigil) sodium oxybate (Xyrem)	16	0	1	1

* Clonidine IR tablets and transdermal system (Catapress, Catapress patch, generic) and guanfacine IR (Tenex, generics) are designated UF in the Miscellaneous Anti-hypertensive Agents Drug Class.

Drugs designated with NF status on UF:	For	Opposed	Abstain	Absent
Stimulants: desmethylphenidate ER (Focalin XR) lisdexamphetamine (Vyvanse) methylphenidate transdermal system (Daytrana)	15	1	1	1
Non-Stimulants: None designated NF	16	0	1	1
Wakefulness-PromotingAgents: armodafinil (Nuvigil)	16	0	1	1

* Clonidine IR tablets and transdermal system (Catapress, Catapress patch, generic) and guanfacine IR (Tenex, generics) are designated UF in the Miscellaneous Anti-hypertensive Agents Drug Class.

Drugs approved to move from NF status to Formulary status on UF:	For	Opposed	Abstain	Absent
Stimulants: dexmethylphenidate IR (Focalin, generic)	15	1	1	1

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended:

Drugs designated with BCF status:	For	Opposed	Abstain	Absent
Stimulants: mixed amphetamine salts ER (Adderall XR, generic) methylphenidate IR (Ritalin, generic) methylphenidate LA (Ritalin LA, generic)† methylphenidate OROS (Concerta) *Non-stimulants*:* None designated BCF *Wakefulness-Promoting:* None designated BCF	14	2	1	1

† Ritalin LA was added to the BCF, to have the most cost-effective long-acting methylphenidate formulation available at all MTFs. Concerta was maintained on the BCF, due to the large numbers of pediatric patients currently stabilized on the drug. Ritalin LA is encouraged to be considered in new patients requiring a long-acting methylphenidate formulation.

* Clonidine IR tablets (Catapress, generic) are designated BCF in the Miscellaneous Anti-hypertenisve Agents Drug Class.

Director, TMA, Decision: ☒ ~~Approved~~ ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluations for theADHD stimulants [dexmethylphenidate ER (Focalin XR), lisdexamphetamine (Vyvnase) and methylphenidate transdermal system (Daytrana)] , the wakefulness-promoting agents [armodafinil (Nuvigil)], and the conditions for establishing MN for NF medications, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) MN criteria for armodafinil (Nuvigil) and maintaining the current MN criteria for Focalin XR, Vyvanse, and Daytrana. (See Appendix C for full MN criteria.)

Director, TMA, Decision: ☒ ~~Approved~~ ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: PA CRITERIA***— The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) PA criteria should apply to modafinil (Provigil), armodafinil (Nuvigil), and sodium oxybate (Xyrem). The current PA criteria for modafinil were recommended to be continued without modification. The P&T Committee recommended maintaining the current PA criteria for Nuvigil, with one modification; jet lag would be added to the list of uses not provided. Additionally, the recommendation was that all current and new users of Nuvigil must undergo the PA process. The P&T Committee recommended PA criteria for sodium oxybate, which would be provided only for the current FDA-approved indications. Prior authorization is not intended to apply to modafinil or armodafinil use in active duty operational/readiness situations based on established protocols; MTFs should make necessary allowances for such use. (See Appendix B for full PA criteria).

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD*** —The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the P&T Committee's recommendation, the effective date is July 11, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VI. UTILIZATION MANAGEMENT

A. Crizotinib (Xalkori)—PA: Crizotinib (Xalkori) is an oral anaplastic lymphoma kinase (ALK) inhibitor indicated for the treatment of patients with ALK-positive non-small cell lung cancer (NSCLC) as detected by a FDA-approved diagnostic test. The FDA has approved a new molecular diagnostic test (Vysis ALK FISH Probe test) designed to

identify ALK-positive NSCLC patients for treatment with Xalkori.

1. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) the following PA criteria should apply to Xalkori capsules, consistent with the FDA-approved product labeling:

    a) Coverage would be approved for the treatment of patients with documented diagnosis of ALK-positive NSCLC, detected by a FDA-approved test such as Vysis ALK FISH Probe test.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows: The approved PA limits coverage of the drug to its labeled use. TMA will expedite review of the required test to determine its coverage under 32 CFR 199.4(g)(15). Providers and beneficiaries will be advised to retain receipts for the test for submission for reimbursement following the coverage determination.

B. Crizotinib (Xalkori)—Quantity Limits (QLs): QLs and/or days supply limits currently apply to several oral chemotherapy agents. Xalkori is only available at the retail point of service through five specialty pharmacies (Curascript, Acredo, Walgreen's, CVS Caremark, and US Bioservices).

1. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (16 for, 0 opposed, 1 abstain, 1 absent) QLs/days supply limits, restricting the maximum allowable quantity to a 30-day supply at the retail point of service. This is consistent with supply limits for other oral chemotherapy agents.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Vermurafenib (Zelboraf)—PA: Vermurafenib (Zelboraf) is an oral kinase inhibitor indicated for the treatment of patients with unresectable or metastatic melanoma with $BRAF^{V600E}$ mutation. Zelboraf is not recommended for use in wild-type BRAF melanoma. The FDA also approved a new molecular diagnostic test (Cobas 4800) designed to detect the $BRAF^{V600E}$ mutation and identify patients likely to respond to Zelboraf therapy.

1. ***COMMITTEE ACTION: PA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstain, 1 absent) the following PA criteria should apply to Zelboraf tablets, consistent with the FDA-approved product labeling.

    a) Coverage will be approved for the treatment of patients with documented diagnosis of unresectable or metastatic melanoma with $BRAF^{V600E}$ mutation, detected by a FDA-approved test such as Cobas 4800.

    b) Coverage will not be approved for patients with wild-type BRAF melanoma.

Director, TMA, Decision: ☐ Approved ☐ Disapproved

Approved, but modified as follows: The approved PA limits coverage of the drug to its labeled use. TMA will expedite review of the required test to determine its coverage under 32 CFR 199.4(g)(15). Providers and beneficiaries will be advised to retain receipts for the test for submission for reimbursement following the coverage determination.

D. Vermurafenib (Zelboraf)—QLs: QLs and/or days supply limits currently apply to several oral chemotherapy agents.

1. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (16 for, 0 opposed, 1 abstain, 1 absent) QLs/days supply limits, restricting the maximum allowable quantity to a 30-day supply at the retail point of service and a 45-day supply at Mail Order. This is consistent with supply limits for other oral chemotherapy agents.

Director, TMA, Decision: ☐ Approved ☐ Disapproved

Approved, but modified as follows:

E. Ivacaftor (Kalydeco)—PA: Ivacaftor (Kalydeco) is a new oral agent that targets a specific subgroup of patients with Cystic Fibrosis (CF). It is a potentiator of the cystic fibrosis transmembrane conductance regulator (CFTR). Kalydeco is indicated for the treatment of CF in patients aged 6 years of age and older who have a G551D mutation in the CFTR gene. This rare mutation occurs in about 4% of CF patients. In patients for whom the genotype is unknown, a FDA-approved test should be used to detect the presence of the G551D mutation. Kalydeco is not effective in patients with CF who are homozygous for the F508del mutation in the CFTR gene, which occurs in about 90% of

CF patients. There are several FDA-approved in-vitro molecular diagnostic tests designed to simultaneously detect and identify mutations in the CFTR gene.

1. ***COMMITTEE ACTION: PA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstain, 1 absent) the following PA criteria should apply to Kalydeco tablets, consistent with the FDA-approved product labeling:
   a) Coverage will be approved for the treatment of CF patients aged 6 years and older who have a G551D mutation in the CFTR gene, detected by a FDA-approved test.
   b) Coverage will not be approved for patients who are homozygous for the F508del mutation in the CFTR gene.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows: The approved PA limits coverage of the drug to its labeled use. TMA will expedite review of the required test to determine its coverage under 32 CFR 199.4(g)(15). Providers and beneficiaries will be advised to retain receipts for the test for submission for reimbursement following the coverage determination.

F. Ivacaftor (Kalydeco)—QL: Quantity limits/days supply limits were recommended for Kalydeco.

1. ***COMMITTEE ACTION: QL***—The P&T Committee recommended (16 for, 0 opposed, 1 abstain, 1 absent) QLs/days supply limits, restricting the maximum allowable quantity to a 30-day supply at the retail point of service and a 45-day supply at Mail Order.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

G. *COMMITTEE ACTION: PA IMPLEMENTATION PERIOD FOR XALKORI, ZELBORAF, AND KALYDECO*—The P&T Committee recommended (16 for, 0

opposed, 1 abstain, 1 absent) an effective date of the first Wednesday after a 30-day implementation period in all points of service. The effective date is July 11, 2012.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VII. SECTION 703

A. Section 703—The P&T Committee reviewed a list of products—Alocril, Avage, Azelex, Betagan, Blephamide, Elestat, Elimite, FML, FML Forte, FML S.O.P., Ocufen, Ocuflox, Poly-Pred, Poly-Trim, Pred Mild, Pred-G, and Transderm-Scop—to determine MN and PA criteria. These products were identified as not fulfilling refund requirements as required in section 703 of the 2008 National Defense Authorization Act (NDAA). The listed medications were designated NF on the UF at previous P&T Committee meetings.

1. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following should apply to the listed drugs. Coverage at retail network pharmacies would be approved if the patient met all the following criteria:

    a) Manual PA criteria:

        (1) Use of formulary agent is contraindicated.

        (2) Obtaining the product from home delivery would be detrimental to the patient.

        (3) For branded products with AB generic availability, use of the generic product would be detrimental to the patient.

The PA criteria listed above do not apply to any point of service other than retail network pharmacies.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following should apply to the listed drugs:

    a) Use of formulary agent is contraindicated.

Director, TMA, Decision: □ ~~Approved~~ □ Disapproved

Approved, but modified as follows:

VIII. ITEMS FOR INFORMATION

A. The PORT provided the P&T Committee with an update and review of findings on various topics:

- *Comparative costs across pharmacy POS*—Based on an analysis of all non-specialty maintenance medications filled at all three pharmacy POS, the mean cost for a 90-day supply appears to be about 19% lower at MTFs or mail order compared to retail for 4QFY11, adjusting for FY12 co-pay changes. The difference was driven by brand-only medications, which were about 27% lower at MTFs or mail compared to retail; generically available medications were either similar across POS or slightly higher at MTFs/mail order compared to mail order (+2%). This represents a narrowing of the gap between POS; a similar analysis for 4QFY10 showed costs at MTFs/mail order to be about 25% lower overall versus retail, with brand-only and generic medications running about 30% and 15% lower, respectively. Cost differences between MTFs and mail order remained minimal.

- Effective October 1, 2011, co-pays changed from $3 to $0 for Tier 1 medications at mail order; $3 to $5 for Tier 1 medications at retail; $9 to $12 for Tier 2 medications at retail [remaining at $9 in mail order]; and $22 to $25 for Tier 3 medications at both mail order and retail. The PORT reported an increase in mail order utilization during the first four months following the change, most prominently for generic but also occurring for branded medications. The trend continued across all POS towards increased generic use, consistent with recent generic availability for several widely-used medications.

- The PORT also provided a list of the top 100 outpatient medications by DoD expenditures for 1QFY12, which represent about 64% of costs across all POS. Of these, 76 are in classes already reviewed by the P&T Committee at least once. The data facilitated a discussion of potential future drug class reviews.

- The PORT also reported preliminary results from a study of the effect of co-pay differences on medication adherence among DoD beneficiaries, performed in conjunction with the MHS Scientific Advisory Panel. Final results are expected shortly.

IX. CLASS OVERVIEWS

Two drug class overviews were presented to the P&T Committee. The Newer Insomnia Agents Drug Class was last reviewed in February 2007. The Smoking Cessation Drug Class has not previously been reviewed by the P&T Committee. The DoD is currently reviewing a proposed rule to establish a TRICARE smoking cessation program; see Section 713 of the Duncan Hunter NDAA for Fiscal Year 2009. The P&T Committee is responsible for identifying and evaluating pharmaceutical products available through this program, consistent with 32 CFR 199.21(e)(1). The clinical and economic analyses of these classes will be presented at an upcoming meeting.

X. ADJOURNMENT

The meeting adjourned at 1100 hours on February 17, 2012. The next meeting will be in May 2012.

Appendix B—Prior Authorization Criteria for the Wakefulness-Promoting Drug Class

	Modafinil (Provigil)	Armodafinil (Nuvigil)	Sodium Oxybate (Xyrem)
Prior Authorization	Coverage provided for the treatment of: ▪ Excessive daytime sleepiness associated with narcolepsy, as diagnosed by polysomnogram or MSLT objective testing ▪ Excessive daytime sleepiness associated with OSAHS, only after adequate titration of CPAP treatment ▪ Excessive sleepiness associated with SWSD, only in patients who work night shifts ▪ Excessive fatigue associated with multiple sclerosis, only after secondary causes of fatigue have been addressed ▪ Excessive fatigue associated with myotonic dystrophy ▪ Depression, only after primary therapy has failed and if the use of other stimulant augmentation is contraindicated ▪ Idiopathic hypersomnia diagnosed by a sleep specialist ▪ Fatigue associated with traumatic brain injury Coverage NOT provided for the treatment of other conditions not listed above, including the following: ▪ Chronic fatigue syndrome ▪ Stroke rehabilitation ▪ Appetite suppression ▪ Parkinson's disease	Coverage provided for the treatment of: ▪ Excessive daytime sleepiness associated with narcolepsy, as diagnosed by polysomnogram or MSLT objective testing ▪ Excessive daytime sleepiness associated with OSAHS, only after adequate titration of CPAP treatment ▪ Excessive sleepiness associated with SWSD, only in patients who work night shifts Coverage NOT provided for the treatment of other conditions not listed above, including the following: ▪ Jet lag ▪ Excessive fatigue associated with multiple sclerosis ▪ Excessive fatigue associated with myotonic dystrophy ▪ Depression ▪ Idiopathic hypersomnia ▪ Fatigue associated with traumatic brain injury ▪ Chronic fatigue syndrome ▪ Stroke rehabilitation ▪ Appetite suppression ▪ Parkinson's disease	Coverage provided for the treatment of: ▪ Treatment of excessive daytime sleepiness and cataplexy in patients with narcolepsy, diagnosed by polysomnogram and MSLT ▪ Excessive sleepiness associated with narcolepsy without cataplexy, if the patient has previously tried modafinil (Provigil) Coverage NOT provided for the treatment of other conditions not listed above or any non-FDA approved use, including the following: ▪ Fibromyalgia ▪ Insomnia ▪ Excessive sleepiness not associated with narcolapsy

CPAP: continuous positive airway pressure
MSLT: mean sleep latency time
OSAHS: obstructive sleep apnea/hypopnea syndrome
SWSD: shift work sleep disorder

Appendix C—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
Saxagliptin (Onglyza) Saxagliptin/Metformin ER (Kombiglyze XR) **Non-insulin Diabetes Drugs: DPP-4 Inhibitors**	• Use of formulary DPP-4 agents contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary DPP-4 inhibitors
Dexmethylphenidate ER (Focalin XR) Lisdexamphetamine (Vyvanse) Methylphenidate transdermal (Daytrana) **ADHD/Wakefulness-Promoting Drugs: Stimulants Subclass**	No change from previous MN criteria • Use of formulary ADHD stimulants is contraindicated • The patient has experienced significant adverse effects from formulary ADHD stimulants • Use of the formulary stimulants has resulted in therapeutic failure • For Daytrana: No alternative formulary agent available—the patient is unable to take oral medications
Armodafinil (Nuvigil) **ADHD/Wakefulness-Promoting Drugs: Wakefulness-Promoting Subclass**	• Use of modafinil (Provigil) is contraindicated

Appendix D—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2012	**Antiplatelet Agents**	UF Class Review	▪ Clopidogrel (Plavix)	▪ Prasugrel (Effient) ▪ Ticagrelor (Brilinta) ▪ Aspirin/dipyridamole ER (Aggrenox) ▪ Ticlopidine (Ticlid, generics) ▪ Cilostazol (Pletal), generics) ▪ Dipyridamole (Persantine, generics) ▪ Pentoxifylline (Trental, generics)	▪ - Not applicable (no drug designated nonformulary)	Pending signing of minutes/ 60 days	Not applicable	▪ Clopidogrel remains BCF
Feb 2012	**Non-Insulin Diabetes Drugs** **DPP-4 Inhibitors**	UF Class Review	▪ Sitagliptin (Januvia) ▪ Sitagliptin/Metformin (Janumet)	▪ Sitagliptin/Simvastatin (Juvisync) ▪ Linagliptin (Tradjenta)	▪ Saxagliptin (Onglyza) ▪ Saxagliptin/Metformin ER (Kombiglyze XR)	Pending 60 days	Step therapy required – see comments	▪ Must try metformin and sulfonylurea 1st before any DPP-4 drug ▪ Must try sitagliptin-containing product 1st before Onglyza, Kombiglyze XR, and Tradjenta
Feb 2012	**ADHD / Wakefulness-Promoting Drugs** **Wakefulness-Promoting Drugs**	UF Class Review	▪ Not applicable	▪ Modafinil (Provigil) ▪ Sodium oxybate (Xyrem) – restricted distribution	▪ Armodafinil (Nuvigil)	Pending 60 days	PA required – see comments	▪ All current and new users of Nuvigil must go through PA process

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2012	**ADHD / Wakefulness-Promoting Drugs** **ADHD Stimulants**	UF Class Review	**Long-acting stimulants** ▪ Mixed amphetamine salts ER (Adderall XR generics) ▪ Methylphenidate LA (Ritalin LA, generic) ▪ Methylphenidate OROS (Concerta **Short-acting stimulants** ▪ Methylphenidate IR (Ritalin, generic)	**Short-acting stimulants** ▪ Mixed amphetamine salts IR (Adderall, generic) ▪ Dexmethylphenidate IR (Focalin, generic) ▪ Dextroamphetamine (Dexedrine, Dextrostat, Procentra solution) ▪ Methylphenidate CD (Metadate CD) ▪ Methylphenidate ER (Metadate ER, Methylin ER, generic) ▪ Methylphenidate chewable tablets, solution (Methylin, generic) ▪ Methylphenidate SR (Ritalin SR, generic) ▪ Methamphetamine HCl (Desoxyn)	**Long-acting stimulants** ▪ Dexmethylphenidate ER (Focalin XR) ▪ Lisdexamphetamine (Vyvanse) ▪ Methylphenidate transdermal system (Daytrana)	Pending 60 days	Not applicable	▪ Ritalin LA now BCF
Feb 2012	**ADHD / Wakefulness-Promoting Drugs** **ADHD Non-Stimulants**	UF Class Review	▪ Not applicable	▪ Atomoxetine (Strattera) ▪ Clonidine ER (Kapvay) ▪ Guanfacine ER (Intuniv)	▪ Not applicable (no nonformulary drugs)	Pending 60 days	Not applicable	▪ Clonidine IR tabs are BCF ▪ Clonidine Patches and guanfacine IR (Tenex, generic are UF) in Misc Anti-hypertensive Drug Class

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2012	**Ophthalmic-1**	New Drug Review	Antihistamine/Mast Cell Stabilizers ▪ Olopatadine 0.1% (Patanol) (Aug 2010)	▪ **Alcafatinde 0.25% (Lastacaft) (Feb 2012)** August 2010 Dual Action Antihistamine/ Mast Cell Stabilizers ▪ Bepotastine (Bepreve) ▪ Olopatadine 0.2% (Pataday) ▪ Azelastine (Optivar, generics) ▪ Epinastine (Elestat) Antihistamines ▪ Emedastine (Emadine) Mast Cell Stabilizers ▪ Pemirolast (Alamast) ▪ Nedocromil (Alocril) ▪ Cromolyn (Crolom/Opticrom, generic) ▪ Lodoxamide (Alomide) NSAIDs ▪ Ketorolac 0.4% (Acular LS, generic) ▪ Ketorolac 0.45% (Acuvail) ▪ Ketorolac 0.5% (Acular, generic) ▪ Bromfenac (Xibrom) ▪ Bromfenac 0.9% (Bromday) ▪ Diclofenac (Voltaren, generic) ▪ Flurbiprofen (Ocufen, generics ▪ Nepafenac (Nevanac)	August 2010 ▪ Not applicable (no drug designated nonformulary)	Pending signing of minutes/ 60 days	Not applicable	▪ Ketotifen (Zaditor, generics) is available OTC

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Feb 2012	**Narcotic Analgesics** **Subclass: High potency single analgesic agents**	New Drug Review	High potency single analgesic agents ▪ Morphine sulfate 12 hours ER (MS Contin, generics) ▪ Morphine sulfate IR	▪ **Tapentadol extended release (Nucynta ER) (Feb 2012)** Previous Decisions ▪ Hydromorphone ER (Exalgo) ▪ Fentanyl buccal soluble film (Onsolis) ▪ Fentanyl transdermal system, transmucosal tablet (Fentora); & transmucosal lozenge ▪ Hydromorphone (Dilaudid) ▪ Levorphanol ▪ Meperidine ▪ Methadone ▪ Morphine products (other than BCF), Kadian and Avinza (ER products) ▪ Morphine sulfate ER / naltrexone (Embeda) ▪ Opium tincture ▪ Opium/belladonna alkaloids(suppositories) ▪ Oxycodone IR ▪ Oxycodone ER (Oxycontin) ▪ Oxymorphone (Opana) ▪ Oxymorphone ER (Opana ER)	▪ Tapentadol immediate release (Nucynta) (Nov 2009)	Pending signing of minutes/ 60 days	Not applicable	—

CD: controlled delivery
DPP-4: dipeptidyl peptidase-4
ER: extended release
LA: long-acting
SR: sustained release
OROS: osmotic-controlled release oral delivery system (OROS)

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
November 2011

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on November 9, 2011, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of August Minutes**—Jonathan Woodson M.D., Director, approved the minutes for the August 2011 DoD P&T Committee meeting on October 27, 2011.
2. **Correction of May 2011 Minutes—BCF Clarification for Risperidone:** The May 2011 P&T Committee minutes were clarified to state the BCF listing for risperidone is for the oral tablets, and does not include the orally disintegrating tablets (ODT). Risperidone orally disintegrating tablets are included on the Uniform Formulary (UF).

B. Follow-up to September Beneficiary Advisory Panel Meeting

1. A letter from a beneficiary regarding PDE-5 inhibitors was read publicly at the meeting and acknowledged by the P&T Committee.

III. REQUIREMENTS

All clinical and cost evaluations for new drugs and full drug class reviews included, but were not limited to, the requirements stated in 32 Code of Federal Regulations 199.21(e)(1).

IV. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Osteoporosis Drugs—Risedronate Delayed Release (Atelvia)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of a newly approved bisphosphonate, risedronate delayed release (DR) tablets (Atelvia). It is only approved for the treatment of postmenopausal osteoporosis. Risedronate is also available in an immediate release (IR) formulation, under the trade name Actonel, which has other FDA indications in addition to postmenopausal osteoporosis. Generic formulations of risedronate IR are expected in 2012. The

osteoporosis drug class, which includes the bisphosphonates, was reviewed for UF placement in June 2008.

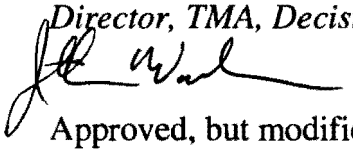
Atelvia was developed to allow coadministration with food, and it is administered immediately after breakfast. Other oral bisphosphonates (alendronate, ibandronate, risedronate IR) require administration with water 30–60 minutes in the morning prior to breakfast. Clinical trials with Atelvia have only evaluated changes in bone mineral density; there are no studies assessing Atelvia's affect on outcomes of fracture prevention.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) risedronate DR (Atelvia) offers some convenience to the patients in terms of administration schedule, but there are no studies assessing patient compliance, and it has limited clinical trial data and safety information compared to risedronate IR (Actonel). Alternative treatments are available for patients who cannot comply with the administration schedule of the other oral bisphosphonates.

Relative Cost-Effectiveness Analysis and Relative Cost-Effectiveness Conclusion—Cost-minimization analysis (CMA) was performed. Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) Atelvia was more costly when compared to other bisphosphonates on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) risedronate DR (Atelvia) be designated nonformulary (NF) .

Director, TMA, Decision: ☒Approved ☐ Disapproved



Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluation of risedronate DR (Atelvia) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) MN criteria for risedronate DR (Atelvia). (See Appendix C for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MN IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the P&T Committee's recommendation, the effective date is April 18, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

V. UF DRUG CLASS REVIEWS

A. Depression and Non-Opioid Pain Syndrome Agents

Background Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the Depression and Non-Opioid Pain Syndrome Drug Class. The class is comprised of the former UF Antidepressants-1 (AD-1s) Drug Class [selective serotonin reuptake inhibitors (SSRIs), selective serotonin/norepinephrine reuptake inhibitors (SNRIs), serotonin antagonist reuptake inhibitors (SARIs), norepinephrine/dopamine reuptake inhibitors (NDRIs), alpha-2 receptor antagonists (A2RAs), serotonin partial agonist/reuptake inhibitors (SPARIs)]; the gamma-aminobutyric acid (GABA) analogs; and the tricyclic antidepressants (TCAs). Military Health System (MHS) expenditures for the Depression and Non-Opioid Pain Syndrome Drug Class exceed $490 million annually.

The class as a whole has not been previously reviewed; however, the AD-1s were reviewed in November 2005, and the GABA analogs were reviewed in February 2006. The drugs in this class are:

- SSRIs: citalopram, escitalopram (Lexapro), fluoxetine, fluoxetine 90 mg weekly regimen (Prozac Weekly), fluoxetine in special packaging (Sarafem), fluvoxamine, paroxetine hydrochloride (HCl) IR, paroxetine HCl controlled release (CR), paroxetine mesylate (Pexeva), sertraline

- SNRIs: duloxetine (Cymbalta), desvenlafaxine (Pristiq), milnacipran (Savella), venlafaxine IR, venlafaxine extended release (ER) capsules, venlafaxine ER tablets
- SARIs: nefazodone, trazodone IR, trazodone ER (Oleptro)
- NDRIs: bupropion HCl IR, bupropion HCl SR, bupropion ER, bupropion hydrobromide (HBr) (Aplenzin)
- A2RAs: mirtazapine tablets, mirtazapine ODT
- SPARIs: vilazodone (Viibryd)
- GABAs: gabapentin, pregabalin (Lyrica)
- TCAs: amitriptyline, desipramine, doxepin, imipramine HCl, imipramine pamoate, nortriptyline, protriptyline

The two newest entrants to the class are trazodone ER (Oleptro) and vilazodone (Viibryd). Two new gabapentin formulations have been approved by the FDA, gabapentin ER (Gralise) and gabapentin encarbil ER (Horizant), but will be reviewed at an upcoming DoD P&T Committee meeting.

For the clinical and cost effectiveness reviews, the Depression and Non-Opioid Pain Syndrome drugs were also evaluated in relation to the skeletal muscle relaxant cyclobenzaprine, and the monoamine oxidase inhibitors (MAOIs), when appropriate.

In order to support the clinical and cost-effectiveness evaluations in this complex class, the Pharmacy Outcomes Research Team (PORT) analyzed prior use of agents in this class among DoD beneficiaries initiating treatment with desvenlafaxine, duloxetine, milnacipran, or pregabalin between April 1, 2011, and June 30, 2011. A total of 135,402 new users (defined as no use of the index medication during the prior 180 days) of one of these four agents were included in the analysis.

The four study medications (desvenlafaxine, duloxetine, milnacipran, pregabalin) were chosen for analysis based on both clinical and economic considerations: all four are widely used or have potential for wide use, have alternatives that offer equal or greater clinical value, and offer the potential for minimizing costs with neutral or beneficial effects on patient outcomes. The analysis was undertaken to estimate new user rates, understand prescribing patterns, and to assess the number of beneficiaries likely to be affected by step therapy programs involving these agents.

Drugs in the class were divided into three groups (with some overlap) for purposes of the analysis:

- Group A (the four study medications): desvenlafaxine, duloxetine, milnacipran, pregabalin;
- Group B (medications used for depression): SSRIS, SNRIs (except milnacipran), TCAs, mirtazapine, bupropion, SARIs, MAOIs; and

- Group C (medications used for non-opioid pain syndromes): SNRIs including milnacipran, TCAs, cyclobenzaprine, GABA analogs (gabapentin and pregabalin).

For purposes of estimating the potential impact of step therapy programs for each of these agents, the "step-preferred" agents (medications that must be tried prior to receiving the study medication) were defined based on clinical considerations, available alternatives, and patterns of prior use.

- Desvenlafaxine is the active metabolite of venlafaxine. For the majority of patients, it offers no clinical advantage compared to the parent compound. Of 15,009 patients for whom desvenlafaxine was the index medication, only about 20% (3,057 patients) were new users; of these, 10% (299 patients) had received a previous prescription for venlafaxine. Looking back 2 years, desvenlafaxine was the first SNRI (venlafaxine, desvenlafaxine, or duloxetine) in 73% of patients, and the first medication for depression (Group B) medication in 25%. About ~11,000 new users annually could be affected by a requirement to try venlafaxine before desvenlafaxine.

- Duloxetine is an SNRI used both for depression and non-opioid pain syndromes, including fibromyalgia. Due to the complexity of depression and non-opioid pain treatment pathways and technical considerations of the step therapy look-back period, a conservative approach was taken with regard to step therapy requirements: the only patients affected are those for whom duloxetine is the first Group B or Group C medication prescribed in the last 180 days. Of 67,375 patients with duloxetine as their index medication, about 18% were new users. Of these, 64% had either a Group B or C medication. This leaves 36% of all new duloxetine users who would potentially be affected by a step therapy program that requires trial of any other Group B or C medication prior to receiving duloxetine.

- Milnacipran is an SNRI; however, in the United States it is indicated only for fibromyalgia. Accordingly, milnacipran was compared to the Group C medications, which includes other medications used for fibromyalgia. Of the 4,536 patients with milnacipran as their index medication, 26% were new users (no milnacipran in the last 180 days). Of these, 58% had a Group C medication in the last 180 days, leaving 42% of new milnacipran users who would potentially be affected by a step therapy program that requires a trial of any other Group C medication prior to receiving milnacipran.

- Pregabalin is a GABA analog similar to gabapentin, which is generically available. Both are used for neuropathic pain syndromes; there is little

clinical evidence to support a substantial difference in efficacy or safety between the two. Of 48,482 patients with pregabalin as their index medication, about 23% were new users (no pregabalin in the last 180 days). Of these, only 24% had a gabapentin Rx in the last 180 days, leaving 76% of new pregabalin users who would potentially be affected by a step therapy program that requires a trial of gabapentin prior to receiving pregabalin.

Relative Clinical Effectiveness Conclusion

1. The P&T Committee agreed (17 for, 0 opposed, 0 abstained, 1 absent) upon the following conclusions regarding drugs used for depression, anxiety and other disorders (SSRIs, SNRIs, SARIs, NDRIs, A2RAs, SPARIs):
    - There are no compelling differences in efficacy to clearly differentiate one agent over the others.
    - High nonresponder rates in major depressive disorder (MDD) and anxiety disorders for each of the agents necessitate including a variety of agents on the UF.
    - Fluoxetine, and possibly escitalopram, are the only agents found to have a favorable risk to benefit profile in the treatment of MDD in children and adolescents.
    - Trials with duloxetine show no differences in efficacy with the comparator agents (fluoxetine, paroxetine, and venlafaxine), despite maximal doses of duloxetine and submaximal doses of the comparators.
    - Vilazodone is efficacious versus placebo for the treatment of MDD. Its unique mix of receptors may be beneficial to some patients. There are no head-to-head trials comparing vilazodone efficacy to other antidepressant agents and long-term data is limited.
    - Trazodone ER is efficacious versus placebo for the treatment of MDD. The effect appears to be heavily influenced by its sedating properties.
    - Mirtazapine consistently demonstrates the most rapid onset of action.
    - Beyond the FDA-indications, there is insufficient evidence to draw conclusions regarding the comparative efficacy of the antidepressants with respect to generalized anxiety disorder, obsessive-compulsive disorder, panic disorder, or post-traumatic stress disorder.

- There is a high degree of therapeutic interchangeability for the majority of the antidepressants, when used for MDD.
- Discontinuation rates due to adverse events (AEs) are similar between agents.
- There is wide variation in the specific AE profiles of the antidepressant agents, which is due to their differences in receptor binding properties.
- Factors including activation/sedation properties, weight changes, sexual dysfunction, drug interactions (most commonly based on protein-binding, cytochrome P-450 CYP isoenzyme induction/inhibition), or therapeutic duplication may guide treatment decisions in individual patients.
- Rare serious AEs for mirtazapine, nefazodone, and trazodone typically limit these drugs to second-line status.
- Minor differences in other factors including different salt forms (HCl versus HBr), delivery mechanisms (IR versus ER), or active metabolites of the parent compound (desvenlafaxine versus venlafaxine) may reduce the number of drugs with the same active ingredient that are required for inclusion on the UF.

2. The P&T Committee agreed (18 for, 0 opposed, 0 abstained, 0 absent) upon the following conclusions regarding drugs used for non-opioid pain syndromes.
    - No published, direct head-to-head studies are available that compare duloxetine, milnacipran, and pregabalin for the treatment of diabetic peripheral neuropathy (DPN), fibromyalgia (FM), or post-herpetic neuralgia (PHN). Meta-analyses and systematic reviews are the primary sources for data analysis among agents.
    - Definitive statements about comparative clinical effectiveness between duloxetine and pregabalin are difficult to make given the lack of head-to-head studies.
    - The TCAs (particularly amitriptyline) and cyclobenzaprine have substantial data supporting their use, at low doses, in several pain syndromes, and are supported as first-line therapy by many clinical practice guidelines.
    - *Fibromyalgia:*
        - A meta-analysis published in JAMA 2009 concluded the following:

        - There is strong evidence for the efficacy of antidepressants (TCAs, SNRIs, SSRIs, MAOIs) in the treatment of FM.
        - Antidepressants were shown to decrease pain, sleep disturbance, and depressed mood and improve HRQoL. The effect sizes were smaller for SNRIs, SSRIs, and MAOIs than for TCAs. There is strong evidence against a favorable effect of antidepressants on improving fatigue.
    - A systematic review from the Oregon Drug Effectiveness Review Project (DERP) showed the following:
        - Paroxetine IR was superior to the TCA amitriptyline in decreasing pain and sleep disturbance in one head-to-head study.
        - Amitriptyline was similar to duloxetine, milnacipran, and pregabalin on outcomes of relieving pain and fatigue. There was insufficient data on other outcomes (changes in patient rating scales) to compare the drugs.
        - Milnacipran was inferior to duloxetine on outcomes of pain, depressed mood, and health-related quality of life (HRQoL), and inferior to both duloxetine and pregabalin on improving sleep disturbance.
        - Duloxetine was not effective in reducing pain in male, nonwhite, and older patients.
    - In a meta-analysis by Straube and colleagues, 24% of FM patients taking pregabalin at higher doses (450mg–600mg) obtained at least 50% pain relief based on the patient global impression of change rating scale. The pregabalin dose-response relationship for efficacy in FM was not as striking as that seen in other conditions.
- *Post-Herpetic Neuralgia*: According to the PLoS Medicine systematic review (2005), there is evidence of analgesic efficacy (number needed to treat < 5.0) in PHN for TCAs, opioids, gabapentin, tramadol, and pregabalin.
- *Chronic Low Back Pain* (CLBP):
    - Duloxetine has received an indication for chronic musculoskeletal pain based on studies in CLBP and osteoarthritis of the knee. Duloxetine should not be used first line for CLBP. Acetaminophen, NSAIDs, and a trial of a

TCA should be used prior to use of duloxetine for this indication.

- In the clinical trials used to obtain FDA approval for CLBP, half of the patients treated with duloxetine achieved at least a 30% improvement in pain, which is statistically significant but not clinically significant. There is a significant placebo response (~ 40%) compared to duloxetine when used for CLBP.
- Treating 5–8 patients with duloxetine resulted in modest improvement in pain (a minimally perceptible difference) in one patient treated for 13 weeks.

- *Phantom Limb Pain*
  - Only limited information is available. Current VA/DoD guidelines recommend pregabalin, gabapentin, antidepressants (e.g., SSRIs, or TCAs).
  - Two small trials (<45 patients) reported in the DERP review showed a moderate benefit with gabapentin compared to placebo.
  - There is no published data with pregabalin and a clinical trial with duloxetine was terminated early.
- Safety and Tolerability
  - Duloxetine: An additional safety warning exists regarding use in patients with hepatic impairment. Withdrawals due to AEs occurred more often with duloxetine (15%) than placebo (8%). Duloxetine is more likely to cause nausea, somnolence, constipation, and decreased appetite versus placebo.
  - Pregabalin is similar to gabapentin in AEs, although more peripheral edema and weight gain are likely with pregabalin compared to gabapentin. Pregabalin causes more dizziness and somnolence compared to placebo.
  - For both duloxetine and pregabalin, more patients with neuropathic pain discontinue taking the active drug compared with placebo.
  - Titration and tapering is required with all of the agents.
- Other factors that differentiate the drugs: Duloxetine is dosed once daily and its patent is expected to expire December 2013; pregabalin is dosed three times daily and is a controlled medication. All agents

must be dosed based on either renal or hepatic concerns. Most pharmacy benefit managers have some form of restriction in place for duloxetine, milnacipran and pregabalin.

3. The P&T Committee agreed (18 for, 0 opposed, 0 abstained, 0 absent) upon the following conclusions regarding the TCAs:
    - *Depression*
        - In the primary care setting, based on one meta-analysis (McGillivray), there was a trend in favor of TCAs over SSRIs, although the p-value was not significant in terms of the weighted mean difference in depression scores. There was no significant difference between TCAs and SSRIs in terms of improvement in the Clinical Global Impression (CGI) scale.
        - Another meta-analysis (Arroll) showed that there were no apparent differences between SSRIs and TCAs in terms of an indirect comparison of the CGI, as the relative risks versus placebo were similar (1.37 with SSRIs versus 1.26 with TCAs) and the confidence intervals overlapped.
        - Use of TCAs for depression has largely been replaced by the SSRIs and SNRIs due to safety issues.
    - *DPN*: One meta-analysis (Wong) showed TCAs were significantly more effective than placebo in terms of the odds ratio for 50% decrease in pain over 3–6 weeks.
    - *Fibromyalgia*: The JAMA meta-analysis showed TCAs have large effect sizes for reducing pain, fatigue, and sleep disturbances compared to SSRIs, SNRIs, and MAOIs. There were no significant differences when amitriptyline was compared with cyclobenzaprine and nortriptyline in the DERP review.
    - *PHN*: TCAs are significantly more effective than placebo.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the depression and non-opioid pain syndrome agents. Based on the clinical findings regarding efficacy, safety, tolerability, other factors, and clinical outcomes with these agents, CMAs were performed to compare individual agents as well as combinations of these agents primarily used in the treatment of depression, non-opioid pain syndromes, or both. Budget impact analyses (BIAs) were also performed to compare competing formulary scenarios in the evaluation of the cost-effectiveness of the various groupings of these agents. Various scenarios incorporating step therapy were also evaluated, based on clinical

considerations, available alternatives, and patterns of prior use derived from the PORT analysis outlined above.

Depression Analysis: One analysis evaluated the drugs for depression, including the SSRIs, NDRIs, and the SARIs. The cost of these agents was compared across therapeutic classes in a CMA. The A2RAs, SPARIs, and TCAs were also included in this CMA.

Depression Analysis—desvenlafaxine (Pristiq) versus venlafaxine: The SNRIs (desvenlafaxine and venlafaxine) were also modeled individually in a CMA and BIA to evaluate use of step therapy, where a trial of venlafaxine would be required for new users of desvenlafaxine.

Non-Opioid Pain Syndromes Analysis—pregabalin (Lyrica) versus gabapentin: This analysis included the GABA analogs, pregabalin, and gabapentin. The cost-effectiveness of pregabalin (Lyrica) versus gabapentin was determined in a CMA and BIA to evaluate use of step therapy, where a trial of gabapentin would be required for new users of pregabalin.

Depression and Non-Opioid Pain Syndromes Analysis—duloxetine (Cymbalta) and milnacipran (Savella): CMA and BIA were used to evaluate the cost-effectiveness of duloxetine and milnacipran. The combined depression and non-opioid pain syndromes analyses were grouped into the same categories outlined in the PORT analysis. The depression analysis group ("Group B drugs") included the SSRIs, SNRIs (except milnacipran), TCAs, mirtazapine, bupropion, SARIs, and MAOIs. The non-opioid pain syndrome analysis group ("Group C drugs") included the SNRIs (with milnacipran), TCAs, cyclobenzaprine, and GABA analogs (gabapentin and pregabalin). The final analysis compared the depression and non-opioid pain syndrome drugs together. Costs for each of the subgroups, along with the individual weighted average costs for duloxetine and milnacipran, were used in the CMAs and BIAs to evaluate various step therapy scenarios for the drugs of interest: duloxetine (Cymbalta) versus the depression and non-opioid pain syndrome drugs, and milnacipran (Savella) versus the non-opioid pain syndrome drugs.

Relative Cost-Effectiveness Conclusion—Based on the results of the economic analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 against, 0 abstained, 0 absent) the following for the depression and/or non-opioid pain syndrome agents:

Depression Analysis: CMA results for the depression drugs [SSRIs, SARIs, NDRIs, A2RAs, SPARIs, TCAs, and MAOIs, (not including the SNRIs)], showed the following ranking, from least costly to most costly: SARIs (predominantly generic trazodone) <TCAs < A2RAs < SSRIs (using current prices for escitalopram) < NDRIs < MAOIs < SPARIs. When looking specifically at new entrants to the class, trazodone ER (Oleptro) and vilazodone (Viibryd) were less cost-effective than other antidepressants.

The same is true of bupropion HBr (Aplenzin). Several current NF antidepressants are now available or are expected to become available in cost-effective generic formulations, including escitalopram (Lexapro), fluoxetine in special packaging (Sarafem), fluoxetine weekly (Prozac weekly), and paroxetine CR (Paxil CR).

Desvenlafaxine (Pristiq) versus venlafaxine: CMA results for desvenlafaxine and venlafaxine versus the other depression drugs showed SARIs, TCAs, A2RAs, SSRIs, and NDRIs to be less costly than the SNRIs. Among the SNRIs, venlafaxine was more cost-effective than desvenlafaxine, based on cost per day of treatment. BIA was used to assess the potential impact of cost scenarios where selected agents were designated formulary or NF on the UF. Cost scenarios evaluating the impact of designating agents on the BCF were also considered. BIA results showed the most cost-effective scenario was venlafaxine IR/ER as step-preferred on the UF/BCF, with desvenlafaxine (Pristiq) designated NF and non-step-preferred; a trial of venlafaxine IR/ER would be required for new users of desvenlafaxine. Cost-effective generic formulations of venlafaxine ER capsules are now available.

Non-Opioid Pain Syndromes Analysis and pregabalin (Lyrica) versus gabapentin: CMA results specifically focusing on pregabalin (Lyrica) versus gabapentin for non-opioid pain syndromes showed that TCAs and cyclobenzaprine, which are predominantly generic were less costly than the GABA analogs. Among the GABA analogs, gabapentin was more cost-effective than pregabalin (Lyrica), based on the cost per day of treatment between these two agents. BIA was used to assess the potential impact of cost scenarios where selected agents were designated formulary or NF on the UF. Cost scenarios evaluating the impact of designating agents on the BCF were also considered. BIA results showed the most cost-effective scenario was gabapentin as step-preferred on the UF/BCF, with pregabalin (Lyrica) designated NF and non-step-preferred; a trial of gabapentin would be required for new users of pregabalin.

Depression and Non-Opioid Pain Syndromes Analysis and duloxetine (Cymbalta) and milnacipran (Savella): CMA results specifically focused on duloxetine (Cymbalta) versus all depression and non-opioid pain syndrome drugs (Groups B and C drugs), and milnacipran (Savella) versus all non-opioid pain syndrome drugs (Group C drugs). CMA results showed that generic SSRIs, SNRIs, SARIs, NDRIs, A2RAs, SPARIs, TCAs, MAOIs, GABA analogs and cyclobenzaprine were less costly for the treatment of depression and non-opioid pain syndromes than duloxetine (Cymbalta) or milnacipran (Savella). Milnacipran (Savella) is less costly than duloxetine (Cymbalta), based on the cost per day of treatment; however, clinical evidence and FDA labeling supports the use of duloxetine in a wider range of indications than milnacipran.

BIA was used to assess the potential impact of cost scenarios where selected agents were designated formulary or NF on the UF. Cost scenarios evaluating the impact of designating agents on the BCF were also considered. BIA results showed that

maintaining all depression and non-opioid pain syndrome drugs in their current BCF/UF status, maintaining duloxetine and milnacipran both as NF and non-step-preferred, was the most cost-effective scenario. Since indications for use and prior medication history beyond a 180-day lookback window cannot be determined, a trial of any other Group B or C drug was required for new users of duloxetine. Similarly, a trial of any Group C drug was required for milnacipran.

1. ***COMMITTEE ACTION: UF RECOMMENDATIONS***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following:

Drugs Reviewed with Formulary Status on UF List	For	Opposed	Abstain	Absent
SSRIs: citalopram fluoxetine fluvoxamine paroxetine HCl IR paroxetine HCl CR paroxetine mesylate sertraline *SNRIs:* venlafaxine IR venlafaxine ER venlafaxine ER tablets *SARIs:* nefazodone trazodone *NDRIs:* bupropion HCl IR bupropion HCl SR bupropion HCl ER *TCAs:* amitriptyline desipramine doxepin imipramine HCl imipramine pamoate nortriptyline protriptyline *A2RAs:* mirtazapine tablets mirtazapine ODT	17	0	1	0
GABA analogs: gabapentin	16	1	1	0

Drugs designated with NF status on UF	For	Opposed	Abstain	Absent
SNRIs: desvenlafaxine (Pristiq)[1] *SARIs:* trazodone ER (Oleptro) *NDRIs:* bupropion HBr (Aplenzin)	17	0	1	0
SNRIs: duloxetine (Cymbalta)[2] milnacipran (Savella)[3] *GABA analogs:* pregabalin (Lyrica)[4] *SPARIs:* vilazodone (Viibryd)	16	1	1	0

Drugs approved to move from NF status to Formulary status on UF once cost-effective generic formulations become available	For	Opposed	Abstain	Absent
escitalopram (Lexapro) fluoxetine in special packaging (Sarafem) fluoxetine weekly (Prozac weekly)	17	0	1	0

[1] Desvenlafaxine (Pristiq) is nonformulary and non-step-preferred. All new users of Pristiq are required to try venlafaxine. *See* Prior Authorization Criteria, below.

[2] Duloxetine (Cymbalta) is nonformulary and non-step-preferred. All new users of Cymbalta are required to try an antidepressant [Group B drug—SSRI, SNRI (except milnacipran), TCA, mirtazapine, bupropion, SARI, or MAOI] or non-opioid pain syndrome agent [Group C drug—SNRI including milnacipran, TCA, cyclobenzaprine, gabapentin or pregabalin]. *See* Prior Authorization Criteria, below.

[3] Milnacipran (Savella) is nonformulary and non-step-preferred. All new users of Savella are required to try a non-opioid pain syndrome agent [Group C drug—SNRI including milnacipran, TCA, cyclobenzaprine, gabapentin or pregabalin]. *See* Prior Authorization Criteria, below.

[4] Pregabalin (Lyrica) is nonformulary and non-step-preferred. All new users of Lyrica are required to try gabapentin. *See* Prior Authorization Criteria, below.

Director, TMA, Decision: ☒ Approved □ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended:

Drug Class/Drug Name	Role	Approved	Abstain	Absent
SSRIs: citalopram fluoxetine, excluding fluoxetine in special packaging (Sarafem) and fluoxetine weekly (Prozac weekly) sertraline *SNRIs:* venlafaxine IR venlafaxine ER *SPARIs:* trazodone excluding trazodone ER (Oleptro) *NDRIs:* bupropion HCl IR bupropion HCl SR bupropion HCl ER *GABA analogs:* gabapentin *TCAs:* amitriptyline doxepin imipramine HCl nortriptyline	17	0	1	0

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: DESVENLAFAXINE (PRISTIQ) PRIOR AUTHORIZATION (PA) CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) that desvenlafaxine (Pristiq) be designated step non-preferred, requiring a trial of venlafaxine in new users. Coverage would be approved if the patient met any of the following step therapy/PA criteria:

   a) Automated PA criteria:

      (1) The patient has filled a prescription for any venlafaxine product at any MHS pharmacy point of service [Military Treatment Facilities (MTFs), retail network pharmacies, or mail order] during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met: PA criteria will be developed from existing MN criteria. The existing MN criteria are as follows:

      (1) The patient requires treatment with an SNRI due to failure of another formulary depression agent or has experienced adverse events from the other formulary antidepressant.

      (2) The patient has a contraindication to venlafaxine or failed therapy with venlafaxine, which is not expected to occur with desvenlafaxine (Pristiq).

      (3) The patient has experienced adverse events with venlafaxine which is not expected to occur with desvenlafaxine (Pristiq).

      (4) The patient has previously responded to desvenlafaxine (Pristiq) and changing to a formulary depression agent would incur unacceptable risk.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows: The existing MN criteria are approved as the manual (paper) PA criteria. The Pharmacoeconomic Center staff may make minor changes, NOT involving changes to the underlying criteria, to prior authorization forms, such as correcting contact information or rewording clinical questions, without further involvement of the DoD P&T Committee and the Beneficiary Advisory Panel and without further approval of the Director, TMA.

4. ***COMMITTEE ACTION: PREGABALIN (LYRICA) PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) that pregabalin (Lyrica) be designated non-step-preferred, requiring a trial of gabapentin in new users. Coverage would be approved if the patient met any of the following step therapy/PA criteria:

   a) Automated PA criteria:

      (1) The patient has filled a prescription for gabapentin at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met: PA criteria will be developed from existing MN criteria. The existing MN criteria are as follows:

      (1) The patient has failed therapy with gabapentin or the formulary non-opioid pain syndrome agents.

      (2) The patient has a contraindication to gabapentin or the formulary non-opioid pain syndrome agents which is not expected to occur with pregabalin (Lyrica).

      (3) The patient has experienced adverse events with gabapentin or the formulary non-opioid pain syndrome agents, which is not expected to occur with pregabalin (Lyrica).

(4) The patient has previously responded to pregabalin (Lyrica).and changing to a formulary non-opioid pain syndrome agent would incur unacceptable risk.

Director, TMA, Decision: ☒Approved ☐ Disapproved

Approved, but modified as follows: The existing MN criteria are approved as the manual (paper) PA criteria. The Pharmacoeconomic Center staff may make minor changes, NOT involving changes to the underlying criteria, to prior authorization forms, such as correcting contact information or rewording clinical questions, without further involvement of the DoD P&T Committee and the Beneficiary Advisory Panel and without further approval of the Director, TMA.

5. ***COMMITTEE ACTION: DULOXETINE (CYMBALTA) PA CRITERIA***— The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) that duloxetine (Cymbalta) be designated non-step-preferred, requiring a trial of any antidepressant [Group B drug—SSRI, SNRI (except milnacipran), TCA, mirtazapine, bupropion, SARI, or MAOI] or non-opioid pain syndrome agent [Group C drug—SNRI including milnacipran, TCA, cyclobenzaprine, gabapentin or pregabalin] in new users. Coverage would be approved if the patient met any of the following step therapy/PA criteria:

   a) Automated PA criteria:

      (1) The patient has filled a prescription for any antidepressant (Group B) or non-opioid pain medicine (Group C) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met: PA will be developed from existing MN criteria. The existing MN criteria are as follows:

      (1) The patient has failed therapy with failed therapy with the formulary depression/non-opioid pain syndrome agents, which is not expected to occur with duloxetine (Cymbalta).

(2) The patient has a contraindication to the formulary depression/non-opioid pain syndrome agents which is not expected to occur with duloxetine (Cymbalta).

(3) The patient has experienced adverse events with the formulary depression/non-opioid pain syndrome agents, which is not expected to occur with duloxetine (Cymbalta).

(4) The patient has previously responded to duloxetine (Cymbalta).and changing to a formulary depression/non-opioid pain syndrome agent would incur unacceptable risk.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows: The existing MN criteria are approved as the manual (paper) PA criteria. The Pharmacoeconomic Center staff may make minor changes, NOT involving changes to the underlying criteria, to prior authorization forms, such as correcting contact information or rewording clinical questions, without further involvement of the DoD P&T Committee and the Beneficiary Advisory Panel and without further approval of the Director, TMA.

6. ***COMMITTEE ACTION: MILACIPRAN (SAVELLA) PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) that milnacipran (Savella) be designated non-step-preferred requiring a trial of any non-opioid pain syndrome agent [Group C drug—SNRI, including milnacipran, TCA, cyclobenzaprine, gabapentin or pregabalin] in new users. Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has filled a prescription for any non-opioid pain syndrome agent (Group C) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met: PA criteria will be developed from existing MN criteria. . The existing MN criteria are as follows:

(1) Use of the formulary non-opioid pain syndrome agents is contraindicated.

(2) The patient has experienced adverse effects from the formulary non-opioid pain syndrome agents.

(3) Use of the formulary non-opioid pain syndrome agents has resulted in therapeutic failure.

(4) The patient has previously responded to milnacipran (Savella) and changing to a formulary non-opioid pain syndrome agent would incur unacceptable risk.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows: The existing MN criteria are approved as the manual (paper) PA criteria. The Pharmacoeconomic Center staff may make minor changes, NOT involving changes to the underlying criteria, to prior authorization forms, such as correcting contact information or rewording clinical questions, without further involvement of the DoD P&T Committee and the Beneficiary Advisory Panel and without further approval of the Director, TMA.

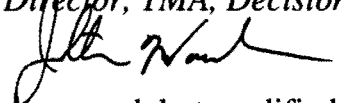
7. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical and cost evaluation of the Depression/Non-Opioid Pain Syndrome agents, and the conditions for establishing MN for a NF medication, the P&T Committee recommended (17 for, 0 opposed, 1 abstained, 1 absent) maintaining the current MN criteria for bupropion HBr (Aplenzin); desvenlafaxine (Pristiq); duloxetine (Cymbalta); milnacipran (Savella); pregabalin (Lyrica); and, until cost-effective generics become available, escitalopram (Lexapro); fluoxetine in special packaging (Sarafem), and fluoxetine weekly (Prozac weekly). The P&T Committee also recommended MN criteria for trazodone ER (Oleptro) and vilazodone (Viibryd). (See Appendix C for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

8. ***COMMITTEE ACTION: UF AND MN IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is April 18, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved



Approved, but modified as follows:

B. Short-Acting Beta Agonists (SABAs)

Relative Clinical Effectiveness—The P&T Committee evaluated the clinical effectiveness of the inhaled Short-Acting Beta Agonists (SABAs). There are three SABA products marketed in the United States, which are formulated as pressurized metered dose inhalers (MDIs) or solutions for inhalation: albuterol (a racemic mixture), levalbuterol (the (R)-enantiomer form of albuterol), and pirbuterol. The SABA inhaled solutions include albuterol (Accuneb, generics; various concentrations), and levalbuterol (Xopenex).

Hydrofluoroalkane (HFA) replaced chlorofluorocarbon (CFC) as the propellant in albuterol MDIs in December 2008. The SABA MDI formulations include albuterol HFA (Ventolin HFA, Proventil HFA, ProAir), levalbuterol HFA (Xopenex), and pirbuterol (Maxair). Pirbuterol (Maxair) is the sole remaining CFC MDI on the market, and will be discontinued in December 2013. The three albuterol HFA products are not considered therapeutically interchangeable by the FDA.

The SABA drug class was previously reviewed for UF placement in November 2008. In fiscal year 2011, over $43M was spent on the SABAs at all three points of service in the MHS.

Information regarding the safety, effectiveness, and clinical outcomes of the SABAs was considered by the Committee. The clinical effectiveness review for the SABAs was limited to the outpatient setting; emergency department use was evaluated only when pertinent.

Relative Clinical Effectiveness Conclusion—The P&T Committee voted (18 for, 0 against, 0 abstained, 0 absent) to accept the following clinical effectiveness conclusions:

1. In terms of efficacy/clinical effectiveness, there is little evidence to suggest there are clinically relevant differences between the SABAs for their FDA-

approved indications. There is no new significant information to change the clinical effectiveness conclusion from the November 2008 UF review.

- Evidence-based guidelines from the VA/DoD Clinical Practice Group (updated 2009), Global Initiative for Asthma, National Heart, Lung and Blood Institute/National Asthma Education & Prevention Program, and Global Initiative for Chronic Obstructive Lung Disease do not list a preference for one SABA over another for treating asthma, exercise-induced bronchospasm (EIB) or chronic obstructive pulmonary disease (COPD).
- For asthma, all the SABAs are more efficacious than placebo at improving the change in forced expiratory volume in one second $\geq$ 12% from baseline, whether administered via MDI or inhalational solution.
- There are no head-to-head studies comparing albuterol MDI with levalbuterol (Xopenex) MDI in adults or children.
- For adults with asthma, there is little evidence to suggest there are clinically relevant differences between albuterol and levalbuterol when administered via the nebulized route in either the outpatient or emergency department settings—in terms of number of puffs of rescue medication used daily or from hospitalization admission rates.
- For children with asthma, there are conflicting and inconclusive results as to whether there are efficacy differences between albuterol and levalbuterol inhalation solution when administered in the outpatient setting or emergency department.
- EIB—Placebo-controlled trials with albuterol administered via MDI 15 to 30 minutes before exercise reported statistically significant results in terms of preventing exercise-related symptoms compared to placebo. Although levalbuterol MDI (Xopenex) is not currently approved by the FDA for EIB, the results of placebo-controlled phase III trials do not suggest that the effect of levalbuterol at preventing EIB symptoms would differ from albuterol.
- COPD—There is insufficient evidence to compare the SABAs when used in COPD.

2. With regards to safety/tolerability, the following conclusions were made:
   - SABAs are associated with similar systemic adverse effects. A systematic review found no clinically relevant differences in discontinuation rates due to changes in heart rate, blood pressure, palpitations, nervousness, anxiety, tremor, hyperglycemia or hypokalemia between albuterol and levalbuterol inhalation solution.

- In the outpatient setting, in adults and children, the incidence of the withdrawal rates due to AEs and overall AE rates were similar between albuterol and levalbuterol inhaled solutions. However, in children there is insufficient evidence from the outpatient studies to determine whether there are clinically relevant differences in the incidence of tachycardia, as conflicting results were reported.
- There is insufficient data with the SABA MDI formulations to assess safety differences between albuterol and levalbuterol.

3. With regards to differences between the SABAs in terms of other factors, the following conclusions were made:
    - Special populations—The P&T Committee recognized that the FDA-approved pediatric age ranges differ between the products.
    - HFA formulations—There are only minor differences between the HFA formulations of albuterol and levalbuterol, including presence of a dose counter (Ventolin HFA is the only product with a dose counter), requirements for priming, storage conditions, and excipients (Ventolin HFA is the only SABA that does not contain alcohol). However, per FDA ruling, the HFA albuterol agents are not interchangeable.
    - Delivery devices—The Ventolin MDI is not compatible with the Lever Haler spacer, but is compatible with all other spacer devices.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the SABAs Drug Class. Based on the clinical findings regarding efficacy, safety, tolerability, and clinical outcomes with SABAs, cost-minimization analyses (CMAs) were performed to compare the metered-dose inhalers (MDIs) and inhalation solutions. Additionally, a BIA was performed to compare competing formulary scenarios for the MDIs. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA results with the SABAs MDIs showed albuterol HFA (Ventolin HFA, Proventil HFA, ProAir HFA) inhalers are most cost-effective. While levalbuterol (Xopenex) is comparable to albuterol HFA with regards to cost, pirbuterol (Maxair) is not cost-effective relative to the other MDIs in the class. BIA results indicated that pirbuterol (Maxair) MDI designated with NF status on the UF was the most cost-effective scenario for the MHS. When the inhalation solutions were compared, albuterol (generic; 2.5 mg/3mL concentration) was the most cost-effective inhalation solution.

Relative Cost-Effectiveness Conclusion—Based on the results of the economic analysis and other clinical and cost considerations, the P&T Committee concluded (17 for, 0

opposed, 1 abstained, 0 absent) that the most cost-effective scenario designated albuterol HFA (Ventolin HFA, Proventil HFA, ProAir HFA), levalbuterol HFA (Xopenex HFA), albuterol inhalation solution (Accuneb, generics), and levalbuterol inhalation solution (Xopenex) with formulary status on the UF and pirbuterol CFC (Maxair) inhaler with NF status on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) albuterol HFA (Ventolin HFA, Proventil HFA, ProAir HFA), levalbuterol HFA (Xopenex HFA), albuterol inhlation solution (Accuneb, generics), and levalbuterol inhalation solution (Xopenex) remain formulary on the UF. The P&T Committee recommended that pirbuterol CFC inhaler (Maxair) be designated NF on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

☐ Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) albuterol HFA (Ventolin HFA) and albuterol inhalation solution (generic; 2.5mg/0.5mL concentration) be designated with BCF status.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

☐ Approved, but modified as follows:

C. Phosphodiesterase Type-5 (PDE-5) Inhibitors for Erectile Dysfunction (ED)

The P&T Committee evaluated the cost-effectiveness analysis for the PDE-5 inhibitors for ED at an interim telephonic meeting held on December 15, 2011. The attendance roster for the interim meeting is found in Appendix B. Please refer to the August 2011 P&T Committee minutes for the relative clinical effectiveness review and conclusions.

Relative Cost Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the PDE-5 inhibitors sildenafil (Viagra), tadalafil (Cialis), and vardenafil (Levitra, Staxyn) for erectile dysfunction. Based on clinical findings regarding efficacy, safety, tolerability, other relevant factors, and clinical outcomes with these agents, CMAs were performed to compare individual agents. BIAs were also performed to compare competing formulary scenarios.

During this drug class evaluation, the DoD joined the VA in a joint national contracting effort. Sildenafil (Viagra) was selected as the winner of the VA/DoD national contract. To comply with the terms of the joint national contract, all scenarios considered in this review included sildenafil (Viagra) as a UF and BCF agent with all other agents designated NF.

Relative Cost Effectiveness Conclusion—Based on the results of the economic analysis and other clinical and cost considerations, the P&T Committee concluded (11 for, 0 opposed, 0 abstained, 0 absent) the following for the PDE-5 inhibitors:

- CMA results showed that sildenafil (Viagra) was the most cost-effective agent across all three points of service.

- BIA was used to compare the potential impact of discontinuing the current step therapy program (which requires a trial of vardenafil for new users with prescriptions for sildenafil or tadalafil) with scenarios where step therapy was maintained, but sildenafil (Viagra) replaced vardenafil as the step-preferred agent. Additional formulary scenarios evaluating the impact of implementing new retail restrictions were also considered. BIA results showed that, among currently available formulary options, the most cost-effective scenario placed sildenafil (Viagra) on the BCF and as the step-preferred product on the UF, with vardenafil (Levitra, Staxyn) and tadalafil (Cialis) designated NF and non-step preferred. Sensitivity analysis results supported the above conclusion.

- The P&T Committee discussed a potential program designed to strongly encourage the use of mail order instead of retail, for appropriate medications. The P&T Committee concluded that the PDE-5s would be well-suited to such a program clinically and including this drug class in such a program, if it becomes available, would most likely generate additional cost avoidance.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (11 for, 0 opposed, 0 abstained, 0 absent):

a) Sildenafil (Viagra 25 mg, 50 mg, and 100 mg) be designated with formulary status on the UF.

b) Tadalafil (Cialis 2.5 mg, 5 mg, 10 mg, and 20 mg) and vardenafil (Levitra 2.5 mg, 5 mg, 10 mg, and 20 mg; Staxyn 10 mg) be designated NF on the UF, based on cost-effectiveness.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee voted (11 for, 0 opposed, 0 abstained, 0 absent) to recommend that sildenafil (Viagra 25 mg, 50 mg, and 100 mg) tablets be designated with BCF status immediately on signing of the November 2011 P&T Committee minutes by the Director, TMA.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of tadalafil (Cialis) and vardenafil (Levitra and Staxyn) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (11 for, 0 opposed, 0 abstained, 0 absent) MN criteria for Cialis, Levitra, and Staxyn. (See Appendix C for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (11 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all

points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is April 18, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

5. ***COMMITTEE ACTION: STEP THERAPYAND PA CRITERIA***—The P&T Committee recommended (11 for, 0 opposed, 0 abstained, 0 absent) that step therapy apply to the PDE-5 inhibitors for the treatment of ED. For all new users of PDE-5 inhibitors, the following criteria apply:

   a) Automated Criteria:
   Coverage approved for treatment of ED if:
      (i) The patient has received a prescription for sildenafil (Viagra), tadalafil (Cialis), or vardenafil (Levitra and Staxyn) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days, AND
      (ii) The patient is a male aged 40 years or older.

   b) Manual Criteria:

   Coverage approved if:

      (i) Patient has tried sildenafil (Viagra) and has had an inadequate response or was unable to tolerate treatment due to adverse effects.

      (ii) Treatment with sildenafil (Viagra) is contraindicated.

      (iii) Patient is less than 40 years of age and is being treated for ED of organic or mixed organic/psychogenic origin. [Must try sildenafil (Viagra) first or indicate inability to due to reasons stated above in b) (i) or b) (ii)].

      (iv) Patient is less than 40 years of age and is being treated for drug-induced ED where the causative drug cannot be altered or discontinued. [Must try sildenafil (Viagra) first or indicate inability to due to reasons stated above in b) (i) or b) (ii)].

Coverage approved for the following non-ED uses requiring daily therapy:

(v) Use of tadalafil (Cialis or Adcirca) for Pulmonary Arterial Hypertension (PAH)

(vi) Use of any PDE-5 inhibitor for preservation/restoration of erectile function after prostatectomy

(vii) Use of any PDE-5 inhibitor for Raynaud's Phenomenon

(viii) Use of Cialis 5 mg for treatment of benign prostatic hyperplasia (BPH)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

6. ***COMMITTEE ACTION: PA IMPLEMENTATION PLAN***—The P&T Committee voted (11 for, 0 opposed, 0 abstained, 0 absent) to recommend the PA implementation plan be timed to coincide with that established for the UF decision for tadalafil and vardenafil.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

7. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee considered QLs for the treatment of ED as well as QLs for other indications. Based on the results of the clinical and economic evaluations presented, the P&T Committee recommended (11 for, 0 opposed, 0 abstained, 0 absent) the following QLs:

Treatment of ED:

Mail Order: Collective QL of 18 tablets per 90 days

Retail: Collective QL of 6 tablets per 30 days

Daily therapy for the approved indications (PAH, preservation or restoration of erectile function after prostatectomy, Raynaud's Phenomenon and BPH):

Mail Order: 90-days supply

Retail: 30-days supply

Director, TMA, Decision: ☒Approved ☐ Disapproved

Approved, but modified as follows:

VI. UTILIZATION MANAGEMENT

A. Tadalafil (Cialis)—PA: The PDE-5 inhibitor tadalafil (Cialis) 5 mg received FDA approval in October 2011 for treatment of BPH and ED with BPH. All PDE-5 inhibitors are currently subject to prior authorization, step therapy, quantity limits, and MN criteria. Prior authorization and step therapy also apply to the alpha-1 blockers used for BPH.

The DoD P&T Committee reviewed the clinical efficacy of tadalafil for BPH. Although the efficacy of tadalafil and the alpha-1 blockers for BPH cannot be directly compared, alpha-1 blockers provide relief of BPH urinary symptoms to a greater extent than PDE-5 inhibitors, based on changes from baseline in the International Prostate Symptom Scale reported in clinical trials. The P&T Committee also recommended that trial of a preferred alpha-1 blocker would be required for new users of tadalafil for BPH.

1. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) in addition to the existing PDE-5 inhibitors automated and manual PA criteria, the following PA criteria should also apply to the tadalafil when used for BPH:

a) Manual PA criteria:

(1) Patient is being treated for BPH and the dosing regimen prescribed is tadalafil 5 mg once daily AND

(a) The patient has tried tamsulosin or alfuzosin and had an inadequate response;

OR

(b) The patient has tried tamsulosin or alfuzosin and was unable to tolerate them due to adverse effects;

OR

(c) Treatment with tamsulosin or alfuzosin is contraindicated.

(d) Prior authorization for the BPH indication will expire after 1 year from input date.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: Tadalafil PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) an effective date upon signing of the November 2011 P&T Committee minutes by the Director, TMA.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Tramadol ER (Conzip)—QLs: Conzip is a new tramadol ER formulation. It is FDA-approved for the management of moderate to moderately severe chronic pain in adults who require around-the-clock treatment of their pain. QLs are currently in place for other tramadol ER formulations (Ultram ER, Ryzolt, generics), which are consistent with their product labeling.

1. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (15 for, 0 against, 1 abstain, 2 absent) QLs of 90 capsules /90 days in the mail order pharmacy and 30 capsules/30 days in the retail network, which is consistent with the recommended dosing from the product labeling.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Sunitinib malate (Sutent)—QLs: In May 2011, Sunitinib malate was FDA-approved for the treatment of progressive, well-differentiated pancreatic neuroendocrine tumors in patients with unresectable locally advanced or metastatic disease. The manufacturer's dosing recommendation includes the following regimen: 37.5 mg orally once daily, continuously without a scheduled off-treatment period.

1. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (15 for, 0 against, 1 abstain, 2 absent) the following QLs for sunitinib malate (Sutent):

Retail:

12.5mg: 120 caps/30 days
25mg: 60 caps/30 days
50mg: 30 caps/30 days

Mail:

12.5mg: 252 caps/84 days
25mg: 120 caps/84 days
50mg: 60 caps/84 days

The above QLs are consistent with the recommended dosing from the product labeling.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

D. Abatacept (Orencia)—PA: A subcutaneous injection of abatacept (Orencia) has been marketed. Orencia will be reviewed as a new FDA-approved drug in the Targeted Immunomodulatory Biologics (TIBs) Drug Class at an upcoming DoD P&T Committee meeting. PA requirements apply to the other TIBs in the UF. The P&T Committee

agreed that the following PA criteria should apply to Orencia, consistent with the FDA-approved labeling and PA requirements for the other TIBs.

1. Coverage would be approved for the treatment of adult patients with moderate to severely active rheumatoid arthritis.
2. Coverage would not be provided for concomitant use with adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), infliximab (Remicade), golimumab (Simponi), or rituximab (Rituxan).

a) ***COMMITTEE ACTION: PA***—The P&T Committee recommended (15 for, 0 against, 1 abstain, 2 absent) approving the PA criteria outlined above.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

E. Abatacept (Orencia)—QLs: QLs are currently in place for the TIBs, which are consistent with the product labeling.

1. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (15 for, 0 against, 1 abstain, 2 absent) QLs of 8 syringes/56 days in the mail order pharmacy and 4 syringes/28 days in the retail network, which is consistent with the recommended dosing from the product labeling and avoids wastage.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VII. ITEMS FOR INFORMATION

A. Antilipidemic-1s (LIP-1s)—Clarification of PA criteria: In May 2010, the P&T Committee recommended step therapy and PA criteria for the LIP-1s Drug Class, and designated generic statins and atorvastatin (Lipitor) as step-preferred drugs within the class. Since implementation, an audit revealed the need to clarify the manual PA

criteria. The P&T Committee recommended clarifications to the manual PA criteria to accurately reflect their intent.

VIII. CLASS OVERVIEWS

Three drug class overviews were presented to the P&T Committee. The Attention Deficit Hyperactivity Disorder and Narcolepsy Drug Class was last reviewed in November 2006. The Dipeptidyl-Peptidase 4 Inhibitors Drug Class was presented in November 2010 as part of the Non-Insulin Diabetes Drug Class. Information regarding antiplatelet drugs was also presented; this drug class has never been reviewed. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in completing the clinical effectiveness reviews and developing the appropriate cost-effectiveness models. The clinical and economic analyses of these classes will be presented at an upcoming meeting.

IX. ADJOURNMENT

The meeting adjourned at 1710 hours on November 9, 2011. An interim telephonic follow-on meeting was held on December 15, 2011. The next meeting will be in February 2012.

Appendix C—Table of Medical Necessity Criteria for Newly-Approved Drugs

Drug / Drug Class	Medical Necessity Criteria
Risedronate delayed release (Atelvia) **Osteoporosis Agents**	• Use of risedronate IR, ibandronate oral, and alendronate is contraindicated. • Patient has experienced significant adverse effects from risedronate IR, ibandronate oral, and alendronate.
Trazodone extended release (Oleptro) **Depression / Non-Opioid Pain Syndrome Agents**	• Use of the formulary depression/non-opioid pain syndrome agents is contraindicated.
Vilazodone (Viibryd) **Depression / Non-Opioid Pain Syndrome Agents**	• No alternative formulary agent – patient requires a drug with activity as serotonin-1a partial agonist/reuptake inhibitor and is unable to tolerate buspirone plus a selective serotonin reuptake inhibitor.
Tadalafil (Cialis) **PDE-5 Inhibitors**	• Use of Viagra is contraindicated • Patient has experienced significant adverse effects from Viagra • Viagra has resulted in therapeutic failure
Vardenafil (Levitra, Staxyn) **PDE-5 Inhibitors**	• Use of Viagra is contraindicated • Patient has experienced significant adverse effects from Viagra • Viagra has resulted in therapeutic failure

Appendix D—Table of Implementation Status of UF Recommendations/Decisions Summary

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Nov 2011	**Depression and Non-Opioid Pain Syndrome Agents**	UF Class Review	**SSRIs:** citalopram fluoxetine sertraline **SNRIs:** venlafaxine IR venlafaxine ER **SPARIs:** trazodone **NDRIs:** bupropion HCl IR bupropion HCl SR bupropion HCl ER **GABA analogs:** gabapentin **TCAs:** amitriptyline doxepin imipramine HCl nortriptyline	**SSRIs:** citalopram fluoxetine fluvoxamine paroxetine HCl IR paroxetine HCl CR paroxetine mesylate sertraline **SNRIs:** venlafaxine IR venlafaxine ER venlafaxine ER tablets **SARIs:** nefazodone trazodone **NDRIs:** bupropion HCl IR bupropion HCl SR bupropion HCl ER **TCAs:** amitriptyline desipramine doxepin imipramine HCl imipramine pamoate nortriptyline protriptyline **A2RAs:** mirtazapine tablets mirtazapine ODT **GABA analogs:** gabapentin	**SSRIs:** escitalopram (Lexapro) fluoexetine (Sarafem) fluoxetine weekly (Prozac Weekly) **SNRIs:** desvenlafaxine (Pristiq) duloxetine (Cymbalta) milnacipran (Savella) **SARIs:** trazodone ER (Oleptro) **SPARIs:** vilazodone (Viibryd) **NDRIs:** bupropion HBr (Aplenzin) **GABA analogs:** pregabalin (Lyrica)	Pending signing of minutes/ 60 days	Step therapy (Automated PA)	Step therapy will apply for four agents in this class: Pristiq is NF and non step-preferred. All new users of Pristiq are required to try venlafaxine first. Cymbalta is NF and non step-preferred. All new users of Cymbalta are required to try an antidepressant (Group B drug) or non-opioid pain syndrome agent (Group C) first. Savella is NF and non step-preferred. All new users of Savella are required to try a non-opioid pain syndrome agent (Group C) first. Lyrica is NF and non step-preferred. All new users of Lyrica are required to try gabapentin first.

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
August 2011

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on August 10 and 11, 2011, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of May Minutes**—Jonathon Woodson M.D. Director, approved the minutes for the May 2011 DoD P&T Committee meeting on August 5, 2011.
2. **Addendum to the May Minutes**—Jonathon Woodson M.D. ASD(HA) also approved on August 5, 2011 the retail network and mail order pharmacy co-pay changes for tiers 1(generic), 2 (formulary) and 3 (non-formulary) and for retail non-network pharmacies, which are effective October 1, 2011.

III. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Renin Angiotensin Antihypertensives (RAAs)—Azilsartan (Edarbi)

Relative Clinical Effectiveness—Azilsartan (Edarbi) is a once daily angiotensin receptor blocker (ARB), the eighth ARB to enter the market. It is classified in the RAAs drug class. The class was last reviewed in August 2010. The clinical evaluation for Edarbi included, but was not limited to, the requirements stated in 32 Code of Federal Regulations (CFR) 199.21(e)(1).

Edarbi is indicated for the management of hypertension, alone or in combination with other agents. It has no other FDA-approved indications and there are no clinical outcomes (e.g., reduction in heart failure hospitalization, death, or type 2 diabetic renal disease) studies completed, in-process, or planned. Because of corresponding published reductions in stroke and all-cause mortality, a reduction of either systolic or diastolic blood pressure (BP) of 2 mm Hg or more is considered clinically meaningful for this review.

In seven clinical trials—two published and five unpublished—Edarbi demonstrated efficacy in treating hypertension. In two studies, it demonstrated superiority to valsartan

(Diovan), a step-preferred, basic core formulary (BCF) agent, at a clinically meaningful reduction in systolic BP of 3-5 mm Hg. Additionally, Edarbi showed non-inferiority and statistical superiority (and a potentially clinically meaningful systolic BP reduction of 1-2 mm Hg) to olmesartan (Benicar). In terms of safety, there is no evidence that Edarbi is more or less safe, on average, than any of the seven other ARBs.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) azilsartan (Edarbi) offers a compelling therapeutic advantage over valsartan and possibly olmesartan, but does not have clinical outcomes studies available.

Relative Cost-Effectiveness—Although the clinical review concluded Edarbi produced a clinically relevant reduction in BP compared to other ARBs, cost-minimization analysis (CMA) was used to compare its cost to the other ARBs, consistent with the cost analysis for the ARBs subclass conducted at the August 2010 UF review for the RAAS. CMA was performed to evaluate Edarbi's cost in comparison to other UF RAAs drugs, including generic losartan, telmisartan (Micardis), valsartan (Diovan), irbesartan (Avapro), olmesartan (Benicar), and candesartan (Atacand). Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) that Edarbi was more costly than telmisartan (Micardis), valsartan (Diovan), irbesartan (Avapro), olmesartan (Benicar), and less costly than Atacand (candesartan).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 1 abstained, 1 absent) azilsartan (Edarbi) remain formulary on the UF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 1 abstained, 1 absent) azilsartan (Edarbi) be excluded from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) that azilsartan (Edarbi) be designated non-step preferred requiring the following step-therapy/PA criteria. Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for losartan, losartan/HCTZ, telmisartan (Micardis), telmisartan/HCTZ (Micardis HCT) telmisartan/amlodipine (Twynsta), valsartan (Diovan), valsartan/HCTZ (Diovan HCT), valsartan/amlodipine (Exforge), or valsartan/amlodipine/HCTZ (Exforge HCT) at any Military Health Service (MHS) pharmacy point of service [Military Treatment Facilities (MTFs), retail network pharmacies, or mail order] during the previous 180 days.

      (2) The patient has received a prescription for azilsartan (Edarbi) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met:

      (1) The patient has tried one of the preferred RAAs and was unable to tolerate treatment due to adverse effects.

      (2) The patient has tried one of the preferred RAAs and has had an inadequate response.

(3) The patient has a contraindication to the preferred RAAs, which is not expected to occur with the non-preferred RAAs (e.g., history of angioedema).

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the P&T Committee's recommendation, the effective date is January 4, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows

B. RAAs—Aliskiren/Amlodipine/Hydrochlorothiazide (Amturnide)

Relative Clinical Effectiveness—Amturnide is a once daily triple-fixed dose combination (FDC) antihypertensive product. It contains aliskiren, a direct renin inhibitor (DRI), amlodipine, a dihydropyridine calcium channel blocker (DHP CCB), and hydrochlorothiazide (HCTZ), a thiazide-type diuretic. Amturnide is the third triple-combination antihypertensive to enter the market. It is classified in the RAAs drug class due to the aliskiren (DRI) component. This class was last reviewed in August 2010. The clinical evaluation for Amturnide included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Amturnide is indicated for the management of hypertension as an add-on or switch from two of the components, or as a substitute for all three titrated components, but not for initial therapy. It has no other FDA-approved indications and there are no clinical outcomes studies completed, in-process, or planned. Aliskiren has outcomes studies underway, while amlodipine and HCTZ have well-established published outcomes data.

In three unpublished clinical trials, Amturnide demonstrated efficacy in treating hypertension versus the efficacy demonstrated by dual combinations of the individual component medications. In terms of safety, there is no evidence that Amturnide is more or less safe, on average, than either of the two other triple FDCs,

valsartan/amlodipine/HCTZ (Exforge HCT) and olmesartan/amlodipine/HCTZ (Tribenzor). The combination of these three drug classes (DRI, DHP CCB and thiazide diuretic) has no compelling advantage in terms of efficacy over giving other combinations (e.g., ARB/DHP CCB/HCTZ). In terms of safety, the Amturnide FDC partially offsets the peripheral edema common to CCBs, the hypokalemia common to diuretics, and the hyperkalemia sometimes seen with ARBs.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) that Amturnide does not offer a compelling therapeutic advantage in terms of efficacy or safety over other antihypertensive FDCs currently on the UF.

Relative Cost-Effectiveness—CMA was performed to evaluate the cost of aliskiren/amlodipine/HCTZ (Amturnide) in relation to the other UF RAAs drugs, including the following: aliskiren/HCTZ (Tekturna HCT) plus generic amlodipine, benazepril/amlodipine, telmisartan/amlodipine (Twynsta), olmesartan/HCTZ (Benicar HCT), valsartan/amlodipine (Exforge), valsartan/amlodipine/HCTZ (Exforge HCT), olmesartan/amlodipine (Azor), and olmesartan/amlodipine/HCTZ (Tribenzor). Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (13 for, 0 opposed, 0 abstained, 2 absent) Amturnide was more costly than Exforge (valsartan containing triple FDC), but less costly than Tribenzor (olmesartan containing FDC).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 0 opposed, 1 abstained, 2 absent) aliskiren/amlodipine/HCTZ (Amturnide) remain formulary on the UF, as the FDC of DRI/amlodipine/HCTZ may be necessary for hypertensive patients requiring 3 drugs who do not respond to other triple FDC RAAs.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 0 opposed, 1 abstained, 2 absent) aliskiren/amlodipine/HCTZ (Amturnide) be excluded from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) aliskiren/amlodipine/HCTZ (Amturnide) be designated non-step preferred requiring the following step-therapy/PA criteria. Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for losartan, losartan/HCTZ, telmisartan (Micardis), telmisartan/HCTZ (Micardis HCT) telmisartan/amlodipine (Twynsta), valsartan (Diovan), valsartan/HCTZ (Diovan HCT), valsartan/amlodipine (Exforge), or valsartan/amlodipine/HCTZ (Exforge HCT) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

      (2) The patient has received a prescription for aliskiren/amlodipine/HCTZ (Amturnide) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met:

      (1) The patient has tried one of the preferred RAAs and was unable to tolerate treatment due to adverse effects.

(2) The patient has tried one of the preferred RAAs and has had an inadequate response.

(3) The patient has a contraindication to the preferred RAAs, which is not expected to occur with the non-preferred RAAs (e.g., history of angioedema).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the P&T Committee's recommendation, the effective date is January 4, 2012.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows

C. Non-Insulin Diabetes Drugs Dopamine Agonist—Bromocriptine Mesylate (Cycloset)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of a newly approved formulation of bromocriptine, bromocriptine mesylate (Cycloset). The clinical review included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

Cycloset is a centrally-acting dopamine agonist (DA) and is the only DA approved for the treatment of diabetes. This agent falls into the new DA subclass of the Non-Insulin Diabetes Drugs, which was reviewed for UF placement in November 2010. The other subclasses include dipeptidyl-peptidase 4 inhibitors (DPP-4s), thiazolidinediones (TZDs), glucagon-like peptide-1 receptor agonists biguanides, sulfonylureas (SUs), meglitinides, and alpha-glucosidase inhibitors. Step therapy (automated PA) applies for the Non-Insulin Diabetes Drug Class, which requires a trial of metformin or a sulfonylurea.

Bromocriptine is an old drug with a new use. It was first approved in 1978 for the treatment of Parkinson's disease and has uses in other endocrine-related disorders such as hyperprolactinemia, acromegaly, and prolactin-secreting adenomas. Bromocriptine should not be used to suppress lactation since an increase in stroke and myocardial infarction were reported in postpartum women. The new bromocriptine Cycloset product is a quick release formulation administered in the morning. Other bromocriptine mesylate formulations are available, including immediate release (IR) 2.5 tablets and scored tablets, and 5 mg IR capsules (Parlodel, generics). Decreased levels of dopamine may contribute to insulin resistance, and increasing dopamine activity in the morning is effective at improving glucose dysregulation. Cycloset is indicated as an adjunct to diet and exercise to improve glycemic control in adults with Type 2 diabetes mellitus (T2DM).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (14 for, 0 opposed, 0 abstained, 1 absent) the following conclusions for bromocriptine mesylate (Cycloset):

- Uptitration of Cycloset is required to achieve the maximum therapeutic benefit. Patients start with 0.8mg (1 tab) daily and increase by 0.8mg in weekly increments to a maximally tolerated dose of 4.8mg daily. The minimum therapeutic dose is 1.6mg daily.

- When used as monotherapy, Cycloset decreased glycosolated hemoglobin or hemoglobin A1c (HbA1c) 0.1% from baseline compared to placebo. Cycloset decreased HbA1c 0.1-0.4% from baseline when added to a SU and a produced a maximum 0.5% decrease from baseline when combined with both metformin and a SU.

- There are no head-to-head studies to date with other non-insulin diabetes medications and no long-term outcomes studies currently in progress.

- Bromocriptine mesylate is weight neutral; however, as with other medications, more weight gain is likely when administered with a SU or TZD. It may have a beneficial effect on lipid levels and BP.

- Nausea is the primary side effect (~31%) although bromocriptine mesylate is generally well tolerated. The incidence of serious adverse events is similar to placebo.

- There was a statistically significant decrease in major cardiovascular events with Cycloset noted in one 52-week study. However, the clinical relevance of this secondary endpoint is not clear.

- Many potential drug interactions exist with Cycloset, including strong CYP 3A4 inducers or inhibitors; highly protein-bound drugs (e.g. salicylates, sulfonamides, chloramphenicol, probenecid); dopamine receptor antagonists; ergot-related drugs and sympathomimetic drugs.

- According to current T2DM treatment guidelines, the place in therapy for bromocriptine mesylate (Cycloset) remains unknown.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of bromocriptine mesylate (Cycloset). CMA was performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e) (2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (13 for, 0 opposed, 0 abstained, 2 absent) Cycloset was more costly when compared to step-preferred UF agents (metformin, SU, DPP-4 inhibitors, TZDs) and generic bromocriptine mesylate IR.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 1 opposed, 1 abstained, 1 absent) bromocriptine mesylate (Cycloset) be designated NF and non-step preferred.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluation of bromocriptine mesylate (Cycloset) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) MN criteria for bromocriptine mesylate (Cycloset). (See Appendix B for full MN criteria.)

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PA CRITERIA***—Step therapy applies to this new subclass (dopamine agonists) requiring prior trial of metformin or a sulfonylurea. Bromocriptine mesylate (Cycloset) is recommended to be designated as non-step preferred and NF. The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) the following PA criteria should apply to bromocriptine mesylate (Cycloset).

   a) Automated PA criteria:

      (1) The patient has received a prescription for metformin or SU at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

      (2) The patient has received a prescription for bromocriptine mesylate (Cycloset) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met:

      (1) The patient has a confirmed diagnosis of T2DM.
      (2) The patient has experienced any of the following adverse events while receiving metformin: impaired renal function that precludes treatment with metformin or history of lactic acidosis.
      (3) The patient has experienced the following adverse event while receiving a SU: hypoglycemia requiring medical treatment.
      (4) The patient has a contraindication or has had inadequate therapy to both metformin and a SU.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this decision. Based on the P&T Committee's recommendation, the effective date is January 4, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

D. Narcotic Analgesics—Buprenorphine Transdermal System (Butrans)

Relative Clinical Effectiveness—Butrans is a transdermal formulation of buprenorphine, a semi-synthetic opioid with mixed agonist/antagonist activity at opioid receptors. It is a Schedule III drug, classified as a low-potency single analgesic agent in the Narcotic Analgesics Drug Class. The class was last reviewed in February 2007. The clinical evaluation for Butrans included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

There are other formulations of buprenorphine commercially available: parenteral formulations for post-operative pain management and sublingual tablets for the management of opioid-dependence. Butrans is indicated for the management of moderate to severe chronic pain in patients requiring a continuous, around-the-clock, opioid analgesic for an extended period of time. One transdermal system allows for systemic delivery of buprenorphine, continuously over seven days, which offers a convenient regimen for patients.

In two unpublished clinical trials, Butrans demonstrated efficacy in treating chronic low back pain. There are no direct head-to-head studies comparing it to other long-acting narcotic agents of similar potency marketed in the United States. In terms of safety, there are some additional concerns with Butrans compared to other narcotics, particularly the risk of QTc prolongation at doses greater than 20mcg/hr, which will limit its use in patients with unstable cardiac disease. The major safety issue with Butrans is buprenorphine-induced respiratory depression. This poses a concern for elderly patients or those with impaired pulmonary function since the effects of buprenorphine are not completely reversible with naloxone (an opioid antagonist). Butrans is not intended for patients requiring treatment with high–dose opioids (>80 mg/day of morphine or equivalent), another factor that may limit its use in patients stable on alternative opioid analgesics. Butrans provides an additional treatment option when a long-acting, low-potency analgesic is needed.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) that other than the convenience of less frequent dosing, buprenorphine transdermal system (Butrans) offers no other compelling therapeutic advantages over the other low potency narcotic analgesics currently on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated Butran's cost relative to the other low-potency agents in the Narcotic Analgesics Drug Class. CMA was performed based on clinical findings that efficacy, safety, tolerability, and factors other than patient convenience found among the agents in this class were similar at equipotent doses. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e) (2).

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, concluded (15 for, 0 opposed, 0 abstained, 0 absent) that buprenorphine transdermal system (Butrans) was more costly, based on an average weighted cost per day of therapy, than other low-potency single analgesic agents currently on the UF. However, Butrans was less costly than the sublingual formulations of buprenorphine already on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 2 opposed, 1 abstained, 0 absent) buprenorphine transdermal system (Butrans) remain formulary on the UF with prior authorization to ensure appropriate use of the drug.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 0 abstained, 0 absent) buprenorphine transdermal system (Butrans) be excluded from the BCF.

Director, TMA, Decision: ☑ Approved □ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following PA criteria should apply to Butrans. Coverage would be approved if the patient met any of the following criteria:

    a) Manual PA criteria:

        (1) Coverage provided for patients ≥18 yrs with moderate-to-severe chronic pain requiring opioid therapy.

            (a) Opioid naïve patients (prior use of <30 mg/day of morphine or equivalent in past 60 days) are limited to Butrans 5 mcg/hr patch.

            (b) Opioid tolerant patients (prior use of 30mg/day to 80 mg/day of morphine or equivalent within past 60 days or Butrans 5 mcg/hr patch) can receive Butrans 10 mcg/hr and 20 mcg/hr patches.

            (c) Maximum dose of Butrans is 20 mcg/hr.

        (2) Coverage NOT provided for treatment of opioid-dependence.

        (3) Coverage NOT provided for patients:

            (a) Requiring >80 mg/day of morphine or equivalent for pain control;

            (b) With significant respiratory depression or severe bronchial asthma;

            (c) With long QT syndrome or family history of long QT syndrome;

            (d) On concurrent Class 1A (procainamide, quinidine) or Class III (dofetilide, amiodarone, sotalol) antiarrythmics.

Director, TMA, Decision: ☑ Approved □ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the P&T Committee's recommendation, the effective date is January 4, 2012.

Director, TMA, Decision: ☑ Approved □ Disapproved

Approved, but modified as follows

IV. UF DRUG CLASS REVIEWS

A. Oral Non-steroidal Anti-inflammatory Drugs (NSAIDs)

Background Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the oral NSAIDs. There are 26 drugs in the class, comprised of 19 different chemical entities. Generic formulations are available for 21 drugs and there are 5 branded products: Celebrex, Arthrotec, Vimovo, Zipsor, and Cambia. Celecoxib (Celebrex) is the only cyclooxygenase-2 (COX-2) selective inhibitor available in the United States. Two FDCs of an NSAID with an anti-ulcer drug are available. Arthrotec is a combination of diclofenac and the prostaglandin analog misoprostol. Vimovo is the first FDC of an NSAID and a proton pump inhibitor (PPI) and is comprised of naproxen and esomeprazole. Diclofenac potassium liquid-filled capsules (Zipsor) contains 25 mg of diclofenac potassium, which is the lowest diclofenac dosage strength marketed; it is solely indicated for relief of mild-to-moderate acute pain. Cambia is a formulation of diclofenac potassium in powder packets for suspension.

The partially COX-2-selective NSAIDs include meloxicam, nabumetone, and etodolac. The remaining drugs in the class are the non-COX-2-selective NSAIDs: diclofenac potassium tablets (Cataflam, generics), diclofenac sodium (Voltaren, generics), diflunisal, fenoprofen, flurbiprofen, ibuprofen, indomethacin, ketoprofen, ketorolac, meclofenamate, mefenamic acid (Ponstel, generics), naproxen (Naprosyn, generics),

naproxen sodium (Anaprox, generics), naproxen sodium extended release (ER) (Naprelan CR, generics), oxaprozin, piroxicam, sulindac, and tolmetin.

The oral NSAIDs have not previously been reviewed; however, prior to implementation of the Uniform Formulary Rule in 2005, the following drugs were added to the BCF: ibuprofen, indomethacin, meloxicam, and naproxen. The clinical review focused on use of the oral NSAIDs for adults with chronic pain due to osteoarthritis, rheumatoid arthritis, soft-tissue pain, back pain, or ankylosing spondylitis. The review included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (14 for, 0 opposed, 0 abstained, 1absent) the following conclusions for the Oral NSAIDs:

With regards to efficacy,

1. For short-term pain relief (less than 6 months), all of the oral NSAIDs have a similar effect on reducing chronic pain in adults due to osteoarthritis, rheumatoid arthritis, soft-tissue pain, back pain, or ankylosing spondylitis, based on systematic reviews from the Oregon Drug Effectiveness Review Project (DERP), and the Cochrane group.
2. There is no significant difference in efficacy of pain relief with celecoxib (Celebrex) versus the partially COX-2 selective or nonselective NSAIDs, based on results from randomized controlled trials, meta-analyses, and a systematic review from the Agency for Healthcare Research and Quality (AHRQ; Chou 2007).
3. Diclofenac potassium liquid-filled capsules (Zipsor) were superior to placebo for reducing pain following bunionectomy in two trials. There are no head-to-head trials comparing Zipsor to the other NSAIDs.
4. The FDC of naproxen with esomeprazole (Vimovo) was superior to placebo and non-inferior to celecoxib for reducing pain in patients with osteoarthritis of the knee in two trials.

With regard to gastrointestinal (GI) safety,

5. All the NSAIDs increase the risk of serious GI adverse reactions, including bleeding, inflammation, ulceration, and perforation of the stomach or intestines, which can be fatal.
6. Celecoxib showed benefit for short-term (therapy duration less than or equal to 6 months) GI safety versus nonselective NSAIDs based on meta-analyses (DERP and AHRQ) and the SUCCESS trial. However, celecoxib did not show benefit for long-term (therapy duration greater than 6 months) GI safety (CLASS trial; DERP and AHRQ meta-analyses; FDA analysis).
7. In one trial, celecoxib plus aspirin versus naproxen plus the PPI lansoprazole plus aspirin showed no significant difference for development

of endoscopically-confirmed ulcers at 12 weeks (short-term) (Goldstein 2007).

8. Celecoxib versus diclofenac plus the PPI omeprazole showed no significant differences in terms of recurrent ulcer bleeding at 6 months (short-term GI safety) (Chan 2002 New England Journal of Medicine).
9. The GI protective effects of celecoxib therapy alone versus NSAID plus PPI were recently evaluated in the CONDOR study. The results showed short-term GI safety benefit for celecoxib for the composite endpoint of upper and lower GI bleeds when compared to diclofenac plus omeprazole. The results were primarily due to a lower risk of a decrease in hemoglobin (due to presumed occult bleeding of GI origin in the small bowel) in the celecoxib group. (Chan 2010 Lancet)
10. For high-risk patients, taking celecoxib with a PPI may provide increased GI protection versus long-term celecoxib monotherapy. The results of one good-quality trial reported that celecoxib plus omeprazole significantly lowered recurrent GI bleeding in very high-risk GI patients (12-month trial) (Chan 2007 Lancet).
11. For the partially selective NSAIDs, nabumetone showed short-term GI safety benefit compared to nonselective NSAIDs in a single meta-analysis of fair quality (Huang 1999). Etodolac and meloxicam showed no consistent differences in conferring GI safety benefit as compared to nonselective NSAIDs, based on randomized controlled trials and observational studies.
12. For the non-COX-2-selective NSAIDs, clinical trial data suggest that all nonselective NSAIDs are associated with relatively similar risks of serious GI events.
13. Further study is needed to determine the comparative GI safety benefits of concomitant use of an NSAID with various gastroprotective agents (misoprostol, H2 blocker, PPI) in preventing clinical GI events. Misoprostol decreases the risk of clinically relevant GI events, but is associated with a significant increase in nausea, diarrhea, and abdominal pain.
14. In terms of endoscopically visualized gastric ulcers and discontinuation of therapy due to GI adverse events, Vimovo showed short-term GI safety benefit in patients taking low-dose aspirin versus enteric-coated naproxen alone in two trials.
15. There is insufficient data with Zipsor to assess GI risks.

With regard to cardiovascular (CV) safety,

16. NSAIDs may cause an increased risk of serious CV thrombotic events, myocardial infarction (MI), and stroke, which can be fatal.
17. Based on indirect analyses and observational studies, naproxen appears to be risk-neutral with regard to cardiovascular events; however, a black box warning is still present in the package insert for CV events.
18. Celecoxib, partially-selective NSAIDs, and nonselective NSAIDs have an increased risk of CV events, but there are no consistent differences in the incidence of CV events between them (with the exception of naproxen), based on clinical trials, and the DERP and AHRQ analyses.
19. No CV events related to Vimovo and Zipsor were reported in short-term clinical trials, but there is limited data available.

With regard to tolerability,

20. Relative to nonselective NSAIDs, COX-2 selective and partially selective NSAIDs demonstrated improved or similar tolerability profiles. There are no clear differences in tolerability between the nonselective NSAIDs
21. Vimovo showed a significant benefit in tolerability as compared to use of enteric-coated naproxen alone.

With regard to other factors,

22. Two NSAIDs are available over-the-counter without a prescription: ibuprofen and naproxen.
23. Four NSAIDs are formulated as oral suspensions: indomethacin, meloxicam, ibuprofen, and naproxen.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the oral NSAIDs. Based on the clinical findings regarding efficacy, safety, tolerability, and clinical outcomes with NSAIDs, a CMA was performed to compare the non-COX-2 selective/partially-COX-2 selective NSAIDs and NSAID/anti-ulcer FDCs. A cost-effectiveness analysis (CEA) was conducted to compare celecoxib (Celebrex) with the nonselective NSAIDs for treatment of osteoarthritis, and a budget impact analysis (BIA) was performed to compare competing formulary scenarios. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA results for nonselective/partially-selective NSAIDs showed that these products are the most cost-effective option within the oral NSAID class and should be used prior to treatment with NSAID/anti-ulcer FDCs or celecoxib (Celebrex) when clinically appropriate. However, several specific

nonselective/partially-selective NSAIDs were recognized as not being cost-effective relative to the other agents in the class, including naproxen sodium ER (Naprelan CR, generic), diclofenac potassium liquid-filled capsules (Zipsor), diclofenac potassium powder packets (Cambia), and mefenamic acid (Ponstel, generic). The NSAID/anti-ulcer FDCs were comparable on costs with other agents in the oral NSAID class.

Results of the CEA demonstrated that celecoxib was more costly than the nonselective/partially-selective NSAIDs. Published clinical evidence suggested lower risk of GI events with celecoxib compared to nonselective NSAIDs in the short-term (less than or equal to 6 months). However, the cost of preventing an additional ulcer complication with celecoxib was high due to the large difference in cost and small risk reduction in the published clinical data with celecoxib compared to nonselective NSAIDs. Longer-term evidence (greater than 6 months) with celecoxib remains inconclusive with regards to GI risk. Based on these findings, celecoxib should be reserved for patients at high risk for adverse GI events.

The BIA compared several formulary scenarios, including a scenario with an automated PA (step therapy) requiring a trial of generic formulations of partially-selective or nonselective NSAIDs prior to use of celecoxib, and a scenario without an automated PA (no step therapy). The BIA results concluded that the no step-therapy scenario was more cost-effective than the scenario with step therapy for new users of celecoxib.

Relative Cost Effectiveness Conclusion—Based on the results of the economic analysis and other clinical and cost considerations, the P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) that the most cost-effective scenario designated the following with formulary status on the UF: diclofenac potassium, diclofenac sodium, etodolac, fenoprofen, flurbiprofen, ibuprofen, indomethacin, ketoprofen, ketorolac, meclofenamate, meloxicam, nabumetone, naproxen, naproxen sodium, oxaprozin, piroxicam, sulindac, tolmetin, naproxen/esomeprazole (Vimovo), diclofenac/misoprostol (Arthrotec), and celecoxib (Celebrex).

1. ***COMMITTEE ACTION: UF RECOMMENDATIONS***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 1 abstained, 1 absent) the following remain formulary on the UF without step therapy: diclofenac potassium, diclofenac sodium, etodolac, fenoprofen, flurbiprofen, ibuprofen, indomethacin, ketoprofen, ketorolac, meclofenamate, meloxicam, nabumetone, naproxen, naproxen sodium, oxaprozin, piroxicam, sulindac, tolmetin, naproxen/esomeprazole (Vimovo),

diclofenac/misoprostol (Arthrotec), and celecoxib (Celebrex). The P&T Committee recommended diclofenac potassium liquid-filled capsules (Zipsor), diclofenac potassium powder packets (Cambia), naproxen sodium ER (Naprelan CR), and mefenamic acid (Ponstel) be designated NF.

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 1 abstained, 1 absent), ibuprofen (400 mg, 600 mg, 800 mg tablets and ~~125 mg/5 mL suspension~~), indomethacin (25 mg, 50 mg), meloxicam (7.5 mg, 15 mg) and naproxen (250 mg, 500 mg) remain designated with BCF status.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

☐ Approved, but modified as follows:

3. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical and cost evaluation of the oral NSAIDs and the conditions for establishing MN for a NF medication, the P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) MN criteria for diclofenac potassium liquid-filled capsules (Zipsor), diclofenac potassium powder packets (Cambia), naproxen sodium ER (Naprelan CR), and mefenamic acid (Ponstel). Since there are many formulary alternatives available, the MN criteria would require that a formulary alternative be contraindicated. (See Appendix B for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

☐ Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 4, 2012

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Contraceptive Agents

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the drugs in the Contraceptive Agents class. The clinical review for the contraceptive products included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1). The Contraceptives Agents class is comprised of three subclasses: oral contraceptive products (OCPs), miscellaneous contraceptives (transdermal patch, vaginal ring, medroxyprogesterone injections) and emergency contraceptives. The subclasses are outlined in Table 1 on pages 30–33.

The Contraceptive Agents were previously reviewed in May 2006 for UF status. Generic formulations are available for several products (See Table 1). Four new OCPs have recently entered the market: drospirenone 3mg/ethinyl estradiol (EE) 20 mcg/levomefolate Ca 0.451mg (Beyaz), norethindrone acetate 1mg/EE 10mcg/ferrous fumerate 75mg (Lo Loestrin Fe), levonorgesterol 0.1mg/EE 20mcg and levonorgesterol 0.1mg/EE 10mcg for extended use (LoSeasonique), and drospirenone 3mg/EE 30mcg/levomefolate Ca 0.451mg (Safyral). One new emergency contraceptive is also available, ulipristal (Ella).

Several OCPs are available on the UF and BCF, and all the miscellaneous contraceptives are currently designated as UF. For the emergency contraceptives, in November 2009, levonorgestrel 0.75 mg (Next Choice, Plan B generic) was designated as BCF and levonorgestrel 1.5 mg (Plan B One Step) was designated as Uniform formulary.

The Contraceptive Drug Class accounted for $87 million in MHS expenditures in FY 2010. In terms of MHS utilization, drospirenone 3mg/EE 20mcg (Yaz, generics) is the most utilized contraceptive, followed by norgestimate 0.18mg/0.215mg/0.25mg/EE 25mcg (Ortho Tri-Cyclen Lo).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended the following conclusions for the contraceptives:

- **Oral Contraceptives Subclass**—For the OCPs subclass, the P&T Committee, voted (15 for, 0 against, 0 abstained, 0 absent) the following conclusions were made:

  1. The differences among the OCPs include estrogen content, progestogen content, regimen, phasic formulation, and non-contraceptive benefits (e.g., acne, premenstrual dysmorphic disorder). The most commonly utilized OCPs are the low-estrogen products containing 20-30 mcg of EE. OCPs commonly include an estrogen with a progestin (combined OCP).
  2. There are no clinically relevant differences in contraceptive effectiveness among the different OCPs, as they all have Pearl Indices (pregnancies per 100 woman-years of use) ranging from < 1 to <3. Current literature does not provide sufficient evidence that combined OCPs containing ≤ 20 mcg EE differ from those with higher EE dosage in preventing pregnancy. However, combined OCPs with ≤ 20 mcg EE are associated with higher rates of changes in bleeding and amenorrhea.
  3. The continuous and extended cycle products (Lybrel, Seasonale, Seasonique, LoSeasonique), allow for shorter, fewer or no periods. The Cochrane reviewers concluded extended or continuous cycle contraceptives are reasonable options for women without contraindications to therapy. Of note, the same regimen can be reproduced by eliminating the pill-free interval of monophasic combined OCPs for 2-3 cycles.
  4. Most if not all combined contraceptives offer non-contraceptive benefits, including control of heavy menstrual bleeding or irregular cycles, and reduction of acne, dysmenorrhea, endometriosis pain and menstrual migraines, regardless of FDA approval for uses other than pregnancy prevention.
  5. The most commonly reported adverse effects of oral contraceptives include breast tenderness, headache, migraine, nausea, nervousness, vomiting, dizziness, weight gain, fluid retention, tiredness, decline of libido, and increased blood pressure.
  6. The use of combined OCPs confers an increased risk of venous thromboembolism (VTE). Based on epidemiological data, the risk of VTE with drospirenone (found in Yaz, drosperinone 3mg/EE 30mcg [Yasmin], Sayfral and Beyaz) is about 2-3 times higher than levonorgestrel-containing OCPs; this risk appears similar to the risk with the third-generation progestins (e.g., desogestrel). FDA is currently reviewing all available data regarding the increased VTE risk with drospirenone-containing oral contraceptives.

7. Comments regarding the newest OCPs include the following: dienogest 2mg/3mg/estradiol valerate 3mg/2mg/2mg/1mg, (Natazia) has complicated dosing instructions if a dose is missed, and the benefits of a quadraphasic OCP remain to be determined. For Beyaz and Safyral, these two products are similar to Yaz and Yasmin, respectively, with the exception of folate, which is added to decrease the risk of neural tube defects if a pregnancy occurs during therapy. Efficacy for both Beyaz and Sayfral was based on data with the innovator products, and clinical trial data is not available. Lo Loestrin Fe has the lowest dose of EE available in an OCP, and had a Pearl Index of 2.92 in the open-label trial used to gain FDA approval. LoSeasonique is a low-EE dose extended cycle OCP given for 91 days (84 days of estrogen and progesterone and 7 days of low dose estrogen).

- **Miscellaneous Contraceptives Subclass**—For the miscellaneous contraceptives subclass, the P&T Committee, based upon its collective professional judgment voted (15 for, 0 against, 0 abstained, 0 absent)

  1. Contraceptive products offer alternative routes of administration including depot medroxyprogesterone acetate (DMPA) injections, a transdermal patch (Ortho Evra), and a vaginal ring (Nuvaring).
  2. Trials have demonstrated similar contraceptive effectiveness for the patch or vaginal ring as the combined OCs. The injectable DMPA contraceptives are highly effective agents; no pregnancy was reported in the three, year-long trials used to gain FDA approval.
  3. Based on a comparative trial, adverse effects of the transdermal patch appear similar to the combined OCP comparator, with the exception of a higher incidence of site application reactions, breast symptoms (e.g., breast tenderness), and dysmenorrhea. Other concerns with the Ortho Evra patch include adhesion problems and application site reactions. The OrthoEvra patch has a black box warning with respect to greater risk of VTE than oral contraceptives, and higher consistent estrogen blood levels (systemic exposure ~ 60% higher than combined OCs).
  4. The most common adverse effects of the vaginal ring were vaginitis, headache, vaginal secretion, weight gain, and nausea. One concern with Nuvaring is deployment limitations related to storage requirements.
  5. Women receiving injectable DMPA may lose significant bone mineral density, an effect which may not be completely reversible. Injectable DMPA products carry a black box warning regarding this risk. Other concerns with injectable DMPA include progressive (and substantial) weight gain, amenorrhea, irregular menses and unpredictable

spotting/bleeding; and lack of immediate reversibility (10 months to return to baseline fertility)

6. The miscellaneous contraceptives serve a niche role and are appropriate contraceptive options for select patients.

- **Emergency Contraceptives Subclass**—For the miscellaneous contraceptives subclass, the P&T Committee, (14 for, 1 against, 0 abstained, 0 absent)

1. Levonorgestrel (Next Choice, generic Plan B; Plan B One Step) has a 3-day window of effectiveness following unprotected intercourse or contraceptive failure, and is available over-the-counter (OTC) for women older than 17 years. Ulipristal (Ella) is a new prescription emergency contraceptive which is effective for up to 5 days after unprotected intercourse.
2. Levonorgestrel 0.75 mg taken in 2 doses 12 hours apart has an efficacy rate of about 95% if taken within 24 hours of unprotected intercourse. Efficacy decreases over time; the efficacy rate is 86% if taken within 25-48 hours, and 58% if taken within 49 to 72 hours of unprotected intercourse. The single-dose 1.5-mg levonorgestrel regimen is as effective as the two-dose regimen taken 12 hours apart.
3. Ulipristal (Ella) is effective at preventing pregnancy following unprotected intercourse, based on the two pivotal trials. No decrease in efficacy occurred over the 120 hour study period. Two head-to-head comparisons of Ella 30 mg with levonorgestrel 1.5mg, are available. In one study Ella was non-inferior to levonorgestrel at preventing pregnancy (Creinin 2006). The other study demonstrated that Ella prevented more unintended pregnancies than levonorgestrel when administered within 72 and 120 hours after unprotected intercourse (observed pregnancy rate with Ella 1.90, 95% CI 1.13-3.12, versus levonorgestrel 2.50, 95% CI 1.68-3.94; p = 0.037; (Glasier 2010).
4. Ella was well tolerated in the clinical trials and its side effect profile is similar to that of levonorgestrel. The most common adverse effects were headache, abdominal pain, nausea and dysmenorrhea. Long term safety with Ella remains unknown.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the oral contraceptive products (OCPs), the miscellaneous contraceptives (patch, vaginal ring, medroxyprogesterone injections), and the emergency contraceptives. CMAs and BIAs were performed based on clinical findings that the efficacy, safety, tolerability, and other factors among the OCPs were similar with regard to contraception when used correctly. CMAs were used to analyze the miscellaneous contraceptives. CEAs and CMAs were used to analyze the emergency contraceptives, as efficacy differences between the agents were noted in the clinical

review. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

- CMA and BIA were used to assess the potential impact of cost scenarios where selected OCPs were designated with formulary or NF status on the UF. Two of the selected products are currently designated with BCF status: Yaz, and Yasmin. Four new agents selected are currently designated with formulary status on the UF: Beyaz, Loestrin Fe, LoSeasonique, and Safyral. Cost scenarios evaluating the impact of designating selected agents on the BCF were also considered.
- CMA alone was performed on the miscellaneous contraceptives (patch, vaginal ring, and medroxyprogesterone intramuscular (IM) and subcutaneous formulations) because there is limited generic competition within the class.
- In the emergency contraceptives subclass, CEA and CMA analyses were used to assess potential impact of pregnancies avoided, based on the clinically reviewed differences between the agents. The relative drug costs of the various treatment regimens were also assessed.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses, the P&T Committee concluded the following:

- **Oral Contraceptives Subclass**—For the OCPs subclass, the P&T Committee, based upon its collective professional judgment, voted (14 for, 0 against, 0 abstained, 1 absent) as follows: BIA showed the scenario where all current BCF agents were retained on the BCF, all current UF agents that had been previously reviewed were retained on the UF, and all current NF, as well as the four new agents, were designated with NF status resulted in the lowest cost estimate compared to current MHS expenditures.
- **Miscellaneous Contraceptives Subclass**—For the miscellaneous contraceptives subclass, the P&T Committee, based upon its collective professional judgment, voted (15 for, 0 against, 0 abstained, 0 absent) as follows: CMA results showed that the average weighted price per day of therapy at all three points of service for the miscellaneous contraceptives was comparable to formulary agents included in the OCPs subclass.
- **Emergency Contraceptives Subclass**—For the emergency contraceptives subclass, the P&T Committee, based upon its collective professional judgment, voted (15 for, 0 against, 0 abstained, 0 absent) as follows: CEA results for the emergency contraceptive agents showed that at current costs, the incremental cost effectiveness ratio with ulipristal (Ella) was less than the projected annual median cost of a live birth in the United States and treatment with ulipristal is a cost-effective alternative compared to levonorgestrel in the MHS. The CMA

results showed that Next Choice was the most cost-effective agent, followed by Plan B One-Step and Ella.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following:

    - **OCPs Subclass**—For the OCPs subclass, the P&T Committee voted (14 for, 0 against, 0 abstained, 1 absent) that the Jolessa branded generic formulation of levonorgestrel 0.15mg/EE 30mcg, extended regimen (Seasonale, generics) be designated formulary on the UF (UF listing only applies to the Jolessa formulation), and to retain the following drugs on the UF: drospirenone 3mg/EE 20mcg, (Yaz, generics), levonorgestrel 0.1mg/EE 20mcg, (Sronyx, generics), norethindrone1mg/EE 20mcg +/- ferrous fumerate, (Loestin 1/20 or Loestrin Fe 1/20 generics), drospirenone 3mg/EE 30mcg (Yasmim, generics), levonorgestrel 0.15mg/EE 30mcg (Levora, generics), norgestrel 0.3mg/EE 30mcg, (Lo/Ovral, generics), desogestrel 0.15mg/EE 30mcg (Desogen, generics), norethindrone 1.5mg/EE 30mcg +/- ferrous fumerate (Loestrin 1.5/30 or Loestrin Fe 1.5/30, generics), norethindrone 1mg/EE 35mcg (Norinyl 1+35, generics), norgestimate 0.25mg/EE 35mg (Mononessa, generics), norethindrone 0.5mg/EE 35mcg (Modicon, generics), ethynodiol diacetate 1mg/EE 35mcg (Zovia 1/35E, generics), Norinyl 1+50 (norethindrone 1mg/mestranol 50mcg, generics), ethynodiol diacetate 1mg/EE 50mg (Zovia 1/50E), norgestrel 0.5mg/EE 50mcg (Ogestrel), 0.5mg/1mg/EE 35mcg (Necon 10/11 norethindrone), desogestrel 0.15mg/EE 20mcg/10mcg (Mircette, generics), norgestimate 0.18mg/0.215mg/0.25mg/EE 25mcg (Ortho-Tri Cyclen Lo), norgestimate 0.18mg/0.215mg/0.25mg/EE 35mcg (Trinessa generics), levonorgestrel 0.05mg/0.075mg/0.125mg/EE 30mcg/40mcg/30mcg (Trivora, generics), norethindrone 0.5mg/1mg/0.5mg/EE 35mcg (Tri-Norinyl, generics), norethindrone 0.5mg/0.75mg/1mg/EE 35mcg (Ortho-Novum 7/7/7, generics), desogestrel 0.1mg/0.125mg/0.15mg/EE 25mcg (Cyclessa, generics), and Nor-Q-D (norethindrone 0.35mg, (Nor-Q-D generics).

      The following OCPs were designated NF or retained NF status on the UF:

        - norethindrone acetate 1mg/EE 10mcg (Lo Loestrin Fe)
        - levonorgestrel 0.1mg/EE 20mcg + 10mcg (LoSeasonique)
        - drospirenone 3mg/EE 20mcg/levomefolate 0.451mg (Beyaz)

- drospirenone/EE 30mcg/levomefolate 0.451mg (Safyral)
- levonorgestrel 90mcg/EE 20mcg, continuous regimen (Lybrel, generic)
- norethindrone acetate 1mg/EE 20mg, extended regimen (Loestrin 24 Fe)
- norethindrone 0.4mg/EE 35mcg (Ovcon-35 generics; also includes Femcon Fe chewable and Zeosa chewable)
- norethindrone 1mg/EE 50mcg (Ovcon-50)
- levonorgestrel 0.15mg/EE 30mcg + 10mcg, extended regimen (Seasonique, generics)
- norethindrone 1mg/EE 20mcg/30mcg/35mcg/ferrous fumerate 75mg (Estrostep Fe, generics)
- dienogest 2mg/3mg/estradiol valerate 3mg/2mg/2mg/1mg, (Natazia)
- levonorgestrel 0.15mg/EE 30mcg, extended regimen (Seasonale, generics, including Introvale and Quasense), with the exception of Jolessa branded generic

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

- **Miscellaneous Contraceptive Subclass**—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) the following drugs remain formulary on the UF: norelgestromin/EE 50 mcg transdermal (Ortho Evra), etonorgestrel/EE vaginal ring (NuvaRing), medroxyprogesterone acetate 150 mg/mL (Depo-Provera IM, generics), and medroxyprogesterone acetate 104 mg/0.65 mL (Depo-SubQ Provera 104). No miscellaneous contraceptive agent was recommended for NF placement.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

- **Emergency Contraceptive Subclass**—The P&T Committee recommended (12 for, 0 opposed, 3 abstained, 0 absent) the following drugs remain formulary on the UF: levonorgestrel 0.75mg (Next Choice; Plan B generic), levonorgestrel 1.5mg (Plan B One Step), and that ulipristal (Ella) be designated formulary on the UF. No emergency contraceptive was recommended for NF placement

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following regarding BCF placement for the Contraceptive Agents:

   - **OCPs Subclass**—The P&T Committee recommended (13 for, 1 opposed, 0 abstained, 1 absent) the following drugs remain designated BCF:
     - drospirenone 3mg/EE 20mcg (Yaz, generics)
     - levonorgestrel 0.1mg/EE 20mcg (Sronyx, generics)
     - drosperinone 3mg/EE 30mcg (Yasmin, generics)
     - levonorgestrel 0.15mg/EE 30mcg (Levora, generics)
     - norethindrone 1mg/EE 35mcg (Norinyl 1+35, generics)
     - norgestimate 0.25mg/EE 35mcg (Mononessa, generics)
     - norgestimate 0.18mg/0.215mg/0.25mg/EE 25mcg (Ortho-Tri Cyclen Lo)
     - norgestimate 0.18mg/0.215mg/0.25mg/EE 35mcg (Trinessa, generics)
     - norethindrone 0.35mg (Nor-Q-D, generics).
     - Additionally, levonorgesterol 0.15mg/EE 30 mcg for extended use, the Jolessa branded formulation of Seasonale, was added to the BCF, due to patient compliance and because cost-effective generics are now available at prices comparable to other generic BCF agents.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

- **Miscellaneous Contraceptive Subclass**—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) that none of the miscellaneous contraceptives be designated as BCF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

- **Emergency Contraceptive Subclass**—The P&T Committee recommended (13 for, 0 opposed, 2 abstained, 0 absent) 0.75 mg levonorgestrel (Next Choice; generic Plan B) remain designated BCF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluation of contraceptive agents, and the conditions for establishing MN for NF medications, the P&T Committee recommended (14 for, 0 against, 0 abstained, 1 absent) MN criteria for the following OCPs: Beyaz, Safyral, Lo Loestrin Fe, and LoSeasonique, and to maintain the existing MN criteria for Seasonale or equivalents (e.g., Quasense, Introvale—excludes Jolessa brand), Loestrin Fe 24 and equivalents, Natazia, Ovcon 50 and equivalents, Lybrel and equivalent, Ovcon 35 and equivalents, including Femcon Fe chewable and Zeosa, Seasonique, and Estrostep Fe and equivalents. (See Appendix B for full MN criteria.)

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 against, 0 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the P&T Committee's recommendation, the effective date is January 4, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

5. ***COMMITTEE ACTION: EMERGENCY CONTRACEPTION QUANTITY LIMITS (QLs)***—The P&T Committee recommended (13 for, 0 against, 2 abstained, 0 absent) maintaining the current QLs for all the emergency contraceptives of one fill per prescription with no refills.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Phosphodiesterase Type 5 (PDE-5) Inhibitors for Erectile Dysfunction (ED)

Relative Clinical Effectiveness—The P&T Committee evaluated the clinical effectiveness of the PDE-5 Inhibitors for the treatment of ED. The drugs in the class include sildenafil (Viagra), tadalafil (Cialis), vardenafil oral tablets (Levitra), and one new drug—vardenafil orally dissolving tablets (ODT) (Staxyn). The PDE-5s for ED were previously reviewed in August 2009; at that time, vardenafil was designated with BCF status, with an automated PA requiring a trial of vardenafil prior to sildenafil or tadalafil, which were designated NF. Quantity limits are in place for the PDE-5s for ED.

Vardenafil ODT (Staxyn) contains the same chemical ingredient as vardenafil oral tablets (Levitra). It is available in 10 mg ODT tablets, which is the recommended dose for all patients. In contrast, the starting dose for vardenafil oral tablets is 5 mg in patients older than age 65. Pharmacokinetic studies with vardenafil 10 mg ODT show a higher area under the curve compared to vardenafil 10 mg oral tablets. The two placebo-controlled trials used to obtain FDA approval reported superior efficacy with Staxyn in treating ED. Information regarding the safety, effectiveness, and clinical outcomes of the PDE-5s for ED subclass was considered. The clinical review included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 0 absent) the following conclusions for the PDE-5s for ED:

With regards to efficacy,

1. There are no head-to-head comparative trials between the PDE-5 inhibitors assessing efficacy for ED.
2. Based on meta-analyses by AHRQ, Cochrane, and BioMed Central, indirect comparisons suggest that there are similar improvements between vardenafil oral tablets, sildenafil, and tadalafil in the following endpoints: International Index of Erectile Function (IIEF) "EF" domain change, percentage of patients responding "Yes" to Global Assessment question 1 (which asks "Did this treatment improve your erections?"), and percentage of patients reporting improved erections.
3. The improvement in IIEF score with Staxyn appears similar to that seen in the AHRQ review based on indirect comparison.
4. The 2009 PDE-5 UF review reported there was insufficient evidence to conclude that daily therapy for ED was superior to on demand therapy. There is no new evidence to change this conclusion
5. The improvement in IIIEF score with Staxyn appears similar to that seen in the AHRQ review based on indirect comparison.

With regard to safety,

6. There is insufficient evidence to conclude that there are clinically relevant differences in safety between PDE-5 inhibitors for ED.
7. Clinical trials with vardenafil ODT have identified no safety issues that were not previously identified in the studies of the vardenafil film-coated tablets. However, unlike the other PDE-5s, vardenafil ODT is not recommended for use in patients with renal or hepatic impairment.

With regard to other factors,

8. The PDE-5 inhibitors are highly therapeutically interchangeable, when used for treating ED.

Relative Cost-Effectiveness, Relative Cost-Effectiveness Conclusion, UF Recommendation, BCF Recommendation—Due to contract solicitation issues, the cost effectiveness review and P&T Committee conclusions for the PDE-5 inhibitors for ED will be presented at a future meeting.

1. ***COMMITTEE ACTION: QLs***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) QLs for Staxyn, consistent with the QLs for the other PDE-5 inhibitors for ED. The collective QL for Staxyn is 16 ODT per 90 days in the Mail Order Pharmacy and the collective QL is 6 ODT per 30 days in the Retail Network.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

V. BCF ISSUES—SIMVASTATIN 80 MG BCF DELETION

In June 2011, the FDA updated the package inserts of products containing simvastatin 80 mg (Zocor, generic; and simvastatin/ezetimibe, Vytorin 80/10) to reflect safety concerns. Based on results of the published SEARCH trial and an internal analysis, the FDA concluded there was a higher risk of myopathy and rhabdomyolysis with simvastatin 80 mg, when compared to simvastatin 20 mg. Accordingly, there are new contraindications with other drugs and warnings limiting use to patients already stabilized on simvastatin 80 mg for longer than 12 months. Currently there over 11,000 MHS patients receiving simvastatin 80 mg. Although there are several limitations to this data, including the fact the FDA did not evaluate patient-level adverse reaction reports, the P&T Committee agreed to remove simvastatin 80 mg from the BCF, and to update the existing automated step therapy criteria for the Antilipidemic-1s.

1. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee voted (12 for, 1 opposed, 1 abstained, 1 absent) to remove the simvastatin 80 mg dosage strength (Zocor; generics) from the BCF.

Director, TMA, Decision: ☒Approved □ Disapproved

Approved, but modified as follows:

VI. UTILIZATION MANAGEMENT

A. Montelukast (Singulair)—PA: PA criteria were proposed for montelukast. National and international treatment guidelines, as well as pertinent published clinical literature, were used to define supportable indications for use of montelukast. Utilization data from the MHS population was presented to the P&T Committee with respect to indications deemed supportable.

1. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (12 for, 1 opposed, 1 abstained, 1 absent) the following PA criteria should apply to montelukast. Montelukast will be approved only for patients under the age of 19 and patients 19 or older who show evidence of use for an FDA-approved and guideline-supported indication. All current and new users of montelukast must meet one of the following criteria to pass through the PA process.

    a) Automated PA criteria:

        (1) Patient is ≤18 years of age.

        (2) Patient has received an inhaled corticosteroid or combination inhaled corticosteroid/inhaled long-acting beta agonist during the previous 180 days at a MTF, retail network pharmacy, or the mail order pharmacy.

    b) Manual PA criteria:

        (1) Coverage approved if:

            (a) The patient/provider documents use of montelukast for seasonal allergic rhinitis (or nasal polyposis) with evidence of a inadequate therapy with a nasal corticosteroid dispensed during the previous 180 days at a MTF, a retail network pharmacy, or the mail order pharmacy; or

(b) The patient/provider documents intolerance (due to experienced adverse events) or contraindication to either inhaled or intranasal corticosteroids.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: Montelukast PA IMPLEMENTATION PERIOD***— The P&T Committee recommended (12 for, 0 opposed, 2 abstained, 1 absent) 1) an effective date of the first Wednesday after a 90-day implementation period in all points of service; and 2) TMA send a letter to beneficiaries affected by this UF decision. The effective date is February 1, 2012.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Prescription Omega-3 Acid (Lovaza)—PA: Prior authorization for all current and new users of prescription omega-3-acid (Lovaza) was recommended at the February 2011 Committee meeting, limiting Lovaza use to the current FDA-approved indication for patients with triglyceride (TG) levels greater than 500 mg/dL. Since implementation of the PA requirements in July 2011, several questions regarding the PA form have been raised by providers and patients regarding patients with TG levels less than 500 mg/dL. P&T Committee members were briefed on the current status of the Lovaza PA program. Recommendations were made to clarify the decision point for patients with TG < 500mg/dL to more accurately reflect the intent of the P&T Committee.

1. ***COMMITTEE ACTION: LOVAZA PA FORM CLARIFICATION AND IMPLEMENTATION***—The P&T Committee recommended (12 for, 0 against, 1 abstained, 2 absent) updating the Lovaza PA form as noted above. Implementation can occur administratively.

Director, TMA, Decision: ☑ Approved □ Disapproved

Approved, but modified as follows:

VII. ITEMS FOR INFORMATION

A. Pharmacy Outcomes Research Team (PORT): The PORT updated the P&T Committee on prescribing trends and patient outcomes in several drug classes where step therapy (automated PA) had been implemented.

B. Rosiglitazone (Avandia) Risk Evaluation and Mitigation Strategy (REMS)—Rosiglitazone (Avandia) was designated NF at the November 2010 P&T Committee meeting, due to well-established safety concerns and the FDA requirement for a REMS program by the manufacturer. The details of the REMS are now available. Rosiglitazone products will be withdrawn from supply chains beginning October 18, 2011, and patients will not be able to buy their prescriptions in retail pharmacies after November 18, 2011. Further information regarding availability will be provided on the TRICARE Formulary Search Tool.

C. Saxagliptin/Metformin ER (Kombiglyze XR) PA Criteria—The manual PA criteria for Kombiglyze XR were updated to remove the criteria regarding adverse events or history of lactic acidosis with metformin.

D. Disease-Modifying Drugs for Multiple Sclerosis Drug Class—The UF review of the injectable drugs for multiple sclerosis originally scheduled for this meeting was tabled.

VIII. ADJOURNMENT

The meeting adjourned at 1700 hours on August 10, 2011, and at 1130 hours on August 11, 2011. The next meeting will be in November 2011.

Appendix B—Table of Medical Necessity Criteria for Newly-Approved Drugs

Drug / Drug Class	Medical Necessity Criteria
Drospirenone 3 mg/EE 20 mcg / levomefolate 0.451 mg (Beyaz) **Contraceptives**	• Use of ALL formulary oral contraceptives is contraindicated (e.g., due to hypersensitivity), and treatment with Beyaz is not contraindicated.
Drospirenone 3 mg/EE 30 mcg / levomefolate 0.451 mg (Sayfral) **Contraceptives**	• Use of ALL formulary oral contraceptives is contraindicated (e.g., due to hypersensitivity), and treatment with Sayfral is not contraindicated.
Norethindrone acetate 1mg/EE 10 mcg / ferrous fumarate 75 mg (Lo Loestrin Fe) **Contraceptives**	• Use of ALL formulary oral contraceptives is contraindicated (e.g., due to hypersensitivity), and treatment with Lo Loestrin Fe is not contraindicated.
Levonorgestrel 0.1 mg/EE 20 mcg, EE 10 mcg for extended use (LoSeasonique) **Contraceptives**	• Use of ALL formulary oral contraceptives is contraindicated (e.g., due to hypersensitivity), and treatment with Lo Seasonique is not contraindicated.
Estradiol valerate/dienogest (Natazia) **Contraceptives**	(No change from previous criteria) • Use of formulary agents contraindicated. • No alternative formulary agent available (if other oral contraceptive agents do not provide adequate bleeding and cycle control).
Norethindrone acetate 1mg/EE 20 mcg (Loestrin 24 Fe) **Contraceptives**	(No change from previous criteria) • Use of formulary agents contraindicated.
Levonorgestrel 0.9 mg /EE 20 mcg for extended use (Lybrel and equivalents) **Contraceptives**	No change from previous criteria) • The patient has experienced significant adverse effects from formulary combined Ocs and is expected to tolerate a non-formulary contraceptive agent. • Use of formulary combined Ocs has resulted in therapeutic failure.

Drug / Drug Class	Medical Necessity Criteria
Norethindrone 0.4mg/EE 35 mcg (Ovcon-35 and equivalents; includes Femcon Fe chewable and Zeosa) Norethindrone 1mg/EE 50mcg (Ovcon-50) Levonorgestrel 0.15 mg /EE 30 mcg, EE 10 mcg for extended use (Seasonique) Norethindrone 1 mg/EE 20/30/35 mcg / ferrous fumerate 75mg (Estrostep Fe and equivalents) Levonorgestrel 0.15 mg/EE 30 mcg for extended use (Seasonale and equivalents; with the exception of Jolessa brand) **Contraceptives**	(No change from previous criteria) • Use of formulary agents contraindicated. • The patient has experienced significant adverse effects from formulary combined Ocs and is expected to tolerate a non-formulary contraceptive agent. • Use of formulary combined Ocs has resulted in therapeutic failure.
Bromocriptine mesylate (Cycloset) **Non-Insulin Diabetes Drugs – Dopamine Agonists**	• The use of formulary alternatives is contraindicated. • The patient has experienced significant adverse effects from the formulary alternatives.
Diclofenac potassium liquid filled capsules (Zipsor) Diclofenac potassium powder packets (Cambia) Naproxen sodium ER (Naprelan CR) Mefenamic acid (Ponstel) **Oral Non-steroidal Anti-Inflammatory Drugs (NSAIDs)**	• Use of formulary alternatives is contraindicated.

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

May 2011

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on May 11 and 12, 2011, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of May Minutes**—Jonathon Woodson M.D. Director, approved the minutes for the February 2011 DoD P&T Committee meeting on May 9, 2011.

III. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Non-Insulin Diabetes Drugs: Dipeptidyl Peptidase-4 Inhibitor (DPP-4)/Biguanide Fixed-Dose Combination (FDC)—Saxagliptin/Metformin XR (Kombiglyze XR)

Relative Clinical Effectiveness—Kombiglyze XR is a FDC product containing the DPP-4 inhibitor saxagliptin (Onglyza) and the biguanide metformin extended-release (ER) (generic Glucophage XR) in one tablet. This drug is the second FDA-approved DPP-4/metformin FDC product. The Non-Insulin Diabetes drug class, which included the DPP-4s and biguanides separately, as well as combinations, was reviewed during the November 2010 P&T Committee meeting. The clinical evaluation for Kombiglyze XR included, but was not limited to, the requirements stated in 32 Code of Federal Regulations (CFR) 199.21(e)(1).

Kombiglyze XR is approved for use as adjunct to diet and exercise to improve glycemic control in adults with Type 2 diabetes mellitus when treatment with both saxagliptin and metformin is appropriate. In November 2010, sitagliptin (Januvia) and sitagliptin/metformin immediate-release (IR) (Janumet) were designated with Basic Core Formulary (BCF) status and saxagliptin was designated with Uniform Formulary (UF) status. Automated Prior Authorization or Step Therapy applies to the DPP-4 subclass, which requires a trial of metformin alone or a sulfonylurea (SU) prior to use of sitagliptin, sitagliptin/metformin IR, or saxagliptin. The generic metformin ER component of Kombiglyze XR is available on the BCF as a single agent.

Clinical trials with sitagliptin and saxagliptin when used as monotherapy show reduction in hemoglobin A1C (HbA1C) of 0.4 - 0.79%. The saxagliptin/metformin FDC provides a 2.5% decrease in HbA1c from baseline. There are no head-to-head trials comparing saxagliptin/metformin ER (Kombiglyze XR) and sitagliptin/metformin IR (Janumet). However, in a head-to-head non-inferiority trial, sitagliptin/metformin IR lowered HbA1c by approximately 0.1% more from baseline than saxagliptin/metformin IR. Saxagliptin was considered non-inferior to sitagliptin. While statistical significance was achieved, the difference between the two agents is not clinically significant. There are no clinically relevant differences between sitagliptin and saxagliptin when combined with metformin in terms of glycemic control, and changes in lipid profile, weight, or blood pressure.

The product labeling for Kombiglyze XR contains the same contraindications and warnings as metformin. Renal and hepatic impairment remains a concern as well as other conditions that increase the risk of developing lactic acidosis. Kombiglyze XR can be dosed once daily. To achieve the target dose of metformin, patients can take an additional dose of metformin or take two 2.5mg/1000mg Kombiglyze XR tablets together once daily.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) saxagliptin/metformin XR (Kombiglyze XR) offers no clinically meaningful therapeutic advantage over sitagliptin/metformin IR (Januvia) in terms of efficacy, safety, or tolerability.

Relative Cost-Effectiveness—Cost-minimization analysis (CMA) was performed to evaluate the cost of saxagliptin/metformin ER (Kombiglyze XR) in relation to the other UF DPP-4 inhibitor/biguanide FDC agent, sitagliptin/metformin IR (Janumet), and to generic metformin IR or ER in combination with sitagliptan (Januvia) or saxagliptan (Onglyza). Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) that saxagliptin/metformin ER (Kombiglyze XR) tablets were more costly, compared with the other DPP-4s currently designated with BCF or UF status.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 0 absent) saxagliptin/metformin ER (Kombiglyze

XR) remain formulary on the UF. Prior authorization/step therapy for the DPP-4s would require a trial of metformin or sulfonylurea prior to use of Kombiglyze XR for new patients.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 0 absent) saxagliptin/metformin ER (Kombiglyze XR) be excluded from the BCF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) the following PA criteria should apply to Kombiglyze XR. Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for metformin or sulfonylurea at any Military Health Service (MHS) pharmacy point of service [Military Treatment Facilities (MTFs), retail network pharmacies, or mail order) during the previous 180 days. OR

      (2) The patient has received a prescription for a DPP-4 inhibitor (Januvia, Janumet, or Onglyza) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

b) Manual PA criteria, if automated criteria are not met:

(1) The patient has experienced the following adverse event while receiving a SU: hypoglycemia requiring medical treatment.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the P&T Committee's recommendation, the effective date is October 5, 2011

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows

B. Ophthalmic-1 Class—Bromfenac 0.09% Ophthalmic Solution (Bromday)

Relative Clinical Effectiveness—Bromfenac 0.09% ophthalmic solution (Bromday) is a non-steroidal anti-inflammatory drug (NSAID). It is the only ophthalmic NSAID approved for once daily dosing. Bromday is the same formulation of bromfenac (Xibrom) that was previously a twice daily dosed product. The branded formulation Xibrom was withdrawn from the market in February 2011 by the manufacturer. At the time of the May 2011 P&T Committee meeting, no generic formulations of Xibrom were approved. The Ophthalmic-1 Class was reviewed at the August 2010 P&T Committee meeting. All the ophthalmic NSAIDs are designated with formulary status on the UF; none are designated with BCF status. The clinical evaluation included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Bromday was approved under a Supplemental New Drug Application using the data from Xibrom to change the dosing regimen to once daily dosing. Two Phase III placebo-controlled studies concluded that bromfenac dosed once daily for 16

days is effective for treating inflammation and pain in patients who have undergone cataract extraction with intraocular lens implantation. There are no head-to-head clinical trials comparing the bromfenac once-a-day formulation with the twice-a-day formulation. There are no studies comparing the bromfenac once daily formulation with any other ophthalmic NSAIDs. The safety profile of bromfenac is consistent with the other ophthalmic NSAIDs. The most common adverse events in the Phase III clinical trials that led to drug discontinuation and which occurred in a higher incidence than placebo were eye inflammation, photophobia, and eye pain. Based on the safety data from two Phase III studies, there are no clinically relevant differences between bromfenac ophthalmic solution and other ophthalmic NSAIDs.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) there is no published evidence to suggest that bromfenac ophthalmic solution 0.09% (Bromday) has a compelling clinical advantage over other ophthalmic NSAID products currently included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of bromfenac 0.09% ophthalmic solution (Bromday) in relation to the efficacy, safety, tolerability, and clinical outcomes of the other Ophthalmic-1 NSAIDs prescribed for postoperative pain and inflammation following cataract surgery. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of Bromday compared to other UF agents. CMA results showed the projected weighted average cost per day for Bromday is higher than generic ophthalmic NSAIDs, but comparable in price to brand name ophthalmic NSAIDs.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) bromfenac 0.09% ophthalmic solution (Bromday) is cost-effective relative to the other branded Ophthalmic-1 NSAIDs in this class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 1 absent) bromfenac 0.09% ophthalmic solution (Bromday) remain formulary on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 1 absent) bromfenac 0.09% ophthalmic solution (Bromday) be excluded from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Alpha Blockers for Benign Prostatic Hyperplasia (BPH)—Tamsulosin/Dutasteride (Jalyn)

Relative Clinical Effectiveness—Tamsulosin/dutasteride (Jalyn) is a FDC product containing tamsulosin (Flomax, generics), an uroselective alpha-1 blocker (A1B) and dutasteride (Avodart), a 5-alpha reductase inhibitor (5-ARI). Jalyn is the first combination product for BPH. The drug is indicated for treatment of symptomatic BPH in men who have an enlarged prostate (>30 mL prostate volume). Jalyn is classified in the A1B subclass of the BPH agents, which was last reviewed in May 2010. Automated PA/Step Therapy applies to the A1B subclass, which requires a trial of generic tamsulosin or alfuzosin (Uroxatral) for new patients. For the 5-ARI subclass, finasteride (Proscar, generics) is designated with BCF status, and dutasteride (Avodart) is nonformulary on the UF. The clinical evaluation for Jalyn included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

FDA approval for Jalyn is based on the large randomized controlled four-year study, Combination of Avodart and Tamsulosin (CombAT), which evaluated the combination versus individual components. Results from the CombAT study showed the combination of dutasteride and tamsulosin (Jalyn) was not superior to dutasteride monotherapy for males with BPH with an enlarged prostate (>30ml), in terms of objective clinical progression to acute urinary retention (AUR) or BPH-related surgery.

The combination was superior to both tamsulosin and dutasteride monotherapy in terms of improvement of BPH-related symptoms.

The safety and tolerability data from the ComBAT study did not show a clinically relevant difference with Jalyn as compared to monotherapy with tamsulosin or dutasteride. There was a numerical increase in the incidence of cardiac failure with combination tamsulosin/dutasteride, however the FDA determined that co-morbidities were more likely the cause than the drug effect. There was a higher incidence of sexual adverse events (e.g., erectile dysfunction, retrograde ejaculation) with Jalyn, but these did not lead to a higher discontinuation rate with Jalyn, compared to the single agents administered as monotherapy.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that the FDC tamsulosin/dutasteride (Jalyn) is superior to tamsulosin and dutasteride monotherapy in terms of delaying BPH symptoms. However, it was not superior to dutasteride in delaying clinical progression to AUR and BPH-related surgery. There were no clinically relevant differences for Jalyn as compared to tamsulosin or dutasteride monotherapy in terms of safety and tolerability. The P&T Committee also agreed there is a high degree of therapeutic interchangeability between Jalyn and other combinations of selective A1B and a 5-ARI (e.g., tamsulosin/finasteride).

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of tamsulosin/dutasteride (Jalyn) in relation to the efficacy, safety, tolerability, and clinical outcomes of the other uroselective A1Bs and 5-ARIs used for BPH. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of Jalyn compared to other UF agents. Results from the CMA showed the projected weighted average cost per day for Jalyn was higher than the most cost-effective combination—generic tamsulosin and generic finasteride. However, Jalyn was more cost-effective than its individual components taken separately.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) the combination of tamsulosin and finasteride administered together represents the most cost-effective combination of uroselective A1Bs and 5-ARIs for treatment of BPH. The FDC tamsulosin/dutasteride (Jalyn) is a cost-effective alternative relative to other combinations of A1Bs and dutasteride (Avodart).

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 1 opposed, 1 abstained, 1 absent) tamsulosin/dutasteride (Jalyn) remain formulary on the UF, with automated PA/Step Therapy requiring generic tamsulosin or alfuzosin (Uroxatral) for new patients.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 1 absent) tamsulosin/dutasteride (Jalyn) be excluded from the BCF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PA CRITERIA***—Prior authorization for the A1Bs requires a trial of a step-preferred drug [tamsulosin or alfuzosin (Uroxatral)] prior to a non-step-preferred A1B [silodosin (Rapaflo)]. Tamsulosin/dutasteride (Jalyn) would be designated non-step-preferred. The P&T Committee recommended (13 for, 1 opposed, 2 abstained, 1 absent) the following PA criteria apply to tamsulosin/dutasteride (Jalyn):

    a) Automated PA criteria:
        (1) The patient has received a prescription for a preferred agent in the A1B subclass at any MHS pharmacy point of service (MTFs, retail network pharmacies, or home delivery) during the previous 180 days.

b) Manual (paper) PA criteria, if automated criteria are not met:

(1) The patient has received a trial of tamsulosin or alfuzosin and had an inadequate response and requires therapy with both an A1B and 5-ARI.
(2) The patient has received a trial of alfuzosin but was unable to tolerate it due to adverse effects but is expected to tolerate tamsulosin and requires therapy with both an A1B and 5-ARI.
(3) Treatment with alfuzosin is contraindicated for this patient (e.g., due to hypersensitivity) but tamsulosin is not contraindicated, and the patient requires therapy with both an A1B and 5-ARI.
(4) The patient requires therapy with both an A1B and 5-ARI and requires a fixed-dose combination (e.g., swallowing difficulties).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 2 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the P&T Committee's recommendation, the effective date is October 5, 2011.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

IV. UF DRUG CLASS REVIEWS

A. Atypical Antipsychotic Drugs

Background Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the drugs in the atypical antipsychotics (AAP) Drug Class. The clinical review for the oral AAP drugs included, but was not limited to,

sources of information listed in 32 CFR 199.21(e)(1). The injectable AAPs were not included in the review.

The class is comprised of the following agents: clozapine (Clozaril, generics; Fazaclo), risperidone (Risperdal, Risperdal orally disintegrating tablet (ODT), generics), aripiprazole (Abilify, Abilify Discmelt), asenapine (Saphris), iloperidone (Fanapt), lurasidone (Latuda), olanzapine (Zyprexa, Zyprexa Zydis), olanzapine/fluoxetine (Symbyax), paliperidone (Invega), quetiapine IR and ER (Seroquel; Seroquel XR), and ziprasidone (Geodon).

The AAP Drug Class has not previously been reviewed for UF status, although quetiapine IR (Seroquel) and risperidone tablets were added to the BCF in May 2003 (prior to implementation of the Uniform Formulary Rule). Clarifications were made in August 2007 to include quetiapine ER (Seroquel XR) on the BCF and to exclude risperidone ODT. Currently, risperidone is the only AAP drug available in a generic formulation. The anticipated generic entries in the class are Zyprexa, Geodon, Abilify, and Seroquel IR, with patents set to expire in 2011 to 2014.

The AAP Drug Class is associated with a significant cost within the MHS; expenditures exceed $200 million annually. In terms of MHS utilization, quetiapine is the most utilized AAP, followed by generic risperidone. Aripiprazole is the third most utilized agent but accounts for most of the expenditures in the class.

The Pharmacy Outcomes Research Team (PORT) analyzed utilization and prescribing patterns in the MHS and noted that approximately 60% of AAP use in the MHS appears to be consistent with FDA-approved labeling. This estimate is higher than noted in the literature and may be overstated. The most common diagnosis codes for the AAPs differed by the population studied. For the active duty population, depression was the most commonly reported diagnosis code (53%, although it is unclear whether AAP use was for insomnia or to augment antidepressant effect). In the non-active duty population (ages 18–64 years), depression was the most commonly reported diagnosis code (61%). In contrast, attention deficit hyperactivity was the most commonly reported diagnosis code in the pediatric population (62%), compared with the over-65 population, where dementia was the most common diagnosis code (52%).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (16 for, 0 against, 0 abstained, 1 absent) the following conclusions for the AAPs:

1. Schizophrenia: All AAPs are efficacious in treating schizophrenia. Data from the Clinical Antipsychotic Trials of Intervention Effectiveness (CATIE) trial suggests that olanzapine is superior to the other AAPs in efficacy, but use is limited by adverse events. The four newest AAPs (asenapine, iloperidone, lurasidone, and paliperidone) are superior to placebo in treating schizophrenia, but the data is limited to small trials of short duration.

2. Bipolar Disorders: AAPs are used as adjunctive therapy to mood stabilizers in treating mania and mixed episodes. Six AAPs are FDA-approved for use in bipolar disorders (aripiprazole, asenapine, olanzapine, quetiapine, ziprasidone, and risperidone). Recommendations from the 2010 VA/DoD Clinical Practice Guideline (CPG) for bipolar disorder conclude olanzapine and quetiapine have more positive evidence than the other AAPs.
3. Major Depressive Disorder (MDD): For treatment-resistant MDD, AAPs are superior to placebo in augmenting antidepressant therapy. Three AAPs are FDA-approved for the treatment of MDD: aripiprazole, olanzapine/fluoxetine, and quetiapine ER. Data from systematic reviews suggests more positive evidence exists with quetiapine and aripiprazole for this indication. Risperidone also shows benefit in treating MDD, but is not FDA-approved.
4. Post-Traumatic Stress Disorder (PTSD): The available evidence from the 2010 VA/DoD CPG for PTSD and the American Psychiatric Association supports some benefit for the AAPs when used as adjunctive therapy to cognitive behavioral therapy (CBT) and selective serotonin reuptake inhibitors (SSRIs) or selective norepinephrine reuptake inhibitors (SNRIs). The results of one meta-analysis show olanzapine and risperidone were more efficacious than placebo. None of the AAPs are FDA-approved for treating PTSD.
5. Dementia: There is evidence from systematic reviews that dementia symptoms of aggression and agitation are improved with AAPs (risperidone and olanzapine) but there is no benefit conferred in terms of cognition and functionality. Use of AAPs for psychiatric symptoms and behavioral disturbances in dementia patients is not approved by the FDA and is associated with significant risks of adverse events, including development of heart failure, cerebrovascular accident, and sudden cardiac death.
6. Insomnia: None of the AAPs are FDA-approved for treating insomnia. USCENTCOM MOD-10, military guidance for deployment, currently allows for the use of low-dose quetiapine (25 mg) for sleep with no waivers required. In the absence of other psychiatric comorbidities, the use of low-dose AAPs for primary insomnia should be discouraged due to the lack of supportive evidence, risk of adverse events (metabolic and cardiac), and lack of monitoring (e.g., EKG) for adverse events in-theatre. Other drug options to treat insomnia are available on the CENTCOM formulary, which have a lower risk of adverse events than the AAPs.

- The P&T Committee strongly recommends education of providers regarding the lack of evidence to support use of AAPs for primary insomnia and revision of current theater guidance (MOD-10).

7. With regards to safety, a black box warning applies to the entire class precluding use in elderly patients with behavioral and psychological symptoms of dementia due to increased mortality risk.
8. AAPs have different tolerability profiles as noted below:
   - Extrapyramidal symptoms are most likely to occur with risperidone (higher doses), paliperidone, and asenapine; and are least likely to occur with quetiapine, ziprasidone, aripiprazole, iloperidone and olanzapine.
   - Diabetes and weight gain are most commonly associated with clozapine and olanzapine. These effects are less common with aripiprazole, lurasidone, and ziprasidone.
   - Hyperprolactinemia has been most commonly associated with risperidone and paliperidone. Aripiprazole, iloperidone, and quetiapine have the lowest risk of this adverse event.
   - QTc interval prolongation is a concern with ziprasidone and iloperidone, but is least likely to occur with aripiprazole and lurasidone.
9. Adverse events are usually dose dependent and can be potentiated by patient characteristics such as age and comorbid conditions. AAP receptor binding affinities are associated with individual adverse events. Overall, the benefits conferred by AAPs are offset by limiting adverse effects.
10. For the pediatric population, the AAPs differ in their FDA-approved indications and ages. Aripiprazole, olanzapine, risperidone, paliperidone, and quetiapine are approved for use in pediatrics.
11. In a request for provider opinion, most respondents wanted 4 or more AAPs on their local formulary. In addition to risperidone, most respondents requested aripiprazole and quetiapine for inclusion on the BCF.
12. The clinician's choice for selecting an AAP should be influenced by the relationship between the efficacy and tolerability profile of the drug as well as individual patient characteristics.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the AAP Drug Class. Although there are differences within the drug class regarding safety and tolerability profiles, CMA and budget impact analyses (BIA) were conducted, since clinically relevant differences in efficacy for schizophrenia are not apparent Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA and BIA were used to assess the potential impact of cost scenarios where selected AAPs—aripiprazole (Abilify, Abilify Discmelt), asenapine (Saphris), clozapine (Clozaril, generics; Fazaclo), iloperidone (Fanapt), lurasidone (Latuda), olanzapine (Zyprexa, Zyprexa Zydis), olanzapine/fluoxetine (Symbyax), paliperidone (Invega), quetiapine IR and ER (Seroquel IR, Seroquel XR), risperidone (Risperdal, Risperdal ODT), and ziprasidone (Geodon)—were designated with formulary or NF status on the UF. Cost scenarios evaluating the impact of designating selected agents on the BCF were also considered.

Relative Cost Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) BIA results for the AAP agents showed that all investigated scenarios resulted in lower cost estimates compared to current MHS expenditures. Overall cost analyses indicated the most cost-effective scenario and operationally-appropriate choice placed clozapine (Clozaril, generics; Fazaclo), risperidone (Risperdal, Risperdal ODT, generics), aripiprazole (Abilify, Abilify Discmelt), olanzapine (Zyprexa, Zyprexa Zydis), olanzapine/fluoxetine (Symbyax), paliperidone (Invega), quetiapine (Seroquel; Seroquel XR), and ziprasidone (Geodon) on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATIONS***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (9 for, 6 against, 2 abstained, 0 absent) clozapine (Clozaril, generics; Fazlaco), risperidone (Risperdal, Risperdal ODT, generics), aripiprazole (Abilify, Abilify Discmelt), olanzapine (Zyprexa, Zyprexa Zydis), olanzapine/fluoxetine (Symbyax), paliperidone (Invega), quetiapine (Seroquel; Seroquel XR), and ziprasidone (Geodon) remain formulary on the UF. The P&T Committee recommended iloperidone (Fanapt), asenapine (Saphris), and lurasidone (Latuda) be designated NF on the UF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATIONS***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 against, 1 abstained, 0 absent) to maintain risperidone (Risperdal, Risperdal ODT, generics), quetiapine IR (Seroquel), and quetiapine XR (Seroquel XR) on the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluation of iloperidone (Fanapt), asenapine (Saphris), lurasidone (Latuda), and the conditions for establishing MN for NF medications, the P&T Committee recommended (16 for, 0 against, 1 abstained, 0 absent) MN criteria for iloperidone (Fanapt), asenapine (Saphris), and lurasidone (Latuda). (See Appendix B for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 against, 2 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60 days implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the Committee's recommendation the effective date is October 5, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Nasal Allergy Drugs (NADs)

Relative Clinical Effectiveness—The P&T Committee evaluated the clinical effectiveness of the NADs. The nasal corticosteroids were previously reviewed in November 2005, August 2007, and November 2008. The class is comprised of three subclasses as listed below.

- *Nasal Corticosteroids*: beclomethasone (Beconase AQ), budesonide (Rhinocort AQ), ciclesonide (Omnaris), flunisolide (generics), fluticasone furoate (Veramyst), fluticasone propionate (Flonase, generics), mometasone furoate (Nasonex), and triamcinolone (Nasacort AQ)
- *Nasal Antihistamines*: azelastine 0.1% (Astelin, generic), azelastine 0.15% with sucralose and sorbitol (Astepro), and olopatadine (Patanase)
- *Nasal Anticholinergics*: ipratropium (Atrovent, generics)

Information regarding the safety, effectiveness, and clinical outcomes of these drugs was considered. The clinical review included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

In terms of numbers of prescriptions dispensed, fluticasone propionate (Flonase, generics) is the highest utilized nasal allergy drug in the MTFs, followed by mometasone (Nasonex), and azelastine 0.1% (Astelin). This utilization pattern is also seen in the Retail Network. The current BCF drug for the NAD Drug Class is azelastine 0.1%; fluticasone propionate was removed from the BCF in May 2010 due to supply issues.

Relative Clinical Effectiveness Conclusion—The P&T Committee voted (17 for, 0 opposed, 0 abstained, 0 absent) to accept the following clinical effectiveness conclusions:

Nasal Corticosteroids:

With regards to efficacy/clinical effectiveness of the nasal corticosteroids, the following conclusions were made:

- FDA-approved indications—The P&T Committee recognized that there were minor differences among the drugs with regard to FDA-approved uses for seasonal allergic rhinitis (SAR), perennial allergic rhinitis (PAR), prophylaxis of allergic rhinitis (AR) symptoms, nonallergic rhinitis, and nasal polyps. Additionally, the pediatric FDA-approved age ranges differ between the products.
- Clinical Practice Guidelines—Evidence-based guidelines from the 2008 American Academy of Allergy, Asthma and Immunology (AAAAI) and 2010 Allergic Rhinitis and its Impact on Asthma (ARIA) consider the nasal corticosteroids as the most effective drug class at reducing allergic rhinitis symptoms of sneezing, rhinorrhea, nasal congestion, and itching.

- Pharmacodynamic/pharmacokinetic properties—The AAAAI guidelines concluded that despite differences in topical potency, lipid solubility, receptor binding affinity, and systemic bioavailability, the overall clinical response does not appear to vary significantly between drugs.
- Efficacy for SAR/PAR—There was no compelling new data to change the conclusion from the 2008 P&T Committee Meeting review, which established there is no evidence of clinically relevant differences between the agents at relieving nasal or ocular symptoms of AR. However, ciclesonide lacks published evidence for reducing ocular symptoms.
- Nasal polyps—Mometasone and beclomethasone are FDA-approved for nasal polyps.
- There was no compelling new evidence to change previous conclusions.

With regards to regards to safety and tolerability, the following conclusions were made:

- Local effects—Nasal irritation, epistaxis, and rhinorrhea are the most common local adverse effects and are equally likely to occur with any of the nasal corticosteroids.
- Systemic effects—For systemic effects of hypothalamic pituitary adrenal-axis suppression, growth suppression, and ocular adverse events (cataracts/glaucoma), there is insufficient evidence to determine whether one nasal corticosteroid is more likely to cause these effects than another. When given in recommended doses, the nasal corticosteroids are not generally associated with clinically significant systemic adverse effects.
- Tolerability and patient preferences—Patient preferences may play a role in differentiating between the nasal corticosteroids. However, the available clinical data is poor, and no nasal corticosteroid has proven superior to the others in patient preference trials. Nevertheless, flunisolide is poorly tolerated and must be dosed three or four times daily while the others are dosed once or twice daily. Budesonide (Rhinocort AQ) is the only nasal corticosteroid with a pregnancy category B rating by the FDA. All the nasal corticosteroids have a class labeling that these drugs should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.

Nasal Antihistamines:

With regards to efficacy/clinical effectiveness of the nasal antihistamines, the following conclusions were made:

- FDA-approved indications—The P&T Committee recognized that there were minor differences between olopatadine (Patanase), azelastine 0.1% (Astelin, generic), and azelastine 0.15% (Astepro) with regard to FDA-approved uses for SAR and nonallergic rhinitis [e.g., vasomotor rhinitis (VMR)], and pediatric approval.
- Clinical Practice Guidelines—The 2010 ARIA guidelines suggest use of non-sedating oral antihistamines preferentially to nasal antihistamines. The 2008 AAAAI guidelines state that nasal antihistamines are generally less effective than nasal corticosteroids for treating AR, but may be considered for use as first-line treatment for AR and nonallergic rhinitis. Nasal antihistamines are associated with a clinically significant effect on reducing nasal congestion.
- Efficacy for SAR—Azelastine and olopatadine are superior to placebo in relieving symptoms of SAR. There is no new compelling clinical data to suggest one product is more efficacious than the others.
- Head-to-head study—One head-to-head trial comparing the use of olopatadine with azelastine found no difference in relief of nasal symptoms, but suggests that olopatadine may be better tolerated by patients, as shown by a lower incidence of bitter taste.

With regards to safety and tolerability of the nasal antihistamines, the following conclusions were made:

- Local adverse effects—Somnolence is considered a class effect (AAAAI guidelines). Bitter taste has a higher incidence with azelastine, while epistaxis occurred with roughly equal frequency between olopatadine and azelastine.
- Patient preferences and tolerability—The available clinical data is sparse and is limited to manufacturer-sponsored studies, but tends to favor olopatadine. However, there is insufficient evidence to definitively conclude that clinically relevant differences exist between the nasal antihistamines.

Nasal Anticholinergics:

With regards to efficacy/clinical effectiveness, safety, tolerability, and other factors, of the ipratropium nasal spray (Atrovent, generics), the following conclusions were made:

- FDA-approved indications—Ipratropium is solely indicated for the relief of SAR in adults and children 12 years of age and older.
- Clinical Practice Guidelines—2010 AAAAI guidelines state that nasal anticholinergics may effectively reduce rhinorrhea, but have no effect

on other nasal symptoms. Although adverse events are minimal, dryness of the nasal membranes may occur.

- Efficacy and Safety—No new efficacy or safety data have been published since the prior review. Ipratropium is rated Pregnancy Category B by the FDA.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the NADs. CMAs and BIAs were performed based on findings that there were no clinically relevant differences in efficacy, safety, tolerability, and other factors among the NADs. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA and BIA were used to assess the potential impact of cost scenarios where selected nasal allergy agents were designated as formulary or nonformulary on the UF. Cost scenarios evaluating the impact of designating selected agents on the BCF were also considered.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 0 abstained, 0 absent) the following:

BIA results for the NADs showed that six out of seven investigated scenarios resulted in lower cost estimates than current MHS expenditures. Scenarios where generic fluticasone propionate was selected as a BCF agent, with branded agents olopatadine (Patanase) and mometasone (Nasonex) on the UF were the most cost-effective scenarios overall. Sensitivity analysis results supported the above conclusion unless generic fluticasone propionate becomes unavailable for an extended period of time.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the NADs, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (16 for, 0 opposed, 1 abstained, and 0 absent) to recommend that:
    a) Fluticasone propionate (Flonase, generics), flunisolide (generics), mometasone (Nasonex), azelastine 0.1% (Astelin, generic), olopatadine (Patanase), and ipratropium (Atrovent, generics) be classified as formulary on the UF.
    b) Azelastine 0.15% (Astepro), beclomethasone (Beconase AQ), budesonide (Rhinocort Aqua), ciclesonide (Omnaris), fluticasone furoate (Veramyst), and triamcinolone (Nasacort AQ) remain designated as nonformulary under the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee considered the BCF status of the NADs. Based on the results of the clinical and cost evaluations presented, the P&T Committee voted (16 for, 0 opposed, 1 abstained, and 0 absent) to recommend that fluticasone propionate (Flonase, generics) be designated with BCF status. As a result of this action, azelastine 0.1% (Astelin, generics) is no longer designated with BCF status. Implementation would occur immediately on signing of the May 2011 P&T Committee minutes by the Director, TMA.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

V. UTILIZATION MANAGEMENT

A. Sumatriptan (Alsuma)—QUANTITY LIMITS (QLs): A new sumatriptan autoinjection (Alsuma) is now marketed. Alsuma will be reviewed as a new FDA-approved drug in the triptan drug class at an upcoming P&T Committee meeting. QLs are currently in place for both oral and other injectable formulations of sumatriptan (Imitrex, generics; Sumavel) and the other oral triptans, which are consistent with their product labeling.

COMMITTEE ACTION: QL—The P&T Committee voted (16 for, 0 against, 1 abstain, 0 absent) to recommend QLs of 24 units/90 days in the mail order pharmacy and 8 units/30 days in the retail network, which is consistent with the recommended dosing from the product labeling and avoids breaking apart packages for dispensing.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Buprenorphine Transdermal System (Butrans)—QL: A transdermal formulation of buprenorphine is now available. Buprenorphine transdermal system (Butrans) is FDA-approved for management of moderate-to-severe chronic pain in patients requiring a continuous, around-the-clock opioid analgesic for an extended period of time. The manufacturer's dosing recommendation mandates one transdermal system for seven days. Butrans will be reviewed as a new FDA-approved drug in the narcotic analgesics drug class at an upcoming P&T Committee meeting.

1. ***COMMITTEE ACTION: QL***—The P&T Committee voted (16 for, 0 against, 1 abstain, 0 absent) to recommend QLs for transdermal buprenorphine of 12 patches/84 days in the mail order pharmacy and 4 patches/28 days in the retail network, which is consistent with the recommended dosing from the product labeling and will decrease the risk of inadvertent misuse of the product.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VI. ITEMS FOR INFORMATION

A. Dabigatran (Pradaxa)—Potential Prior Authorization: Dabigatran is the first oral anticoagulant to reach the market since warfarin (Coumadin). It is currently limited to use in patients with non-vavular atrial fibrillation to reduce the risk of stroke and systemic embolism. The P&T Committee reviewed the existing clinical data for dabigatran and its advantages and disadvantages versus warfarin. The P&T Committee also discussed whether prior authorization was required to ensure prescribing is consistent with the current FDA-approved indications. The P&T Committee agreed that Prior Authorization was not needed at this time. Dabigatran will be reviewed with the other anticoagulants at a future meeting.

B. PORT—The PORT updated the P&T Committee on their mission, and reviewed ongoing initiatives and studies.

C. Over-the-counter Fexofenadine (Allegra OTC)—Allegra is now available over-the-counter and does not require a prescription. Therefore, it is not covered under the TRICARE benefit. Fexofenadine (generic Allegra) is a covered benefit by prescription. However, raw material is not being supplied to the generic manufacturers. Therefore,

the supply of fexofenadine is diminishing. Once fexofenadine supplies are depleted, it is unlikely the medication will be available in the future.

VII. FUTURE CLASS OVERVIEWS

An overview of the antidepressants/pain drug class was presented to the P&T Committee. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important to use in completing the clinical effectiveness reviews and developing appropriate cost-effectiveness models. The clinical and economic analyses of this drug class will be presented at an upcoming meeting.

VIII. ADJOURNMENT

The meeting adjourned at 1615 hours on May 11, 2011, and at 1140 hours on May 12, 2011. The next meeting will be in August 2011.

ADDENDUM TO MAY 2011 MINUTES FOR DEPARTMENT OF DEFENSE PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

At the May 11–12, 2011, meeting, the Pharmacy and Therapeutics Committee, based on experience with the Uniform Formulary, changes in economic circumstances, and other appropriate factors, voted (14 for, 0 against, 3 abstain, 0 absent) to recommend an adjustment to the per prescription co-payments established in Title 32, Code of Federal Regulations, Section (Sec.) 199.21(i)(2). The proposed co-payment changes for tiers 1 (generic)/2 (formulary)/3 (non-formulary) are $5/$12/$25 for up to a 30-day supply at the Retail Network, and $0/$9/$25 for up to a 90-day supply at the Mail Order Pharmacy. These adjusted amounts maintain compliance with the requirements of Title 10, United States Code, Sec. 1074g(a)(6).

SUBMITTED BY:

John P. Kugler, M.D., MPH
Chair, Department of Defense Pharmacy
and Therapeutics Committee

DECISION ON RECOMMENDATIONS:

The recommended co-pay adjustment is approved effective October 1, 2011. For formulary and generic pharmaceutical agents obtained from a retail non-network pharmacy there is a 20 percent or $12.00 co-payment (whichever is greater) per prescription for up to a 30-day supply. For non-formulary pharmaceutical agents obtained at a retail non-network pharmacy there is a 20 percent or $25.00 co-payment (whichever is greater) per prescription for up to a 30-day supply.

Jonathan Woodson, M.D.
Assistant Secretary of Defense
(Health Affairs)

5 August 2011
(Date)

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
February 2011

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on February 16 and 17, 2011, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of August Minutes**—Jonathon Woodson M.D. Director, approved the minutes for the November 2010 DoD P&T Committee meeting on February 4, 2011.

III. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Renin Angiotensin Antihypertensive Agents (RAAs)—Aliskiren/Amlodipine Tablets (Tekamlo)

Relative Clinical Effectiveness—Tekamlo is a fixed-dose combination product containing the direct renin inhibitor (DRI) aliskiren (Tekturna) and amlodipine (Norvasc, generics), a dihydropyridine (DHP) calcium channel blocker (CCB). Aliskiren is also available in a fixed-dose combination tablet containing the diuretic hydrochlorothiazide (HCTZ).

Aliskiren and aliskiren/HCTZ are currently designated with formulary status on the Uniform Formulary (UF), non-step-preferred, requiring prior authorization. Amlodipine is designated Basic Core Formulary (BCF). Tekamlo is included in the RAAs Drug Class, which is comprised of several subclasses: angiotensin receptor blockers (ARBs), angiotensin-converting enzyme (ACE) inhibitors, and direct renin inhibitors (DRIs) and their combinations with CCBs or diuretics. The RAAs Drug Class was reviewed at the August 2010 P&T Committee meeting. The clinical evaluation for Tekamlo included, but was not limited to, the requirements stated in 32 Code of Federal Regulations (CFR) 199.21(e)(1).

Tekamlo is indicated for treating hypertension. No positive clinical outcomes have been reported for Tekamlo or any aliskiren-containing product, though outcomes trials

with aliskiren remain underway. Current national guidelines [Joint National Committee (JNC-7)] for treating hypertension have not yet addressed the place in therapy for DRIs, although updated guidelines (JNC-8) are anticipated later this year. The American Society of Hypertension does not list the Tekamlo (or any aliskiren-containing) combination as either preferred or acceptable in their recent position statement. Tekamlo does not contain a thiazide-type diuretic, which is considered first-line for most patients.

Treatment with Tekamlo was shown in one randomized trial to significantly reduce blood pressure (BP) compared to placebo. The adverse reaction profile for Tekamlo reflects that of the individual components.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent) that although aliskiren/amlodipine (Tekamlo) has a unique mechanism of action due to the DRI component and offers the potential for increased medication persistence, it did not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other RAAs included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of aliskiren/amlodipine (Tekamlo) in relation to the efficacy, safety, tolerability, and clinical outcomes of the other RAAs, as well as the individual components, aliskiren and amlodipine. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost-minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of Tekamlo compared to other UF agents. Results from the CMA showed the projected weighted average cost per day for Tekamlo is higher than the other formulary RAAs, including the triple fixed-dose combination drug valsartan/amlodipine/HCTZ (Exforge HCT) and the individual components, Tekturna and amlodipine.

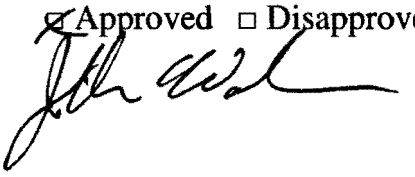
Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent) aliskiren/amlodipine (Tekamlo) is not cost-effective relative to the other RAAs in this class

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 1 absent) aliskiren/amlodipine (Tekamlo) be

designated with nonformulary (NF) status on the UF.

Director, TMA, Decision: ☑ Approved □ Disapproved

Approved, but modified as follows:



2. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***—As a result of UF action, Tekamlo is designated as a non-preferred RAAs. Prior Authorization for the RAAs class requires a trial of one of the following step-preferred drugs for new patients: losartan (Cozaar, generics), losartan/HCTZ (Hyzaar, generics), telmisartan (Micardis), telmisartan/HCTZ (Micardis HCT), telmisartan/amlodipine (Twynsta), valsartan (Diovan), valsartan/HCTZ (Diovan HCT), valsartan/amlodipine (Exforge), and valsartan/amlodipine/HCTZ (Exforge HCT). The other RAAs are non-preferred.

   The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) the following PA criteria should apply to aliskiren/amlodipine (Tekamlo):

   a) Automated PA criteria:

      (1) The patient has received a prescription for losartan, losartan/HCTZ, telmisartan (Micardis), telmisartan/HCTZ (Micardis HCT), telmisartan/amlodipine (Twynsta), valsartan (Diovan), valsartan/HCTZ (Diovan HCT), valsartan/amlodipine (Exforge), or valsartan/amlodipine/HCTZ (Exforge HCT) at any Military Health System (MHS) pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met:

      (1) The patient has tried one of the preferred RAAs and was unable to tolerate treatment due to adverse effects.

      (2) The patient has tried one of the preferred RAAs and has had an inadequate response.

      (3) The patient has a contraindication to the preferred RAAs, which is not expected to occur with the non-preferred RAAs (e.g., history of angioedema).

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluation of aliskiren/amlodipine (Tekamlo) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) MN criteria for Tekamlo. (See Appendix B for full MN criteria.)

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60 days implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the Committee's recommendation the effective date is July 13, 2011.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows

B. Renin Angiotensin Antihypertensive Agents (RAAs)—Olmesartan/ Amlodipine/HCTZ Tablets (Tribenzor)

Relative Clinical Effectiveness—Tribenzor is a fixed-dose combination product containing olmesartan (Benicar), amlodipine (Norvasc, generics), and HCTZ. It is the second three-drug combination product containing an ARB (olmesartan; Benicar), a DHP CCB (amlodipine), and thiazide-type diuretic (HCTZ) to reach the market. Exforge HCT [valsartan (Diovan)/amlodipine/HCTZ] was the first three-drug entrant on the market.

Olmesartan is currently designated with formulary status on the UF, non-step-preferred, requiring prior authorization; amlodipine and HCTZ are designated as BCF. Tribenzor is included in the RAAs Drug Class, which was reviewed at the August 2010 P&T Committee meeting. The clinical evaluation for Tribenzor included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Tribenzor is solely indicated for treating hypertension; it can be substituted for the individual titrated components or used as add-on therapy in patients not adequately controlled on two of the component drugs. It is not approved for initial therapy to control BP. Each of the component drugs is consistent with first-line therapy choices per current national guidelines (JNC-7).

Treatment with Tribenzor was shown in one randomized trial to significantly reduce BP when compared to baseline and to each two-drug combination of the component drugs. There are no trials evaluating clinical outcomes of mortality or morbidity with Tribenzor, although outcomes trials are available with the individual components.

The adverse reaction profile for Tribenzor reflects that of the individual components. Although no studies are available specifically addressing the potential for increased compliance with Tribenzor over the individual components administered together, other studies have shown an increase in persistence with fixed-dose antihypertensive combination products.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 2 absent) that although olmesartan/amlodipine/HCTZ (Tribenzor) offers the potential for increased medication persistence, it did not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other RAAs included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of olmesartan/ amlodipine/HCTZ (Tribenzor) in relation to the efficacy, safety, tolerability, and clinical outcomes of the RAAs as well as the individual components, olmesartan, amlodipine, and HCTZ. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of Tribenzor relative to other UF agents in this class. Results from the CMA showed the projected weighted average cost per day for Tribenzor is higher than the other formulary fixed-dose combination RAAs, including the triple-therapy drug amlodipine/valsartan/hydrochlorothiazide (Exforge HCT) and the individual components olmesartan (Benicar), amlodipine, and HCTZ.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 2 absent) olmesartan/amlodipine/HCTZ (Tribenzor) is not cost-effective relative to the other RAAs in this class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 2 absent) olmesartan/amlodipine/HCTZ (Tribenzor) be designated NF on the UF.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: PA CRITERIA***—As a result of the UF action, Tribenzor is designated as a non-preferred RAAs. The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) the same automated and manual PA criteria as outlined above for aliskiren/amlodipine (Tekamlo) should apply to olmesartan/amlodipine/HCTZ (Tribenzor). (See III, A, 2 for full PA criteria.)

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

3. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of olmesartan/amlodipine/HCTZ (Tribenzor) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) MN criteria for Tribenzor. (See Appendix B for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60 days implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the Committee's recommendation the effective date is July 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows

C. Alzheimer's Drugs—Donepezil 23 mg Tablets (Aricept 23 mg)

Relative Clinical Effectiveness—Donepezil 23 mg (Aricept 23 mg) is a formulation of donepezil (Aricept) in a higher dosage than previously available (5, 10 mg). The Alzheimer's Drug Class was previously reviewed in November 2005; donepezil 5 and 10 mg tablets are the current Extended Core Formulary (ECF) drugs. Generic formulations of donepezil 5 and 10 mg tablets and orally disintegrating tablets (ODTs) entered the market in November 2010.

The pharmacokinetic profile of one donepezil 23 mg tablet shows a delayed and lower peak concentration compared to giving two of the 10 mg tablets. The 23 mg formulation is not an extended-release preparation; the 5 mg, 10 mg, and 23 mg tablets are administered once daily.

The one clinical trial used to gain FDA approval, which compared donepezil 23 mg with 10 mg, showed statistically significant improvement in measures of cognition, but no benefit in improving global functioning. An indirect comparison suggests efficacy of 23 mg donepezil appears similar to giving 10 mg donepezil with memantine (Namenda).

Tolerability of the donepezil 23 mg formulation will be limited by the increased incidence of adverse events, particularly gastrointestinal (GI) effects, compared with donepezil 10 mg.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) donepezil 23 mg (Aricept 23 mg) did not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over donepezil 10 mg.

Relative Cost-Effectiveness—CMA was performed that evaluated the cost of donepezil 23 mg (Aricept 23 mg) in relation to other currently available agents in the Alzheimer's Drug Class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) donepezil 23 mg (Aricept 23 mg) tablets are currently cost competitive with all other comparators in the Alzheimer's Drug Class. However, the current generic manufacturer enjoys exclusive marketing rights until spring 2011. Once other generic manufacturers enter the market, donepezil 23 mg (Aricept 23 mg) tablets will be more costly than all other drugs in the Alzheimer's Drug Class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 4 opposed, 1 abstained, 0 absent) donepezil 23 mg tablets (Aricept 23 mg) be designated NF on UF.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of donepezil 23 mg tablets and the conditions for establishing MN for a NF medication, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) MN criteria for Aricept 23 mg . (See Appendix B for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3 ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) 1) an effective date of the first Wednesday after a 60 days implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the Committee's recommendation the effective date is July 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

D. Antiemetics—Ondansetron Soluble Film (Zuplenz)

Relative Clinical Effectiveness—Ondansetron oral soluble film (Zuplenz) is a serotonin subtype 3 (5-HT3) receptor antagonist. It is the only newer antiemetic available in an oral soluble film dosage form. Ondansetron (Zofran, generics) is also available in tablets, ODT, and an oral solution; these formulations are included on the UF. The Newer Antiemetics Drug Class was reviewed at the May 2006 P&T Committee meeting. There are no newer antiemetics designated as BCF; the older antiemetic promethazine is the only BCF antiemetic. The clinical evaluation included, but was not limited to, the requirements sated in 32 CFR 199.21(e)(1).

Ondansetron oral soluble film (Zuplenz) obtained FDA approval via section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act using efficacy and safety data submitted from the ondansetron ODT (Zofran) submission. Bioequivalence studies demonstrated that a single dose of ondansetron oral soluble film 8 mg, taken with or without water and in underfed and fasting conditions, was comparable to ondansetron ODT 8 mg. There are no head-to-head clinical trials comparing ondansetron oral soluble film to the other newer antiemetics. Zuplenz's safety profile reflects that of the other ondansetron products.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) there is no evidence to suggest ondansetron oral soluble film (Zuplenz) has a compelling clinical advantage over ondansetron products currently included on the UF.

Relative Cost-Effectiveness—CMA was performed that evaluated the cost of ondansetron oral soluble film (Zuplenz) in relation to other currently available newer antiemetics. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) ondansetron oral soluble film (Zuplenz) was more costly than all other oral comparators in the newer antiemetic class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) ondansetron oral soluble film (Zuplenz) be designated NF on the UF.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of ondansetron oral soluble film (Zuplenz) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Zuplenz. (See Appendix B for full MN criteria.)

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60 days implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the Committee's recommendation the effective date is July 13, 2011.

Approved

E. Self-Monitoring Blood Glucose System Test Strips—Glucocard 01, Glucocard Vital, Embrace, and NovaMax Test Strips

Relative Clinical Effectiveness—The self-monitoring blood glucose system (SMBGS) test strips were reviewed at the August 2008 P&T Committee meeting. SMBGS test strips designated with formulary status on the UF include Accu-Chek Aviva, Precision Xtra (the BCF SMBGS test strip), Freestyle Lite, Contour and TRUEtest. The clinical evaluation for Glucocard 01, Glucocard Vital, Embrace, and Nova Max test strips included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Glucocard 01, Glucocard Vital, Embrace, and Nova Max SMBGS test strips met the previously determined minimum technical requirements, which were approved at the May 2007 P&T Committee meeting. These 4 test strips also met the operational limitations of the existing Mail Order and Retail contracts, and Federal Government contracting regulations.

With regard to efficacy, the Glucocard 01, Glucocard Vital, Embrace, and Nova Max SMBGS test strips are accurate according to the requirements of the FDA and the International Standard for Organization, do not require manual coding, require only a 0.3–0.6 microliter blood sample size, are approved for at least one alternate testing site, and provide results in 5 to 7 seconds. The Glucocard 01, Glucocard Vital, Embrace, and Nova Max test strips utilize glucose oxidase instead of glucose dehydrogenase pyrroloquinolinequinone (GDH-PQQ) as the reagent. Test strips with GDH-PQQ have rarely been associated with falsely high blood glucose readings and potential patient harm when used concurrently with products containing maltose (e.g., dialysis patients receiving icodextrin dialysate solutions).

The following did not meet the minimum technical requirements: Advocate Redi-code, EasyMax, EZ Smart Plus, Fifty50, Microdot, Rightest GS100, Rightest GS300, Ultratrak Ultimate. The following were not in compliance with the Buy American/Trade Agreement Acts: Blood Sugar Diagnostic, Liberty, Wavesense Jazz, Wavesense Presto.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent): 1) Glucocard 01, Glucocard Vital, Embrace, and Nova Max test strips are similar to the other test strips included on the UF, in terms of meeting the minimum technical requirements; 2) Nova Max test strips offer ketone testing on the Nova Max Plus meter (ketone testing is also available with the Precision Xtra meter); 3) Nova Max test strips offer wireless communication with insulin pumps on the Nova Max Link meter; and 4) Embrace test strips used in the Embrace meters offers a talking feature that speaks blood glucose results and instructions for testing.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of Glucocard 01, Glucocard Vital, Embrace, and Nova Max test strips in relation to efficacy, safety, tolerability, and clinical outcomes of the other test strips in the SMBGS test strip class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was performed to evaluate the cost-effectiveness of the Glucocard 01, Glucocard Vital, Embrace, and Nova Max SMBGS test strips. The cost-effectiveness of each new test strip was evaluated relative to the following agents: Accu-chek Aviva, Contour, OneTouch Ultra, Precision Xtra, and TRUEtest. CMA results showed the following, in order from most to least cost-effective: Glucocard Vital > Glucocard 01 > TRUEtest > Contour > Embrace > Precision Xtra > Accu-Chek Aviva > One Touch Ultra > Nova Max.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 2 absent) 1) Glucocard Vital is the most cost-effective strip in all points of service, 2) Glucocard 01 is the second most cost-effective strip, 3) Embrace test strips fall in the middle of the price range for UF products and 4) Nova Max is the least cost-effective SMBGS test strip.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 2 absent):
    a) Glucocard 01, Glucocard Vital, and Embrace test strips be designated with formulary status on the UF;

    b) Nova Max be designated with NF status on the UF; and

c) Advocate Redi-code, Blood Sugar Diagnostic, EasyMax, EZ Smart Plus, Fifty50, Liberty, Microdot, Rightest GS100, Rightest GS300, Ultratrak Ultimate, Wavesense Jazz, and Wavesense Presto be designated with NF status on the UF because they do not meet the minimum technical standards required for inclusion on the UF or Federal Government contracting regulations.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

COMMITTEE ACTION: BCF RECOMMENDATION—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 2 absent) Glucocard 01, Glucocard Vital, and Embrace SMBGS test strips not be included in the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of the SMBGS and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) MN criteria for Nova Max SMBGS test strips. (See Appendix B for full MN criteria.)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday after a 60 days implementation period in all points of service, and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the Committee's recommendation the effective date is July 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

5. ***COMMITTEE ACTION: QUANTITY LIMITS (QLs)***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) the following QLs: 600 strips/90 days in the mail order pharmacy and 200 strips/30days in the retail network. These QLs are consistent with the other SMBGS test strips.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

IV. UF DRUG CLASS REVIEWS

A. Gastrointestinal-1 (GI-1) Drugs

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the GI-1 Drug Class. The class is comprised of three subclasses: aminosalicylates, GI steroids, and miscellaneous agents for irritable bowel syndrome (IBS). The aminosalicylates are comprised of sulfasalazine and the 5-aminosalicylate products (balsalazide, olsalazine, and mesalamine). The GI-1s have not been previously reviewed. There are no agents currently on the BCF; all drugs in the class are classified as UF drugs. The clinical review included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

The individual GI-1s are listed below:

- **Aminosalicylates:** sulfasalazine (Azulfidine, generic), sulfasalazine enteric coated (EC) (Azulfidine EN, generic), balsalazide (Colazal,

generic), olsalazine (Dipentum), oral mesalamine (Asacol; Asacol HD; Pentasa; Lialda; Apriso), rectal mesalamine (Rowasa, generic enema; sulfite-free Rowasa enema; Canasa suppositories)

- **GI steroids:** budesonide (Entocort EC), rectal hydrocortisone (Colocort, Cortenema; Cortifoam)
- **Miscellaneous IBS agents:** alosetron (Lotronex), tegaserod (Zelnorm)

The GI-1 Drug Class expenditures exceed $60 million annually. In terms of overall utilization at all points of service, Asacol is the most utilized aminosalicylate and Entocort is the most utilized GI steroid. The miscellaneous agents for IBS have restrictive distribution and limited utilization within the MHS.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following conclusions for the GI-1Drug Class:

- **Aminosalicylates:**
  1. Sulfasalazine, which is comprised of two molecules, sulfapyridine and 5-aminosalicylic acid (5-ASA), remains the first-line oral aminosalicylate recommended by the American College of Gastroenterology for extensive active ulcerative colitis. For the induction of remission in active ulcerative colitis, evidence from a systematic review by the Cochrane group found no clinically relevant differences in efficacy between sulfasalazine and the newer 5-ASA formulations.
  2. For maintenance of remission in ulcerative colitis, another systematic review showed a therapeutic advantage of sulfasalazine over the 5-ASA formulations. This advantage was offset by an increase in adverse events observed with sulfasalazine, due to the sulfapyridine moiety. The 5-ASAs are better tolerated than sulfasalazine since they lack the sulfa moiety.
  3. The newer 5-ASA formulations employ different release mechanisms to deliver drug at various sites in the GI tract. These differences in drug release and site of release do not confer additional benefits in terms of clinical response. All available 5-ASA formulations have shown superiority over placebo in treating ulcerative colitis. The lack of consensus in terms of efficacy measures for clinical trials makes it difficult to evaluate the comparative efficacy of the 5-ASAs.
  4. The efficacy of aminosalicylates in treating Crohn's disease is questionable. Though the aminosalicylates are often used in clinical practice for induction of mild to moderate Crohn's disease, a Cochrane

review showed minimal benefit over placebo and less effect compared to budesonide and conventional steroids.

5. In terms of safety, 5-ASAs, though not devoid of adverse reactions, are generally well tolerated. Olsalazine induces a secretory-type diarrhea, which largely limits its use. Otherwise, the safety profile is similar for the 5-ASA products. Concerns regarding renal toxicity, hepatotoxicity, and pancreatitis are idiosyncratic and equally projected across the 5-ASAs.
6. The choice of 5-ASA for treatment of ulcerative colitis will depend on other factors, such as location and extent of disease, as well as patient preference in terms of ease of administration, pill burden, and frequency of dosing.
7. Rectal 5-ASAs are useful in distal colitis. The choice between the liquid enema and suppositories is based on the extent of diseased colon. Current guidelines recommend combination of oral and rectal therapy for treating mild to moderate distal ulcerative colitis since combination therapy is more effective than either therapy alone.

- **GI steroids:**

1. Budesonide delayed-release capsules (Entocort EC) are the only oral steroid preparation available in the GI-1 Drug Class. Budesonide has fewer systemic effects than the other oral corticosteroids (e.g., prednisone) and is delivered directly to the colon. For induction of remission in Crohn's disease, a systematic review found oral budesonide was more effective than placebo and mesalamine, but corticosteroids were more effective than budesonide.
2. For the maintenance of remission in Crohn's disease, another systematic review found budesonide was no more effective than placebo after 6-12 months, and budesonide was no more effective than glucorticoids (which are not effective for maintaining remission). Budesonide was more effective at maintaining remission in Crohn's disease compared to mesalamine. The package labeling for Entocort EC limits treatment to 3 months.
3. Budesonide is not effective for maintenance of remission in ulcerative colitis, based on a systematic review comparing budesonide with placebo, oral mesalamine, and corticosteroids.
4. The rectally-administered topical steroids include the hydrocortisone enema (Colocort, Cortenema) and foam (Cortifoam) preparations,

which are effective and safe for the treatment of distal ulcerative colitis.

5. Treatment choice depends on the location of disease and tolerability of the preparation.

- **Miscellaneous IBS agents:**
  1. Due to severe adverse effects, including death due to bowel obstruction, alosetron (Lotronex) is restricted to women with severe refractory diarrhea-predominant IBS under an FDA-mandated risk evaluation and mitigation strategy program.
  2. Due to severe adverse cardiovascular effects, tegaserod (Zelnorm) is available only for emergency use in cases of severe constipation-predominant IBS after application to the FDA. Upon approval, the manufacturer sends the medication to the patient.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the GI-1 Drug Class. CMAs and budget impact analyses (BIAs) were performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

- **Aminosalicylates:** CMA and BIA were used to assess the potential impact of cost scenarios where sulfasalazine (Azulfidine, generic), sulfasalazine EC (Azulfidine EN, generic), balsalazide (Colazal, generic), olsalazine (Dipentum), oral mesalamine (Asacol, Asacol HD, Apriso, Lialda, Pentasa), and rectal mesalamine (Canasa, Rowasa, sfRowasa) were designated with formulary or NF status on the UF. Cost scenarios evaluating the impact of designating selected agents with BCF status were also considered. BIA results showed that all investigated scenarios resulted in lower cost estimates compared to current MHS expenditures. Overall, cost analyses indicated that the placement of all agents on the UF was the most cost-effective scenario.

- **GI steroids and Miscellaneous IBS agents:** Cost analysis and budget estimates were used to assess the potential impact of designating budesonide (Entocort EC), and rectal hydrocortisone (Colocort, Cortenema, and Cortifoam) with formulary or NF status on the UF. Cost analysis results and budget estimates indicated that the placement of all agents on the UF was the most cost-effective scenario.

Relative Cost-Effectiveness Conclusions—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee voted to accept the relative cost-effectiveness of the aminosalicylates (17 for, 0 opposed, 0 abstained, 1 absent) and GI Steroids and Miscellaneous IBS agents (17 for, 0 opposed, 0 abstained, 1 absent) in the GI-1 Drug Class.

1. ***COMMITTEE ACTION: UF RECOMMENDATIONS***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following:

   a) **Aminosalicylates:** sulfasalazine, balsalazide, olsalazine (Dipentum), mesalamine (Asacol, Asacol HD, Pentasa, Lialda, Apriso, Canasa, sulfite-free Rowasa, and mesalamine enema) remain classified with formulary status on the UF (15 for, 1 opposed, 1 abstained, 1 absent).

   b) **GI steroids and Miscellaneous IBS Agents:** budesonide (Entocort EC), hydrocortisone enema, hydrocortisone foam (Cortifoam) and alosetron (Lotronex) remain classified with formulary status on the UF (16 for, 0 opposed, 1 abstained, 1 absent). Tegaserod (Zelnorm) is only available from the FDA under a treatment investigational new drug application.

   c) As a result of the above recommendations, there are no GI-1 agents designated with NF status on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended:

   a) **Aminosaliclates:** Mesalamine (Asacol) be designated with BCF status upon signing of the minutes (15 for, 1 opposed, 1 abstained, 1 absent).

b) **GI steroids and Miscellaneous IBS agents:** None of the GI steroids or Miscellaneous IBS agents be added to the BCF (16 for, 0 opposed, 1 abstained, 1 absent).

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Pancreatic Enzyme Products (PEPs)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the PEPs. There are three drugs in the class, which all contain the same active ingredient of lipase, protease, and amylase in different amounts. Creon and Zenpep were approved for marketing in 2009 and Pancreaze was approved in April 2010. There is one authorized generic PEP formulation, pancrelipase delayed-release capsules, which is equivalent to Zenpep 5,000. All previously marketed non-FDA approved PEPs have been discontinued.

The PEP Drug Class has not previously been reviewed; all the drugs are currently designated with formulary status on the UF. This class is designated as an ECF drug class. The clinical review focused on use of the PEPs for exocrine pancreatic insufficiency (EPI) and included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1). Creon has the highest utilization, with about 500,000 units dispensed monthly in the MHS, followed by Zenpep and Pancreaze at an estimated 100,000 units each dispensed monthly.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following clinical effectiveness conclusions for the PEPs:

1. There are no head-to-head trials comparing the PEPs. Based on indirect studies comparing each agent to placebo, Creon, Pancreaze, and Zenpep are superior to placebo for improving fat malabsorption associated with EPI due to cystic fibrosis (CF).
2. For patients with EPI due to CF, the endpoint of the average coefficient of fat absorption (CFA) for Creon, Pacnreaze, and Zenpep ranged between 83%–88% in the placebo-controlled trials used to obtain FDA approval. A

CFA > 80% is considered clinically relevant for improving fat malabsorption.

3. Creon was superior to placebo for improving fat malabsorption (measured by CFA) as compared to placebo in one study conducted in 44 patients with chronic pancreatitis or following pancreatectomy. Creon is the only PEP approved for use in patients with chronic pancreatitis. In contrast, Zenpep did not meet primary endpoint for improving fat malabsorption in 72 patients with chronic pancreatitis in one unpublished study.
4. With regards to safety, the available evidence suggests there are no clinically relevant differences between Creon, Pancreaze, and Zenpep.
5. With regards to other factors such as microsphere size and storage requirements/stability, there are no clinically relevant differences between the PEPs. Zenpep has unpublished information for enteral administration via G-tube administration, but this route of administration is currently under FDA review.
6. With regard to special populations, Pancreaze is the only PEP which has efficacy and safety data in children as young as 6 months. Pediatric dosing should follow Cystic Fibrosis Foundation Consensus Conferences guidelines.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the PEPs. Based on clinical findings that efficacy, safety, tolerability, and other factors found among the PEPs were similar at equipotent doses, CMA and BIA were performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost-minimization analysis and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent) that Pancreaze was the most cost-effective PEP, followed by Zenpep. Creon was the least cost-effective agent based on weighted average cost per day of therapy. BIA results indicated the scenario that placed all PEPs on the UF was the most cost-effective formulary scenario.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 1 absent) Creon, Pancreaze, and Zenpep be designated with formulary status on the UF. As a result of this action, no PEPs are designated NF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: ECF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 1 opposed, 1 abstained, 1 absent) Pancreaze be designated with ECF status upon signing of the minutes.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Antilipidemic-2s (LIP-2s)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the LIP-2 Drug Class, which was previously reviewed at the May 2007 P&T Committee meeting. The clinical review for the LIP-2s included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

The LIP-2 Drug Class accounted for $111 million in MHS expenditures in FY 2010. This class is comprised of three subclasses: fibric acid derivatives, prescription omega-3 fatty acids, and bile acid sequestrants (BAS). For the omega-3 fatty acids (fish oil products), there are a number of nutritional supplement products available over-the-counter (OTC); they are not eligible for inclusion on the UF. The individual drugs are outlined, below.

- **Fibric acid derivatives:** gemfibrozil (Lopid, generics) and several formulations of fenofibrate (Tricor; Lofibra, generics; Antara, Lipofen and Triglide), fenofibrate acid (Fibricor), and choline fenofibrate acid (Trilipix)
- **Prescription Omega-3 fatty acids:** Lovaza (formerly known by the brand name Omacor)
- **BAS:** cholestyramine/sucrose (Questran, generics), cholestyramine/aspartame (Questran Light, generics), colestipol (Colestid, generics), and colesevelam (Welchol).

Gemfibrozil is the current LIP-2 BCF drug. The prescription omega-3 fatty acid product Lovaza, the BAS colesevelam (Welchol), and several fenofibrate formulations (including Tricor and Trilipix) are nonformulary.

Fenofibrate meltdose (Fenoglide) was removed from the BCF in November 2010 due to manufacturing problems. Subsequently, it was not covered by TRICARE® based on the manufacturer's refusal to sign a Master Agreement with the Veterans Administration and participate in the drug discount program required by 38 United States Code 8126. Additionally, the manufacturer voluntarily removed Fenoglide from the TRICARE Pharmacy Benefits Program.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following clinical effectiveness conclusions for the LIP-2s:

- **Fibric acid derivatives:**
  1. Both gemfibrozil and fenofibrate reduce triglycerides (TG) 20%–50% and raise high density lipoprotein (HDL) 10%–20%. There is insufficient evidence to conclude that gemfibrozil and fenofibrate differ in their ability to reduce TG and raise HDL.
  2. In terms of clinical outcomes, there are no head-to-head trials comparing gemfibrozil with fenofibrate. Gemfibrozil was shown in two trials (HHS and VA-HIT trials) to reduce nonfatal myocardial infarction (MI) and coronary heart disease (CHD) death. Mixed results have been shown with fenofibrates. A reduction in nonfatal MI was seen with fenofibrates in the FIELD trial, but there was a nonsignificant increase in CHD death. In the ACCORD trial when fenofibrate was used in combination with a statin, there was a trend for a reduction in nonfatal MI, nonfatal stroke or death from cardiovascular (CV) causes in individuals with TG > 204 mg/dl and HDL < 34 mg/dl.
  3. The newer fenofibrate formulations [nanocrystallized (Tricor), micronized (Antara and Lofibra), insoluble drug-delivery particle (IDD-P) (Triglide), meltdose (Fenoglide), and lidose (Lipofen)] utilize distinct technologies to enhance absorption. The fenofibric acid products (Trilipix and Fibricor) are prodrugs which are water soluble. Despite differences in dosage strength, particle technology, or active ingredient, the fenofibrates are bioequivalent to the original Tricor 200 mg formulation approved in 1988. In terms of efficacy, these newer fenofibrate formulations do not offer a clinical advantage over the original Tricor fenofibrate formulation. The newer fenofibrate formulations do offer patient convenience of administration

without regard to meals and once daily dosing, which compares with gemfibrozil.

4. Fenofibrate acid (Trilipix) is the only fenofibrate indicated for combination use with a statin, but other fenofibrate formulations are frequently given concurrently with a statin.
5. Gemfibrozil and the fenofibrates have similar drug-drug interaction profiles and contraindications. Tolerability issues that may affect patient compliance include GI distress (abdominal pain, constipation, nausea, etc.). Gemfibrozil must be taken twice daily prior to meals.
6. The ACCORD trial demonstrated the combination of a fenofibrate with a statin was well tolerated. Although pharmacokinetic and FDA spontaneous adverse event reporting data suggest that gemfibrozil is more likely to interact with statins than fenofibrates, there is a lack of clinical evidence to support that the incidence of myopathy/rhabdomyolysis is lower with fenofibrates. Current guidelines from the American Heart Association and the American College of Cardiology conclude there is a risk with all fibric acid and statin combinations that is not limited to just gemfibrozil.
7. For MHS patients requiring a fibric acid derivative, gemofibrozil and at least one fenofibrate formulation would be expected to meet the needs of the majority of the patient population.

- **Omega-3 fatty acids:**

1. Lovaza is the only prescription omega-3 fatty acid product approved by the FDA. It is indicated for use as an adjunct to diet in patients with very high TG levels (>500 mg/dL).
2. FDA oversight of the manufacturing process for Lovaza offers increased assurance of its omega-3 fatty acid content and purity, in contrast to some fish oil supplements.
3. Overall, Lovaza decreases TG 20%–45%. However, Lovaza has also been associated with increases in low density lipoprotein (LDL), which may offset the beneficial reductions in TG.
4. Lovaza's TG-lowering effects are slightly lower than those achieved with fibric acid derivatives or niacin. Lovaza is associated with similar increases in HDL compared to fibric acid derivatives and niacin. Niacin and gemfibrozil both have clinical trial evidence supporting long-term benefits on cardiovascular outcomes.

5. There are no head-to-head trials comparing Lovaza with fish oil supplements to evaluate lipid profile changes. Trials with fish oil supplements show they are effective at reducing TG levels at doses ranging between 2–4 grams/day.
6. The Lovaza product marketed in the United States does not have outcomes studies showing beneficial effects of reducing death, MI, or stroke, and is not indicated to prevent CHD. The evidence of fish oil supplements or dietary fish consumption for reducing CHD risk is supportive but not conclusive.
7. There is insufficient evidence to support the use of Lovaza for non-CV conditions, including behavioral health/psychiatric conditions. The results of small clinical trials have been conflicting, and used formulations of fish oil different than that found in the Lovaza product.
8. GI disturbances and taste perversions are the most commonly reported adverse effects of Lovaza.
9. There are a few OTC fish oil supplements available from reputable manufacturers that contain the equivalent ingredients per capsule as Lovaza, which should yield similar clinical results. But concerns remain regarding issues such as potency, capsule counts, batch-to-batch consistency, and purity/ truth in labeling with the fish oil supplements.
10. Lovaza provides an alternative therapy in patients with elevated TGs who are not candidates for niacin or fibrates due to a history of adverse effects.

- **BAS:**

1. The BAS reduce LDL 15%–30%. This subclass has largely been replaced by the statins, which reduce LDL 18%–55%. There is insufficient evidence to conclude that BAS differ in their ability to lower LDL. Cholestyramine is the only BAS to show beneficial effects on cardiovascular outcomes.
2. In terms of lipoprotein effects, colesevelam (Welchol) has no major efficacy advantages compared to cholestyramine or colestipol, despite manufacturer claims of enhanced bile acid binding capacity. It has a more favorable pregnancy category rating than the older products (B versus C) and may cause less constipation, which may be clinically relevant in patients with a previous history of GI obstruction.
3. Colesevelam (Welchol) is now FDA-approved for glycemic control in patients with Type 2 diabetes mellitus, when used as adjunctive therapy with other glucose-lowering drugs. Colesevelam only provides a modest HbA1c reduction and other noninsulin diabetes drugs reduce HbA1c more than 0.5%.

4. Issues with palatability of powder formulations and/or large daily tablet burdens are a concern with the class as a whole and may affect compliance.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of LIP-2 Drug Class. CMAs and BIAs were performed based on findings that there were no clinically relevant differences in efficacy, safety, tolerability, and other factors among the LIP-2 subclasses. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

- **Fibric acid derivatives:** BIA was used to assess the potential impact of cost scenarios where selected fibric acid derivatives were designated with formulary or NF status on the UF. Cost scenarios evaluating the impact of designating selected agents with BCF and step-preferred statuses were also considered. BIA results for the fibric acid derivatives subclass showed that all investigated scenarios resulted in lower cost estimates than current MHS expenditures. Overall, scenarios where fenofibrate nanocrystallized (Tricor), generic gemfibrozil, and generic fenofibrate micronized/non-micronized were selected as step-preferred agents, while designating all other fibric acids as UF, were the most cost-effective scenarios. A sensitivity analysis was performed regarding the date of generic competition for fenofibrate nanocrystallized (Tricor) and fenofibric acid choline (Trilipix). Sensitivity analysis results supported the above conclusion.
- **Omega-3 fatty acids:** BIA was used to assess the potential impact of cost scenarios where Lovaza was designated with formulary or NF status on the UF. Cost scenarios evaluating the impact of implementing prior authorization were also considered. Overall, scenarios where Lovaza was subject to a prior authorization, which would apply to all current and new users, were the most cost-effective. Results from a sensitivity analysis performed supported the above conclusion.
- **BAS:** Results from CMAs performed showed colesevelam (Welchol) was less cost effective than generic BAS currently available on the UF.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee voted to accept the relative cost-effectiveness of the fibric acid derivatives (17 for, 0 opposed, 0 abstained, 1 absent), prescription omega-3 fatty acids (Lovaza) (16 for, 0 opposed, 0 abstained, 2 absent), and BAS (17 for, 0 opposed, 0 abstained, 1 absent) in the LIP-2 Drug Class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following:

   a) **Fibric Acid Derivatives:**

      (1) Gemfibrozil (Lopid, generics), fenofibrate IDD-P (Triglide), fenofibrate micronized/nonmicronized (Lofibra, generics), and fenofibrate lidose (Lipofen) remain designated with formulary status on the UF; and that fenofibrate micronized (Antara) fenofibrate nanocrystallized (Tricor), fenofibric acid (Fibricor), and choline fenofibric acid (Trilipix) be designated with formulary status on the UF (16 for, 0 opposed, 0 abstained, 2 absent).

      (2) Prior authorization for the fenofibrate acid derivatives would require a trial of gemfibrozil, generic fenofibrate micronized/nonmicronized formulations (including Lofibra), or fenofibrate nanocrystallized (Tricor) (step-preferred drugs) for new patients (16 for, 0 opposed, 0 abstained, 2 absent).

   b) **Omega-3 fatty acids**: Lovaza be designated with formulary status on the UF (12 for, 4 opposed, 1 abstained, 1 absent) and subject to PA criteria that allows use in all current and new users, only for FDA-approved indications.

   c) **Bile Acid Sequestrants:** Cholestyramine/sucrose (Questran, generics), cholestyramine/aspartame (Questran Light, generics), and colestipol (Colestid, generics) remain formulary on the UF; and, colesevelam (Welchol) remain designated with NF status on the UF (14 for, 2 opposed, 1 abstained, 1 absent).

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T

Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 0 abstained, 2 absent) gemfibrozil and fenofibrate nanocrystallized (Tricor) be designated with BCF status.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: FIBIC ACID DERIVATIVES PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 2 absent) the following PA criteria should apply to the nonpreferred fibric acid derivatives, fenofibrate micronized (Antara), fenofibrate IDD-P (Triglide), fenofibrate micronized (Lipofen), fenofibric acid (Fibricor), and fenofibric acid choline (Trilipix). Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for gemfibrozil, generic fenofibrate micronized/nonmicronized formulations (including Lofibra) or fenofibrate nanocrystallized (Tricor) (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met:

      (1) The patient has a contraindication to the preferred fibric acid derivatives that is not expected to occur with the nonpreferred fibric acid derivatives.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: FIBRIC ACID DERIVATIVES PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 2 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service; and 2) TMA send a letter

to beneficiaries affected by this UF decision. Based on the Committee's recommendation the effective date is July 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

5. ***COMMITTEE ACTION: LOVAZA PA CRITERIA***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) the following PA criteria should apply to the prescription omega-3 fatty acid product, Lovaza. Lovaza would be approved only for the FDA-approved indications. All current and new users of Lovaza must meet one of the following criteria to pass through the PA process.

   a) Patients with TG > 500 mg/mL who are receiving statins AND have had an inadequate TG-lowering response to a therapeutic trial of niacin (1-2 g/day) or fibrates, are unable to tolerate niacin or fibrates, or are not candidates for niacin or fibrate therapy.

   b) Patients with TG > 500 mg/mL who are not receiving statins AND who have had an inadequateTG-lowering response to a therapeutic trial of monotherapy with both a fibrate and niacin, are unable to tolerate niacin and fibrates, or are not candidates for niacin and fibrate therapy.

   c) Coverage is not approved for Lovaza for use in non-FDA approved conditions, including the following: Attention Deficit Hyperactivity Disorder, Alzheimer's disease, bipolar disease, Crohn's disease, cystic fibrosis, dementia, depression, inflammatory bowel disease, intermittent claudication, metabolic syndrome, osteoporosis, post-traumatic stress disorder, renal disease (immunoglobulin A nephropathy), rheumatoid arthritis, schizophrenia, Type 2 diabetes mellitus, and ulcerative colitis.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

6. ***COMMITTEE ACTION: LOVAZA PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 3 opposed, 1 abstained, 1 absent) 1) an

effective date of the first Wednesday after a 60-day implementation period in all points of service; and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the Committee's recommendation the effective date is July 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

7. ***COMMITTEE ACTION: WELCHOL MN CRITERIA***—Based on the clinical evaluation of the BAS and the conditions for establishing MN for a NF medication, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) maintaining the current MN criteria for colesevelam (Welchol). (See Appendix B for full MN criteria.)
   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

V. BASIC CORE FORMULARY ISSUES—TRIPTAN BCF CLARIFICATION

The Triptan Drug Class was reviewed in June 2008. At that time, rizatriptan (Maxalt) was designated with BCF status upon signing of the minutes, and sumatriptan oral tablets and one injectable formulation would be added to the BCF when cost-effective multisource generic formulations became available. The cost of generic formulations of sumatriptan tablets has decreased. The cost of generic formulations of sumatriptan injection is lower than the branded products, but is still more expensive than the tablet formulations.

1. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee voted (16 for, 0 opposed, 1 abstained, 1 absent) upon signing of the minutes, to:
   a) maintain rizatriptan tablets on the BCF; and
   b) add sumatriptan tablets to the BCF.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VI. UTILIZATION MANAGEMENT—QUININE SULFATE (QUALAQUIN) QLs

Quinine sulfate, under the trade name Qualaquin, is FDA-approved only for the treatment of malaria. Qualaquin's product labeling states it is not approved for malaria prophylaxis or for persistent malaria. Recommended dosing for treatment of malaria is 2 capsules, 3 times daily, for 7 days. Center for Disease Control recommendations for quinine use include co-administration with tetracycline, doxycycline, or clindamycin, dependent on the type of plasmodium species and the resistance patterns in each malaria-endemic country. In May 2010, the P&T Committee recommended a prior authorization requirement for Qualaquin, limited to treatment of malaria, due to severe adverse events, including death. The PA took effect on October 6, 2010.

1. ***COMMITTEE ACTION: QUANTITY LIMIT***—To ensure the appropriate use of Qualaquin, consistent with the product labeling, the P&T Committee recommended (16 for, 2 opposed, 0 abstained, 0 absent) implementing a quantity limit of 42 capsules per fill, one fill per prescription, with no refills, which will allow quinine (Qualaquin) use in patients who meet the following criteria:

   a) a documented diagnosis of malaria.

   The quantity limits for Qualaquin become effective the first Wednesday after a 60-day implementation period in all points of service. Based on the Committee's recommendation the effective date is July 13, 2011.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

VII. ITEMS FOR INFORMATION

A. Use of Non-Insulin Diabetes Drugs in the MHS—DoD Pharmacy Outcomes Research Team (PORT)

As a follow-up to the November 2010 review of non-insulin diabetes drugs, the PORT presented analysis of HbA1c levels among 6,947 MTF patients who were new users of specific subclasses of oral non-insulin diabetetes drugs [metformin, sulfonylureas, thiazolidinediones (TZDs), dipeptidyl-peptidase 4 (DPP-4s), or glucagon-like peptide-1 receptor agonists (GLP1RAs)] from July 2008 to December 2008. Findings suggested appropriate use of the newer agents, with DPP-4s and GLP1RAs being used generally as third- or fourth-line therapy. Additionally, the percentage of new DPP-4 or GLP1RA users with HbA1c > 10 (who will probably require insulin therapy rather than an additional oral non-insulin diabetes drug to reach HbA1c goal) was similar to that found among new users of metformin, sulfonylureas, or TZDs. The P&T Committee agreed that the analysis provides a baseline for future drug utilization review, following addition of sitagliptin (Januvia) and sitagliptin/ metformin (Janumet) to the BCF.

B. Propoxyphene Withdrawal from the Market—Propoxyphene has been available since the late 1950s, but concerns regarding adverse events, including prolongation of the QT interval have persisted. All propoxyphene products (Darvon, Darvocet, generics) were voluntarily withdrawn from the market in November 2010.

VIII. FUTURE CLASS OVERVIEWS

Overviews for four drug classes were presented to the P&T Committee. Multiple sclerosis-disease modifying drugs were reviewed in May 2005, the contraceptives drug class was reviewed in May 2006, and the short-acting beta agonists were reviewed in November 2008. Information regarding the non-steroidal anti-inflammatory drugs (NSAIDs) drug class was also presented; this class includes the cyclooxygenase-2 selective NSAIDs. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in completing the clinical effectiveness reviews and developing appropriate cost-effectiveness models. The clinical and economic analyses of these classes will be presented at an upcoming meeting.

IX. ADJOURNMENT

The meeting adjourned at 1620 hours on February 16, 2011, and at 1200 hours on February 17, 2011. The next meeting will be in May 2011.

Appendix B—Table of Medical Necessity Criteria for Newly-Approved Drugs

Drug / Drug Class	Medical Necessity Criteria
Colesevelam (Welchol) **Antilipidemic-2s** (No change in MN criteria from May 2007)	• The use of BOTH of the following formulary alternatives is contraindicated: cholestyramine and colestipol • The patient has experienced or is likely to experience significant adverse effects from BOTH of the following formulary alternatives: cholestyramine and colestipol • BOTH of the following formulary alternatives have resulted in therapeutic failure: cholestyramine and colestipol • The patient has a history of GI obstruction and requires treatment with a BAS. • The patient is pregnant and requires treatment with a BAS.
Donepezil 23 mg (Aricept 23 mg) **Alzheimer's Drugs**	• Use of formulary agents has resulted in therapeutic failure.
Ondansetron oral film (Zuplenz) **Antiemetics**	• Use of formulary agents contraindicated • No alternative formulary agent available for pediatric patients who cannot take ondansetron ODT or patients with phenylketonuria (Zuplenz does not contain phenylalanine)
Aliskiren/amlodipine (Tekamlo) **Renin-Angiotensin Antihypertensives**	• Use of formulary agents contraindicated
Olmesartan/amlodipine/ hydrochlorothiazide (Tribenzor) **Renin-Angiotensin Antihypertensives**	• Use of formulary agents contraindicated • The patient previously responded to a nonformulary agent, and changing to a formulary agent would incur unacceptable risk
Novamax test strip **Self-monitoring Blood Glucose Test Strips**	• No alternative formulary agent available for patients using an insulin pump (for SMBGS that wirelessly communicate results to the pump only)

BAS: bile acid sequestrant; ODT: orally dissolving tablets; SMBGS: self-monitoring blood glucose test strips

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
November 2010

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on November 16 and 17, 2010, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of August Minutes**—George Peach Taylor, Jr., M.D. MPH, Acting Director, approved the minutes for the August 2010 DoD P&T Committee meeting on November 8, 2010.
2. **Reanalysis of Antihemophilic Agents**—The P&T Committee evaluated the relative clinical and cost effectiveness of the Antihemophilic Factors at the February 17–18, 2010, meeting. The minutes were subsequently signed by the Acting Director, TMA, on May 3, 2010. The following Antihemophilic Agents were returned to formulary status on the UF, per execution of the required DoD Retail Refund Pricing Agreement, as signed by George Peach Taylor, Jr., M.D., MPH, Acting Director, on November 8, 2010:
    - Human Factor VIII: Hemofil M
    - Recombinant Factor VIII: Recombinate, Advate
    - Prothrombin Complex Concentrates: Bebulin VH, Feiba VH

III. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Inhaled Corticosteroid (ICS)/Long-acting Beta Agonist (LABA)—Mometasone/formoterol Oral Inhaler (Dulera)

Relative Clinical Effectiveness—Dulera is a fixed-dose combination (FDC) product containing the ICS mometasone (Asmanex) and the LABA formoterol (Foradil) in an oral metered-dose inhaler (MDI). It represents the third FDA-approved ICS/LABA combination inhaler. The Pulmonary 1 class, which includes the ICS/LABA combinations, was reviewed at the February 2009 P&T Committee meeting. The

clinical evaluation for Dulera included, but was not limited to, the requirements stated in 32 Code of Federal Regulations (CFR) 199.21(e)(1).

Dulera is FDA-approved for treating patients older than 12 years with moderate-to-persistent asthma who are not controlled on moderate-to-high dose ICS. Advair is approved for treating asthma in patients older than 4 years, and is also approved for treating chronic obstructive pulmonary (COPD). All three ICS/LABA products (Advair, Symbicort and Dulera) have dose counters.

There are no head-to-head trials between Dulera and the other ICS/LABA combinations inhalers, but clinically relevant differences in efficacy are not expected, if equivalent doses are used.

The product labeling contains the same black box warning as Advair and Symbicort regarding increased risk of death in patients with asthma who receive unopposed LABA therapy.

The mometasone component of Dulera is available on the Basic Core Formulary (BCF) as a single inhaler (Asmanex). For patients who are receiving mometasone and require step-up/step-down therapy to or from a combination ICS/LABA inhaler, maintaining Dulera on the UF allows this population an option to return to their initial ICS.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained) mometasone/formoterol (Dulera) offers no clinically meaningful therapeutic advantage over other ICS/LABA combinations in terms of efficacy, safety, or tolerability. However, it does provide a third ICS/LABA option for the treatment of asthma.

Relative Cost-Effectiveness— Cost-minimization analysis (CMA) was performed to evaluate the cost of mometasone/formoterol (Dulera) in relation to the other currently available ICS/LABAs. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) mometasone/formoterol (Dulera) was less costly than the other ICS/LABA combination agents on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) mometasone/formoterol (Dulera) be designated formulary on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) mometasone/formoterol (Dulera) be excluded from the BCF.

Director, TMA, Decision : ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: QUANTITY LIMTS (QL)***—ICS/LABA combination inhalers on the UF are subject to QLs, which are consistent with the recommended dosing from the product labeling and safety concerns. The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) QLs for mometasone/formoterol (Dulera), consistent with the other products in the class: 3 inhalers/90-day supply in the mail order pharmacy and 1 inhaler/30-day supply in the retail point of service.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Newer Sedative Hypnotic Agents (SED-1s)—Doxepin Tablets (Silenor)

Relative Clinical Effectiveness—Silenor is a new low-dose 3mg and 6 mg tablet formulation of doxepin (Sinequan, generics). The product is FDA-approved for treatment of insomnia characterized by difficulty with sleep maintenance. The SED-1s class was reviewed in February 2007. The current BCF/UF drug is zolpidem IR (Ambien, generic). Automated Prior Authorization (PA)/step-therapy applies to this class: a trial of zolpidem immediate release (IR) prior to use of the other drugs in the class is required. Eszopiclone (Lunesta) is designated with formulary status on the UF; the other SED-1s are nonformulary (NF); zolpidem controlled release (Ambien CR), zaleplon (Sonata), and ramelteon (Rozerem). The clinical evaluation for Silenor included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Silenor differs from the other SED-1s because it selectively binds the histamine H1 receptor to reduce wakefulness. It is not a controlled substance; all other agents in the class are classified as schedule IV, except ramelteon (Rozerem).

There are no head-to-head trials with the other SED-1s. Silenor's adverse event profile and discontinuation rate were similar to placebo. There were no reports of aberrant sleep behaviors, increased suicidality, or amnesia that has been noted with the other UF agents. However, a patient medication guide is dispensed with each prescription that details risk of these events.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) doxepin tablets (Silenor) are superior to placebo in the treatment of sleep maintenance insomnia. Silenor's adverse event profile is more favorable that those of formulary agents on the UF. It provides an option for patients with sleep maintenance problems where a controlled substance is not warranted.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of doxepin (Silenor) in relation to the other available newer sedative hypnotics in this drug class. CMA was performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) doxepin tablets (Silenor) was less costly than the other sleep maintenance agents included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) doxepin tablets (Silenor) be designated formulary on UF, with a PA requiring a trial of zolpidem IR for new users.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) doxepin tablets (Silenor) be excluded from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) the following PA criteria should apply to doxepin (Silenor). Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:
      (1) The patient has received a prescription for zolpidem IR at any Military Health Service (MHS) pharmacy point of service

(Military Treatment Facilities (MTFs), retail network pharmacies, or home delivery) during the previous 180 days.

b) Manual (paper) PA criteria, if automated criteria are not met:
   (1) The patient has tried zolpidem IR and was unable to tolerate treatment due to adverse effects.
   (2) The patient has tried zolpidem IR and has had an inadequate response.
   (3) The patient has a known contraindication to zolpidem IR.
   (4) The patient requires a nonscheduled agent for sleep maintenance.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the committee's recommendation, the effective date is April 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

C. Antilipidemic-1s (LIP-1s)—Pitavastatin (Livalo)

Relative Clinical Effectiveness—Pitavastatin (Livalo) is the seventh statin to reach the U.S. market. At the maximum 4 mg dose, it lowers low-density lipoprotein (LDL) by less than 45%. The statins are classified in the LIP-1s drug class, which were reviewed in May 2010. Automated PA/step-therapy now applies to the LIP-1s; generic statins (simvastatin, pravastatin, lovastatin) or atorvastatin (Lipitor) are the preferred drugs. The clinical evaluation for Livalo included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

There are no published or planned studies evaluating clinical outcomes with pitavastatin (e.g., mortality, cardiovascular (CV) events, acute coronary syndromes, etc.). Short-

term clinical trials lasting less than 12 weeks show efficacy comparable to other low-to-moderate dose statins (those that lower LDL <45%) for lowering LDL and triglyceride (TG), and raising high-density lipoprotein (HDL).

Livalo's safety profile appears similar to the other statins but more long-term safety data is required. Pitavastatin undergoes minimal CYP 450 metabolism and is similar to pravastatin and rosuvastatin, but has a more favorable drug interaction profile than simvastatin. However, pitavastatin is metabolized by the transporter system and has unique drug interactions not seen with the other statins, including contraindications with cyclosporine and reduced dosage requirements with erythromycin.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) that pitavastatin (Livalo) does not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and tolerability over other LIP-1s included on the UF, which have evidence for positive effects on CV clinical outcomes.

Relative Cost-Effectiveness—CMA was performed that evaluated the cost of pitavastatin (Livalo) in relation to other available LIP-1s. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) pitavastatin (Livalo) was more costly than all other low-to-moderate LDL-lowering LIP-1s included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) pitavastatin (Livalo) be designated NF on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluation of pitavastatin (Livalo) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) MN criteria for pitavastatin (Livalo). (See Appendix B for full MN criteria).

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PA CRITERIA***—Prior authorization for the LIP-1s requires a trial of a step-preferred drug [simvastatin, lovastatin, lovastatin or atorvastatin (Lipitor)] prior to a non-step preferred LIP-1 [other UF LIP-1s, including rosuvastatin (Crestor), simvastatin/ezetimibe (Vytorin)]. Pitavastatin (Livalo) would be designated as non-step preferred and NF. The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) the following PA criteria should apply to pitavastatin (Livalo).

   a) Automated PA criteria:
      (1) The patient has received a prescription for a preferred agent targeting similar LDL reduction at any MHS pharmacy point of service (MTFs, retail network pharmacies, or home delivery) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met:
      (1) The patient has a known contraindication to the preferred LIP-1 drugs.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service; and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the committee's recommendation, the effective date is April 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

D. Narcotic Analgesics—Hydromorphone Hydrochloride (HCl) Extended Release (ER) Tablets (Exalgo)

Relative Clinical Effectiveness—Hydromorphone HCl ER (Exalgo) is a potent opioid agonist that is FDA-approved for the treatment of moderate-to-severe pain in opioid-tolerant patients requiring continuous, around-the-clock opioid analgesia for an extended period of time. Exalgo is classified as a high-potency single analgesic agent in the Narcotic Analgesics drug class, which was reviewed in February 2007. Exalgo utilizes the osmotic controlled release oral delivery system (OROS) to confer its extended release properties. The delivery mechanism allows for once daily dosing of hydromorphone, which offers a convenient regimen for patients as opposed to the four times a day dosing with the IR formulation. The clinical evaluation for Exalgo included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

There are no direct comparative clinical trials between Exalgo and the other high-potency extended release narcotic analgesics; however, it is unlikely that there are clinically relevant differences in pain relief if equianalgesic doses are administered. Exalgo's safety and tolerability profile is consistent with the known profile of narcotic analgesics. The OROS formulation does not appear to potentiate the known gastrointestinal (GI) effects of hydromorphone (constipation, nausea, and vomiting). Exalgo's hard tablet shell makes it difficult to crush and attempts to dissolve the

particles result in a viscous substance that is potentially fatal if injected. These features, though unproven, may decrease the abuse liability of the drug.

Relative Clinical Effectiveness Conclusion—Despite the fact that there are several other high-potency controlled-release narcotics available on the UF and BCF (many are available in generic formulations), the P&T Committee concluded (17 for, 0 opposed, 1 abstained, 0 absent) that Exalgo is the only extended-release hydromorphone product on the market. With the exception that Exalgo provides an option for patients who do not respond to or cannot tolerate other high-potency agents, Exalgo does not offer compelling clinical advantages over the other high-potency long-acting narcotic analgesics included on the UF.

Relative Cost-Effectiveness—CMA was performed that evaluated the cost of hydromorphone HCl ER (Exalgo) in relation to other currently available agents in Narcotic Analgesic drug class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 1 abstained, 0 absent) hydromorphone HCl ER (Exalgo) was more costly than the other high-potency narcotic analgesics with sustained-release formulations currently on the UF. Exalgo is still a necessary agent because it is the only currently marketed extended-release formulation of hydromorphone HCl in the United States.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (10 for, 6 opposed, 2 abstained, 0 absent) hydromorphone HCl ER (Exalgo) be designated formulary on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 2 opposed, 2 abstained, 0 absent) hydromorphone HCl ER (Exalgo) be excluded from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

F. Antilipidemic-2s (LIP-2s)—Fenofibric Acid (Fibricor)

Relative Clinical Effectiveness—Fibricor is the second fenofibric acid marketed in the United States; Trilipix, the choline salt of fenofibric acid, was marketed first. The fenofibrates are classified in the LIP-2s drug class, which was reviewed in May 2007. The entire LIP-2s drug class (fenofibrates, omega-3/fish oil, and bile acid sequestrants) is scheduled for review at the February 2011 P&T Committee meeting.

Fibricor is approved for use as monotherapy to reduce TG levels in patients with severe hypertriglyceridemia (>500 mg/dl). In contrast to Trilipix, Fibricor is not FDA-approved for concomitant use with a statin. The fenofibric acid (Fibricor) clinical evaluation included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Fibricor obtained FDA approval via section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act using efficacy and safety data submitted from the original fenofibrate nanocrystallized (Tricor) submission. Pharmacokinetic studies comparing Fibricor 105mg with Tricor 145mg demonstrated bioequivalence between the two products. There are no head-to-head clinical trials comparing Fibricor and the other LIP-2s. Fibricor's safety profile reflects that of the other fenofibrate products.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent) there is no evidence to suggest Fibricor has a compelling clinical advantage over the fenofibrate products on the UF.

Relative Cost-Effectiveness—CMA was performed that evaluated the cost of fenofibric acid (Fibricor) in relation to other currently available LIP-2s. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent) fenofibric acid (Fibricor) was more costly than all other comparators in the fenofibrate subclass of LIP-2s, except for Trilipix or Tricor.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 1 opposed, 1 abstained, 1 absent) fenofibric acid (Fibricor) be designated NF on the UF.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of fenofibric acid (Fibricor) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) MN criteria for fenofibric acid (Fibricor). (See Appendix B for full MN criteria).

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

G. Contraceptives—Estradiol Valerate/Dienogest (Natazia)

Relative Clinical Effectiveness—Natazia is a combination oral contraceptive containing a new dosage form of estradiol valerate (which was previously only available in an injectable form) and a new progestin (dienogest). It utilizes a 4-phasic active drug regimen with 2 hormone-free days.

Estradiol valerate/dienogest is solely indicated for the prevention of pregnancy. It is included in the Contraceptive Agents drug class, which was reviewed in May 2006. The clinical evaluation for estradiol valerate/dienogest (Natazia) included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

A head-to-head comparison between Natazia and 20 mcg ethinyl estradiol/100 mg levonorgestrel (Lessina, Sronyx equivalent) found significantly fewer days of withdrawal (scheduled) bleeding with Natazia but a similar incidence of intracyclic (unscheduled) bleeding, due to the shorter number of hormone-free days (2 with Natazia versus 7 with the comparator). Spotting or breakthrough bleeding is still common, especially when therapy is first started.

The adverse event profile for Natazia is similar to that of other oral contraceptives. The patient instructions for missed doses are significantly more complicated than those for other oral contraceptives. The purported benefits of 4-phasic contraceptive regimens remain to be established and Natazia's long-term safety remains unknown.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 1 abstained, 1 absent) estradiol valerate/dienogest (Natazia) does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over the other oral contraceptives on the UF.

Relative Cost-Effectiveness— CMA was performed to evaluate the cost of estradiol valerate/dienogest (Natazia) in the Contraceptive Agents drug class. Information

considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent) estradiol valerate/dienogest (Natazia) was more costly than all other contraceptive agents on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 1 absent) estradiol valerate/dienogest (Natazia) be designated NF on the UF.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of estradiol valearate/dienogest (Natazia) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) MN criteria for estradiol valerate/dienogest (Natazia). (See Appendix B for full MN criteria).

IV. UF DRUG CLASS REVIEWS

A. Non-Insulin Diabetes Drugs

Background Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the drugs in the Non-insulin Diabetes drug class. The clinical review for the non-insulin diabetes drugs included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

The class is comprised of the following 8 subclasses: dipeptidyl-peptidase 4 (DPP-4) inhibitors, glucagon-like peptide-1 receptor agonists (GLP1RAs), biguanides (metformin), thiazolidinediones (TZDs), sulfonylureas (SU), meglitinides, alpha-glucosidase inhibitors (AGIs), and amylin agonists (pramlintide; Symlin), and their FDC products with metformin or SU. The Non-insulin Diabetes drug class as a whole has not previously been reviewed.

The Non-insulin Diabetes drug class is ranked in the top 5 most costly MHS drug classes, with expenditures exceeding $311 million annually. For the individual subclasses, Fiscal Year 2010 expenditures for the DPP-4 inhibitors were approximately $124 million, followed by the TZDs ($108 million), GLP1RAs ($28 million), biguanides ($23 million), SUs ($15 million), meglitinides ($9 million), amlyin agonists ($3 million), and AGIs ($800,000).

In terms of MHS utilization, the biguanides are the most utilized (approximately 225,000 30-day equivalent prescriptions (Rxs) dispensed monthly), followed by the SUs (160,000 30-day equivalent Rxs), TZDs (100,000 30-day equivalent Rxs), and DPP-4 inhibitors (60,000 30-day equivalent Rxs); the GLP1RAs, meglitinides, AGIs, and amylin agonists each account for less than 10,000 30-day equivalent Rxs dispensed monthly.

American Diabetes Association (ADA) Guidelines (Diabetes Care, 2009, 32:193-203) recommend metformin, in addition to lifestyle modification, as first-line therapy for Type 2 Diabetes Mellitus (T2DM) and is considered in tier 1 (well-validated therapy). SUs or basal insulin are recommended next in the hierarchy (second-line, tier one).

Tier two or less well-validated therapies include the TZDs and GLP1RAs. No recommendation is made for DPP-4 inhibitors, but the algorithm is updated annually in January.

A request for MHS providers' opinions solicited over 440 responses. When asked which subclass was most appropriate for first-line therapy for T2DM, over 98% of the responders selected metformin, followed by the SUs (62% of responders), TZDs (39%), DPP-4 inhibitors (36%), and GLP1RAs (23%).

Based on recommendations from the current ADA guidelines (metformin first-line, followed by SUs as tier one, well-validated therapies for T2DM) and the MHS providers' responses, an automated PA/step-therapy was considered for the Non-insulin Diabetes drug class, which would require a trial of metformin or a SU prior to using another Non-insulin Diabetes subclass. Step-therapy was also considered for the TZDs, GLP1RAs, and DPP-4 inhibitors within each subclass (e.g., requiring a trial of a step-preferred drug before using the other drugs in the subclass).

DoD Pharmacy Outcomes Research Team (PORT) Analysis: MHS Patterns of Use of Diabetes Drugs—The PORT analyzed data for new users of insulin and non-insulin diabetes drugs. Overall, 619,993 unique DoD beneficiaries received one or more Rxs for a diabetes medication (including insulin) during the one-year period from July 1, 2009–June 30, 2010.

The breakdown of classes is:

- 68% metformin/metformin FDC products
- 36% SU/SU FDC products
- 30% insulin
- 22% TZD/TZD FDC products
- 15% DPP-4 inhibitors
- 4% GLP1RAs
- 3% meglitinides, AGIs or pramlintide

Approximately 102,000 new users of diabetes medications are expected annually across all points of service in the MHS. For the DPP-4 inhibitors, an estimated 35,364 new users are expected each year; 17% of the new users may start first-line on a DPP-4 inhibitor, and are not expected to have had a prior prescription for metformin or a SU. There are 12,024 estimated new users for the GLP1RAs; 10% are anticipated to have no prior prescription for metformin or a SU.

Background Relative Cost Effectiveness—Cost-effectiveness analysis (CEA) was conducted to provide an overall assessment of the relative cost-effectiveness among the following subclasses used for second-line therapy (when added to metformin): AGIs,

basal insulins, DPP-4 inhibitors, GLP1RAs, meglitinides, SUs, and TZDs. The Basal Insulin drug class was reviewed in February 2010 but is included in the CEA due to its inclusion in the ADA guidelines.

Relative Cost Effectiveness Conclusion—For subclasses added as second-line therapy to metformin, the SU subclass were considered to be dominant (e.g., providing the largest reduction in HbA1c at the lowest cost) in terms of cost per HbA1c reduction, followed by the basal insulins. GLP1RAs and TZDs were more expensive therapies than the SUs with relatively little difference in HbA1c efficacy. The DPP-4 inhibitors were similar in efficacy to the SUs but were less cost effective.

B. Non-insulin Diabetes Drugs—Biguanides

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the Biguanides subclass. Metformin is the only biguanide drug currently on the market. The Biguanides subclass has not previously been reviewed; all the drugs are currently designated with formulary status on the UF. The BCF includes all strengths of generic metformin IR and ER; BCF metformin products were selected prior to implementation of the UF Rule in 2005. The clinical review focused on use of metformin for T2DM (non-DM uses were not considered) and included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

The individual metformin formulations are:

- **Metformin IR:** 500 mg, 850 mg, 1000 mg tablets (Glucophage, generics); 500 mg/5 ml liquid (Riomet)
- **Metformin ER:** 500 mg, 750 mg (Glucophage XL, generics); 500 mg, 1000 mg (Fortamet); and 500 mg, 1000 mg (Glumetza)

Metformin IR has the highest utilization, with over 200,000 30-day equivalent Rxs dispensed monthly in the MHS, followed by generic metformin ER products (40,000 30-day equivalent Rxs dispensed monthly). There were <1,000 30-day equivalent Rxs dispensed monthly for the branded metformin ER products Fortamet and Glumetza.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (18 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions for the Biguanides subclass:

1. The ADA guidelines recommend metformin as the first-line, tier one (well-validated therapy) for the treatment of T2DM.

2. When used as monotherapy, metformin decreases HbA1c by 1.5%–2%.

3. With regard to efficacy, the results of one large prospective sub-study of the United Kingdom Prospective Diabetes Study (UKPDS) reported beneficial effects of metformin on improving clinical outcomes, including a risk reduction for diabetes-related death and all-cause mortality, when compared to dietary modification.

4. There is no evidence to suggest that differences in the ER formulations of Glumetza and Fortamet confer clinically relevant benefits in efficacy or safety when compared to the generic metformin ER preparations.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the Biguanides subclass. Metformin and metformin combination products were evaluated with the parent compound (e.g., Janumet (sitagliptan/metformin) was evaluated with the DPP-4s subclass.) CMAs were performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) all generic formulations of metformin and the branded drug Riomet were more cost-effective than Fortamet and Glumetza.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 1 opposed, 1 abstained, 0 absent):

   a) metformin IR (500 mg, 850 mg,1000 mg), metformin ER (500 mg, 750 mg), and Riomet (500 mg/5 ml) remain formulary on the UF;

   b) Fortamet (500mg, 1000 mg) and Glumetza (500 mg, 1000 mg) be designated NF on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) metformin IR (500 mg, 850 mg, 1000 mg), and metformin ER (500 mg, 750 mg) remain on the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of Fortamet and Glumetza and the conditions for establishing MN for a NF medication, the P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) MN criteria for Fortamet and Glumetza. (See Appendix B for full MN criteria).

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service; and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the committee's recommendation, the effective date is April 13,, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Non-insulin Diabetes Drugs—SUs

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the SUs subclass. The SUs have not previously been reviewed; all the drugs are currently designated with formulary status on the UF. The BCF includes glipizide (Glucotrol, generics), glyburide (Diabeta, Micronase, generics), and glyburide micronized (Glynase Pres Tab, generics). BCF SU products were selected prior to implementation of the UF Rule in 2005. All the SU products are available in generic formulations. In the MHS, glipizide is the highest utilized sulfonylurea agent. The clinical review for the SUs included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

The individual SUs agents are:

- **First generation :** chlorpropamide (Diabinese, generic)
- **Second generation:** glimepiride (Amaryl, generic), glipizide (Glucotrol, generic), glipizide ER (Glucotrol XL, generic), glyburide (Diabeta, Micronase, generic), glyburide, micronized (Glynase Press Tab, generic)
- **Combination products:** glipizide/metformin (Metaglip, generic), glyburide/metformin (Glucovance, generic)

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (18 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions for the SUs:

1. The ADA guidelines recommend SUs as the second-line of tier one, (well-validated therapies) for the treatment of T2DM.
2. The SUs decrease HbA1c 1.5% to 2% when used as monotherapy.
3. In a UKPDS sub-study, patients receiving a SU or insulin had a lower risk of developing any diabetes-related endpoint and microvascular endpoints than patients receiving dietary modification alone. Diabetes-related mortality and all-cause mortality did not differ between the two groups.
4. For adverse effects, the SUs are well known to cause hypoglycemia and weight gain.
5. With regard to renal dysfunction, glipizide may be used in patients who have creatinine clearance <50 mL/min if the dose is reduced.
6. With regard to special populations, glyburide crosses the placenta in minimal amounts. In one retrospective review of more than 500 women

with gestational diabetes, glyburide treatment resulted in achievement of target HbA1c.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the SUs subclass. SUs and SU combination products were evaluated with the parent compound (e.g., Duetact (pioglitazone/glimepiride) was evaluated with the TZDs subclass). Chlorpropamide was not evaluated due to its extremely low utilization in the MHS. CMAs were performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) all agents in the SUs subclass were cost-effective.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) the following remain formulary on the UF:

    a) chlorpropamide (Diabinese, generic); glimepiride (Amaryl, generic); glipizide (Glucotrol, generic); glipizide ER (Glucotrol XL, generic); glyburide (Diabeta, Micronase, generic); glyburide micronized (Glynase Press Tab, generic); glipizide/metformin (Metaglip, generic); and glyburide/metformin (Glucovance, generic)

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) the following remain on the BCF:

a) glipizide (Glucotrol, generic); glyburide (Diabeta, Micronase, generic); and glyburide micronized (Glynase Press Tab, generic)

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

D. Non-insulin Diabetes Drugs—DPP-4 Inhibitors

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the DPP-4 inhibitors subclass. The DPP-4 inhibitors subclass includes sitagliptin (Januvia), sitagliptin/metformin (Janumet), and saxagliptin (Onglyza). A FDC product saxagliptin/metformin ER (Kombiglyze XR) recently received FDA approval and will be reviewed an upcoming meeting. The DPP-4 inhibitors have not previously been reviewed. The clinical review included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following clinical effectiveness conclusions for the DPP-4 inhibitors subclass:

1. The ADA guidelines do not mention DPP-4 inhibitors. However, the DPP-4 inhibitors may be mentioned when the guidelines are updated next year, given wider clinical use and concerns regarding the TZD safety profile.
2. There are no completed long-term studies assessing CV outcomes, although 2 studies are under way; the TECOS trial with sitagliptin and the SAVOR-TIMI 53 trial with saxagliptin. Results are expected in 2014–2015.
3. Monotherapy with sitagliptin 100mg daily reduced HbA1c on average by 0.6%–0.79% (mean difference from placebo); whereas, saxagliptin monotherapy reduced HbA1c approximately 0.4%–0.7%. Adding sitagliptin to metformin or pioglitazone (Actos) reduced HbA1c 0.5%–0.9%. The FDC sitagliptin 50mg plus metformin 1000mg (Janumet) given twice daily reduced HbA1c by 1.9% from baseline.

4. There is one published head-to-head non-inferiority trial evaluating glycemic control between the two DPP-4 inhibitors when added to stable metformin therapy. Sitagliptin lowered HbA1c by approximately 0.1% more from baseline than saxagliptin. Saxagliptin was considered non-inferior to sitagliptin. While statistical significance was achieved, the difference between the two agents is not clinically significant.
5. When used as monotherapy or when combined with metformin, DPP-4 inhibitors may provide weight loss; typically less than -0.7 kg from baseline with sitagliptin and metformin and -1.8 kg from baseline with saxagliptin and metformin. When the DPP-4s are combined with SUs or TZDs, weight gain may occur, which is a known adverse effect of the SUs and TZDs subclasses. Therefore, DPP-4 inhibitors are generally considered to be weight-neutral.
6. Effects on lipid parameters were assessed in some but not all studies with the DPP-4 inhibitors. DPP-4 inhibitors are generally considered to have neutral effects on lipids.
7. In terms of commonly reported adverse events, there are no clinically relevant differences between sitagliptin and saxagliptin. Drug interaction profiles are also similar between agents.
8. In terms of serious adverse events, 88 cases of acute pancreatitis have been reported to the FDA as of September 2009. The majority of cases occurred with sitagliptin, but sitagliptin has a longer marketing history than saxagliptin.
9. Results from a request for MHS providers' input showed the majority of responders stated at least one DPP-4 inhibitor was necessary on the UF. Providers would be willing to use either sitagliptin or saxagliptin, but acknowledged more familiarity with sitagliptin.
10. There is a high degree of therapeutic interchangeability between sitagliptin and saxagliptin.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the DPP-4 inhibitors. CMAs and budget impact analyses (BIAs) were performed based on findings that there were no clinically relevant differences in efficacy, safety, tolerability, and other factors among the DPP-4 inhibitors. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent) the following:

- BIA was used to assess the potential impact of cost scenarios where selected DPP-4 inhibitors and DPP-4 inhibitor FDCs were designated as formulary or NF on the UF. Cost scenarios evaluating the impact of designating selected agents on the BCF were also considered. BIA results for the DPP-4 inhibitors subclass showed that all investigated scenarios resulted in lower cost estimates than current MHS expenditures. Sensitivity analysis results supported the above conclusion.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 1 absent) sitagliptin (Januvia), sitagliptin/metformin (Janumet), and saxagliptin (Onglyza) remain formulary on the UF. Prior authorization/step-therapy for the DPP-4 inhibitors would require a trial of metformin or SUs for new patients.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 1 opposed, 1 abstained, 1 absent) sitagliptin (Januvia) and sitagliptin/ metformin (Janumet) be added to the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) the following PA criteria should apply to the DPP-4 inhibitors subclass. Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for metformin or SU at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

      (2) The patient has received a prescription for a DPP-4 inhibitor (Januvia, Janumet, or Onglyza) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual PA criteria, if automated criteria are not met:

      (1) The patient has experienced any of the following adverse events while receiving metformin: impaired renal function that precludes treatment with metformin or history of lactic acidosis.

      (2) The patient has experienced the following adverse event while receiving a SU: hypoglycemia requiring medical treatment.

      (3) The patient has a contraindication to both metformin and a SU.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the committee's recommendation, the effective date is April 13, 2011.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

E. Non-insulin Diabetes Drugs—GLP1RAs

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the GLP1RAs subclass. The GLP1RAs subclass includes exenatide (Byetta) injection and liraglutide (Victoza) injection. The GLP1RAs have not previously been reviewed. Prior authorization currently applies to the class, which excludes off-label use of the drugs for obesity in patients who do not have DM. The clinical review included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following clinical effectiveness conclusions for the GLP1RAs:

1. The ADA guidelines for T2DM place GLP1RAs in tier 2, (less well-validated therapy) after therapeutic lifestyle modification plus metformin.
2. Both exenatide and liraglutide are indicated for use in patients with T2DM as monotherapy, and in combination with metformin, SUs, or TZDs. Off-label uses of the GLP1RAs include weight loss in patients without DM; weight loss is not a benefit covered by TRICARE.
3. Exenatide is dosed twice daily 30–60 minutes prior to meals whereas liraglutide is dosed once daily without regard to meals. The titration schedule and maximum doses differ between the two drugs.
4. There are no long-term studies assessing CV outcomes. However, two trials are underway: the EXSCEL trial (using an investigational formulation of exenatide dosed once weekly), and the LEADER trial (with liraglutide). Results are expected in 2016–2017.
5. GLP1RAs offer another option for add-on therapy when oral agents (e.g., metformin, SUs, TZDs) no longer provide adequate glycemic control. When combined with metformin, SU, or both metformin and SU, exenatide 10mcg twice daily lowered HbA1c 0.77%–0.86% from

baseline. Liraglutide 1.8mg once daily, when combined with metformin and SU, lowered HbA1c 1.3% from baseline.

6. Both exenatide and liraglutide improve fasting plasma glucose (FPG) and postprandial glucose (PPG) concentrations; however, liraglutide has a greater effect on lowering FPG than PPG due to its longer duration of action. In contrast, exenatide has a greater effect on PPG than FPG.
7. Exenatide and liraglutide have been compared to insulin glargine (Lantus); both trials were non-inferiority in design. GLP1RAs offer no clinically significant reduction in HbA1c compared to basal insulin.
8. LEAD-6 is the only head-to-head trial between exenatide and liraglutide. Using the maximum doses of each agent, liraglutide showed a greater decrease in HbA1c compared to exenatide (1.16% versus 0.87%), respectively. While the difference of 0.29% was statistically significant, it was not clinically significant. Limitations to the study included the open-label and non-inferiority study design and sponsorship by the manufacturer of liraglutide.
9. The relationship between weight loss and HbA1C was assessed in the LEAD-6 trial. The difference in HbA1C reduction between patients with and without weight loss was not statistically significant. Patients using a GLP1RA as monotherapy, or in combination with metformin, can expect a 2 kg to 3 kg weight loss.
10. Lipid parameters improved or remained neutral in the exenatide and liraglutide trials; changes in the lipid levels were not statistically significant.
11. There are no clinically relevant differences among the GLP1RAs in common adverse events (nausea and hypoglycemia) and drug interactions.
12. Serious adverse events reported with the GLP1RAs include altered renal function with exenatide, and rare pancreatitis with both exenatide and liraglutide. Both agents may cause formation of antibodies to the GLP1RA. Liraglutide has a black box warning for risk of developing thyroid C-cell tumors and is contraindicated in patients with a personal or family history of medullary thyroid carcinoma or in patients with Multiple Endocrine Neoplasia syndrome type 2.
13. Both agents are available in prefilled pen devices. Exenatide requires two different pens to titrate patients to the target 10mcg twice daily

dose. Conversely, all three doses of liraglutide are available in one dial-a-dose pen.

14. Results from a request for MHS providers' input showed that 49% of responders replied a GLP1RA was required on the UF, 21% were undecided, and 30% replied a GLP1RA was not required on the UF. Providers had little to no experience with liraglutide; however, 63% were willing to prescribe the drug if efficacy and cost were similar to exenatide.
15. With the exception that liraglutide offers patient convenience of a decreased dosing frequency compared to exenatide (daily versus twice daily, respectively), and that liraglutide targets FPG while exenatide targets PPG, there is a high degree of therapeutic interchangeability between the two products in terms of glycemic control. There is a lower degree of therapeutic interchangeability between the two products in terms of serious adverse events of endocrine system tumors.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the GLP1RAs subclass. CMAs and BIAs were performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 1 abstained, 1 absent) the following:

- BIA was used to assess the potential impact of cost scenarios where selected GLP1RAs were designated as formulary or NF on the UF. Cost scenarios evaluating the impact of designating selected agents on the BCF were also considered.

- Victoza (liraglutide) pens are less costly than Byetta (exenatide) pens when comparing price per pen. However, Victoza (liraglutide) patients require 2 or 3 pens per 30 days of therapy. Byetta (exenatide) patients only require 1 pen for 30 days of therapy. From a perspective examining cost-per-day of therapy, Byetta (exenatide) is significantly less costly than Victoza (liraglutide). The scenario where Byetta (exenatide) was step-preferred on the UF while Victoza (liraglutide) was non-preferred and remained on the UF was determined to be the most cost-effective scenario. A sensitivity analysis was performed on the percentage of new users receiving a Victoza (liraglutide) prescription.

Sensitivity analysis results showed that market share gains by Victoza (liraglutide) will result in additional costs to the MHS.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 1 absent) exenatide (Byetta) be designated formulary on the UF (step-preferred), and liraglutide (Victoza) be designated as formulary on the UF (non-preferred). Prior authorization for the GLP1RAs would require a trial of metformin or SUs for new patients. Exenatide (Byetta) was designated as the preferred drug within the subclass; a trial of exenatide (Byetta) would be required prior to liraglutide (Victoza) for new patients.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 1 opposed, 2 abstained, 1 absent) excluding exenatide (Byetta) and liraglutide (Victoza) from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended the following PA criteria should apply to the GLP1RAs. The prior PA criteria for the GLP1RAs would be replaced by the new criteria. Coverage would be approved if the patient met the following criteria:

The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) the following PA criteria would apply to both exenatide (Byetta) and liraglutide (Victoza):

a) Automated PA criteria:

(1) The patient has received a prescription for metformin or SU at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

AND

The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) the following PA criteria would apply to liraglutide (Victoza):

b) Automated PA criteria:

(1) The patient has received a prescription for exenatide (Byetta) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

c) Manual PA criteria, if automated criteria are not met:

The following would apply to exenatide (Byetta) and liraglutide (Victoza):

(1) The patient has a confirmed diagnosis of T2DM.

(2) The patient has experienced any of the following adverse events while receiving metformin: impaired renal function that precludes treatment with metformin or history of lactic acidosis.

(3) The patient has experienced the following adverse event while receiving a SU: hypoglycemia requiring medical treatment.

(4) The patient has a contraindication to both metformin and a SU.

In addition to the above criteria regarding metformin and SU, the following PA criteria would apply specifically to liraglutide (Victoza):

(1) The patient has a contraindication to exenatide (Byetta).

(2) The patient has had inadequate response to exenatide (Byetta).

(3) The patient has experienced an adverse event with exenatide (Byetta), which is not expected to occur with liraglutide (Victoza).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the committee's recommendation, the effective date is April 13, 2011.

Director, TMA, Decision: ☒Approved □ Disapproved

Approved, but modified as follows:

F. Non-insulin Diabetes Drugs—TZDs

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the TZDs subclass. The subclass is comprised of rosiglitazone and pioglitazone, and FDC products with metformin or SU. The individual TZDs are:

- **Rosiglitazone drugs:** rosiglitazone (Avandia), rosiglitazone/metformin (Avandamet), rosiglitazone/glimepiride (Avandaryl)
- **Pioglitazone drugs:** pioglitazone (Actos), pioglitazone/metformin (Actoplus Met), pioglitazone/metformin ER (Actoplus Met XR), pioglitazone/glimepiride (Duetact)

None of the TZDs are available in generic formulations; the patent for pioglitazone is expected to expire in 2012.

The TZDs were reviewed previously for UF placement. Currently all the TZDs are designated formulary on the UF and there are no BCF drugs. The clinical review included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 2 absent) the following clinical effectiveness conclusions for the TZDs subclass:

1. ADA guidelines list pioglitazone (but not rosiglitazone) as a step 2, tier 2, (less well-validated) therapy for the treatment of T2DM.
2. Based on meta-analyses and head-to-head trials, rosiglitazone and pioglitazone at maximal doses reduce HbA1c by 0.6% to 1.6%. The differences between the two drugs for HbA1C reduction are not clinically relevant, when used as monotherapy or when combined with metformin, SUs, or insulin.
3. Outcomes studies are available with the TZDs. Pioglitazone in the PROactive trial resulted in a statistically significant reduction in the composite endpoint, including all-cause mortality, non-fatal myocardial infarction (MI) (including silent MI), stroke, and above the knee major leg amputation. In contrast, there is no direct evidence that rosiglitazone prevents vascular events in patients with T2DM.
4. The TZDs differ in their effects on the lipid profile. Pioglitazone has a less unfavorable effect on lipid parameters than rosiglitazone.
5. Safety and tolerability profiles are similar between rosiglitazone and pioglitazone in terms of incidence of heart failure, weight gain, edema, and hypoglycemia.
6. Rosiglitazone is associated with an increase in adverse CV events that is not seen with pioglitazone, based on results of meta-analyses, an open label, non-inferiority trial (RECORD), and a retrospective study using the Medicare database (Graham, JAMA 2010). The rosiglitazone product labeling includes a black box warning regarding increased risk of MI.
7. The FDA has allowed rosiglitazone to remain on the U.S. market, but the manufacturer must develop a restricted access program under a Risk Evaluation and Mitigation Strategy (REMS) with measures limiting rosiglitazone use to patients unable to attain glycemic control with other drugs. An ongoing head-to-head trial (TIDE) comparing CV events between rosiglitazone and pioglitazone has been halted. In Europe, rosiglitazone has been removed from the market.
8. The FDA released a safety communication regarding a potential increase in risk of bladder cancer with pioglitazone. Studies are ongoing to further assess this risk.
9. The DoD PORT analyzed the effects of discontinuing TZDs and switching between pioglitazone and rosiglitazone. Observations from the analysis suggest that TZDs were discontinued, rather than substituted with another non-insulin diabetes drug subclass or insulin. Of the 24,683 patients total who received rosiglitazone in the analysis timeframe, 73% of these patients continued with

rosiglitazone, 8% switched to pioglitazone, 13% received (or continued to receive) other diabetes medications, but not TZDs, and 6% did not fill a Rx for any diabetes medication (including insulin). Changes in utilization patterns are likely to accelerate with implementation of the REMS program for rosiglitazone.

10. The PORT also commented on trends that show a sharp decrease in use of rosiglitazone and an overall decrease in TZD use. New users of rosiglitazone fell from 274 during June 2010 to 34 during October 2010, MHS-wide. New users of pioglitazone also decreased month-by-month, with 2,202 new users in June 2010 compared to 1,372 during October 2010.
11. Results from a request for MHS providers' input showed that 69% of responders would prefer pioglitazone over rosiglitazone; 75% of the responders stated a TZD/metformin FDC product was not required on the UF.
12. In terms of glycemic control, there is a high degree of therapeutic interchangeability between rosiglitazone and pioglitazone. However, there is a lower degree of therapeutic interchangeability with regard to safety profiles.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the TZDs subclass. CMAs were performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 1 abstained, 1 absent) rosiglitazone and rosiglitazone FDCs [rosiglitazone (Avandia), rosiglitazone/ metformin (Avandamet), and rosiglitazone/glimepiride (Avandaryl)] are more cost-effective than pioglitazone and pioglitazone FDCs [pioglitazone (Actos), pioglitazone/metformin (Actoplus Met, Actoplus Met RX), and pioglitazone/glimepiride (Avandaryl)]. Additionally, increased safety concerns for rosiglitazone and rosiglitazone FDCs outweigh their apparent cost efficiency.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 1 absent):

a) pioglitazone (Actos), pioglitazone/metformin (Actoplus Met, Actoplus Met RX), and pioglitazone/glimepiride (Duetact) remain designated formulary on the UF;

b) rosiglitazone (Avandia), rosiglitazone/ metformin (Avandamet), and rosiglitazone/glimepiride (Avandaryl) be designated NF on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 1 absent) pioglitazone, pioglitazone FDC products, rosiglitazone, and rosiglitazone FDC products be excluded from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of rosiglitazone and the conditions for establishing MN for a NF medication, the P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) MN criteria for rosiglitazone (Avandia), rosiglitazone/ metformin (Avandamet), and rosiglitazone/glimepiride (Avandaryl). (See Appendix B for full MN criteria).

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) the following PA criteria should apply to the TZDs subclass. Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for metformin or SU s at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

      (2) The patient has received a prescription for a TZD at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual PA criteria, if automated criteria are not met:

      (1) The patient has experienced any of the following adverse events while receiving metformin: impaired renal function that precludes treatment with metformin or history of lactic acidosis.

      (2) The patient has experienced the following adverse event while receiving a SU: hypoglycemia requiring medical treatment.

      (3) The patient has a contraindication to metformin and SUs.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

5. ***COMMITTEE ACTION: UF AND PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 2 absent) 1) an effective date of the first Wednesday after a 60-day implementation period in all points of service; and 2) TMA send a letter to beneficiaries affected by this UF decision. Based on the committee's recommendation, the effective date is April 13, 2011.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows

G. Non-insulin Diabetes Drugs—Meglitinides

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the Meglitinides subclass. The subclass includes nateglinide (Starlix, generic), repaglinide (Prandin), and the FDC product repaglinide/metformin (Prandimet). The Meglitinides subclass has not previously been reviewed. Repaglinide has the highest MHS utilization in this subclass. The clinical review included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (18 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions for the Meglitinides subclass:

1. The ADA guidelines consider the meglitinides as "other therapies," and the subclass is not considered in the tier one (well-validated) or tier two (less well-validated) therapies. Joint guidelines from the DoD/Veterans Affairs (VA) list the meglitinides as alternative agents, which may be used after therapy with metformin or the SUs.
2. Average HbA1c reductions for the subclass range from 0.1% to 2.1% with repaglinide (Prandin), 0.2% to 0.6% with nateglinide, and 1.4% with repaglinide/metformin (Prandimet).
3. In a systematic review by the Cochrane group, repaglinide and nateglinide both reduced HBA1c >0.5% versus placebo (range for nateglinide 0.2%–0.6%; range for repaglinide 0.1%–2.1%).
4. In terms of adverse events, nateglinide and repaglinide can cause hypoglycemia; assistance is rarely required. In the Cochrane systematic review, weight gain ranging from 0.7 kg to 2.1 kg occurred with both agents.
5. In terms of efficacy or safety/tolerability, there were no clinically relevant differences between nateglinide and repaglinide overall.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the Meglitinides subclass. CMAs were performed. Information

considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 2 absent) that all meglitinides in this subclass were cost-effective.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 2 absent) nateglinide (Starlix, generic), repaglinide (Prandin), and repaglinide/metformin (Prandimet) be designated formulary on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 2 absent) nateglinide (Starlix, generic), repaglinide (Prandin), and repaglinide/metformin (Prandimet) be excluded from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

H. Non-insulin Diabetes Drugs—AGIs

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the AGIs subclass. The subclass is comprised of acarbose (Precose, generics) and miglitol (Glyset). The AGIs have not previously been reviewed. The subclass has very low utilization in the MHS. The clinical review included, but was not

limited to, sources of information listed in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (18 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions for the AGIs subclass:

1. The ADA guidelines consider the AGIs as "other therapies," and the subclass is not considered in the tier one (well-validated) or tier two (less well-validated) therapies. Joint guidelines from the DoD/VA list the AGIs as alternative agents, which may be used after therapy with metformin or the SUs.
2. The AGIs reduce HbA1c by less than 1%; acarbose reduces HbA1c by 0.77% and miglitol reduces HbA1c by 0.68%. A decrease in HbA1c by 0.5% is considered clinically relevant.
3. In terms of efficacy or safety/tolerability, there were no clinically relevant differences between acarbose and miglitol overall. The significant GI adverse effects caused by AGIs, the requirement for multiple-daily dosing, and the minimal reduction in HbA1c limit the clinical usefulness of this subclass when compared to the other non-insulin diabetes drug subclasses.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the AGIs subclass. CMAs were performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (18 for, 0 opposed, 0 abstained, 0 absent) acarbose (Precose, generics) and miglitol (Glyset) were cost-effective for the subset of patients who could tolerate the frequent GI side effects and multidose regimens required by these agents.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 1 opposed, 1 abstained, 0 absent) acarbose (Precose, generics) and miglitol (Glyset) be designated formulary on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (17 for, 0 opposed, 1 abstained, 0 absent) acarbose (Precose, generics) and miglitol (Glyset) be excluded from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

I. Non-insulin Diabetes Drugs—Amylin Agonists (Pramlintide)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the Amylin Agonists subclass. Pramlintide (Symlin) injection is the only amylin agonist currently on the market. Pramlintide has not previously been reviewed; it is currently designated with formulary status on the UF. Due to safety concerns, a PA was implemented in 2005 to ensure appropriate dosing of pramlintide, which is consistent with the product labeling. The clinical review included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following clinical effectiveness conclusions for the Amylin Agonists subclass:

1. The ADA guidelines for T2DM do not mention the place in therapy for pramlintide.
2. Pramlintide is indicated as adjunctive therapy for the treatment of Type 1 diabetes (T1DM) and T2DM when patients are inadequately controlled on intensive insulin regimens (e.g., bolus insulin doses with meals). Off-label uses of pramlintide include weight loss in patients without DM; weight loss is not a benefit covered by TRICARE.

3. Patients with T1DM showed an average decrease in HbA1c from baseline ranging from -0.1% to -0.39% with pramlintide compared to -0.12% to +0.09% with placebo. In patients withT2DM, the average change in HbA1c ranged from -0.3% to -0.62% with pramlintide versus -0.15% to -0.25% with placebo.
4. There are no outcomes studies with pramlintide.
5. Pramlintide causes weight loss. Mean weight loss with pramlintide ranged from -1.0 kg to -2.3 kg in patients with T1DM compared to a weight gain of 0.3 kg with placebo.
6. Pramlintide is available in multidose vials and a prefilled pen device. Because the product is dosed in mcg, dosing errors are a concern when vials are used but drawn up in insulin syringes marked with units. The prefilled pen device includes a dial-a-dose feature which decreases the risk of dosing errors.
7. Results from a request for providers' input showed over 90% of respondents do not prescribe pramlintide.
8. Pramlintide is efficacious in lowering HbA1c and improving glycemic control, and patients can expect a 1 kg to 2 kg weight loss. However, its clinical utility is limited because it cannot be mixed with insulin, patients require multiple injections of insulin and pramlintide at separate times, there is an increased risk of dosing errors when vials are used, and insulin doses must be decreased by 50% on initiation of therapy to reduce the risk of hypoglycemia.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the Amylin Agonists subclass. A CMA was performed. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analysis and other clinical and cost considerations, the P&T Committee concluded (17 for, 0 opposed, 0 abstained, 1 absent) that pramlintide is cost-effective as an adjunct treatment in T1DM and T2DM patients who cannot achieve desired glucose control despite optimal insulin.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16

for, 0 opposed, 1 abstained, 1 absent) pramlintide (Symlin) injection remain designated as formulary on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (16 for, 0 opposed, 1 abstained, 1 absent) excluding pramlintide (Symlin) from the BCF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) the following PA criteria should apply to the pramlintide (Symlin). Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for bolus insulin at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   The current PA for pramlintide (Symlin) does not exclude use in obese patients who do not have DM. The P&T Committee recommended adding the following to the existing manual PA:

   b) Manual PA criteria, if automated criteria are not met:

(1) The patient has a confirmed diagnosis of T1DM or T2DM.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION: PA IMPLEMENTATION PERIOD***—The P&T Committee recommended (17 for, 0 opposed, 0 abstained, 1 absent) an effective date of the first Wednesday after a 60-day implementation period in all points of service. Based on the committee's recommendation, the effective date is April 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

V. BASIC CORE FORMULARY ISSUES—FENOFIBRATE MELTDOSE (FENOGLIDE) BCF DELETION

The LIP-2s drug class was previously reviewed for UF placement in May 2007. At that time, fenofibrate insoluble drug delivery micro-particle (Triglide) was added to the BCF. In June 2008, fenofibrate meltdose (Fenoglide) replaced Triglide on the BCF, and a $3.00 co-pay was implemented. Changes in licensing and manufacturing agreements have disrupted the availability of Fenoglide, and MTFs are unable to obtain the product. Due to the back order situation, the P&T Committee recommended removing fenofibrate meltdose (Fenoglide) from the BCF. The LIP-2 drug class will be re-reviewed at an upcoming meeting.

1. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee voted (16 for, 0 opposed, 1 abstained, 1 absent) to:
   a) remove Fenoglide from the BCF;
   b) maintain Fenoglide with formulary status on the UF;
   c) raise the co-pay from $3.00 to $9.00; and
   d) notify beneficiaries of the change in formulary status.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Based on the manufacturer's (Shore Therapeutics) refusal to sign a Master Agreement with the VA and participate in the drug discount program required by 38 U.S.C. 8126, and on the manufacturer's voluntary removal of Fenoglide from the TRICARE Pharmacy Benefits Program on November 24, 2010, Fenoglide is no longer covered by TRICARE.

VI. UTILIZATION MANAGEMENT—PA

A. Fingolimod (Gilenya)—PA: Fingolimod is an oral disease-modifying agent for multiple sclerosis (MS). It is FDA-approved for treating patients with relapsing forms of MS to reduce the frequency of clinical exacerbations and delay the accumulation of physical disability. Fingolimod is the first oral agent marketed for the treatment of relapsing MS and its cost per month of therapy is considerably more than that of injectable interferon agents on the UF. The fingolimod product labeling states it is not approved for concurrent use with the injectable interferons or glatiramer injection (Copaxone).

1. ***COMMITTEE ACTION: PA CRITERIA AND IMPLEMENTATION***—To ensure the appropriate use of fingolimod is consistent with the product labeling, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) implementing a PA, which will allow use of fingolimod (Gilenya) in patients who met the following criteria:

    a) a documented diagnosis for relapsing forms of MS;

    b) no current use of interferon alpha/beta or Copaxone;

    The fingolimod PA becomes effective the first Wednesday after a 60-day implementation period in all points of service. Based on the committee's recommendation, the effective date is April 13, 2011.

    Director, TMA, Decision: ☒ Approved ☐ Disapproved

    Approved, but modified as follows:

B. Fentanyl Citrate—Expansion of PA: In August 2007, an automated PA was implemented for transdermal fentanyl to ensure patients are not opioid-naïve. The dispensing process is stopped with a warning if there is no previous prescription for a high-potency opioid in the pharmacy profile within the past 60 days. Pharmacists at all points of service have the ability to override the system warning after determining that the patient could be presumed to be opioid-tolerant. Fentanyl transmucosal tablets (Fentora) and lozenges (Actiq, generic) were added to the automated PA in May 2009.

The P&T Committee discussed expanding the fentanyl citrate automated PA to include high-potency opioids with specific labeling that restricts their use to opioid-tolerant patients.

The specific automated PA criteria that will apply to the proposed drugs, as well as all fentanyl prescriptions, is:

- Patient is likely to be opioid-tolerant based on receiving at least one prescription for one of the following strong opioids (fentanyl transdermal, fentanyl transmucosal, morphine, oxycodone (not including combination products), hydromorphone, methadone, or oxymorphone) during the last 60 days.

After reviewing estimates of the number of utilizers affected by this expanded PA, the P&T Committee agreed to incorporate the high-potency opioids labeled for use in opioid-tolerant patients to the existing fentanyl citrate PA. The impact was estimated to be relatively small compared to the number of current fentanyl utilizers.

1. ***COMMITTEE ACTION: MODIFICATION OF FENTANYL PA AND IMPLEMENTATION***—To ensure the appropriate use of high-potency opioids in opioid-tolerant patients, the P&T Committee recommended (16 for, 0 opposed, 1 abstained, 1 absent) modifying the fentanyl automated PA and including the following drugs:

    - morphine sulfate ER (MS Contin generics 100, 200 mg; Avinza 45, 60, 75, 90, 120 mg; Kadian 100, 200 mg);
    - morphine sulfate ER/naltrexone (Embeda 100/4mg);
    - fentanyl buccal soluble film (Onsolis 200, 400, 600, 800, 1200 mcg);
    - hydromorphone ER (Exalgo 8, 12, 16 mg); and
    - oxycodone ER (Oxycontin 60, 80, 160 mg)

The expanded fentanyl PA becomes effective the first Wednesday after a 60-day implementation period in all points of service. Based on the committee's recommendation, the effective date is April 13, 2011.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VII. ITEMS FOR INFORMATION

A. Effects of Formulary Changes—PORT: The PORT presented data on the effects of formulary changes in two drug classes: the LIP-1s, last reviewed in May 2010, and the Phosphodiesterase-5 Inhibitors (PDE-5s), last reviewed in November 2009. The P&T Committee requested further analysis as more data becomes available.

B. Simvastatin/Niacin ER (Simcor) Automated PA Update—Simvastatin/niacin ER (Simcor) is now available in 40/500 mg and 40/1000 mg tablets, with a maximum dose of 40 mg/2000 mg daily. P&T Committee was informed that the automated PA was updated to include the new simvastatin/niacin ER dosage strengths.

C. Clopidogrel-Proton Pump Inhibitor (PPI) Drug Interaction Update—The P&T Committee was briefed on the most recent information regarding a drug interaction between clopidogrel (Plavix) and PPIs. A previous update was provided to the P&T Committee in May 2009. Joint guidelines from the American College of Cardiology/American Heart Association/American College of Gastroenterology, published in November 2010, address concomitant use of PPIs with clopidogrel and other anti-platelet drugs. The P&T Committee recommended maintaining the current PPI MN and automated PA criteria, continued monitoring of literature and the FDA for new updates, and revisiting the issue when significant new developments occur.

D. Process For New Drug Pharmacy Benefit Determination—A proposed algorithm to determine whether a newly-marketed FDA-approved drug falls under the pharmacy benefit was presented. The proposed algorithm will be reviewed by the TRICARE Office of General Counsel.

VIII. FUTURE CLASS OVERVIEWS

Overviews for three drug classes were presented to the P&T Committee. The LIP-2s drug class is comprised of the fenofibric acid derivatives (gemfibrozil and the fenofibrates), prescription omega-3 fatty acids, and bile acids sequestrants. The nasal corticosteroids were previously reviewed by the P&T Committee in November 2005 and November 2008; they will be re-reviewed at an upcoming meeting. Information regarding the atypical antipsychotics drug class was also presented. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in completing the clinical effectiveness reviews and developing the appropriate cost-effectiveness models. The clinical and economic analyses of these classes will be presented at an upcoming meeting.

IX. ADJOURNMENT

The meeting adjourned at 1700 hours on November 16, 2010, and at 1600 hours on November 17, 2010. The next meeting will be in February 2011.

Appendix B—Table of Medical Necessity Criteria for Newly-Approved Drugs

Drug / Drug Class	Medical Necessity Criteria
Metformin ER (Fortamet) Metformin ER (Glumetza) **Non-insulin Diabetes Drugs: Biguanides**	• Use of formulary agents contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives
Rosiglitazone (Avandia) Rosiglitazone/metformin (Avandamet) Rosiglitazone/glimepiride (Avandaryl) **Non-insulin Diabetes Drugs: Thiazolidinediones (TZDs)**	• Use of formulary agents contraindicated • The patient previously responded to a nonformulary agent, and changing to a formulary agent would incur unacceptable risk
Pitavastatin (Livalo) **Antilipidemics-1s**	• Use of formulary agents contraindicated
Fenofibrate (Fibricor) **Antilipidemics-2s**	• Use of formulary agents contraindicated
Estradiol valerate / dienogest (Natazia) **Contraceptive Agents**	• Use of formulary agents contraindicated • No alternative formulary agent available (if other oral contraceptive agents do not provide adequate bleeding and cycle control)

Appendix C—Table of Implementation Status of UF Recommendations/Decisions Summary Table

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Comments
Nov 2010	**Non-Insulin Diabetes Drugs** Biguanides	UF Review	▪ Metformin IR 500, 850, 1000 mg (generics) ▪ Metformin ER 500, 750 mg (generics)	▪ Metformin 500 mg/5mL liquid (Riomet)	▪ Metformin ER 500, 1000 mg (Fortamet) ▪ Metformin ER 500, 1000 mg (Glumetza) (Nov 2010)	Pending 60 days	Not applicable	Trial of metformin and/or sulfonylurea is mandated before TZDs, DPP-4 inhibitors or GLP-1 agonists can be used
Nov 2010	**Non-Insulin Diabetes Drugs** Sulfonylureas	UF Review	▪ Glipizide (generics) ▪ Glyburide (generics) ▪ Glyburide micronized tabs (generics)	▪ Chlorpropamide (generics) ▪ Glimepiride (generics) ▪ Glipizide ER (generics) ▪ Glipizide/metformin (generics) ▪ Glyburide/metformin (generics)	Not applicable (no drug designated nonformulary)	Pending 60 days	Not applicable	Trial of metformin and/or sulfonylurea is mandated before TZDs, DPP-4 inhibitors or GLP-1 agonists can be used
Nov 2010	**Non-Insulin Diabetes Drugs** Alpha Glucosidase Inhibitors	UF Review	Not applicable (no drug designated BCF)	▪ Acarbose (generics) ▪ Miglitol	Not applicable (no drug designated nonformulary)	Not applicable	Not applicable	-
Nov 2010	**Non-Insulin Diabetes Drugs** Meglitinides	UF Review	Not applicable (no drug designated BCF)	▪ Nateglinide (generics) ▪ Repaglinide (Prandin) ▪ Repaglinide/metformin (Prandimet)	Not applicable (no drug designated nonformulary)	Not applicable	Not applicable	-
Nov 2010	**Non-Insulin Diabetes Drugs** Thiazolidinediones	UF Review	Not applicable (no drug designated BCF)	▪ Pioglitazone (Actos) ▪ Pioglitazone/metformin (Actoplus Met) ▪ Pioglitazone/metformin XL (Actoplus Met XR) ▪ Pioglitazone/glimepiride (Duetact)	▪ Rosiglitazone (Avandia) ▪ Rosiglitazone/ metformin (Avandamet) ▪ Rosiglitazone/ glimepiride (Avandaryl) (Nov 2010)	Pending 60 days	Step Therapy (Automated PA)	Step Therapy (automated PA) with metformin and sulfonylureas as step preferred agents

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
August 2010

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on August 11, and 12, 2010, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of May minutes**—Dr. Charles Rice, Acting Director, approved the minutes for the May 2010 DoD P&T Committee meeting on July 23, 2010.
2. **Clarification of May minutes**—The Basic Core Formulary (BCF) recommendation for the alpha blocker terazosin was clarified to specify generic formulations—not proprietary formulations—are included on the BCF.
3. **Clarifications of February 2010 Minutes**—The clinical effectiveness conclusion for the antihemophilic agents regarding purified factor VIII and IX concentrates was clarified to state:

> "National professional group guidelines, including the National Hemophilia Foundation Medical and Scientific Advisory Committee (MASAC 159) and national hemophilia patient advocacy groups caution against switching between products once a patient is stabilized."

III. UNIFORM FORMULARY (UF) DRUG CLASS REVIEWS

A. Renin Angiotensin Antihypertensive Agents (RAAs)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the RAAs drug class. The class is comprised of the Angiotensin Converting Enzyme (ACE) Inhibitors, Angiotensin II Receptor Blockers (ARBs), the Direct Renin Inhibitors (DRIs), and their fixed-dose combination (FDC) products with hydrochlorothiazide (HCTZ), calcium channel blockers (CCBs), or other RAAs. The ARBs were previously reviewed by the P&T Committee in May 2007 and February 2005; ACE Inhibitors were previously reviewed in August 2005; and the fixed-dose combination ACE Inhibitor/CCB products were previously reviewed in February 2006.

The clinical review included, but was not limited to, sources of information listed in 32 Code of Federal Regulations (CFR) 199.21(e)(1).

The individual RAAs are listed below:

- **ACE Inhibitors:** benazepril (Lotensin, generic), benazepril/HCTZ (Lotensin HCT, generic), captopril (Capoten, generic), captopril/HCTZ (Capozide, generic), enalapril (Vasotec, generic), enalapril/HCTZ (Vasoretic, generic), fosinopril (Monopril, generic), fosinopril/HCTZ (Monopril HCT, generic), lisinopril (Prinvil, Zestril, generic), lisinopril HCT (Prinzide, Zestoretic, generic), moexipril (Univasc, generic), moexipril/HCTZ (Uniretic generic), perindopril (Aceon, generic), quinapril (Accupril, generic) quinapril/HCTZ (Accuretic, generic), trandolapril (Mavik, generic), and ramipril (Altace, generic)
- **ARBs:** candesartan (Atacand), candesartan/HCTZ (Atacand HCT), eprosartan, (Teveten), eprosartan/ HCTZ (Teveten HCT), irbesartan (Avapro), irbesartan/HCTZ (Avalide), losartan (Cozaar, generic), losartan/HCTZ (Hyzaar, generic), olmesartan (Benicar), olmesartan/HCTZ (Benicar HCT), telmisartan (Micardis), telmisartan/ HCTZ (Micardis HCT), valsartan (Diovan), and valsartan/HCTZ (Diovan HCT)
- **DRIs:** aliskiren (Tekturna), aliskiren/HCTZ (Tekturna HCT), and valsartan/aliskiren (Valturna)
- **Fixed dose combinations:** (RAAs/CCBs): benazepril/amlodipine (Lotrel, generic), trandolapril/verapamil sustained release (SR) (Tarka, generic), olmesartan/amlodipine (Azor), telmisartan/amlodipine (Twynsta), valsartan/amlodipine (Exforge), and valsartan/amlodipine/HCTZ (Exforge HCT)

The current BCF products are lisinopril, lisinopril/HCTZ, ramipril, and benazepril/amlodipine. The nonformulary (NF) agents include perindopril, moexipril +/- HCTZ, trandolapril/verapamil sustained release (SR), eprosartan +/- HCTZ, irbesartan +/-HCTZ, olmesartan +/- HCTZ, valsartan +/-HCTZ, olmesartan/amlodipine, telmisartan/amlodipine, valsartan/amlodipine, and aliskiren/valsartan. The remaining drugs are classified as UF drugs. Generic formulations are available for all the ACE inhibitors and the ACE inhibitor/diuretic products; generic formulations of losartan and losartan/HCTZ entered the market in April 2010. Generic formulations of candesartan, irbesartan, and valsartan are expected in 2012.

The RAAs class is ranked within the top 5 most costly Military Health System (MHS) drug classes, with expenditures exceeding $300 million annually. In terms of utilization, the ACE inhibitors comprise 58% of the RAAs market share, with the ARBs comprising 36%, and the fixed-dose combinations comprising 6%. For expenditures, the ARBs account for 66% of the annual MHS cost for the RAAs.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) the following conclusions for the RAAs:

1. For treating hypertension, the results of one systematic review reported the ARBs reduce blood pressure (BP) to a similar degree; at maximum recommended doses, the average trough systolic blood pressure reduction is -8 mmHg and the average trough diastolic blood pressure reduction is -5 mmHg.
2. The ACE inhibitors, ARBs, and the DRI aliskiren (Tekturna) reduce BP to a similar degree, based on the conclusions from two systematic reviews.
3. The addition of HCTZ increases the BP-lowering efficacy of the RAAs. The current Joint National Committee (JNC) 7 hypertension guidelines recommend multidrug regimens include a thiazide diuretic (e.g., HCTZ).
4. Hypertension studies show that the FDC products produce significantly greater BP reductions than their individual components. Additional benefits of FDC products include potential enhanced medication compliance, and simplified medication regimens. Disadvantages include loss of flexibility for dosage initiation and titration.
5. All the ARBs are U.S. Food and Drug Administration (FDA)-approved for treating hypertension; some of the ARBS have shown evidence for positive clinical outcomes. Telmisartan (Micardis) is FDA-approved to reduce the risk of cardiovascular (CV) mortality and morbidity in patients who are at high risk for CV events and are intolerant of ACE inhibitors (ON-TARGET and TRANSCEND trials). Candesartan (Atacand) and valsartan (Diovan) are FDA-approved for reducing the risk of death and hospitalization in patients with chronic heart failure. Losartan (Cozaar, generic) and irbesartan (Avapro) are FDA-approved to reduce the risk of delaying progression to end-stage renal disease (ESRD), doubling of serum creatinine, or death in patients with Type 2 diabetes mellitus (DM).
6. Although losartan (Cozaar, generic) is currently not FDA-approved for treating chronic heart failure, data from one trial (HEAAL, Lancet

2010) reported losartan 150 mg reduced the risk of death or hospitalization due to heart failure.

7. One unpublished trial (ORIENT) with olmesartan in patients with Type 2 DM did not find a delayed progression to ESRD, doubling of serum creatinine, or death. Another unpublished trial (ROADMAP) evaluating olmesartan in Type 2 DM patients did find a benefit in the surrogate outcome of delaying progression to microabluminuria.
8. For the RAA/CCB products, benazepril/amlodipine (Lotrel, generic) was superior to benazepril/HCTZ (Lotensin HCT, generic) in reducing the composite of CV mortality and morbidity in patients with hypertension who are at high risk for CV events (ACCOMPLISH trial). Benazepril/amlodipine is the only RAA/CCB FDC product with evidence for positive clinical outcomes, in addition to reducing BP.
9. There is no data to suggest that there are clinically relevant differences in the BP-reducing efficacy of the ARB/CCB FDC products olmesartan/amlodipine (Azor), telmisartan/amlodipine (Twynsta), or valsartan/amlodipine (Exforge). Adding an ARB to amlodipine results in a lower incidence of peripheral edema than that reported with CCB monotherapy.
10. Valsartan/amlodipine/HCTZ (Exforge HCT) is the first triple FDC antihypertensive drug to obtain FDA approval. It is more effective at reducing BP than administering two antihypertensive drugs, but has a higher incidence of orthostatic hypotension and dizziness than two-drug regimens.
11. The DRI aliskiren (Tekturna) reduces BP by suppressing plasma renin activity, which is unique among the RAAs. Aliskiren is effective at reducing BP when used as monotherapy or in combination with other antihypertensive drugs, but the BP effects are similar to that achieved with the diuretics, ARBs, or ACE inhibitors. Aliskiren is approved solely for treating hypertension; clinical outcomes trials are ongoing. Current JNC guidelines do not address the place in therapy for the DRIs. The adverse event profile for aliskiren appears similar to the ARBs.
12. Adding HCTZ to aliskiren (Tekturna HCT) provides enhanced BP reduction and is consistent with JNC guidelines, due to the diuretic component. There is limited published information for aliskiren/ HCTZ.

13. Aliskiren/valsartan (Valturna) is the first DRI/ARB that is FDA-approved for hypertension; it provides another option for patients requiring multidrug antihypertensive regimens. However, there are only limited published studies available, it is approved solely for treating hypertension, and the benefits of dual RAA inhibition are debatable, due to an increased risk of adverse events.
14. For the ACE inhibitors, with the exception of moexipril (Univasc, generics), evidence exists for positive clinical outcomes (e.g., decreased risk of major CV events or death in high-CV risk patients, those with heart failure, in patients with Type 2 diabetic renal disease, or in the post-myocardial (MI) setting), in addition to lowering BP.
15. For the ARBs, it is unlikely that there are clinically relevant differences in their adverse event profiles. Clinical trials show similar adverse event rates as with placebo.
16. The FDA is evaluating the association of ARBs and an increased risk of cancer, which was reported in a recent meta-analysis (Sipahi, et al., Lancet Oncology 2010). The FDA maintains the benefits of ARBs currently outweigh their risk.
17. The FDA is evaluating the risk of increased CV death with olmesartan reported in Type 2 DM patients from the ROADMAP and ORIENT trials. FDA is currently reviewing the data for olmesartan and has not concluded that it increases the risk of death.
18. For the ACE inhibitors, the major adverse events are hyperkalemia, increased serum creatinine, and cough. One systematic review comparing the ARBs with the ACE inhibitors reported the overall incidence of ACE inhibitor-induced cough as ranging between 0%–23% (mean 10%).
19. The DoD Pharmacy Outcomes Research Team (PORT) provided an analysis of RAAs MHS prescription data and reported that ARBs are initiated as first-line therapy in the majority of patients, instead of ACE inhibitors. Additionally, it does not appear that patients with comorbidities (chronic heart failure, DM, left ventricular hypertrophy, post-MI) are prescribed an ARB based on the evidence for positive outcomes data and hypertension.
20. A survey of Military Treatment Facility (MTF) providers regarding the place in therapy using RAAs for hypertension revealed the ACE inhibitors are considered first-line, the ARBs are second-line, and the DRIs are third-line. The majority of providers responded that ARBs are interchangeable for

treating hypertension. Most respondents did not agree that FDC products were necessary to treat the majority of their hypertensive patients.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the RAAs. Cost-minimization analyses (CMAs) and budget impact analyses (BIAs) were performed based on clinical findings that the efficacy, safety, tolerability, and other factors among the RAAs subclasses of ACE inhibitors, ARBs, DRIs, and FDC products with HCTZ, CCBs, or other RAAs were similar with regard to treating hypertension. For the cost effectiveness analysis, the FDC products were compared with their parent RAA. Products containing aliskiren were analyzed and incorporated into the CMA and BIA used to evaluate the ARB subclass.

Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

- **ACE Inhibitors and their combinations with HCTZ and/or CCBs:** Because all ACE inhibitors are now available in generic formulations, comparisons were made against the ARBs, ARB/combinations, DRIs, and DRI/combinations in the form of an ACE inhibitor step-therapy model. BIA was used to assess the potential impact of cost scenarios where ACE inhibitors or their combination agents were designated as the step-preferred agents on the UF prior to filling a prescription for ARBs, DRIs, or their respective combination products. Cost scenarios evaluating the impact of designating ACE inhibitors or ACE inhibitors/combinations as BCF agents prior to the use of ARBs, DRIs, or their respective combinations were also considered. BIA results showed that requiring an ACE inhibitor prior to using any ARB, DRI, or their respective combinations would be cost effective. Due to existing prescribing practices in the MHS, the P&T Committee agreed that use of an ACE inhibitor as a required step-preferred therapy could not be operationalized in an Automated Prior Authorization (PA).
- **ARBs, ARB/combinations, DRIs, and DRI/combinations:** BIA was used to assess the potential impact of cost scenarios where selected ARBs, ARB/combinations, DRIs, and DRI/combinations were designated as formulary or NF on the UF. Cost scenarios evaluating the impact of designating selected agents on the BCF were also considered. BIA results for the ARBs and DRIs showed the scenario placing losartan, losartan/HCTZ, telmisartan (Micardis), telmisartan/ HCTZ (Micardis HCT), telmisartan/amlodipine (Twynsta), valsartan (Diovan), valsartan/HCTZ (Diovan HCT), valsartan/amlodipine (Exforge), and valsartan/amlodipine/HCTZ (Exforge HCT) as step-preferred agents, while

placing all other ARBs, ARB/combinations, DRIs, and DRI/combinations on the UF was the most cost-effective scenario and operationally-appropriate choice.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 1 abstained, 0 absent) to accept the relative cost-effectiveness analysis of the RAAs.

1. ***COMMITTEE ACTION: UF RECOMMENDATIONS***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following:

    a) losartan, losartan/HCTZ, telmisartan (Micardis), and telmisartan/HCTZ (Micardis HCT), remain classified as formulary on the UF, and that telmisartan/amlodipine (Twynsta), valsartan (Diovan), valsartan/HCTZ (Diovan HCT), valsartan/amlodipine (Exforge) and valsartan/amlodipine/HCTZ (Exforge HCT) be designated formulary on the UF. Prior authorization (PA) for the RAAs drug class would require a trial of one of these step-preferred drugs for new patients (15 for, 0 opposed, 1 abstained, 0 absent);

    b) aliskiren (Tekturna), aliskiren/HCTZ (Tekturna HCT), candesartan (Atacand), candesartan/HCTZ (Atacand HCT), eprosartan (Teveten), eprosartan/HCTZ (Teveten HCT), irbesartan (Avapro), irbesartan/HCTZ (Avalide), olmesartan (Benicar), olmesartan/HCTZ (Benicar HCT), olmesartan/amlodipine (Azor), and valsartan/aliskiren (Valturna), be designated formulary on the UF (non-preferred) (15 for, 0 opposed, 1 abstained, 0 absent);

    c) benazepril, benazepril HCTZ, benazepril/amlodipine, captopril, captopril HCTZ, enalapril, enalapril HCTZ, fosinopril, fosinopril HCTZ, lisinopril, lisinopril HCTZ, quinapril, quinapril HCTZ, ramipril, and trandolapril remain formulary on the UF (15 for, 0 opposed, 1 abstained, 0 absent);

    d) The following four ACEs previously designated NF on the UF are now available in cost-effective generic formulations and will be designated formulary on the UF: moexipril (Univasc), moexipril HCTZ (Uniretic), perindopril (Aceon), and trandolapril/verapamil (Tarka) (15 for, 0 opposed, 1 abstained, 0 absent).

e) As a result of the above recommendations, there are no RAAs designated as nonformulary on the UF.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved 11/10/10

Approved, but modified as follows:

2. ***COMMITTEE ACTION: PA CRITERIA***—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 2 absent) the following PA criteria should apply to the non-preferred RAAs, aliskiren (Tekturna), aliskiren/HCTZ (Tekturna HCT), aliskiren/valsartan (Valturna), candesartan (Atacand), candesartan/HCTZ (Atacand HCT), eprosartan (Teveten), eprosartan/HCTZ (Teveten HCT), irbesartan (Avapro), irbesartan/HCTZ (Avalide), olmesartan (Benicar), olmesartan/HCTZ (Benicar HCT), and olmesartan/amlodipine (Azor). Coverage would be approved if the patient met any of the following criteria:

   a) Automated PA criteria:

      (1) The patient has received a prescription for losartan, losartan/HCTZ, telmisartan (Micardis), telmisartan/HCTZ (Micardis HCT) telmisartan/amlodipine (Twynsta), valsartan (Diovan), valsartan/HCTZ (Diovan HCT), valsartan/amlodipine (Exforge), or valsartan/amlodipine/HCTZ (Exforge HCT) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

   b) Manual (paper) PA criteria, if automated criteria are not met:

      (1) The patient has tried one of the preferred RAAs and was unable to tolerate treatment due to adverse effects.

      (2) The patient has tried one of the preferred RAAs and has had an inadequate response.

      (3) The patient has a contraindication to the preferred RAAs, which is not expected to occur with the non-preferred RAAs (e.g., history of angioedema).

Acting Director, TMA, Decision: ☒*Approved* □ *Disapproved*

11/10/10

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 2 absent) an effective date an effective date of first Wednesday after a 60 days implementation period in all points of service. The effective date is 12 Jan 2011.

Acting Director, TMA, Decision: ☒ Approved □ Disapproved

11/8/10

Approved, but modified as follows

4. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended:
    a) losartan, losartan HCTZ, telmisartan (Micardis), telmisartan/HCTZ (Micardis HCT), valsartan (Diovan), valsartan/HCTZ (Diovan HCT) be designated with BCF status (15 for, 0 opposed, 1 abstained, 0 absent);
    b) captopril, benazepril/amlodipine (Lotrel generics), lisinopril, lisinopril HCTZ, ramipril remain on the BCF (15 for, 0 opposed, 1 abstained, 0 absent).

Acting Director, TMA, Decision: ☒Approved □ Disapproved

11/8/10

Approved, but modified as follows:

B. Ophthalmic-1s

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the agents in the Ophthalmic-1 drug class. The class is comprised of the ophthalmic antihistamines (AHs), mast cell stabilizers (MCS), dual action AH/MCS, and the nonsteroidal anti-inflammatory drugs (NSAIDs). The Ophthalmic-1s have not previously been reviewed for UF placement; all the drugs are currently designated with formulary status on the UF, and there are no BCF or NF drugs. The clinical review focused on use of the Ophthalmic-1s for allergic conjunctivitis (AC) and included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(1).

The individual Ophthalmic-1s are listed below:

- **Antihistamines:** emedastine (Emadine)
- **Dual Action Antihistamine/Mast Cell Stabilizers:** azelastine (Optivar, generics), bepotastine (Bepreve), epinastine (Elestat), olopatadine 0.1% (Patanol), and olopatadine 0.2% (Pataday)
- **Mast Cell Stabilizers:** pemirolast (Alamast), nedocromil (Alocril), cromolyn (Crolom/Opticrom, generic), and lodoxamide (Alomide)
- **NSAIDs:** ketorolac 0.4% (Acular LS, generic), ketorolac 0.45% (Acuvail), ketorolac 0.5% (Acular, generic), bromfenac (Xibrom), diclofenac (Voltaren, generic), flurbiprofen (Ocufen, generics), and nepafenac (Nevanac)

MHS expenditures for the Ophthalmic-1s exceed $19 million annually. In the MHS, olopatadine 0.2% (Patanol) is the highest utilized Ophthalmic-1 agent.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions for the Ophthalmic-1s:

1. With regard to mechanism of action and pharmacokinetic properties, the antihistamines provide relief of ocular itching, hyperemia, and edema, while MCS have anti-inflammatory effects. The dual action AH/MCS exhibit both properties. MCS have a slower onset of action for providing relief of ocular symptoms than AH/MCS (days to weeks, vs. minutes, respectively). NSAIDs relieve pain and reduce erythema.
2. With regard to FDA-approved indications, dual action AH/MCS and the MCS are approved for treating AC. For the NSAIDs, ketorolac 0.5% (Acular, generic) is approved for AC, and clinical trial data supports use of bromfenac (Xibrom) for this indication.

3. With regard to place in therapy, professional guidelines from the American Academy of Ophthalmology and the American Optometric Association recommend use of AHs or AH/MCS as first-line topical therapy for relief of AC symptoms.
4. With regard to efficacy for the treatment of AC, the results of one meta-analysis reported the following: MCS and AHs are superior to placebo in relieving symptoms of AC; there is no significant difference between the AHs and MCS in terms of proportion of patients with perceived benefit; there is insufficient evidence to demonstrate superiority of agents within each subclass; and convenience of use, cost and patient preference should guide treatment choice.
5. Interpretation of clinical efficacy differences between the individual dual action AH/MCS and individual MCS is difficult due to small patient enrollment, short-term treatment, use of single-dose studies, and acute course of symptoms. There are no head-to-head trials comparing bepotastine (Bepreve) with another Ophthalmic-1 agent. Overall, for relief of ocular itching, there does not appear to be clinically relevant differences between the dual action AH/MCS and the MCS.
6. With regard to safety and tolerability, published data does not suggest there are clinically relevant differences concerning burning/stinging, headaches, taste perversion, and hyperemia between the individual dual action AH/MCS and individual MCS in treating AC. The only published available meta-analysis did not assess adverse events, and the head-to-head trials were too small to determine clinically relevant differences individual dual action AH/MCS and individual MCS. The overall adverse event rate is low.
7. Data from the product labeling reports the dual action AH/MCS bepotastine (Bepreve) is associated with taste perversion in 25% of patients. For the MCS, nedocromil (Alocril) has an incidence of burning/stinging on instillation, plus taste perversion in 10%–30% of patients. The 0.5% concentration of ketorolac (Acular) is associated with burning/stinging in up to 40% of patients.
8. With regard to dosing frequency, olopatadine 0.2% (Pataday) is the only dual action AH/MCS that is dosed once daily; the other AH/MCS are dosed twice daily. For the MCS, nedocromil (Alocril) is dosed twice daily, while the other MCS are dosed 4–6 times daily. The NSAID ketorolac 0.5% (Acular) is dosed four times daily for AC.
9. With regard to preservatives, it remains to be determined whether the presence of carboxymethylcellulose instead of benzalkonium chloride

(BAK) in ketorolac 0.45% (Acuvail) or the reduced BAK concentration in bepotastine (Bepreve) are associated with a lower risk of adverse events.

10. A request for input from MTF providers revealed that the majority of responders ranked olopatadine 0.2% (Patanol) as the preferred Ophthalmic-1 agent to treat AC and olopatadine 0.1% (Pataday) as the second preference. The majority of responders chose cromolyn (Crolom/Opticrom, generic) as the preferred MCS, and ketorolac 0.5% (Acular, generic) as the preferred NSAID for treating AC.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the agents in the Ophthalmic-1 drug class used in the treatment of AC. CMAs and BIAs were performed based on clinical findings that the efficacy, safety, tolerability, and other factors among the Ophthalmic-1 subclasses were similar. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

- **Antihistamines and Dual Action AH/MCS:** Emedastine (Emadine) was analyzed with the dual action AH/MCS subclass. CMA results showed olopatadine 0.1% (Patanol) to be the most cost-effective agent for the treatment of AC, based on the cost per day of treatment. BIA was used to assess the potential impact of cost scenarios where Emedastine (Emadine) and/or dual action AH/MCS were designated formulary or NF on the UF. Cost scenarios evaluating the impact of designating agents on the BCF were also considered. BIA results from this analysis showed the most cost-effective scenario designated bepotastine (Bepreve) and epinastine (Elestat) NF on the UF, and the remaining dual action AH/MCS as formulary on the UF. Follow-up P&T Committee discussion considered the potential for MTF recapture of bepotastine (Bepreve) and epinastine (Elestat) from the retail sector to recommend formulary status for all other antihistamines and dual action AH/MCS agents.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 1 absent) to accept the relative cost-effectiveness analysis of the Antihistamines and Dual Action AH/MCS subclass.

- **Mast Cell Stabilizers:** BIA was used to assess the potential impact of cost scenarios where selected MCS were designated formulary or NF on the UF.

Cost scenarios evaluating the impact of designating agents on the BCF were also considered. BIA results showed the most cost-effective scenario designated cromolyn 0.4% (generic) with formulary status on the UF, with all other MCS designated as NF on the UF. However, P&T Committee discussion recommended that all MCS should remain formulary on the UF because they are primarily prescribed by specialists and have low MHS low utilization.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (16 for, 0 opposed, 0 abstained, 0 absent) to accept the relative cost-effectiveness analysis of the Mast Cell Stabilizers subclass.

- **Ophthalmic-1 NSAIDs:** BIA was used to assess the potential impact of cost scenarios where selected Ophthalmic-1 NSAIDs were designated formulary or NF on the UF. Cost scenarios evaluating the impact of designating agents with BCF status were also considered. This subclass is more commonly used in the treatment of post-surgical procedures than in the treatment of AC. BIA results showed that the most cost-effective scenario designated ketorolac 0.5% (generic Acular) with BCF status, with all other Ophthalmic-1 NSAIDs designated formulary on the UF. After discussion, the P&T Committee recommended against designating a BCF Opthmalic-1 NSAID because the majority of use is by ophthalmologic specialists for post-surgical procedures rather than primary care providers for AC.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (16 for, 0 opposed, 0 abstained, 0 absent) to accept the relative cost-effectiveness analysis of the Ophthalmic-1 NSAIDs subclass.

1. ***COMMITTEE ACTION: UF RECOMMENDATIONS***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following:
    a) **Antihistamines and Dual Action AH/MCS:** azelastine (Optivar, generics), bepotastine (Bepreve), emedastine (Emadine), epinastine (Elestat), olopatadine 0.1% (Patanol), and olopatadine 0.2% (Pataday) remain designated formulary on the UF (15 for, 0 opposed, 1 abstained, 0 absent);

b) **Mast Cell Stabilizers:** cromolyn (generic), lodoxamide (Alomide), nedocromil (Alocril), and pemirolast (Alamast) remain designated formulary on the UF (15 for, 0 opposed, 1 abstained, 0 absent);

c) **NSAIDs:** bromfenac 0.09% (Xibrom), diclofenac 0.1% (Voltaren, generic), flurbiprofen 0.03% (Ocufen, generic), ketorolac 0.4% (Acular LS, generic), ketorolac 0.45% (Acuvail), ketorolac 0.5% (Acular, generic), and nepafenac 0.1% (Nevanac) remain designated formulary on the UF (15 for, 0 opposed, 1 abstained, 0 absent).

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved 11/10/10

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended upon signing of the minutes:

   a) **Antihistamines and Dual Action AH/MCS:** olopatadine 0.1% (Patanol) be added to the BCF (15 for, 0 opposed, 1 abstained, 0 absent).

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved 11/10/10

Approved, but modified as follows:

IV. UTILIZATION MANAGEMENT—QUANTITY LIMITS (QL)

A. Tramadol ODT (Rybix)—QL: A new orally disintegrating formulation (ODT) of tramadol (Rybix) has been marketed. Tramadol ODT will be reviewed for UF status at an upcoming P&T Committee meeting as a newly-approved drug in the narcotic analgesic drug class. QLs are currently in place for both immediate and extended-release tramadol (Ultram, Ultram ER, generics).

1. ***COMMITTEE ACTION: QL***—The P&T Committee voted (14 for, 0 opposed, 1 abstained, 1 absent) to recommend QLs for tramadol ODT of 720 tablets/90 days in the mail order pharmacy and 240 tablets/30 days in the retail network, which is consistent with the recommended dosing from the product labeling and safety concerns.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

11/10/10

Approved, but modified as follows:

B. Ondansetron soluble film (Zuplenz)—QL: An oral soluble film of ondansetron (Zuplenz) is now on the market. Zuplenz will be reviewed as a new FDA-approved drug in the anti-emetic drug class at an upcoming P&T Committee meeting. QLs are currently in place for other formulations of ondansetron and the remainder of the 5-HT3 receptor antagonists in the class.

1. ***COMMITTEE ACTION: QL***— The P&T Committee voted (14 for, 0 opposed, 1 abstained, 1 absent) to recommend QLs for ondansetron soluble film of 180 tablets/90 days in the mail order pharmacy and 60 tablets/30 days in the retail network, which is consistent with the recommended dosing from the product labeling and avoids breaking apart packages for dispensing.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

11/10/10

Approved, but modified as follows:

C. Certolizumab Pegol Injection (Cimzia Starter Kit)—QL: A new starter kit of certolizumab pegol pre-filled syringes (Cimzia) for Crohn's disease has been marketed. Cimzia was reviewed as a new FDA-approved drug in the targeted immunomodulatory biologics (TIB) drug class in August 2009. This starter kit provides for a loading dose required at initiation of therapy. QLs are currently in place for the other formulations of certolizumab pegol and the remainder of the TIBs products.

1. ***COMMITTEE ACTION: QL***—The P&T Committee voted (15 for, 0 opposed, 1 abstained, 0 absent) to recommend QLs for certolizumab pegol of 1 kit (6 syringes) with no refills in the mail order pharmacy and 1 kit (6 syringes) with no refills in the retail network, which is consistent with the recommended dosing from the product labeling and avoids breaking apart packages.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved 11/10/10

Approved, but modified as follows:

D. Nilotinib Capsules (Tasigna)—QL: Nilotinib (Tasigna) is a kinase inhibitor that is approved for treating Philadelphia chromosome-positive chronic myeloid leukemia. QLs are currently in place for imatinib (Gleevec) and oral antineoplastic agents, due to the potential for drug discontinuations or dosage changes due to adverse effects, drug interactions, or patient response to therapy.

1. ***COMMITTEE ACTION: QL***— The P&T Committee voted (15 for, 0 opposed, 1 abstained, 0 absent) to recommend QLs for nilotinib of 224 capsules/56 days in the mail order pharmacy and 112 capsules/28 days in the retail network, which is consistent with the recommended dosing from the product labeling and safety concerns.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved 11/10/10

Approved, but modified as follows:

V. ITEMS FOR INFORMATION

A. Pharmacy Outcomes Research Team—The PORT briefed the P&T Committee on the utilization and expenditures for several of the UF drug classes previously reviewed by the P&T Committee. Additional updates will be provided at upcoming meetings.

B. Thiazolidinedione (TZD) Safety Update—The P&T Committee reviewed updated safety information for rosiglitazone. Additional information will be provided when the TZD drug class review is presented at the November 2010 P&T Committee Meeting.

C. **PA for Quinine Sulfate Safety Update**—The P&T Committee reviewed new FDA-mandated safety requirements for quinine sulfate (Qualaquin). Prior Authorization for Qualaquin restricting use for malaria was recommended at the May 2010 P&T Committee Meeting. In July 2010, an FDA safety communication stated Qualaquin should only be used for malaria, warned of safety issues when used off-label for leg cramps; and required the manufacturer to develop a risk evaluation and mitigation strategy program.

D. **BCF Consensus Statement** —The P&T Committee stated its position that BCF-designated drugs will be stocked in the Pharmacy or readily available on the next duty day for MTFs located in the continental United States (CONUS), and be readily available on the next available order for MTFs located outside the continental United States (OCONUS).

VI. CLASS OVERVIEWS

Overviews for two drug classes were presented to the P&T Committee. The inflammatory bowel disease/irritable bowel syndrome drug class is comprised of the 5-aminosalicylates, gastrointestinal steroids, and the 5-HT3 antagonists. The pancreatic enzymes were also reviewed. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in completing the clinical effectiveness reviews and developing the appropriate cost-effectiveness models. The clinical and economic analyses of these classes will be presented at an upcoming meeting.

VII. ADJOURNMENT

The meeting adjourned at 1620 hours on August 11, 2010, and at 0945 hours on August 12, 2009. The next meeting will be in November 2010.

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
May 2010

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on May 12, 2010, and May 13, 2010, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of February minutes**—Dr. Charles Rice, Acting Director, approved the minutes for the February 2010 DoD P&T Committee meeting on May 3, 2010.
2. **Correction to February minutes**—The P&T Committee recommended by consensus the following Factor VIII and Factor IX drugs be returned to formulary status on the Uniform Formulary (UF) upon execution of the DoD Retail Refund Pricing Agreement:

   Human Factor VIII: Humate-P, Monoclate-P

   Recombinant Factor VIII: Helixate FS

   Human Factor IX: MonoNine

   a) ***COMMITTEE ACTION***—The P&T Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend the Acting Director, TMA, amend the February 2010 P&T Committee Minutes to reflect the Factor VIII and Factor IX drugs listed, above, have been returned to formulary status on the UF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

III. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Narcotic Analgesics—Fentanyl Citrate Transmucosal Soluble Film (Onsolis)

Relative Clinical Effectiveness—Fentanyl citrate transmucosal soluble film (Onsolis) is a pure opioid agonist available in a new transmucosal delivery system. It is FDA-approved for the treatment of breakthrough pain in adults with cancer who are opioid tolerant. Onsolis contains the same active drug (fentanyl) via the same route of administration (oral mucosa) as the UF products Actiq (fentanyl transmucosal lozenge; generics) and Fentora (fentanyl transmucosal tablet). It differs from Actiq and Fentora as fentanyl is delivered through a soluble film that adheres to the mucosal membrane and provides protection from the saliva. The film dissolves completely over 15–30 minutes.

There are no direct comparative clinical trials between Onsolis and the other transmucosal fentanyl products. Onsolis is not bioequivalent with other transmucosal fentanyl products. The safety and tolerability profile for Onsolis appears comparable to other transmucosal fentanyl products. The new delivery system offers more efficient absorption with less swallowing of the drug, which could possibly result in less gastrointestinal (GI) adverse effects. Other potential benefits of the new delivery system include reduced ability for diversion and less risk of dental caries.

Onsolis has a restricted distribution risk evaluation and mitigation strategy (REMS) program that requires enrollment by both the physician and patient, limits dispensing to a single retail pharmacy, and provides delivery of the drug via traceable courier. The FDA is requiring, but has not determined an effective date, for similar REMS programs for Actiq and Fentora.

The narcotic analgesic drug class was last reviewed in February 2007. The clinical evaluation for Onsolis included, but was not limited to, the requirements stated in 32 Code of Federal Regulations (CFR) 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) the plausible, yet unproven, benefits of the transmucosal fentanyl buccal film (Onsolis) new delivery system include less GI side effects, less risk of diversion, and less risk of dental caries, compared to other UF transmucosal fentanyl products. The clinical relevance of the proposed advantages is unclear at this time. The FDA-mandated REMS program will ensure use is limited to opioid-tolerant patients.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of fentanyl citrate transmucosal soluble film (Onsolis) in relation to the efficacy, safety, tolerability, and clinical outcomes of the other currently available narcotic analgesics. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of the agent. Results from the CMA showed the projected weighted average cost per day for Onsolis is higher than other formulary narcotic analgesics, except the branded drug Actiq.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 0 absent) that fentanyl citrate transmucosal soluble film (Onsolis) is more costly than generic fentanyl products in the narcotic analgesic drug class. In comparison to generics in this class, the P&T Committee determined that the higher daily cost for Onsolis was offset by its unique delivery system and the strict REMS program, which will limit inappropriate prescribing.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 2 opposed, 1 abstained, 0 absent) fentanyl citrate transmucosal soluble film (Onsolis) be designated as formulary on the UF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: BASIC CORE FORMULARY (BCF) RECOMMENDATION***—The P&T Committee considered the BCF status of fentanyl citrate transmucosal soluble film (Onsolis). Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) fentanyl citrate transmucosal soluble film (Onsolis) would not be added to the BCF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

B. Triptans—Sumatriptan Needle-Free Injection (Sumavel DosePro)

Relative Clinical Effectiveness—Sumatriptan needle-free injection (Sumavel DosePro) is a new single-use delivery system for administering sumatriptan subcutaneously. Sumatriptan (Imitrex) is available in oral tablets, a nasal spray, and a traditional needle-containing injection device; all are available in generic formulations. The triptans drug class was last reviewed for UF placement in June 2008. Sumatriptan oral tablets and injection (Imitrex STATdose; generics) are currently included on the BCF.

Sumavel DosePro is FDA-approved for treating migraines and cluster headaches. The sumatriptan dose is delivered by a high pressure burst of nitrogen gas, which propels the drug through the subcutaneous space. Pharmacokinetic studies comparing Sumavel DosePro with Imitrex STATdose demonstrated bioequivalence between the two products. Sumavel DosePro obtained FDA approval via section 505(b)(2) of the Federal Food, Drug, and Cosmetic (FDC) Act using data submitted from the original Imitrex STATdose submission. Thus, there are no clinical trials with Sumavel DosePro that measure efficacy for providing pain relief from migraine headaches. Following administration, initially there is a higher incidence of bleeding, swelling, and bruising with Sumavel Dose Pro than with Imitrex STATdose; these adverse effects dissipate, and show no difference in severity with Imitrex STATdose 8 hours after administration. Potential benefits of Sumavel DosePro compared to sumatriptan needle-containing injection include that the device is easy to use, it provides an alternative injection option to patients with severe needle phobia, and it does not require special biohazard disposal (e.g., disposal in household refuse).

The clinical evaluation for Sumavel DosePro included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) that although sumatriptan needle-free injection (Sumavel DosePro) is easy to use, particularly for patients with dexterity issues, and can be disposed of without special precautions, it does not have a significant, clinically relevant therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to the existing UF product, sumatriptan needle-containing injection.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of sumatriptan needle-free injection (Sumavel DosePro) in relation to the efficacy, safety, tolerability, and clinical outcomes of the other non-oral sumatriptan formulations included in the triptans drug class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of Sumavel DosePro relative to other non-oral UF sumatriptan agents. Results from the CMA showed the projected weighted average cost per day for Sumavel DosePro is higher than other non-oral sumatriptan formulary agents, with the exception of the Imitrex STATdose proprietary formulation.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 0 absent) that sumatriptan needle-free injection (Sumavel DosePro) is more costly compared to current UF agents except the Imitrex STATdose proprietary formulation.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness, relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 0 opposed, 1 abstained, 0 absent) sumatriptan needle-free injection (Sumavel DosePro) be designated nonformulary (NF) on the UF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluation of sumatriptan needle-free injection (Sumavel DosePro) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Sumavel DosePro. (See Appendix B for full MN criteria).

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent)
   1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the retail network and mail order, and at Military Treatment Facilities (MTFs) no later than a 60-day

implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

IV. UF DRUG CLASS REVIEWS

A. Antilipidemic-1s (LIP-1s)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the agents in the Antilipidemic-1s (LIP-1s) drug class. This class is currently ranked number one in the Military Health System (MHS), with drug class expenditures exceeding $480 million annually. The class was last reviewed in August 2006. The individual drugs included in the LIP-1s class are listed, below:

Statins: atorvastatin (Lipitor), amlodipine/atorvastatin (Caduet), fluvastatin (Lescol), fluvastatin extended release (ER; Lescol XL), lovastatin (Mevacor, generics), lovastatin ER (Altoprev), pravastatin (Pravachol, generics), rosuvastatin (Crestor), simvastatin (Zocor, generics), and ezetimibe/simvastatin (Vytorin)

Statin combination products and add-on therapies: niacin ER (Niaspan), lovastatin/niacin ER (Advicor), simvastatin/niacin ER (SIMCOR), and ezetimibe (Zetia)

The current BCF agents are pravastatin, simvastatin, niacin ER (Niaspan), and ezetimibe/simvastatin (Vytorin). The NF agents are atorvastatin/amlodipine (Caduet) and rosuvastatin (Crestor). The remaining drugs are classified as UF agents. Generic formulations of simvastatin, pravastatin, and lovastatin are now marketed. Generic formulations of atorvastatin are expected in late 2011.

Relative Clinical Effectiveness Conclusion—The Committee recommended (14 for, 0 opposed, 0 abstained, 1 absent) the following conclusions for the LIP-1s:

1. Across equipotent doses, the statins achieve a similar percentage reduction in low-density lipoprotein (LDL), and a similar percentage increase in high-density lipoprotein (HDL).
2. All statins show a plateau and drop-off in ability to raise HDL at increasing doses.
3. Doubling the dose of a statin provides only an additional 4% to 7% reduction in LDL and 3% to 6 % reduction in non-HDL.
4. There is a strong correlation between the change in LDL and C-reactive protein (CRP). CRP appears to be a strong predictor of coronary heart disease (CHD). It is unclear what emphasis the upcoming National Heart and Lung Blood Institute Adult Treatment Panel (ATP) IV guidelines will place on CRP in managing patients with hypercholesterolemia.
5. A 1:1 log-linear relationship exists between lowering LDL and non-HDL and reduced relative risk of CHD. In one mortality study, non-HDL was a stronger predictor of CHD risk than LDL.
6. With respect to the low-to-moderate intensity statins (statins able to reduce LDL levels by $\leq 45\%$):
   - The results of one meta-analysis show Lipitor, pravastatin, and simvastatin have similar effects in providing long-term cardiovascular (CV) prevention (e.g., reducing all-cause deaths, major coronary events, CV death, and major cerebrovascular events).
   - There are fewer trials published for lovastatin and fluvastatin, but positive outcomes are still shown.
   - Simvastatin at doses ≤ 40 mg will remain the DoD-preferred statin.
7. The high-intensity statins (those statins able to reduce LDL levels by >45%) include Lipitor 40 and 80 mg; Vytorin 10/20, 10/40, and 10/80 mg; Crestor 10, 20, and 40 mg; and simvastatin 80 mg.
8. In trials assessing the primary prevention of CHD, statins do not appear to decrease the risk of all-cause mortality. At a dose of 20 mg, Crestor showed a decreased risk of all-cause mortality in the JUPITER trial. The benefit of Crestor in this trial was limited to patients with CRP> 2 and an additional CHD risk factor besides age. When used in the primary prevention of CHD, statins in general decrease the risk of CV events by 22% to 30%.

9. In trials assessing the secondary prevention of CHD, statins decrease the risk of mortality and the risk of major CV events 21% to 23%. Similar benefits are conferred among patients with or without diabetes. When used in acute coronary syndrome, Lipitor 80 mg decreases the risk of a second event by 16% to 19%. There are no studies with Crestor assessing the secondary prevention of CHD.
10. Vytorin provides added efficacy in terms of LDL lowering, but still lacks clinical outcomes data showing a reduction in CV events. Positive benefits in reducing CV events have been shown with the simvastatin component of Vytorin in The Heart Protection Study and The Scandinavian Simvastatin Survival Study trials.
11. Zetia lowers LDL 15%–20% by a mechanism distinct from that of the statins.
12. Niaspan lowers LDL 5%–15%. However, Niaspan is required in the MHS, as its primary benefit is to raise HDL by 25%.
13. Since the 2006 review, there is no new compelling data for Advicor, SIMCOR, Caduet, Altoprev, or Lescol XL to change the original conclusion that these drugs do not offer additional clinical benefits over the other LIP-1s. These drugs have low utilization in the MHS.
14. With regard to safety, there is no evidence that increases in liver function tests or minor adverse events (gastrointestinal disturbances, headaches, rash, itching) are less likely to occur with one statin versus another; these adverse effects are dose-related.
15. Concerns of proteinuria remain with Crestor 40 mg, but the clinical significance of this effect is unknown.
16. The risk of statin-related myotoxicity increases with increasing dosages. There is no evidence that one statin is less likely to cause myotoxicity than another. The FDA recently updated the labeling for simvastatin 80 mg, warning of the risk of myotoxicity. The overall incidence of rhabdomyolysis is rare with all statins.
17. There is no conclusive data yet to suggest that statin therapy is associated with cognitive decline, behavioral defects, or cancer. However, there is evidence to suggest an increased risk of new onset diabetes with statin therapy (JUPITER trial and Lancet 2010 meta-analysis). The clinical implications of this finding are still unclear.

18. Fluvastatin, pitavastatin (a new statin not yet marketed), pravastatin, and Crestor do not interact with CYP 3A4 and have more favorable drug-drug interaction profiles than the other statins. Pravastatin is renally metabolized and bypasses the CYP 450 system entirely.
19. The Pharmacy Outcomes Research Team (PORT) analyzed LIP-1s utilization in the MHS during a 7-month period between August 1, 2009, and March 31, 2010. Overall, approximately 1.4 million DoD beneficiaries receive lipid-lowering therapies and about 1.2 million DoD beneficiaries receive statins. The percentage of the study group classified as new statin users was 7%. Women comprised 51% of the entire study group; the mean patient age was 42.4 years (standard deviation 11.8 years).

    The majority of use is statin monotherapy (882,000 patients). The most common add-on therapy is ezetimibe (194,000), followed by fibrates (123,000) and niacin (57,000). Zetia is frequently prescribed as Vytorin (73%); only 27% of the study group received Zetia with a statin other than simvastatin. Most niacin is given separately (74%), with only 6,819 patients receiving SIMCOR or Advicor.

    About 29% of all patients receiving statin monotherapy or a statin and Zetia are receiving high-intensity statins (statins able to reduce LDL levels by >45%); 17% of this group is receiving a high-intensity statin alone; 11% are receiving a high-intensity statin plus Zetia. The most common triple therapy is a statin and Zetia and niacin (12,000). Overall, about 73,000 patients receive some combination targeting LDL and HDL/triglycerides.
20. To meet the clinical needs of the majority of MHS patients, the UF must include the low-to-moderate intensity statins simvastatin and pravastatin, and at least one high-intensity statin.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the LIP-ls in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Statins: A series of cost-effectiveness analyses (CEAs) and budget impact analysis (BIAs) were used to determine the relative cost-effectiveness of agents in the class.

Four separate cost-effectiveness models were constructed in the analyses of low-to-moderate statins (statins able to reduce LDL levels by ≤ 45%) and high-intensity statins (statins able to reduce LDL levels by >45%). Analyses were based on direct and indirect comparisons of relevant trial data.

1. The Annual Cost per 1% LDL Decrease Model compared the cost-effectiveness of the high % LDL-lowering agents based on annual cost per 1% LDL reduction using a decision analytical model.
2. The Annual Cost per Patient Treated to Goal Model compared the cost-effectiveness of these agents based on annual cost per patient successfully treated to ATP III National Cholesterol Education Program goal using a decision analytical model.
3. The Annual Cost per 1% Non-HDL Decrease Model compared the cost-effectiveness of the high % non-HDL lowering agents based on annual cost per 1% non-HDL reduction using a decision analytical model.
4. The Annual Cost per 1% HDL-increase Model compared the cost-effectiveness of the high % HDL-increasing agents based on annual cost per 1% HDL increase using a decision analytical model.

Statin combination products and add-on therapies: CMA and BIA were used to evaluate the cost-effectiveness of the statin combination products and add-on therapies.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded the following:

Statins (13 for, 0 opposed, 1 abstained, 1 absent)**:**

1. For the low-to-moderate % LDL-lowering agents (≤ 45% LDL reduction) evaluated: simvastatin (10, 20, and 40 mg), Lipitor 10 and 20 mg, and all strengths of pravastatin, the cost-effectiveness of the agents in this class were evaluated using each of the decision analytic models described, above. In pharmacoeconomic terms, simvastatin was considered to be dominant at all equipotent strengths, in terms of cost per LDL reduction, cost per LDL goal attainment, cost per non-HDL reduction, and cost per HDL increase. CEA results showed simvastatin was located along the cost efficiency frontier and considered to be the optimal agent.

Note: Based on low utilization and conclusions presented at the August 2006 P&T Committee Meeting, the following agents were not evaluated in the model(s): simvastatin 5 mg, Crestor 5 mg, ezetimibe/simvastatin (Vytorin) 10/10 mg, fluvastatin IR, fluvastatin ER, lovastatin IR, and lovastatin ER were not included in the CEA).

2. For the high-intensity % LDL-lowering agents (> 45% LDL reduction) evaluated: Lipitor 40 and 80 mg, Crestor 10, 20, and 40 mg, simvastatin/ezetimibe (Vytorin) 10/20, 10/40, 10/80 mg, and simvastatin 80 mg, the cost-effectiveness of the agents in this class were evaluated using each of the decision analytic models described, above. In pharmacoeconomic terms, the results of the first three cost-effectiveness analyses showed Lipitor 40 and 80 mg to be the overall most cost-effective high-intensity agent(s), in terms of cost per % LDL reduction, cost per % LDL goal attainment, and cost per % non-HDL reduction. Crestor 40 mg was more effective but considerably more costly compared to Lipitor at equipotent doses, but not more effective nor less costly than the equipotent dosage of ezetimibe/simvastatin (Vytorin) 10/80 mg. CEA determined Vytorin was not dominant in cost per outcome compared to Lipitor. From a price per % LDL-reduction perspective, Lipitor (all strengths) was more cost-effective than Vytorin. CEA results showed Lipitor 40 and 80mg was located along the cost efficiency frontier and considered to be the optimal agent(s).

3. BIA was used to assess the potential impact of cost scenarios where selected LIP-1s were designated formulary or nonformulary on the UF. Cost scenarios evaluating the impact of designating agents on the BCF were also considered. Results from the BIA for LIP-1s revealed that the scenarios placing Lipitor at all strengths on the BCF and as the step-preferred product in front of a step-therapy requirement and placing all generic agents in front of a step-therapy requirement were the most cost-effective scenarios.

4. The results of the BIA showed that Lipitor was less costly than the other brand agents Crestor and Vytorin in all scenarios evaluated. All scenarios placing Lipitor in the step-preferred position were less costly than all nonstep-scenarios and all other scenarios involving multiple step-preferred branded agents.

Statin combination products and add-on therapies (14 for, 0 opposed, 0 abstained, 1 absent):

1. The CMA results revealed that SIMCOR was the most cost-effective add-on product, based on an analysis of the cost per day of therapy. Cost per day of therapy was calculated using cost per tablet adjusted by daily average consumption (DACON) rates for SIMCOR, Niaspan, Advicor, and Zetia.
2. BIA was used to assess the potential impact of cost scenarios where selected statin combination products and add-on agents were designated formulary or nonformulary on the UF. Scenarios evaluating the impact of designating agents on the BCF were also considered. Results from the BIA revealed the most cost-effective scenario overall to add Niaspan on the BCF and UF, add Zetia on the UF, and designate SIMCOR and Advicor NF. However, designating SIMCOR NF may result in increased usage of Niaspan and increase overall costs. Sensitivity analyses show no individual scenario was dominant after considering the margin for error present in all cost projections. Therefore, the cost avoidance of the aforementioned most cost-effective scenario was within the margin of error.

a) ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended the following:

(1) Ezetimibe/simvastatin (Vytorin), Atorvastatin (Lipitor), simvastatin (Zocor, generics), fluvastatin (Lescol), fluvastatin ER (Lescol XL), lovastatin (Mevacor, generics), lovastatin ER (Altoprev) and pravastatin (Pravachol, generics) remain classified as formulary on the UF; and that atorvastatin/amlodipine (Caduet) and rosuvastatin (Crestor) be designated formulary agents on the UF, with prior authorization (PA) for the LIP-1s drug class requiring a trial of atorvastatin (Lipitor) and the generic formulations of simvastatin or pravastatin for new patients (12 for, 0 opposed, 2 abstained, 1 absent);

(2) Ezetimibe (Zetia), niacin ER (Niaspan), lovastatin/niacin ER (Advicor), and simvastatin/niacin ER (SIMCOR) remain designated as UF; (13 for, 0 opposed, 1 abstained, 1 absent);

(3) As a result of the above recommendations, there are no LIP-1s designated as nonformulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

b) ***COMMI TTEE ACTION: PA CRITERIA***—The Committee recommended (13 for, 1 opposed, 1 abstained, 0 absent) the following PA criteria should apply to the LIP-1s other than generics and Lipitor. Coverage would be approved if the patient met any of the following criteria:

(1) Automated PA criteria:

(a) The patient has received a prescription for a preferred agent targeting similar LDL reduction at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

(2) PA criteria, if automated criteria are not met:

(a) The patient has tried the preferred agent and was unable to tolerate treatment due to adverse effects.

(b) The patient is taking a concurrent drug that is metabolized by CYP3A4.

(c) The patient requires ≥55% LDL lowering.

(d) The patient requires primary prevention with rosuvastatin (Crestor) and is not able to take atorvastatin (Lipitor).

Acting Director, TMA, Decision: ☑ *Approved* ☐ *Disapproved*

Approved, but modified as follows:

c) ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (13 for, 1 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the retail network and mail order, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries

affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows

d) ***COMMI TTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended:

(1) Simvastatin (Zocor, generics) and pravastatin (Pravachol, generics) remain BCF; atorvastatin (Lipitor) be added to the BCF; and, ezetimibe/simvastatin (Vytorin) be removed from the BCF (11 for, 0 opposed, 2 abstained, 2 absent);

(2) Niacin ER (Niaspan) remain BCF (13 for, 0 opposed, 1 abstained, 1 absent).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Alpha Blockers for Benign Prostatic Hyperplasia (BPH)

Relative Clinical Effectiveness—The P&T Committee evaluated the relative clinical effectiveness of the alpha blockers used for BPH currently marketed in the United States. The class is comprised of three non-uroselective agents: terazosin (Hytrin, generics), doxazosin immediate release (IR; Cardura; generics), and doxazosin ER (Cardura XL); and three uroselective agents: alfuzosin (Uroxatral), tamsulosin (Flomax) and silodosin (Rapaflo). Generic formulations of tamsulosin were launched in March 2010. The BPH alpha blocker drug class was first reviewed in August 2005 and reviewed again in November 2007. The newest agent, Rapaflo, was reviewed in August 2009. Current annual expenditures for the BPH alpha blockers are $52 million.

There is an existing automated PA process for the uroselective alpha blockers, which requires a trial of Uroxatral as initial therapy. All the alpha blockers are FDA-approved for treating BPH. The clinical evaluation for the BPH alpha blockers included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions regarding the BPH alpha blockers:

1. There are limited head-to-head trials comparing the BPH alpha blockers; the available placebo-controlled trials and meta-analyses were reviewed. Although all the alpha blockers are superior to placebo, variability in study design and demographics preclude the ability to designate one agent as clinically superior.
2. Based on randomized placebo-controlled trials, terazosin, doxazosin, tamsulosin, alfuzosin, and silodosin produce clinically significant and comparable symptom improvements when compared to placebo.
3. Uroselective agents are well tolerated, with a few differences in safety considerations.
4. Uroselective agents appear to be better tolerated than non-uroselective agents, as measured by withdrawals due to adverse events and discontinuation of therapy.
5. Non-uroselective alpha blockers exhibit a higher rate of vasodilatory adverse effects relative to uroselective alpha blockers
6. All agents have similar warnings regarding intraoperative floppy iris syndrome.
7. The PORT analyzed the rejected claims attributable to the existing automated PA process (step-therapy edit) for the BPH alpha blockers from April 16, 2008, to December 31, 2009.
    a) Over the study period, 154,691 patients received uroselective alpha blockers for BPH in the retail or mail points of service; 43% of the patients encountered the step-therapy edit reject. Step therapy was highly effective at causing switches to preferred products; 81% of the patients who received a selective alpha blocker received the preferred product, alfuzosin, within 90 days. However, a substantial percentage of patients did not receive an alpha blocker within 90 days; 30% of patients did not receive a selective alpha blocker and 26% did not receive any alpha blocker (selective or non-selective).
    b) About 7% of the patients affected by the step therapy edit were female. Results for the women were similar to the overall results: 81% of women receiving a selective alpha blocker were switched to alfuzosin. However, the majority of women (64%) encountering the reject did not receive a selective alpha blocker within 90 days.
    c) When the alpha blocker step-therapy results were compared to previous analyses of UF drugs with step edits, similar results were noted. The percentages for those patients who did not receive a prescription after the step-edit reject were 35% in the newer sedative hypnotics class, and 31%

in the proton pump inhibitor class, versus 26%–30% in the alpha blocker class.

8. A review of the clinical literature since the previous UF reviews did not add substantial new information or support changes in clinical practice.
9. Terazosin, doxazosin, and doxazosin ER have a low degree of therapeutic interchangeability with alfuzosin, tamsulosin, and silodosin in terms of safety and tolerability, due to the higher incidence of discontinuation rates and vasodilatory effects seen with the non-uroselective alpha blockers.
10. Alfuzosin, tamsulosin, and silodosin have a high degree of therapeutic interchangeability; any of these drugs could be expected to meet the needs of the majority of MHS BPH patients requiring an uroselective agent.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of the alpha blockers used for BPH in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA and BIA were used to evaluate the cost-effectiveness of the BPH alpha blockers. Currently, there is a national shortage of doxazosin, resulting in a higher price for some dosage strengths.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) the following:

1. CMA results for the non-uroselective agents revealed that generic terazosin and generic doxazosin IR were the most cost-effective agents based on the weighted average cost per day of therapy.

2. CMA results for the uroselective agents revealed that generic tamsulosin was the most cost-effective agent and Rapaflo (silodosin) was the least cost-effective agent based on the weighted average cost per day of therapy.

3. BIA results revealed the scenario that placed generic tamsulosin alone in front of a step on the UF and the scenario that included generic tamsulosin and Uroxatral (alfuzosin) on the UF in front of a step were the most cost effective.

a) ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and

relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted to recommend (11 for, 3 opposed, 1 abstained, 0 absent) that:

(1) tamsulosin (generic Flomax) and alfuzosin (Uroxatral) be designated as the uroselective UF alpha blockers; terazosin (Hytrin, generics) and doxazosin IR (Cardura) be maintained as the non-uroselective UF alpha blockers;

(2) silodosin (Rapaflo) remain classified as NF with a PA requiring a trial of alfuzosin or generic tamsulosin for new patients; and

(3) doxazosin ER (Cardura XL) be classified as the NF non-uroselective alpha blocker for BPH.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

b) ***COMMI TTEE ACTION: PA CRITERIA***—The automated PA (step therapy) currently in effect requires alfuzosin (Uroxatral) before other NF alpha blockers for BPH, unless there is therapeutic failure, intolerance, or hypersensitivity. The automated PA criteria will now include generic tamsulosin as a preferred BPH alpha blocker, along with alfuzosin (Uroxatral). The P&T Committee voted (13 for, 0 opposed, 2 abstained, 0 absent) to recommend the PA criteria outlined, below, should apply to silodosin (Rapaflo); there is no change to the criteria for silodosin previously in effect. Coverage would be approved if the patient met any of the following criteria:

(1) Automated PA criteria:

(a) The patient has received a prescription for either silodosin (Rapaflo), tamsulosin (generic Flomax), or alfuzosin (Uroxatral) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

(2) PA criteria if automated criteria are not met:

(a) The patient has tried alfuzosin (Uroxatral) or tamsulosin and had an inadequate response or was unable to tolerate treatment due to adverse effects.

(b) Treatment with alfuzosin (Uroxatral) or tamsulosin is contraindicated.

(c) The patient requires an alpha blocker that can be crushed and sprinkled on food.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

c) ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of the alpha blockers for BPH, and the conditions for establishing MN for a NF medication, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for the uroselective alpha blocker silodosin (Rapaflo), and recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for the non-uroselective alpha blocker doxazosin ER (Cardura XL). (See Appendix B for full MN criteria.)

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

d) ***COMMI TTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the retail network and mail order, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

e) ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 1 opposed, 1 abstained, 0 absent) to retain alfuzosin (Uroxatral) and terazosin (Hytrin) on the BCF, and add tamsulosin (generic Flomax) to the BCF.

Acting Director, TMA, Decision: ☐ Approved ☐ Disapproved

Approved, but modified as follows:

V. UTILIZATION MANAGEMENT

A. PA Requirement for Quinine—Quinine sulfate has been used off-label for years to treat nocturnal leg cramps. The only quinine product approved by the FDA (marketed under the trade name Qualaquin) is only approved for treating malaria; however, the FDA recognizes that the majority of its use is for leg cramps.

In the MHS, between April 1, 2009, and March 31, 2010, over 10,300 patients were prescribed quinine, with over 70% of the prescriptions dispensed from the retail network. The majority of patients receiving quinine sulfate prescriptions are older than 45 years. The current MHS usage is 80% lower than that reported in a DoD P&T Committee analysis from 2004. Results from an analysis of MHS quinine prescriptions during fiscal year 2009 found that out of 11,341 patients, 24% had one or more ICD-9 codes associated with leg cramps and 0.1% had ICD-9 codes associated with malaria; 76% of patients did not have ICD-9 codes for either malaria or leg cramps.

Meta-analyses and professional guidelines conclude that quinine is likely effective in reducing the frequency of muscle cramps, but the magnitude of benefit is small. No drug is currently FDA-approved for leg cramps, and there are no clearly effective pharmacological or nonpharmacological alternatives. A 2006 post-marketing FDA

surveillance study reported that since 1969 there have been 665 reports of adverse events involving quinine sulfate, including 93 deaths. Serious adverse events reported with quinine sulfate include thrombocytopenia, hemolytic-uremic syndrome/thrombotic thrombocytopenic purpura (HUS-TTP), chronic renal impairment associated with HUS-TTP, hypersensitivity reactions, and QT prolongation. The product labeling for Qualaquin was updated in 2009 to state that the risk associated with quinine sulfate when used for nocturnal leg cramps outweighs any potential benefit.

1. ***COMMITTEE ACTION: PA***—Due to continued safety concerns and FDA advisories recommending against use of quinine sulfate for leg cramps, the P&T Committee recommended (13 for, 1 opposed, 1 abstained, 0 absent) a PA be required for quinine sulfate (Qualaquin) that limits use to the FDA-approved indication of malaria. The PA would apply to both existing and new users of quinine sulfate.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: PA IMPLEMENTATION***—The P&T Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend the quinine sulfate PA should have an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the retail network and mail order, and at the MTFs, no later than a 60-day implementation date. The implementation period will begin immediately following the approval by the Director, TMA.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

VI. BASIC CORE FORMULARY ISSUES

A. Fluticasone proprionate nasal spray (Flonase, generics)—BCF Deletion

The Nasal Allergy Drugs, which include the nasal corticosteroids, were last reviewed in November 2008. Generic fluticasone propionate nasal spray (Flonase) was selected as the BCF nasal corticosteroid. Supplies of both generic and branded fluticasone propionate nasal spray are limited, due to manufacturing plant closures by the FDA and exit of the proprietary manufacturer from the market. The result is an increase in price from the two remaining generic manufacturers. It is unknown when additional supplies will be available. Due to the aforementioned developments, the P&T Committee recommended deleting fluticasone propionate nasal spray from the BCF. Fluticasone propionate nasal spray will remain on the UF. MTFs are encouraged to provide an alternative nasal corticosteroid in the interim, to meet local needs.

1. ***COMMITTEE ACTION: BCF DELETION***—The Committee voted (13 for, 1 opposed, 1 abstained, 0 absent) to remove fluticasone propionate nasal spray (Flonase, generics) from the BCF immediately upon signing of the May 2010 DoD P&T Committee minutes; it will remain formulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Department of Veterans Affairs (VA)/DoD Joint Contracting Initiatives—Non-Basal Insulins BCF Addition

The P&T Committee was briefed regarding the VA National Acquisition Center contract for the non-basal insulin, including insulin aspart (Novolog) and 70% insulin aspart protamine suspension/30% insulin aspart (Novolog Mix 70/30). The insulin aspart (Novolog) vials are currently on the BCF. As part of the new contract, the insulin aspart pen injection devices (Novolog FlexPen) and insulin aspart PenFill cartridges (Novolog PenFill) are now cost-effective and have a similar price/mL as the vials. Likewise the 70% insulin aspart protamine suspension/30% insulin aspart pen injection device (Novolog Mix 70/30 FlexPen) is now similarly priced to the vials.

1. ***COMMITTEE ACTION: BCF ADDITION***—The Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend adding the insulin aspart pen injection device (Novolog FlexPen), the insulin aspart PenFill cartridges (Novolog PenFill), and the 70% insulin aspart protamine suspension/30% insulin

aspart pen injection device (Novolog Mix 70/30 FlexPen) to the BCF, immediately upon signing of the May 2010 DoD P&T Committee minutes.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VII. ITEMS FOR INFORMATION

A. **Pharmacy Outcomes Research Team (PORT)**—The PORT briefed the P&T Committee on their completed, ongoing and future research projects.

VIII. NATIONAL DEFENSE AUTHORIZATION ACT, SECTION 703—INCLUSION OF TRICARE RETAIL PHARMACY PROGRAM IN FEDERAL PROCUREMENT OF PHARMACEUTICALS UPDATE

The P&T Committee reviewed drugs that have been established on a DoD Retail Refund Pricing Agreement; these drugs are now compliant with Fiscal Year 2008 National Defense Authorization Act, Section 703. By law, these drugs were designated NF on the UF and subject to pre-authorization prior to use in the retail point of service (POS) and MN in MTFs. These drugs are now eligible to return to their previous formulary status without a pre-authorization requirement. Drugs with pricing agreements were systematically classified according to therapeutic and pharmacologic lines. The classification system was based on the American Hospital Formulary System Classification and First Data Bank classification.

A. ***COMMITTEE ACTION: DRUGS RETURNED TO UF STATUS***—The P&T Committee recommended by consensus the drugs listed in Appendix C return to formulary status on the UF. See Appendix C for the full list of affected medications.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. ***COMMITTEE ACTION: DRUGS MAINTAINING NF STATUS BUT NOT SUBJECT TO PREAUTHORIZATION***—The P&T Committee recommended by consensus the following drugs maintain NF status and not be subject to PA:

Daytrana, Kapidex, Saizen, Azor, Welchol, Cardene SR, and Vyvanse

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VIII. CLASS OVERVIEWS

The Antidiabetic Drug Class overview was presented to the P&T Committee. The Antidiabetic Drug Class is comprised of the sulfonylureas, sulfonylurea combinations, alpha glycoside agonists, amylin analogs, biguanides, meglitinides, thiazolidinediones, glucose-like-peptide 1 agents, and the dipeptidyl peptidase-4 (DPP-4) inhibitors. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in completing the clinical effectiveness reviews and developing the appropriate cost-effectiveness models. The clinical and economic analyses of this class will be presented at an upcoming meeting.

IX. ADJOURNMENT

The meeting adjourned at 1700 hours on May 12, 2010, and at 1100 hours on May 13, 2009. The next meeting will be in August 2010.

Appendix B—Table of Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
Silodosin (Rapaflo) **Alpha Blockers for BPH**	• Use of the formulary agent is contraindicated. • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure. • There is no alternative formulary agent available, and the patient requires a drug that can be crushed or sprinkled on food.
Doxazosin ER (Cardura XL) **Alpha Blockers for BPH**	• The patient has experienced or is likely to experience significant adverse effects from formulary alternatives.
Sumatriptan needle-free injection (Sumavel) **Triptans**	• No alternative formulary agent available for patients with needle phobia or those with dexterity issues who cannot manipulate the sumatriptan injection (Imitrex STATdose, generics).

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
February 2010

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on February 17, 2010, and February 18, 2010, at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of February minutes**—Allen W. Middleton, Acting Director, approved the minutes of the November 2009 DoD P&T Committee meeting on February 3, 2010.

2. **Corrections to August minutes**—The P&T Committee clarified that the Prior Authorization (PA) for Phosphodiesterase-5 (PDE-5) inhibitors for erectile dysfunction is not subject to a one-year expiration. Minutes from the May 2005 and August 2009 P&T Committee meetings revealed a discrepancy that required corrective action.

   a) ***COMMITTEE ACTION***—The P&T Committee voted (15 for, 0 opposed, 1 abstained, 0 absent) that the PA for the PDE-5 inhibitors is not subject to the one-year expiration.

   Acting Director, TMA, Decision: ■ Approved □ Disapproved

   Approved, but modified as follows:

III. REVIEW OF RECENTLY APPROVED U.S. FOOD AND DRUG ADMINISTRATION (FDA) AGENTS

A. Narcotic Analgesics—Morphine sulfate extended release (ER)/naltrexone capsules (Embeda)

Relative Clinical Effectiveness—Embeda is the first abuse-deterrent formulation of morphine to reach the market. Each capsule contains round pellets of morphine sulfate ER that surround a naltrexone core. Morphine sulfate ER/naltrexone is a Schedule II controlled substance and is classified as a high-potency single analgesic agent in the narcotic analgesic drug class, which was last reviewed in February 2007. Embeda is

indicated for the treatment of moderate to severe pain in adults when continuous, around-the-clock analgesia is required for an extended period of time.

Morphine is a pure opioid agonist selective for the mu receptor, while naltrexone is a mu antagonist that reverses the effects of the mu agonists. When the capsules are taken whole as directed, the morphine provides analgesia with no clinical effects from the naltrexone. Attempts to tamper with the pellets either by crushing or dissolving will cause a rapid release and absorption of the naltrexone, antagonizing the effects of the morphine released.

The unpublished trial used to gain FDA approval reported that Embeda was superior to placebo in relieving pain in patients with osteoarthritis. A study in recreational opioid users reported reduced drug liking for crushed Embeda capsules and whole Embeda capsules, when compared to immediate release morphine solution. The clinical significance of reduction in drug liking is unknown. The product labeling states, "There is no evidence that the naltrexone in Embeda reduces the abuse liability of Embeda." There are no other abuse deterrent opioids on the market, though several are currently in development.

The safety profile for Embeda reflects that of other morphine sulfate ER products and narcotic analgesics on the Uniform Formulary (UF). Crushing, chewing or dissolving pellets can cause fatal release of morphine or precipitate withdrawal in opioid-tolerant individuals.

The clinical evaluation for Embeda included, but was not limited to, requirements stated in 32 Code of Federal Regulations (CFR) 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) there was a potential benefit, though not yet proven, that morphine sulfate ER/naltrexone (Embeda) has a blunted drug-liking response, compared to other UF high-potency narcotic analgesics.

Relative Cost-Effectiveness—The P&T Committee evaluated the costs of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the other currently available narcotic analgesics. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of the agent. Results from the CMA showed the projected weighted average cost per day for Embeda is higher than the other formulary narcotic analgesics, including transdermal fentanyl, morphine sulfate ER (Avinza and MS Contin), oxycodone (OxyContin), and oxymorphone (Opana ER). However, the projected weighted average cost per day for Embeda was lower than the UF agent morphine sulfate (Kadian).

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (16 for, 0 opposed, 0 abstained, 0 absent) morphine sulfate ER/naltrexone (Embeda) was cost effective relative to the other UF agents in the narcotic analgesics drug class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 3 opposed, 1 abstained, 0 absent) morphine sulfate ER/naltrexone capsules (Embeda) be designated formulary on the UF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: BASIC CORE FORMULARY (BCF) RECOMMENDATION***—The P&T Committee considered the BCF status of morphine sulfate ER/naltrexone (Embeda). Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (15 for, 0 opposed, 1 abstained, 0 absent) morphine sulfate ER/naltrexone (Embeda) would not be added to the BCF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

B. Attention Deficit/Hyperactivity Disorder (ADHD)—Guanfacine extended release (ER) tablets (Intuniv)

Relative Clinical Effectiveness—Intuniv is indicated for the treatment of ADHD in children and adolescents aged 6 to 17 years. Intuniv is included in the ADHD/Narcolepsy drug class, which was reviewed in November 2006.

Guanfacine immediate release (IR) (Tenex, generics) is FDA-approved for treating hypertension, but is well accepted for off-label use in ADHD. Intuniv is dosed once daily for ADHD and is approved as monotherapy. Guanfacine IR is usually dosed twice daily for ADHD. Guanfacine is an alpha-2A agonist and is not a scheduled substance, unlike the stimulants (methylphenidate and amphetamine). Clonidine is another alpha-2A agonist used off-label for ADHD. Clonidine is available in tablets and transdermal formulations. Intuniv has a longer half-life than clonidine and causes less sedative and hypotensive effects.

Atomoxetine (Strattera), another nonstimulant, is FDA-approved as monotherapy for children with ADHD and has a different mechanism of action (norepinephrine reuptake inhibitor) than guanfacine. Strattera has more established efficacy data than Intuniv, but safety concerns include suicidal ideation and hepatotoxicity.

There are no direct comparative trials with Intuniv and other ADHD nonstimulants (guanfacine IR or Strattera). In two 8-week studies, Intuniv was superior to placebo in reducing symptoms associated with ADHD. Its efficacy in adolescents and the optimal dose for heavier adolescents remain to be determined. The duration of action of Intuniv ranged between 8 to 12 hours and was dose-dependent. Longer-term trials are necessary to delineate its place in therapy.

The clinical evaluation for Intuniv included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that guanfacine ER (Intuniv) has a different mechanism of action and adverse effect profile than Strattera. The P&T Committee acknowledged that Intuniv offers the convenience of once-daily dosing and a defined dosing regimen compared to guanfacine IR and clonidine, but there is insufficient data to suggest whether there are additional clinical advantages compared to the other UF nonstimulants.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of guanfacine ER (Intuniv) in relation to the efficacy, safety, tolerability, and clinical outcomes of the ADHD agents in the ADHD/Narcolepsy UF drug class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of Intuniv relative to other UF ADHD agents. Results from the CMA showed the projected weighted average cost per day for Intuniv is higher than other formulary ADHD agents except the clonidine transdermal formulation.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 1 absent) that guanfacine ER (Intuniv) is comparable in cost to branded stimulant and nonstimulant products in the ADHD/Narcolepsy drug class. In comparison to generics in this class, the P&T Committee determined that the higher daily cost for Intuniv was offset by its FDA-approved dosing regimen and once-daily administration.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness, relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (11 for, 3 opposed, 1 abstained, 1 absent) guanfacine ER tablets (Intuniv) be designated formulary on the UF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION***—The P&T Committee considered the BCF status of guanfacine ER (Intuniv). Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (14 for, 0 opposed, 1 abstained, 1 absent) guanfacine ER (Intuniv) would not be added to the BCF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

C. Newer Sedative Hypnotics—Zolpidem sublingual tablets (Edluar)

Relative Clinical Effectiveness—Zolpidem sublingual (SL) tablets (Edluar) is a newer sedative hypnotic approved for the short-term treatment of insomnia characterized by difficulties in sleep initiation. The newer sedative hypnotics were last reviewed in February 2007. Generic zolpidem immediate release (IR) oral tablets are currently included on the BCF.

Edluar was approved under section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act by demonstrating bioequivalence to zolpidem IR (Ambien) tablets. The SL tablets disintegrate when placed under the tongue and are not swallowed. The pharmacokinetic profiles of Edluar, Ambien, and zolpidem extended release (Ambien CR) tablets are similar with regard to bioavailability, time to reach maximal concentration, half-life, protein binding, and elimination. There are no direct comparative trials evaluating the final commercially-marketed formulation of Edluar

with zolpidem IR tablets or other newer sedative hypnotics. Two small studies comparing an early zolpidem SL formulation with Ambien reported sleep onset measures were 6 to 7 minutes faster with the SL product than Ambien; however, the clinical relevance of this difference is unknown The safety profile for Edluar reflects that of other zolpidem formulations (e.g., Ambien and Ambien CR).

The clinical evaluation for Edluar included, but was not limited to, the requirements stated in 32 CFR 199.21(3)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee voted (16 for, 0 against, 0 abstained, 0 absent) that although zolpidem SL tablets (Edluar) offer an alternative sedative hypnotic formulation for patients with swallowing difficulties, there is insufficient data to conclude it offers improved efficacy, safety, or tolerability in the treatment of insomnia compared to zolpidem IR tablets.

Relative Cost-Effectiveness—The P&T Committee evaluated the costs of zolpidem SL tablets (Edluar) in relation to the efficacy, safety, tolerability, and clinical outcomes of the other newer sedative hypnotics. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of Edluar tablets. Results from the CMA showed the projected weighted average cost per day for Edluar is higher than the UF newer sedative hypnotic zolpidem IR and nonformulary (NF) newer sedative hypnotics, ramelteon (Rozerem) and zaleplon (Sonata).

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (16 for, 0 opposed, 0 abstained, 0 absent) zolpidem SL (Edluar) was not cost effective relative to the other UF and NF agents in the newer sedative hypnotics drug class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness, relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 0 absent) that zolpidem SL tablets (Edluar) be designated NF on the UF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA***—Based on the clinical evaluation of zolpidem SL tablets (Edluar) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for Edluar. (See Appendix B for full MN criteria).

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the retail network and mail order, and at Military Treatment Facilities (MTFs) no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

D. Renin Angiotensin Antihypertensive Agents (RAAs)—Telmisartan/ amlodipine tablets (Twynsta)

Relative Clinical Effectiveness—Twynsta is a fixed-dose combination product containing telmisartan (Micardis) and amlodipine (Norvasc, generics). It is the third two-drug combination product containing an angiotensin receptor blocker (ARB; Micardis) and dihydropyridine calcium channel blocker (DHP CCB; amlodipine) to reach the market. Azor (olmesartan [Benicar]/amlodipine) and Exforge (valsartan [Diovan]/amlodipine) were the first entrants on the market. Twynsta is solely indicated for treating hypertension; it can be substituted for the individual titrated components or used as initial therapy in patients likely to require two or more drugs to control blood pressure (BP). Current national guidelines for treating hypertension recommend when more than one drug is needed for BP control, one of the components should comprise a diuretic.

Telmisartan is currently designated as formulary on the UF; amlodipine is designated as BCF. Twynsta is included in the RAAs drug class, which is comprised of several

subclasses (ARBs, angiotensin-converting enzyme (ACE) inhibitors, direct renin inhibitors and their combinations with CCBs or diuretics). The RAAs class will be re-evaluated at an upcoming meeting.

Treatment with various combinations of telmisartan/amlodipine was shown in one randomized trial to significantly reduce BP compared to baseline and placebo. There are no trials evaluating clinical outcomes of mortality or morbidity with Twynsta, although outcomes trials are available with the individual components.

The adverse reaction profile for Twynsta reflects that of the individual components. Although no studies are available specifically addressing the potential for increased compliance with Twynsta over the individual components administered together, other studies have shown an increase in persistence with fixed-dose antihypertensive combination products.

The clinical evaluation for Twynsta included, but was not limited to the requirements stated in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) telmisartan/amlodipine (Twynsta) did not have a significant, clinically meaningful, therapeutic advantage in terms of safety, effectiveness, or clinical outcome over other antihypertensive drugs included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the combination antihypertensive agents in this class as well as the individual components, telmisartan and amlodipine. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of Twynsta relative to other UF agents in this class. Results from the CMA showed the projected weighted average cost per day for Twynsta is higher than the other formulary combination antihypertensive agents, including triple-therapy oral agent amlodipine/valsartan/hydrochlorothiazide (Exforge HCT) and the individual components amlodipine and telmisartan (Micardis).

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (15 for, 1 opposed, 0 abstained, 0 absent) telmisartan/amlodipine (Twynsta) is not cost effective relative to the other combination antihypertensive agents in this class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15

for, 0 opposed, 1 abstained, 0 absent) telmisartan/amlodipine (Twynsta) be designated NF on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation for telmisartan/amlodipine (Twynsta) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Twynsta. (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the retail network and mail order, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

E. RAAs—Aliskiren/valsartan tablets (Valturna)

Relative Clinical Effectiveness—Valturna is a fixed-dose combination product containing the ARB valsartan (Diovan) and aliskiren (Tekturna), a direct renin inhibitor. Tekturna is also available in a fixed-dose combination tablet containing the diuretic hydrochlorothiazide (HCTZ); both Tekturna and Tekturna HCT are designated as formulary on the UF. Valsartan (Diovan) is designated NF. Valturna is included in the RAAs drug class, which will be re-evaluated at an upcoming meeting.

Valturna is indicated for treating hypertension. It has other indications based on clinical trials showing positive clinical outcomes; outcomes trials with Tekturna are currently underway. Current national guidelines for treating hypertension have not yet addressed the place in therapy for direct renin inhibitors, although updated guidelines are anticipated later this year.

Treatment with Valturna was shown in one randomized trial to significantly reduce BP compared to placebo or administering the components individually. However, the BP reduction seen with Valturna in this study was not as large as that seen in other studies evaluating fixed-dose antihypertensive combination products. The adverse reaction profile for Valturna reflects that of the individual components.

The clinical evaluation for Valturna included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) that although aliskiren/valsartan (Valturna) has a unique mechanism of action due to the direct renin inhibitor component and offers the potential for increased persistence, it did not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other antihypertensive drugs included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the cost of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the combination antihypertensive agents in this class as well as the individual components, aliskiren and valsartan. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of Valturna compared to other UF agents. Results from the CMA showed the projected weighted average cost per day for Valturna is higher than the other formulary combination antihypertensive agents, including triple-therapy oral agent Exforge HCT and the individual components, Tekturna and Diovan.

Relative Cost-Effectiveness Conclusion—The P&T Committee voted (16 for, 0 opposed, 0 abstained, 0 absent) that aliskiren/valsartan (Valturna) is not cost effective relative to the other combination antihypertensive agents in this class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 0 opposed, 2 abstained, 0 absent) aliskiren/valsartan (Valturna) be designated NF on the UF.

   Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of aliskiren/valsartan (Valturna) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Valturna. (See Appendix B for full MN criteria).

   Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the retail network and mail order, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes.

   Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

IV. UF DRUG CLASS REVIEWS

A. Basal Insulins

Relative Clinical Effectiveness—The P&T Committee evaluated the clinical effectiveness of the long-acting basal insulin analogues (e.g., basal insulins) for the treatment of diabetes mellitus (DM). Insulin detemir (Levemir) and insulin glargine (Lantus) were FDA approved on June 16, 2005, and April 30, 2000, respectively. Lantus and Levemir are available in both vials and prefilled pen devices (Lantus SoloStar and Levemir FlexPen). Lantus vials are currently on the BCF. Information regarding the safety, effectiveness, and clinical outcomes of the long-acting basal insulin analogues was considered. Neutral Protamine Hagedon (NPH) is an intermediate-acting basal insulin. NPH is not classified in the long-acting basal insulins UF drug class; it remains a BCF drug. The clinical review included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

MHS expenditures for the long-acting basal insulin analogues exceeded $4M per month at the retail, mail order, and MTF points of service (POS) from January 2008 to December 2009. In the MHS, Lantus is the highest utilized basal insulin. Lantus vials were dispensed three times more frequently than the next highest utilized drug, Lantus SoloStar, followed by Levemir FlexPen.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions regarding the basal insulin drug class:

1. With regard to efficacy, the following conclusions were made:
   a) In pivotal trials, both Levemir and Lantus produced similar reductions in glycosylated hemoglobin A1c (HbA1c), when compared to NPH insulin in subjects with type-1 or type-2 DM.

      In head-to-head studies, there was no clinically relevant difference in the reduction in HbA1c between Levemir and Lantus in subjects with type-1 or type-2 DM. The absolute HbA1c difference was <0.4% between the two drugs.

   b) In head-to-head studies, there was a statistically significant difference in the reduction in fasting plasma glucose (FPG) values between Levemir and Lantus in subjects with type-1 DM; larger FPG reductions were seen with Lantus. This difference was not observed in subjects with type-2 DM. The clinical significance of this finding is unknown.

   c) In head-to-head studies, the total Levemir dose required to achieve goal HbA1C levels (<7%) was larger than the dose of Lantus used to achieve goal HbA1C levels in subjects with type-1 DM. Levemir was dosed twice-daily more often

2. With regard to safety and tolerability, the following conclusions were made:
   a) Existing evidence does not support clinically relevant differences concerning hypoglycemia or weight gain between Levemir and Lantus. In subjects with type-2 DM, the difference in weight gain between Levemir (daily and twice daily dosing) vs. Lantus (once daily dosing) was 0.9 kg ($p=0.01$). Once daily dosing of Levemir caused less weight gain than twice daily dosing (absolute difference 1.4 kg; $p<0.001$). Once daily dosing of Levemir caused less weight gain than once daily dosing of Lantus (absolute difference 1.6 kg; $p<0.001$). The difference in weight gain was similar when twice daily dosing of Levemir was compared to once daily dosing of Lantus (absolute difference 0.2 kg).
   b) There is insufficient evidence to determine if there are clinically relevant differences between Levemir and Lantus with respect to cancer risk. Observational studies raised concerns of an association between the use of Lantus and cancer incidence. These studies had inconsistent findings and many study design flaws. FDA is uncertain of this association.
3. With regard to other factors
   a) There are no clinically relevant differences between the pen devices for Lantus SoloStar and Levemir FlexPen in terms of refrigeration requirements and expiration date after opening, with the exception that Levemir is stable for 42 days and Lantus is stable for 28 days.
   b) Patient preference studies report that patients overall prefer using insulin pen devices compared to insulin vials. Most studies have shown no patient preferences among various pen devices.
   c) A request for input from MTF providers revealed that the majority of responders ranked Lantus as their first preference for a basal insulin, followed by Levemir as the second choice, primarily due to perceived differences in efficacy and availability on the local formulary. The majority of responders stated that availability of one basal insulin on the local formulary was adequate to meet their prescribing needs.

Relative Cost-Effectiveness—In considering the relative cost-effectiveness of the basal insulins, the P&T Committee evaluated the costs in relation to the efficacy, safety, tolerability, and clinical outcomes. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA and budget impact analysis (BIA) were used to evaluate the cost-effectiveness of the basal insulins.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following:

a) CMA results of the basal insulins revealed that Lantus vials were more cost effective than Levemir vials based on cost per ml of treatment. CMA results of the basal insulins revealed that Lantus SoloStar pen devices were more cost effective than Levemir FlexPen pen devices based on cost per ml of treatment. Cost per ml of treatment was calculated using average quarterly consumption rates for Lantus vials and Lantus SoloStar pen devices and Levemir vials and Levemir FlexPen pen devices.

b) The potential impact of scenarios with selected basal insulins designated formulary or NF on the UF was evaluated using BIA. Scenarios evaluating the impact of designating basal insulins on the BCF were also considered. Results from the BIA for the basal insulins revealed that placing Lantus vials and Lantus SoloStar pen devices on the BCF and UF, with Levemir vials on the UF, and designating Levemir FlexPen pen devices NF was the most cost-effective scenario overall.

c) BIA results showed that Levemir vials and Levemir FlexPen pen devices were more costly than Lantus vials and Lantus SoloStar pen devices in all scenarios that do not require automated prior authorization. Lantus vials and Lantus SoloStar pen devices were more costly than Levemir vials and Levemir FlexPen pen devices in one scenario involving an automated prior authorization. However, The P&T Committee decided that an automated prior authorization was not clinically appropriate for the basal insulin class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 1 abstained, 0 absent) to recommend the following:

    a) Insulin glargine vials (Lantus), insulin glargine pen devices (Lantus SoloStar) and insulin detemir vials (Levemir) remain classified as formulary on the UF.

    b) Insulin detemir pen devices (Levemir FlexPen) be designated NF on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of insulin detemir pen devices (Levemir FlexPen) and the conditions for establishing MN for a NF medication, the P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Levemir FlexPen. (See Appendix B for full MN criteria).

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the retail network and mail order, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

4. ***COMMITTEE ACTION: BCF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 1 abstained, 0 absent) that insulin glargine vials (Lantus) remain BCF, and insulin glargine pen devices (Lantus SoloStar) be added to the BCF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Antihemophilic Agents—Plasma-derived/Recombinant Factor VIII and Factor IX products

Relative Clinical Effectiveness—The P&T Committee evaluated the clinical effectiveness of the antihemophilic agents. The class was divided into the factor VIII and factor IX concentrates; and the factor VIII/von Willebrand (vWF) factor complexes; human prothrombin concentrate complexes (PCCs); and inhibitor bypassing products. The antihemophilic agents have not previously been reviewed for UF placement; they are an extended core formulary (ECF) drug class.

Purified factor VIII drugs are used to treat hemophilia A and are manufactured from two sources: plasma-derived (human) and recombinant. The human factor VIII products include Hemofil M, Koate-DVI, and Monoclate-P. The recombinant factor VIII products include Advate, Helixate FS, Kogenate FS, Recombinate, Refacto, and Xyntha. Although Refacto is still available for use, it was no longer manufactured at the time of this review and, therefore, not considered for ECF status.

Purified factor IX drugs used to treat hemophilia B are likewise derived from two sources: human and recombinant. The human factor IX concentrates include AlphaNine SD and MonoNine. There is only one recombinant factor IX product: BeneFIX. Information was considered regarding the safety, effectiveness, and clinical outcomes of the factor VIII and factor IX subclasses of the antihemophilic agents. Only uses that pertain to the outpatient pharmacy benefit were considered. The clinical review included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1).

Military Health System (MHS) expenditures for the all antihemophilic agents (factor VIII, factor IX, factor VIII/vWF complexes, PCCs, and inhibitor bypassing products) exceeded $39M from December 2008 to November 2009 predominantly at the retail POS. There are approximately 190 unique utilizers in the MHS. There were no MHS utilizers of Monoclate-P or AlphaNine SD during this time period.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions regarding purified factor VIII and IX concentrates:

1. With regard to efficacy, the following conclusions were made:

a) There are no head-to-head comparative trials evaluating the factor VIII or factor IX products. Efficacy studies were limited to open-label clinical trials with no active comparators.

b) Many products obtained FDA approval based on pharmacokinetic demonstration of bioequivalence to previously approved (e.g., earlier generation) products following improvements in production and viral depletion or inactivation methods.

c) There is no evidence to conclude that there are clinically relevant differences in efficacy between the respective factor VIII and factor IX concentrates.

2. With regard to safety and tolerability, the P&T Committee agreed that, although the overall risk is small, there is a lower risk of viral transmission with recombinant products than with plasma-derived products. There is insufficient evidence to conclude there are clinically relevant differences in safety between the recombinant factor VIII products.

3. With regard to other factors, the following conclusions were made:

   a) National professional group guidelines and national hemophilia patient advocacy groups caution against switching between products once a patient is stabilized, due to potentially detrimental outcomes, including development of immunogenicity.

   b) There are differences among the factor VIII and factor IX products with regard to viral deactivation/depletion methods, storage and refrigeration requirements, vial sizes available, reconstitution and administration kits, patient support programs, and stabilizers/cell culture media used in recombinant products.

Relative Cost-Effectiveness—In considering the relative cost-effectiveness of pharmaceutical agents in the antihemophilic plasma-derived/recombinant factor VIII and factor IX subclass, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMAs were used to evaluate the cost-effectiveness of the plasma-derived/recombinant factor VIII and factor IX subclass.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following:

a) CMA results for the antihemophilic factor VIII agents revealed that Xyntha was the most cost-effective recombinant factor VIII product based on cost per unit of treatment. Cost per unit of treatment was calculated using the

b) CMA results for the antihemophilic factor IX agents revealed that BeneFIX was the most cost-effective antihemophilic recombinant factor IX product based on the cost per unit of treatment. Cost per unit of treatment was calculated using average drug price per unit rates for the recombinant factor IX products AlphaNine SD and MonoNine.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (11 for, 1 opposed, 3 abstained, 1 absent):

   a) All factor VIII and factor IX products recommended for inclusion on the UF had existing Uniform Formulary Voluntary Agreement for Retail Refunds (UF VARR) submissions at or below the Federal Ceiling Price (FCP) or a required Mandatory Agreement for Retail Refunds (MARR). No products recommended for NF designation on the UF have required pricing agreements.

   b) The factor VIII products Koate-DVI, Kogenate FS, Refacto, and Xyntha, and the factor IX products AlphaNine SD and BeneFIX remain classified as formulary on the UF.

   c) The factor VIII products Advate, Hemofil M, Helixate FS, Monoclate-P, and Recombinate, and the factor IX product MonoNine be designated NF on the UF.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of the plasma-derived and recombinant factor VIII and factor IX products and the conditions for establishing MN for a NF medication, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1

absent) MN criteria for Advate, Hemofil M, Helixate FS, Monoclate-P, Recombinate, and MonoNine. (See Appendix B for full MN criteria.)

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 180-day implementation period in the retail network and mail order, and at MTFs no later than a 180-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes.

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

4. ***COMMITTEE ACTION: ECF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 1 abstained, 0 absent):

   a) The factor VIII product Xyntha be designated as ECF on the UF.

   b) The factor IX product BeneFIX be designated as ECF on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. Antihemophilic Agents—Human Factor VIII/vWF, PCCs, and Inhibitor Bypassing products (Recombinant VIIa Factor and Human Activated PCC) Products

Relative Clinical Effectiveness—The P&T Committee evaluated the clinical effectiveness of the remainder of the antihemophilic drug class, comprised of the human factor VIII/vWF complexes, the human PCCs, and the inhibitor bypassing products.

Humate-P and Alphanate are the two human factor VIII products containing a measured amount of vWF that are used to treat certain types of von Willebrand disease and to replace factor VIII in patients with hemophilia A. Human PCCs were formerly the treatment of choice for hemophilia B before highly purified products became available and now are used to treat factor II and factor X deficiency. The PCCs include Bebulin VH and Profilnine SD. The inhibitor bypassing products include one recombinant activated factor VII, NovoSeven RT, and one human activated PCC, Feiba VH. These two products are indicated for use in patients with hemophilia A or hemophilia B who have developed inhibitors, and are used to treat bleeding episodes, or to prevent bleeding episodes during surgical interventions.

Information was considered regarding the safety, effectiveness, and clinical outcomes of the factor VIII/vWF complexes, the PCCs, and the inhibitor bypassing subclass of the antihemophilic agents. Only uses that pertain to the outpatient drug benefit were considered. The clinical review included, but was not limited to, the requirements stated in 32 CFR 199.21(e)(1). There were no MHS utilizers of Humate-P or Profilnine SD from December 2008 to November 2009.

Relative Clinical Effectiveness Conclusion—The P&T Committee recommended (14 for, 0 opposed, 0 abstained, 2 absent) the following clinical effectiveness conclusions:

1. With regard to efficacy, the following conclusions were made:
    a) There is no evidence to conclude that there are clinically relevant differences in efficacy between NovoSeven RT and Feiba VH in the outpatient treatment of bleeding episodes in hemophilia patients who have inhibitors.

b) There is no evidence to conclude that there are clinically relevant differences in efficacy between Bebulin VH and Profilnine SD in the outpatient treatment of factor II or factor X deficiency.

c) There is no evidence to conclude that there are clinically relevant differences in efficacy between Humate-P and Alphanate in the outpatient treatment of von Willebrand disease or hemophilia A.

2. With regard to safety and tolerability, the P&T Committee agreed that:

a) Although the risk is small, there is a lower risk of viral transmission with a recombinant product (NovoSeven RT) than with a plasma-derived product (Feiba VH). Feiba VH may also cause an anamnestic response in patients with inhibitors who are classified as high responders to therapy, and can cause anaphylaxis or nephrotic syndrome in hemophilia B patients who have developed inhibitors. Both products carry a very low risk of thrombotic complications. Feiba VH has a warning advising extreme caution when using in patients with hepatic impairment.

b) Bebulin VH contains heparin and may not be appropriate to use in patients with a history of type II heparin induced thrombocytopenia (HIT); otherwise, there is no evidence that there are clinically relevant differences in safety between Bebulin VH and Profilnine SD.

c) Alphanate contains heparin and may not be appropriate to use in patients with a history of type II HIT; otherwise, there is no evidence that there are clinically relevant differences in safety between Humate-P and Alphanate.

3. With regard to other factors:

a) Feiba VH has a longer half-life than Novoseven RT and may be more appropriate when considering prophylactic treatment in a hemophilia patient who has developed inhibitors and is classified as a high responder to therapy.

c) National professional group guidelines and national hemophilia patient advocacy groups caution against switching between products once a patient is stabilized, due to potentially detrimental outcomes, including development of immunogenicity.

There are differences among the factor VIII/vWF concentrates, the human PCCs, and the inhibitor bypassing products with regard to viral deactivation/depletion methods, storage and refrigeration requirements, vial sizes available, reconstitution and administration kits, and patient support programs.

Relative Cost-Effectiveness—In considering the relative cost-effectiveness of pharmaceutical agents in the human factor VIII/vWF, PCCs, and inhibitor bypassing products subclass, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMAs were used to evaluate the cost-effectiveness of the human factor VIII/vWF, PCCs, and inhibitor bypassing products subclass.

Relative Cost-Effectiveness Conclusion—Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (13 for, 0 opposed, 2 abstained, 1 absent) the following:

a) CMA results for the Factor VIII/vWF subgroup revealed that Alphanate was the most cost-effective agent based on cost per patient per year of treatment. Cost per patient per year of treatment was calculated using yearly consumption rates for Alphanate and Humate-P.

b) CMA results for the PCCs subgroup revealed that Profilnine SD was the most cost-effective agent based on cost per patient per year of treatment. Cost per patient per year of treatment was calculated using yearly consumption rates for Bebulin VH and Profilnine SD.

c) CMA results for the inhibitor bypassing products subgroup revealed that NovoSeven RT was the most cost-effective agent based on a cost per patient per year of treatment. Cost per patient per year of treatment was calculated using yearly consumption rates for NovoSeven RT and Feiba VH.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 2 abstained, 1 absent):

    a) All factor VIII and factor IX products recommended for inclusion on the UF had existing UF VARR submissions at or below the FCP or a required MARR. No products recommended for NF designation on the UF have required pricing agreements.

    b) The factor VIII/vWF product Alphanate, the human PCC product Profilinine SD, and the inhibitor bypassing product NovoSeven RT remain classified as formulary on the UF.

c) The factor VIII/vWF product Humate-P, the human PCC product Bebulin VH, and the inhibitor bypassing product Feiba VH be designated NF on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of the factor VIII/vWF complexes, the human PCCs, and the inhibitor bypassing products subclass of the antihemophilic agents, and the conditions for establishing MN for a NF medication, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for Humate-P, Bebulin VH, and Feiba. (See Appendix B for full MN criteria).

   Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD***—The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 180-day implementation period in the retail network and mail order, and at MTFs no later than a 180-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval of the DoD P&T Committee minutes.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

V. UTILIZATION MANAGEMENT—PA/QUANTITY LIMITS (QL)

A. PDE-5 Inhibitors—PA post-prostatectomy: At the August 2009 P&T Committee meeting, PA criteria for the PDE-5 inhibitors were expanded to include restoration/preservation of erectile function following prostatectomy. Clarification regarding the length of therapy and other issues was requested in order to fully operationalize this criterion at the retail network and mail order pharmacy. The P&T Committee reviewed the clinical evidence regarding the use of PDE-5 inhibitors following prostatectomy, including duration of therapy, and also reviewed the requirements from other civilian health plans.

1. ***COMMITTEE ACTION: PA***—The P&T Committee voted (13 for, 0 opposed, 1 abstained, 2 absent) to recommend limiting the length of therapy to one year for the PDE-5s when used following prostatectomy.

   Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

B. Sumatriptan needle-free injection (Sumavel DosePro)—QL: A new needle-free sumatriptan injection (Sumavel DosePro) has been marketed. Sumavel DosePro will be reviewed as a new FDA-approved drug in the triptan drug class at an upcoming DoD P&T Committee meeting. QLs are currently in place for both oral and other injectable formulations of sumatriptan (Imitrex, generics) and the other oral triptans, which are consistent with the product labeling.

1. ***COMMITTEE ACTION: QL***—The P&T Committee voted (13 for, 0 opposed, 1 abstained, 2 absent) to recommend QLs of 9 mL (18 units)/90 days in the mail order pharmacy and 3 mL (6 units)/30 days in the retail network, which is

consistent with the recommended dosing from the product labeling and avoids breaking apart packages.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VI. ITEMS FOR INFORMATION

A. **Pharmacy Outcomes Research Team (PORT)**—The PORT briefed the P&T Committee on study results concerning the automated PA program for the proton pump inhibitors.

B. **Department of Veterans Affairs (VA)/DoD Joint Contracting Initiatives**

BCF/ECF Issues—The P&T Committee was briefed regarding the VA National Acquisition Center contract for insulin needles. In March 2009, the VA/DoD joint national contract for insulin needles was changed to include the 30 ½" and 31 5/16" gauge/length needle sizes with 0.3, 0.5, and 1 ml volumes. The current DoD BCF insulin needles are 28 ½" gauge/length needles with 0.5 and 1ml volumes. DoD anticipates increased availability of the 31 5/16" gauge/length needle. Historical utilization from DoD prime vendor data shows a significant usage of the 0.3 ml volume syringes.

1. ***COMMITTEE ACTION: UF RECOMMENDATION***—Based on the results of the information presented, the P&T Committee voted (14 for, 0 opposed, 1 abstained, 1 absent) to recommend: 1) 31 5/16" gauge/length needle sizes with the 0.3, 0.5, and 1 ml volumes be added to the BCF; 2) 28 ½" gauge/length needles with 0.5 and 1 ml volumes be deleted from the BCF; and 3) 30 ½" gauge/length needles with 0.5 and 1 ml volumes will be maintained as formulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. **Exenatide injection (Byetta)—PA:** Due to a new FDA indication for Byetta for use as monotherapy in patients with type-2 DM, the P&T Committee received a request to re-

criteria were established by the P&T Committee in August 2006, based on Byetta's potential use for indications not covered by TRICARE (i.e., weight loss) and/or not supported by clinical evidence. Since the original establishment of the PA, there have been updates to the product labeling due to safety concerns, including pancreatitis. The injectable drugs for DM, including Byetta and a similar product recently approved by the FDA, liraglutide injection (Victoza), will be reviewed at an upcoming meeting. The P&T Committee agreed to defer action until the class is reviewed.

VII. NATIONAL DEFENSE AUTHORIZATION ACT, SECTION 703—INCLUSION OF TRICARE RETAIL PHARMACY PROGRAM IN FEDERAL PROCUREMENT OF PHARMACEUTICALS UPDATE

The P&T Committee reviewed drugs that were not included on a DoD Retail Refund Pricing Agreement; these drugs are not compliant with Fiscal Year 2008 National Defense Authorization Act, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated NF on the UF and will require pre-authorization prior to use in the retail POS and medical necessity in MTFs. These NF drugs will remain available in the mail order POS without pre-authorization. Pre-authorization criteria will be determined at a future DoD P&T Committee meeting. Drugs with and without pricing agreements were systematically classified according to therapeutic and pharmacologic lines. The classification system was based on the American Hospital Formulary System Classification and First Data Bank classification. See Appendix C for the full list of affected medications.

A. ***COMMITTEE ACTION—DRUGS RETAINING UF STATUS***: The P&T Committee recommended by consensus the drugs listed in Appendix C, Section A, retain formulary status on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. ***COMMITTEE ACTION—DRUGS RETAINING OR DESIGNATED NF:*** The P&T Committee recommended by consensus the drugs listed in Appendix C, Section B to retain NF status or be designated NF on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. ***COMMITTEE ACTION—IMPLEMENTATION DATE FOR PA:*** The P&T Committee recommended by consensus the implementation date will not be prior to July 1, 2010, and not later than 180 days after the minutes of this meeting are signed.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

D. ***COMMITTEE ACTION—TRANSITION DATE AT THE MTF POS:*** The P&T Committee recommended by consensus a transition period at the MTF POS as ending no later than January 1, 2011.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

VIII. CLASS OVERVIEWS

Class overviews for the antilipidemic-1s, which includes the statins, niacin and ezetimibe; benign prostatic hyperplasia drugs; the RAAs; and the ophthalmologic-1s class, which includes the ocular antihistamines, mast cell stabilizers and combination antihistamines/mast cell stabilizers, were presented to the P&T Committee. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in completing the clinical effectiveness reviews and developing the appropriate cost effectiveness models. The clinical and economic analyses of these classes will be completed at upcoming meetings.

IX. ADJOURNMENT

The meeting adjourned at 1700 hours on February 17, 2010, and at 1200 hours on February 18, 2009. The next meeting will be in May 2010.

Appendix B—Table of Medical Necessity Criteria for Newly Approved Drugs

Drug / Drug Class	Medical Necessity Criteria
Detemir pens (Levemir) **Basal Insulins**	• The patient previously responded to nonformulary agent and changing to a formulary agent would incur unacceptable risk (for patients requiring BID dosing with manual dexterity or visual limitations)
Monoclate-P, Hemofil M, Recombinate, Helixate FS, and Advate **Antihemophilic Agents**	• The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure. • The patient previously responded to nonformulary agent and changing to a formulary agent would incur unacceptable risk
Humate-P, Bebulin VH, and Feiba VH **Antihemophilic Agents**	• The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure. • The patient previously responded to nonformulary agent and changing to a formulary agent would incur unacceptable risk • No alternative formulary agent available (if using Feiba VH for prophylaxis and longer half-life is desired)
Zolpidem sublingual tablets (Edluar) **Newer Sedative Hypnotic Agents**	• No alternative formulary agent available (if patients have swallowing difficulties)
Telmisartan/Amlodipine tablets (Twynsta) **Renin Angiotensin Aldosterone Agents**	• No alternative formulary agent available (if patients have swallowing difficulties)
Aliskiren/Valsartan tablets (Valturna) **Renin Angiotensin Aldosterone Agents**	• No alternative formulary agent available (if patients have swallowing difficulties)

Appendix C—National Defense Authorization Act, Section 703 Affected Medications

A. Drugs Retained as Formulary on the Uniform Formulary

Product Name	Subclass	Manufacturer	Num
TARCEVA	Antineoplastic systemic enzyme inhibitors	GENENTECH, INC.	
TARGRETIN	Oral oncological agents	EISAI INC.	

B. Drugs moved to or retained as nonformulary on the Uniform Formulary

Product Name	Subclass	Manufacturer	Num
FLUOROPLEX	Topical antineoplastic & premalignant lesion medic	ALLERGAN INC.	
PANRETIN	Topical antineoplastic & premalignant lesion medic	EISAI INC.	
SUBOXONE	Narcotic analgesics & combos	RECKITT BENCKIS	
SUBUTEX	Narcotic analgesics & combos	RECKITT BENCKIS	
TAZORAC	Psoriasis medications	ALLERGAN INC.	

Appendix D—Table of Implementation Status of UF Recommendations/Decisions

Date	DoD PEC Drug Class	Type of Action*	BCF/ECF Medications MTFs must have BCF meds on formulary	UF Medications MTFs may have on formulary	Nonformulary Medications MTFs may not have on formulary	Decision Date / Implement Date	PA and QL Issues	Original Review and Updates	Comments
Feb 2010	Basal Insulins	UF Review	▪ Insulin glargine (Lantus) vials ▪ Insulin glargine (Lantus Solostar) pens	▪ Insulin levemir (Detemir) vials	▪ Insulin Levemir (Detemir) pens	Pending 60 days			
Feb 2010	Anti-hemophilic Agents	UF Review	▪ Factor VIII: Xyntha ▪ Factor IX: Benefix	▪ Factor VIII: Koate-DVI, Kogenate FS, Refacto, Alphanate ▪ Factor IX: AlphaNine, Profilnine ▪ Inhibitor bypassing product: Novoseven RT	▪ Factor VIII: Advate, Helixate, Hemofil M, Humate-P, Monoclate-P, Recombinate ▪ Factor IX: Mononine; Bebulin VH ▪ Inhibitor bypassing product: Feiba VH	Pending 60 days			
Feb 2010	ADHD Drugs	New Drug Guanfacine ER (Intuniv)	▪ methylphenidate OROS (Concerta) ▪ mixed amphetamine salts ER ▪ methylphenidate IR	▪ **Guanfacine ER (Intuniv)** ▪ Atomoxetine (Strattera) ▪ Methylphenidate OROS (Concerta ▪ Methylphenidate 30% IR/70% ER (Metadate CD) ▪ Methylphenidate SODAS, SR (Ritalin LA; Ritalin SR) ▪ Mixed Amphetamine salts IR ▪ Dexamphetamine IR ▪ Methamphetamine IR (Desoxyn, generics)	▪ dexmethylphenidate IR, SODAS (Focalin; Focalin SR) ▪ methylphenidate transdermal system (Daytrana) ▪ Lisdexamfetamine (Vyvanse) (Nov 07)	Not applicable		Nov 07 Nov 06	▪ Guanfacine ER (Intuniv) recommended to remain UF (pending)

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
November 2009

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on 5 November 2009 and 6 November 2009 at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. **Approval of August minutes** — Ellen P. Embrey, Acting Director, approved the minutes of the August 2009 DoD P&T Committee meeting on 21 October 2009.

III. REVIEW OF RECENTLY APPROVED FDA AGENTS

A. Multiple Sclerosis - Disease-Modulating Drugs (MS-DMDs) — Interferon Beta-1b Injection (Extavia)

Relative Clinical Effectiveness — Interferon beta-1b injection (Extavia) is an immunomodulator classified as a multiple sclerosis disease-modulating drugs (MS-DMDs). The MS-DMDs were last reviewed for Uniform Formulary (UF) placement in August 2005; no products are currently designated non-formulary.

Extavia is a new branded version of interferon beta-1b, and is the same product as that found under the proprietary name Betaseron. The two manufacturers have agreed to this arrangement. FDA approval for Extavia was based on the same registration trials as the approval for Betaseron, but a separate Biologic License Agreement (BLA) was filed by the manufacturer of Extavia. Availability of generic formulations of biologic agents, including the MS-DMDs, is unknown at this time. Extavia is supplied with a larger needle size (27 gauge vs. 30 gauge) and different packaging than Betaseron (30-day supply vs. 28-day supply). The FDA-approved indications for Extavia are the same as Betaseron.

The interferon beta-1b clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). There are no head-to-head trials comparing interferon beta-1b (Extavia) to interferon-beta-1b (Betaseron) and there is no conclusive data to support superiority of one drug over the other. After review of the clinical literature, interferon beta-1b (Extavia) does not have compelling clinical advantages over existing MS-DMDs on the UF.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) there is currently insufficient data to conclude interferon beta-1b (Extavia) offers improved efficacy, safety, or tolerability compared to the UF product interferon beta-1b (Betaseron).

Relative Cost-Effectiveness — The P&T Committee evaluated the costs of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the other currently available MS-DMDs. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of interferon beta-1b (Extavia). Results from the CMA showed the projected weighted average cost per day for interferon beta-1b (Extavia) is higher than the other formulary MS-DMDs, including interferon beta-1a (Avonex), interferon beta-1a (Rebif), interferon beta-1b (Betaseron), and glatiramer acetate (Copaxone).

Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 1 absent) interferon beta-1b (Extavia) was not cost effective relative to the other UF agents in the MS-DMDs drug class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 0 abstained, 1 absent) interferon beta-1b (Extavia) be designated non-formulary on the UF.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** —Based on the clinical evaluation of interferon beta-1b (Extavia) and the conditions for establishing medical necessity (MN) of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) that no MN criteria are applicable for Extavia.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee recommended (14 for, 0 opposed, 0 abstained, 2 absent) 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Pharmacy Benefits Program (TPHARM), and at Military Treatment Facilities (MTFs) no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Antidepressant-1s (AD-1s) — Bupropion Hydrobromide Extended Release (Bupropion HBr ER) Tablets (Aplenzin)

Relative Clinical Effectiveness — Bupropion HBr (Aplenzin) is a norepinephrine and dopamine reuptake inhibitor (NDRI) approved for the treatment of major depressive disorder (MDD) in adults. The antidepressants in the AD-1 drug class were last reviewed for UF placement in November 2005 and are comprised of the selective serotonin reuptake inhibitors (SSRIs), NDRIs, serotonin-norepinephrine reuptake inhibitors (SNRIs), and the serotonin antagonist/reuptake inhibitors. Bupropion HBr ER (Aplenzin) was approved under section 505(b)(2) of the Federal Food, Drug, and Cosmetic (FDC) Act after demonstrating bioequivalence to bupropion hydrochloride (HCl) ER tablets (Wellbutrin XL). The other NDRIs on the UF are bupropion HCl immediate release (IR) (Wellbutrin IR, generics) and bupropion HCl sustained release (SR) (Wellbutrin SR, generics), with the latter designated as BCF. Bupropion HBr ER tablets are dosed daily, whereas the IR and SR formulations of bupropion HCl are dosed three times and two times daily, respectively. Inclusion of the HBr salt in Aplenzin, rather than the HCl salt included in Wellbutrin products, allows the maximum bupropion dose to be contained in one tablet.

The bupropion HBr ER (Aplenzin) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). There are no direct comparative clinical trials between bupropion HBr ER tablets and the other NDRIs, and no trials are available that evaluate outcomes. The clinical trials used to obtain FDA approval were pharmacokinetic studies demonstrating bioequivalence to bupropion HCl

ER (Wellbutrin XL). The safety profile of bupropion HBr is based on data collected for Wellbutrin SR (bupropion hydrochloride sustained release), thus it is identical to other bupropion products.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) bupropion HBr ER tablets (Aplenzin) do not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other NDRIs currently included on the UF.

Relative Cost-Effectiveness — The P&T Committee evaluated the cost of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the other NDRIs in the AD-1 class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of bupropion HBr ER tablets (Aplenzin) relative to other UF NDRIs. Results from the CMA showed the projected weighted average cost per day for bupropion HBr ER (Aplenzin) is higher than the bupropion HCl formulations (Wellbutrin IR, SR, and XL). The CMA also revealed the projected weighted average cost per day for bupropion HBr ER tablets (Aplenzin) is higher than the formulary NDRI, bupropion HCl 12-hour formulation (Wellbutrin SR) and the non-formulary 24-hour formulation (Wellbutrin XL).

Relative Cost-Effectiveness Conclusion —The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 1 abstained, 0 absent) that bupropion HBr ER tablets (Aplenzin) are not cost effective relative to other AD-1 NDRIs included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness, relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 0 opposed, 2 abstained, 0 absent) that bupropion HBr ER tablets (Aplenzin) be designated non-formulary on the UF.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** —

Based on the clinical evaluation of bupropion HBr ER tablets (Aplenzin) and the conditions for establishing MN of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) that no MN criteria are applicable for Aplenzin.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TPHARM, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. Antidepressant-1s (AD-1s) — Milnacipran Tablets (Savella)

Relative Clinical Effectiveness — Milnacipran (Savella) is an SNRI approved for the treatment of fibromyalgia in adults. The agents in the AD-1 drug class were last reviewed for UF placement in November 2005. The other SNRIs on the Uniform Formulary are venlafaxine immediate-release tablets (Effexor, generics), venlafaxine extended release capsules (Effexor XR), and venlafaxine extended-release tablets (no brand name). The UF also includes other drugs medically accepted to treat fibromyalgia, including several selective serotonin reuptake inhibitors (SSRIs), the tricyclic antidepressant (TCA) amitriptyline (Elavil, generics) and cyclobenzaprine (Flexeril, generics). Milnacipran is approved for depression outside of the US, but the manufacturer will not seek FDA approval for depression.

The milnacipran (Savella) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). In clinical trials, milnacipran significantly improved a composite of fibromyalgia symptoms when compared to placebo. There are no direct comparative clinical trials between milnacipran and the other medications FDA-approved or used off-label for the management of fibromyalgia. Meta-analyses have shown efficacy for use of the antidepressants (SSRIs and TCAs) and cyclobenzaprine in treating fibromyalgia. After review of the clinical literature, milnacipran (Savella) does not have compelling clinical advantages over existing fibromyalgia therapies on the UF. There is currently insufficient data to conclude that milnacipran (Savella) offers improved efficacy, safety, or tolerability compared to other SNRIs or other drugs medically accepted for the treatment of fibromyalgia.

Other Factors — The Pharmacy Outcomes Research Team (PORT) reported results of an analysis comparing the relative frequency of ICD-9 diagnosis codes indicative of fibromyalgia; nerve disorders including phantom limb syndrome, carpal tunnel, peripheral neuropathy, diabetes with neurological symptoms, and postherpetic neuralgia (neuropathic pain); depression; or seizure disorder, among patients receiving SNRIs (duloxetine or venlafaxine), GABA analogs (pregabalin or gabapentin), or the SSRI citalopram.

Study patients (n=20,271) comprised a 10% random sample of all patients who received a prescription for any of these medications at any DoD pharmacy point of service in March 2009. All ICD-9 diagnosis codes were collected for these patients over a 21-month period (1 Oct 07 – 30 Jun 09) from purchased and direct care medical claims data (inpatient and outpatient) in the MHS Data Mart (M2). A second, separate analysis using the same methods examined ICD-9 coding among a 10% sample of patients who received a tricyclic antidepressant (TCA) or cyclobenzaprine in March 2009 (n=10,866).

Pertinent results included:

- The percentage of patients with a ICD-9 diagnosis code for fibromyalgia (729.1) was highest among patients with prescriptions for the two agents with FDA-approved indications for fibromyalgia, pregabalin (30%) and duloxetine (26%), followed by 15% with gabapentin, 11% with venlafaxine, and 7% with citalopram. A total of 14% of patients with prescriptions for a TCA or cyclobenzaprine had ICD-9 codes for fibromyalgia.
- ICD-9 codes consistent with neuropathic pain occurred most commonly among patients with prescriptions for pregabalin (50%) or gabapentin (44%), followed by 29%, 15%, and 13% of patients with prescriptions for duloxetine, venlafaxine, or citalopram, respectively.
- A diagnosis of depression was noted in more than half of patients with prescriptions for duloxetine (54%) or venlafaxine (52%), followed by citalopram (47%), pregabalin (28%), and gabapentin (24%).

- A high percentage of patients with ICD-9 codes for fibromyalgia also had ICD-9 codes for depression, ranging from 71% of patients with prescriptions for citalopram to about 40% with gabapentin or pregabalin. A smaller but still substantial percentage of patients with ICD-9 codes for neuropathic pain also had ICD-9 codes for depression (25 to 60%).
- ICD-9 codes for seizure disorder ranged between 2-3% for any study medication.

While this analysis had clear limitations (including the inability to link diagnosis codes with the actual reason for use), the Committee agreed that it was unlikely that fibromyalgia represents the most common use for any study medication. Taken together with milnacipran's regulatory approval and use for depression outside the U.S. and multiple uses for other agents with a fibromyalgia indication, the Committee did not feel that the results supported consideration of a separate drug class for fibromyalgia, even given milnacipran's lack of any other FDA-approved indication. Several Committee members commented that logically such a grouping of agents should also contain the TCAs (particularly amitriptyline) and cyclobenzaprine, which have a substantial body of evidence supporting first-line use for fibromyalgia.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) that despite its FDA-approved status, milnacipran is one of many available treatments for fibromyalgia. Milnacipran (Savella) does not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other SNRIs and medically-accepted drugs used for fibromyalgia currently included on the UF.

Relative Cost-Effectiveness — The P&T Committee evaluated the cost of milnacipran (Savella) in relation to the efficacy, safety, tolerability, and clinical outcomes of the other SNRIs in the AD-1 class, as well as other medically-accepted treatments for fibromyalgia. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of milnacipran (Savella) relative to other UF SNRIs and medically-accepted treatments for fibromyalgia. Results from the CMA showed the projected weighted average cost per day for milnacipran (Savella) is higher than the UF alternatives commonly used to treat fibromyalgia, including the tricyclic antidepressant amitriptyline (Elavil, generics) and cyclobenzaprine (Flexeril, generics).

Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 1 abstained, 0 absent) that

milnacipran (Savella) is not cost effective relative to other medically-accepted drugs for the management of fibromyalgia included on the UF.

1. ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness, relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 1 opposed, 1 abstained, 0 absent) that milnacipran (Savella) be designated non-formulary on the UF.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** —Based on the clinical evaluation of milnacipran (Savella) and the conditions for establishing MN of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) MN criteria. (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TPHARM, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

D. Overactive Bladder Drugs (OABs) — Oxybutynin Topical Gel (Gelnique)

Relative Clinical Effectiveness — Oxybutynin chloride 10% topical gel (Gelnique) is an antimuscarinic agent classified as an overactive bladder (OAB) drug. It is the second topical oxybutynin product to reach the market, following the transdermal patch (Oxytrol). Like the other OAB drugs, Gelnique is FDA-approved for the treatment of OAB with symptoms of urge urinary incontinence, urgency, and frequency. Gelnique is a clear and colorless hydroalcoholic gel available in a 1 gram sachet (1.14 mL) unit dose that contains 100 mg oxybutynin chloride, which is estimated to deliver approximately 4 mg of oxybutynin chloride per day. The OAB drug class was previously reviewed for UF placement in August 2008 and February 2006. Other oxybutynin products are included on the UF (oxybutynin immediate release (IR) and sustained release (SR) tablets [Ditropan, Ditropan SR, generics] and the Oxytrol patch).

The oxybutynin 10% gel (Gelnique) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). There are no comparative clinical trials between Gelnique and the other OAB drugs, and no published trials evaluating outcomes other than changes in signs and symptoms of OAB. The clinical trials used to obtain FDA approval reported Gelnique was effective at reducing the number of incontinence episodes per day, number of urinary frequency episodes per day, and increasing the urinary volume per void in patients with OAB, comparable to the other OAB agents. The safety profile of Gelnique appears to be comparable to other OAB agents.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that oxybutynin 10% gel (Gelnique) did not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcome over other OAB agents included on the UF.

Relative Cost-Effectiveness — The P&T Committee evaluated the cost of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the anticholinergic agents in the overactive bladder (OAB) class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of oxybutynin 10% gel (Gelnique) relative to other UF anticholinergic OAB agents. Results from the CMA showed the projected weighted average cost per day for oxybutynin 10% gel (Gelnique) is higher than the other formulary OAB anticholinergic agents, including extended-release oral agents (oxybutynin ER [Ditropan XL] and tolterodine ER [Detrol LA]), and the UF transdermal patch formulation (Oxytrol).

Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 1 absent) that oxybutynin 10% gel (Gelnique) is not cost effective relative to the other UF anticholinergic agents in the OAB class.

1. ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 1 opposed, 0 abstained, 1 absent) oxybutynin 10% gel (Gelnique) be designated non-formulary on the UF.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** — Based on the clinical evaluation for oxybutynin 10% gel (Gelnique) and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 0 abstained, 2 absent) MN criteria for oxybutynin 10% gel (Gelnique). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee recommended (14 for, 0 opposed, 0 abstained, 2 absent) 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TPHARM, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

E. Narcotic Analgesics — Tapentadol Tablets (Nucynta)

Relative Clinical Effectiveness — Tapentadol (Nucynta) is an oral, centrally acting, synthetic opioid analgesic, indicated for the relief of moderate to severe acute pain in adults. It is a Schedule II controlled substance and classified as an immediate release, single component high potency agent in the narcotic analgesic drug class, which was last reviewed for UF in February 2007. Tapentadol's exact mechanism of action is unknown, but analgesia is potentially conferred by mu-agonist activity and inhibition of norepinephrine reuptake. It has no pharmacologically active metabolites and requires multiple daily dosing.

The clinical evaluation for tapentadol included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). The pivotal trials used to obtain FDA approval reported that tapentadol was superior to placebo, and non-inferior at specific doses to oxycodone immediate release (IR) in relieving pain in patients with end-stage joint disease or following bunionectomy. There are no published direct comparative trials between tapentadol and other narcotic analgesics. The safety profile of tapentadol reflects that of other narcotic analgesics on the UF, with the exception of a lower incidence of constipation observed in clinical trials compared to immediate-release oxycodone.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) that although tapentadol may result in less gastrointestinal adverse events compared to oxycodone IR, this was an irrelevant benefit given its current indication for short-term therapy in the treatment of acute pain. There is insufficient evidence to suggest a clinically meaningful therapeutic advantage in patient outcomes, in terms of efficacy and safety, compared to the other narcotic analgesics already on the UF.

Relative Cost-Effectiveness — The P&T Committee evaluated the cost of tapentadol in relation to the efficacy, safety, tolerability, and clinical outcomes of the other immediate release, single component high potency agents in the narcotic analgesic drug class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of tapentadol (Nucynta) relative to other UF scheduled and non-scheduled agents in the narcotic analgesic class. Results from the CMA showed the projected weighted average

cost per day for tapentadol (Nucynta) is higher than the other formulary immediate release, single component high potency agent in the narcotic analgesic drug class, including morphine sulfate IR oral, oxycodone hydrochloride IR, and tramadol hydrochloride IR formulations.

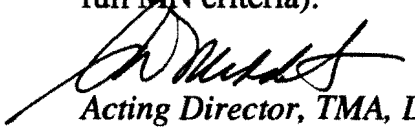
Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (16 for, 0 opposed, 0 abstained, 0 absent) that tapentadol (Nucynta) is not cost effective relative to the other immediate release, single component high potency agents in the narcotic analgesic drug class

1. ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 1 abstained, 0 absent) tapentadol (Nucynta) be designated non-formulary on the UF. This recommendation was based on the clinical effectiveness conclusion and the determination that morphine sulfate (MS-IR/generic; MS-Contin/generic) remains the most cost-effective narcotic analgesic on the UF compared to tapentadol (Nucynta).

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** —Based on the clinical evaluation of tapentadol (Nucynta) and the conditions for establishing medical necessity (MN) of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) MN criteria for tapentadol (Nucynta). (See Appendix B for full MN criteria).



Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** —
The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TPHARM, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

F. Narcotic Analgesics — Tramadol Extended Release (ER) Tablets (Ryzolt)

Relative Clinical Effectiveness — Tramadol extended-release (ER), (Ryzolt) is an oral centrally acting analgesic, and is classified as an extended release, single component, low-potency agent in the narcotic analgesic drug class; it is not a controlled drug. Ryzolt has the same active ingredient as Ultram IR and Ultram ER, but with a differing mode of delivery, and was approved under section 505(b)(2) of the FDC. Ryzolt exhibits immediate-release and extended-release properties, due to its dual-matrix delivery system.

Tramadol ER is indicated for the management of moderate to moderately severe chronic pain in adults who require around-the-clock treatment of their pain for an extended period of time. The postulated mechanism for analgesic efficacy of tramadol is a combination of mu-agonist activity and weak inhibition of serotonin and norepinephrine reuptake. The clinical evaluation for Ryzolt included, but was not limited to the requirements stated in the UF rule, 32 CFR 199.21(e)(1).

In three out of four pivotal trials, Ryzolt was unable to demonstrate superiority over a comparator. The study on which approval was based showed questionable efficacy over placebo. No direct comparative trials have been conducted between Ryzolt and other tramadol products available in the US or other narcotic analgesics. The safety profile of Ryzolt reflects that of other tramadol products on the UF.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that although Ryzolt offered a novel delivery mechanism, there was insufficient evidence to suggest a clinically meaningful

therapeutic advantage in terms of efficacy and safety, compared to the other tramadol products available on the UF.

Relative Cost-Effectiveness — The P&T Committee evaluated the cost of the tramadol ER in relation to the efficacy, safety, tolerability, and clinical outcomes of the other extended release, single component low-potency agents in the narcotic analgesic drug class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of tramadol ER (Ryzolt) relative to the other UF chemically identical chronic pain agents. Results from the CMA showed the projected weighted average cost per day for tramadol ER (Ryzolt) is higher than the non-formulary low-potency single analgesic agent, tramadol extended-release (Ultram ER) and significantly higher than the formulary product tramadol immediate-release (Ultram/generics) Results from the CMA showed the projected weighted average cost per day for tramadol ER (Ryzolt) is higher than the non-formulary low-potency single analgesic agent, tramadol extended release (Ultram ER) and significantly higher than the formulary product tramadol immediate release (Ultram/generics).

Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 1 absent) that tramadol ER (Ryzolt) is not cost effective relative to tramadol extended-release (Ultram ER).

1. ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (15 for, 0 opposed, 0 abstained, 1 absent) tramadol ER tablets (Ryzolt) be designated non-formulary on the UF. This recommendation was based on the clinical effectiveness conclusion and the determination that Ultram (tramadol IR) remains the most cost effective low-potency single narcotic agent on the UF compared to Ryzolt (tramadol ER).

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** —Based on the clinical evaluation of Ryzolt (tramadol ER) and the conditions for establishing medical necessity (MN) of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) MN criteria for Ryzolt (tramadol ER). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TPHARM, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

G. Renin Angiotensin Aldosterone Antihypertensive Agents (RAAs) — Valsartan/Amlodipine/Hydrochlorothiazide (HCTZ) Tablets (Exforge HCT)

Relative Clinical Effectiveness — Exforge HCT is a fixed-dose combination product containing valsartan (Diovan), amlodipine (Norvasc, generics), and hydrochlorothiazide (HCTZ, generics). It is the first three-drug combination product approved for hypertension and contains an angiotensin receptor blocker (ARB; Diovan), a dihydropyridine calcium channel blocker (DHP CCB; amlodipine), and a diuretic (HCTZ). Valsartan/amlodipine/hydrochlorothiazide is solely indicated for treating hypertension. Valsartan (Diovan) and the combination product valsartan/amlodipine (Exforge) are currently designated as non-formulary on the UF; amlodipine (Norvasc, generics) and HCTZ are BCF products. Exforge HCT is included in the renin-angiotensin antihypertensive agents (RAAs) UF drug class, which is comprised of several sub-classes (ARBs, angiotensin converting enzyme (ACE) inhibitors, direct

renin inhibitors and their combinations with CCBs or HCTZ).

Treatment with Exforge HCT has been shown in one randomized trial to produce additive BP lowering and superior BP control compared to combinations of the individual components administered as pairs.

The adverse event profile of valsartan/amlodipine/HCTZ is similar to that of the individual ARB, DHP CCB, and diuretic components. In the clinical trial, the incidence of dizziness (7%) was higher among patients taking the three-drug combination than with any of two-drug combinations, resulting in a 0.7% study drop-out rate, which is less than that seen in a typical ACE inhibitor trial. Hypokalemia was less frequent among participants who took a combination that included the ARB and diuretic than among those who took a combination that included a diuretic without an ARB. Peripheral edema was less common among participants who took a combination that included an ARB and a DHP CCB than among those who took a combination that included a DHP CCB without an ARB.

Studies specifically evaluating patient compliance (adherence and persistence) using Exforge HCT have not been conducted. Nevertheless, there is significant evidence that adherence (short-term compliance) and persistence (long-term compliance) are improved 10–15% for each tablet reduced. That is, both measures of compliance improve 15% when reducing from three tablets to two, and improve 10% when reducing two tablets to one. No study has been conducted addressing reduction of three tablets to one.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 1 absent) that, while valsartan/amlodipine/HCTZ (Exforge HCT) does not have a significant, clinically meaningful therapeutic advantage in terms of safety or efficacy over other antihypertensive combinations/agents included on the UF, the benefits it offers in terms of improved compliance, via decreased tablet burden and simplified medication regimen, are clinically significant.

Relative Cost-Effectiveness — The P&T Committee evaluated the cost of valsartan/amlodipine/HCTZ (Exforge HCT) in relation to the efficacy, safety, tolerability, and clinical outcomes of the antihypertensive agents in the RAAs UF drug class as single ingredient agents and combination formulations. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of Exforge HCT relative to other UF RAAs. Results from the CMA showed the projected weighted average cost per day for amlodipine/valsartan/HCTZ (Exforge HCT) is higher than multi-tablet combinations of the other formulary RAAs, including

amlodipine tablets with lisinopril/HCTZ (Prinzide, generics), telmisartan/HCTZ (Micardis HCT), aliskiren/HCTZ (Tekturna HCT) and losartan/HCTZ (Hyzaar).

Relative Cost-Effectiveness Conclusion — The P&T Committee voted (14 for, 0 opposed, 1 abstained, 1 absent) that amlodipine/valsartan/HCTZ (Exforge HCT) is cost effective relative to the other single ingredient or combination agents in the RAAs drug class. After extensive discussion, the P&T Committee determined that the minimal extra daily cost for the amlodipine/valsartan/HCTZ (Exforge HCT) single tablet formulation was offset by the added patient convenience, and may clinically improve patient compliance.

1. ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (4 for, 11 opposed, 0 abstained, 1 absent) against recommending that valsartan/amlodipine/HCTZ (Exforge HCT) be designated as non-formulary on the UF, thus Exforge HCT will retain uniform formulary status.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: BCF RECOMMENDATION*** — The P&T Committee considered the BCF status of valsartan/amlodipine/HCTZ (Exforge HCT). Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (15 for, 0 opposed, 0 abstained, and 1 absent) to recommend Exforge HCT not be added to the BCF.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

IV. UNIFORM FORMULARY DRUG CLASS REVIEWS

A. Phosphodiesterase-5 (PDE5) Inhibitors for Pulmonary Arterial Hypertension (PAH)

Relative Clinical Effectiveness — The P&T Committee evaluated the clinical effectiveness of the Phosphodiesterase Type-5 (PDE-5) inhibitors for the treatment of pulmonary arterial hypertension (PAH). Sildenafil (Revatio) was previously reviewed for UF placement in August 2005. Tadalafil (Adcirca) is the second PDE-5 inhibitor FDA-approved for PAH, and was recently launched in August 2009. Sildenafil and tadalafil are FDA-approved for treating erectile dysfunction (ED), under the trade names of Viagra and Cialis, respectively. Information regarding the safety, effectiveness, and clinical outcomes of the PAH subclass of the PDE-5 inhibitors was considered. The clinical review included, but was not limited to, the requirements stated in the UF Rule, 32 CFR 199.21(e)(1).

Military Health System (MHS) expenditures for the PDE-5 inhibitors for PAH exceeded $400,000 per month at the retail, mail order and MTFs points of service from September 2007 to September 2009. In the MHS, sildenafil (Revatio) is the highest utilized PDE-5 inhibitor for PAH, with approximately 500 prescriptions dispensed monthly. There have been less than 60 unique utilizers of Adcirca, since its market launch in August 2009.

Relative Clinical Effectiveness Conclusion — The P&T Committee recommended (16 for, 0 opposed, 0 abstained, 0 absent) the following clinical effectiveness conclusions regarding PDE-5 inhibitors for PAH:

1. With regard to efficacy, the following conclusions were made:
    a) Sildenafil (Revatio) and tadalafil (Adcirca) are FDA-approved to improve exercise ability in patients with PAH. Sildenafil has an additional indication specifically to delay clinical worsening in patients with PAH when used in combination with background intravenous epoprostenol (Flolan).
    b) There are no head-to-head trials comparing the two PDE-5 inhibitors for PAH. However, sildenafil and tadalafil show similar improvements in 6-minute walking distance (6MWD) when indirect comparisons of clinical trial results that incorporated the FDA-approved dosing regimens are made.
    c) Sildenafil and tadalafil delay the time to clinical worsening of disease, which is defined variously as a composite of death, transplantation, hospitalization for PAH, initiation of new therapy, or worsening functional class.
        (1) A clinically significant delay in the time to clinical worsening with sildenafil was shown in one trial that used doses four times higher than the FDA-approved dose, and used adjunctive IV epoprostenol treatment in all the patients.

(2) Tadalafil was shown to delay the time to clinical worsening of PAH in one trial that used FDA-approved dosing and used adjunctive bosentan (Tracleer) therapy in 55% of the patients.

d) There is insufficient evidence to conclude that there are clinically relevant differences in clinical effectiveness of PDE-5 inhibitors for PAH.

2. With regards to safety and tolerability, the P&T Committee agreed that there is insufficient evidence to conclude there are clinically relevant differences in safety between PDE-5 inhibitors for PAH. The product labeling for the two drugs is similar with regard to contraindications, precautions, and warnings, and reflects the safety section found in the package inserts for the ED products Viagra and Cialis. The sildenafil and tadalafil doses used for PAH treatment are associated with an increased incidence of adverse events (headache, flushing, myalgia), than occurs with the doses used in ED. Headache is the most frequently reported adverse event with Revatio and Adcirca.
3. With regards to other factors, generic availability of sildenafil (Viagra and Revatio trade names) is expected in 2012, compared to 2020 for tadalafil (Cialis and Adcirca). Additionally, the P&T Committee recognized the convenience to the patient with the once daily dosing required with Adcirca, in contrast to the 3-times daily dosing needed with Revatio. Sildenafil and tadalafil require Prior Authorization when used for PAH (*see* August 2009 DoD P&T Committee meeting minutes for full PA criteria for the PDE-5 inhibitors).

Relative Cost-Effectiveness —The P&T Committee evaluated the costs of sildenafil (Revatio) and tadalafil (Adcirca) in relation to the efficacy, safety, tolerability, and clinical outcomes of the PDE-5 inhibitors for PAH. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2). CMA and Budget Impact Analysis (BIA) were used to evaluate the cost effectiveness of the PDE-5 inhibitors for PAH.

Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (16 for, 0 opposed, 0 abstained, 0 absent) that:

1. Results from the CMA of PDE-5 inhibitors for PAH agents revealed that sildenafil (Revatio) is the most cost effective PDE-5 inhibitor for PAH agent based on an analysis of the cost per day of treatment. Cost per day of therapy was calculated using average daily consumption rates for sildenafil (Revatio) and tadalafil (Adcirca).
2. Budget impact analysis (BIA) was used to evaluate the potential impact of scenarios with selected PDE-5 inhibitor agents designated formulary or non-formulary on the UF. Results from the BIA of PDE-5 inhibitors for PAH

revealed that placing sildenafil citrate (Revatio) on the UF was the most cost effective scenario overall.

3. The results of the BIA showed that tadalafil (Adcirca) is more costly than sildenafil (Revatio) in all scenarios evaluated.

1. ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (14 for, 0 opposed, 1 abstained, 1 absent):

   a) Sildenafil (Revatio 20 mg) remain classified as formulary on the UF.

   b) Tadalafil (Adcirca 20 mg) be designated as non-formulary under the UF, based on cost effectiveness.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** —

   Based on the clinical evaluation of tadalafil (Adcirca) and the conditions for establishing medical necessity (MN) of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) MN criteria for tadalafil (Adcirca). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee recommended (15 for, 0 opposed, 0 abstained, 1 absent) 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TPHARM, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

IV. UTILIZATION MANAGEMENT — UF/BCF ADDITIONS/DELETIONS

A. Status of Bupropion HCl ER Tablets (Wellbutrin XL) on the UF

On an ongoing basis, the DoD PEC monitors changes in the clinical information, current costs, and utilization trends to determine whether the UF status of agents designated as non-formulary needs to be readdressed. The P&T Committee reevaluated the UF status of bupropion ER (Wellbutrin XL, generics) in light of recent price reductions in the generic 150 mg and 300 mg formulations across all three points of service.

Clinical Effectiveness Conclusion — The AD-1 agents were evaluated for UF status at the November 2005 meeting. At that meeting, the P&T Committee concluded bupropion appears similar in efficacy to SSRIs; its major advantage is a lower incidence of sexual adverse effects than the other AD-1 agents. The major disadvantages are the risk of seizures at high doses and its tendency to produce activation/agitation. The putative advantage of the once-daily ER formulation (Wellbutrin XL) is increased compliance, although clinical trial data assessing compliance is not available.

Cost Effectiveness Conclusion — The P&T Committee agreed that the generic bupropion ER (Wellbutrin XL) formulations were now cost effective at all three points of service.

1. ***COMMITTEE ACTION: UF DECISION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 1 abstained, and 0 absent) that bupropion ER (Wellbutrin XL, generic) be immediately reclassified as generic on the UF. Wellbutrin XL was included on the "list of non-formulary drugs for re-evaluation of UF status" presented to the Beneficiary Advisory Panel in January 2008 and approved by the Director, TMA on 13 February 2008. No further approval is needed.

VI. BASIC CORE FORMULARY ISSUES

A. Levonorgestrel — BCF Addition

The Committee received a request to reconsider BCF addition of levonorgestrel (Plan B, generics). Levonorgestrel is currently designated as formulary on the UF; it was originally reviewed for UF status as part of the contraceptive drug class in May 2006. Since the original UF class review, levonorgestrel is now available in a generic product under the trade name Next Choice, which contains two 0.75 mg tablets, taken 12 hours apart for emergency contraception. The Plan B product has been voluntarily discontinued by the manufacturer as of June 2009. A new product, Plan B One Step, is marketed that contains one 1.5 mg tablet, taken in a single dose. Studies evaluating the two tablets vs. one tablet products reported no clinically relevant differences between the regimens in the pharmacokinetic profiles, number of resulting pregnancies, or incidence of nausea and vomiting. The American College of Obstetrics and Gynecology recommends a single dose of 1.5 mg levonorgestrel as one option, or two doses of levonorgestrel 0.75 mg taken 12–24 hours as another option for emergency contraception.

Plan B, Next Choice, and Plan B One Step do not require a prescription for patients 17 years of age and older, thus they are not available from the TPHARM, since they are over-the-counter products for this age group. A prescription is required for patients younger than 17 years; the products are available from the TPHARM if a prescription is supplied. A quantity limit of one fill per prescription, with no refills applies at the TPHARM. Each of the three military services has a policy supporting availability of emergency contraception at the MTFs. A cost analysis between Next Choice and Plan B One Step found Next Choice as the more cost effective product. After reviewing the clinical and cost effectiveness of the product, the P&T Committee agreed that levonorgestrel should be placed on the BCF.

1. ***COMMITTEE ACTION: BCF ADDITION*** — The Committee voted (13 for, 2 opposed, 0 abstained, 1 absent) to recommend adding levonorgestrel 0.75 mg (Next Choice; generic Plan B) to the BCF immediately upon signing of the November 2009 meeting minutes. Plan B One Step would remain designated as formulary under the UF. The current quantity limits of one fill per prescription, with no refills, remains.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Hydrocodone/Acetaminophen 5 mg/500 mg — BCF Deletion

The P&T Committee received a request from the field to re-examine the BCF status of hydrocodone/acetaminophen (Vicodin, generics). Recent FDA communications

outline the potential for accidental ingestion of excessive acetaminophen (Tylenol, generics) doses and a proposed black box warning for prescription products that combine acetaminophen with another drug. Several prescription and OTC products contain acetaminophen, which increases the risk of inadvertent ingestion of higher than maximally recommended dose, and the potential for resulting hepatic injury. Administering hydrocodone/acetaminophen 5mg/500 mg at the highest recommended dose and dosing interval results in an acetaminophen dose that exceeds the maximal FDA-approved dose.

1. ***COMMITTEE ACTION: BCF DELETION*** — The Committee voted (11 for, 3 opposed, 0 abstained, 2 absent) to delete hydrocodone/acetaminophen 5mg/500 mg from the BCF immediately upon signing of the November 2009 meeting minutes; it will remain formulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. Telmisartan +/- HCTZ (Micardis, Micardis HCT) — BCF Deletion

The ARBs and ARB combinations with HCTZ were last reviewed for UF placement in May 2007. Since the last review, the ARB +/- HCTZ combinations have been categorized into a larger class, the Renin-Angiotensin Antihypertensives (RAAs), which is comprised of the angiotensin converting enzyme inhibitors (ACEs +/- HCTZ), the ARB combinations with CCBs, the direct renin inhibitors +/- HCTZ, and the ARB/CCB/HCTZ combinations. The existing preferential pricing for the current BCF ARB, telmisartan +/- HCTZ (Micardis, Micardis HCT) has been terminated by the manufacturer, effective Jan 2010. Additionally in 2010, generic competition in the class is expected, and updated hypertension treatment guidelines from the Joint National Commission will be released. The RAAs drug class will be reviewed for UF status at an upcoming meeting. Due to the aforementioned developments, the Committee recommended deleting telmisartan +/- HCTZ from the BCF.

1. ***COMMITTEE ACTION: BCF DELETION*** — The Committee voted (15 for, 0 opposed, 0 abstained, 1 absent) to delete telmisartan +/- HCTZ (Micardis, Micardis HCT) from the BCF immediately upon signing of the November 2009 DoD P&T Committee minutes; it will remain formulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VII. NATIONAL DEFENSE AUTHORIZATION ACT (NDAA) SECTION 703 — INCLUSION OF TRICARE RETAIL PHARMACY PROGRAM IN FEDERAL PROCUREMENT OF PHARMACEUTICALS UPDATE

A. Medical Necessity for August 09 Section 703 Recommendations —

The committee reviewed medical necessity criteria for drugs that were not included on a Department of Defense Retail Refund Pricing Agreement at the August 2009 meeting. These drugs are not compliant with FY2008 National Defense Authorization Act, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated non-formulary under the Uniform Formulary and will require a pre-authorization prior to use in the retail point of service (POS) and medical necessity in military treatment facilities. These non-formulary drugs will remain available in the mail order POS without pre-authorization. Pre-authorization was determined at the November 2009 DoD P&T Committee meeting. Drugs with and without pricing agreements were systematically classified based along therapeutic and pharmacologic lines. The classification system was based on the American Hospital Formulary System Classification and First Data Bank classification. See Appendix C for the full list of affected medications.

1. ***COMMITTEE ACTION — DRUGS GENERICALLY AVAILABLE REQUIRING PRIORI-AUTHORIZATION:*** The P&T Committee voted (15 for, 0 against, 0 abstained, 1 absent) to recommend the drugs listed in Appendix C, Section A follow the standard TRICARE rules for brand-generic prior-authorization criteria.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION — MEDICAL NECESSITY CRITERIA:*** The P&T Committee voted (13 for, 0 against, 0 abstained, 3 absent) to recommend medical necessity criteria for the drugs listed in Appendix C, Section B.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION — IMPLEMENTATION DATE FOR MEDICAL NECESSITY:*** The P&T Committee voted (13 for, 0 against, 0 abstained, 3 absent) to recommend the implementation date will not be prior to 1 April 2010 and not later than 180 days after the minutes of this meeting are signed.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION — TRANSITION DATE AT THE MTF POS:*** The P&T Committee voted (13 for, 0 against, 0 abstained, 3 absent) to recommend a transition period at the MTF POS as ending no later than 1 January 2011.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Drug Non-compliant with NDAA Section 703 The P&T Committee reviewed drugs that were not included on a DoD Retail Refund Pricing Agreement. These drugs are not compliant with FY08 National Defense Authorization Act, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated non-formulary on the UF and will require a pre-authorization prior to use in the retail point of service (POS) and medical necessity in MTFs. These non-formulary drugs will remain available in the mail order POS without pre-authorization. Pre-authorization will be determined at the February 2010 DoD P&T Committee meeting. Drugs with and without pricing agreements were systematically classified based along therapeutic and pharmacologic lines. The classification system was based on the American Hospital Formulary System Classification and First Data Bank classification. See Appendix D for the full list of affected medications.

1. ***COMMITTEE ACTION — DRUGS RETAINING UF STATUS:*** The P&T Committee voted (12 for, 0 against, 0 abstained, 4 absent) to recommend the drugs listed in Appendix E, Section A to retain formulary status on the Uniform Formulary.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2. ***COMMITTEE ACTION — DRUGS RETAININ OR DESIGNATED AS NON-FORMULARY:*** The P&T Committee voted (12 for, 0 against, 0 abstained, 4 absent) to recommend the drugs listed in Appendix E, Section B to retain non-formulary status or be designated non-formulary on the Uniform Formulary.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3. ***COMMITTEE ACTION — IMPLEMENTATION DATE FOR PRE-AUTHORIZATION:*** The P&T Committee voted (12 for, 0 against, 0 abstained, 4 absent) to recommend the implementation date will not be prior to 1 April 2010 and not later than 180 days after the minutes of this meeting are signed. Formulary status of a drug in these lists will revert back to previous formulary status if Price Agreements are received prior to 1 February, 2010.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4. ***COMMITTEE ACTION — TRANSITION DATE AT THE MTF POS:*** The P&T Committee voted (12 for, 0 against, 0 abstained, 4 absent) to recommend a transition period at the MTF POS as ending no later than 1 January 2011.

Acting Director, TMA, Decision: ☒Approved ☐ Disapproved

Approved, but modified as follows:

VIII. CLASS OVERVIEWS

Class overviews for the Basal Insulins and the RAAs were presented to the P&T Committee. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in completing the clinical effectiveness reviews and developing the appropriate cost effectiveness models. The clinical and economic analyses of these classes will be completed at an upcoming meeting.

IX. ADJOURNMENT

The meeting adjourned at 1700 hours on 5 November 2009 and at 1100 hours on 6 November 2009. The next meeting will be in February 2010.

CDR James Ellzy, MC, USN
DoD P&T Committee Chair

DECISION ON RECOMMENDATIONS

Director, TMA, decisions are as annotated above.

Allen W. Middleton
Acting Director

3 Feb 2010
(Date)

Appendix A — Attendance

Voting Members Present	
CDR James Ellzy, MC	DoD P&T Committee Chair
LTC Stacia Spridgen, MSC	Director, DoD Pharmacoeconomic Center, (Recorder)
Lt Col Thom Bacon *for Col Everett McAllister, MSC*	Chief, Pharmaceutical Operations Directorate
Lt Col William Hannah, MC	Air Force, Internal Medicine Physician
Major Jeremy King, MC	Air Force, OB/GYN Physician
Capt Walter Downs, MC	Navy, Internal Medicine Physician
CAPT David Tanen, MC	Navy, Physician at Large
Lt Col Mike Spilker, BSC	Consultant to the AF/SG
Lt Col Brian Crownover, MC	Air Force, Physician at Large
CDR Phil Blaine *for CAPT Stephanie Simon, MSC*	Navy, Pharmacy Officer
COL Doreen Lounsbery, MC	Army, Internal Medicine Physician, Alternate
LTC Bruce Lovins, MC	Army, Family Practice Physician, Alternate
LTC Douglas Louggee for COL Ted Cieslak, MC	Army, Physician at Large
COL Peter Bulatao *for COL Carole Labadie, MSC*	Army, Pharmacy Officer, Alternate
CAPT Vernon Lew	Coast Guard, Pharmacy Officer
Mr. Joe Canzolino	Department of Veterans Affairs
Voting Members Absent	
COL Carole Labadie, MSC	Army, Pharmacy Officer
CAPT Stephanie Simon, MSC	Navy Pharmacy Officer
COL Ted Cieslak, MC	Army, Physician at Large
Col Everett McAllister BSC	Chief, Pharmaceutical Operations Directorate
Nonvoting Members Present	
Mr. David Hurt	Assistant General Counsel, TMA
Nonvoting Members Absent	
COL Kent Maneval, MS	Defense Medical Standardization Board
Mr. William Davies	TRRx/TMOP COR
Guests	
CDR Michael Lee	Indian Health Service
Dr. Lisa Longo	VA PBM
Ms. Melanie Richardson	DoD Pharmacy Operations Directorate

Appendix A — Attendance (continued)

Others Present	
Lt Col James McCrary, MC	DoD Pharmacoeconomic Center
Lt Col Cynthia Lee, BSC	DoD Pharmacoeconomic Center
LCDR Bob Selvester, MC	DoD Pharmacoeconomic Center
CAPT Brian Haney, MC	DoD Pharmacoeconomic Center
LCDR Marisol Martinez	DoD Pharmacoeconomic Center
HM2 Trishonya McMihelk	DoD Pharmacoeconomic Center
Dr. Shana Trice	DoD Pharmacoeconomic Center
Dr. Eugene Moore	DoD Pharmacoeconomic Center
Dr. Angela Allerman	DoD Pharmacoeconomic Center
Dr. David Meade	DoD Pharmacoeconomic Center
Dr. Teresa Anekwe	DoD Pharmacoeconomic Center
Dr. Jeremy Briggs	DoD Pharmacoeconomic Center
Mr. Stephen Yarger	DoD Pharmacy Outcomes Research Team contractor
Dr. Esmond Nwokeji	DoD Pharmacy Outcomes Research Team contractor
Ms. Deborah Garcia	DoD Pharmacy Outcomes Research Team contractor
Dr. Roger Potyk	DoD Pharmacy Outcomes Research Team contractor
Dr. Dean Valibhai	DoD Pharmacy Operations Center contractor

Appendix B — Table of Medical Necessity Criteria for Newly Approved Drugs

Drug / Drug Class	Medical Necessity Criteria
Tadalafil tablets (Adcirca) **Phosphodiesterase-5 (PDE-5) Inhibitors for Pulmonary Arterial Hypertension (PAH)**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives. • Formulary agents have resulted in therapeutic failure
Interferon Beta 1-b injection (Extavia) **Multiple Sclerosis - Disease Modulating Drugs (MS-DMDs)**	• None of the medical necessity criteria apply; interferon Beta 1-b injection (Betaseron brand name) is on the UF
Milnacipran tablets (Savella) **Antidepressant -1s (AD-1s)**	• Use of formulary alternatives is contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure. • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk
Bupropion hydrobromide extended release tablets (Aplenzin) **Antidepressant -1s (AD-1s)**	• None of the medical necessity criteria apply; Bupropion HCl ER (Wellbutrin XL generic) is now recommended for UF status
Oxybutynin topical gel (Gelnique) **Overactive Bladder (OAB)**	• The patient has experienced significant adverse effects from formulary alternatives.
Tapendatol tablets (Nucynta) Tramadol ER (Ryzolt) **Narcotic Analgesics**	• Use of formulary alternatives is contraindicated

Appendix C — Table of Medical Necessity and Branded Drugs with Formulary Equivalents for August 09 Section 703 Recommendations

Brand Name	Generic Name
Aclovate	aclomethasone diproprionate
Altace	ramipril
Carnitor, Carnitor SF	levocarnitine tablets, solution
Cutivate	fluticasone propionate
Cytoxan	cyclophosphamide
Depakene	valproic acid
Kaon-CL	potassium chloride
Mobic	meloxicam
Omnicef	cedinir capsules, suspension
Persantine	dipyridamole
Pletal	cilostazol
Septra;Septra DS	trimethoprim/sulfamethoxazole
Silvadene	silver sulfadiazine
Tapazole	methimazole
Temovate	clobetasol
Viroptic	trifluridine
Zonegram	zonisamide

Appendix C — Table of Medical Necessity and Branded Drugs with Formulary Equivalents for August 09 Section 703 (continued)

Drug	Generic Alternative	Brand Alternative	Applicable MN Rules
APTIVUS			1,2,3,4,5
ATROVENT HFA		Spiriva Inhaler	1,2,3,4
CORGARD	Atenolol, Metoprolol		1,2,4
CYTOMEL	Levothroid, Levothyroxine tables	Armour Thyroid	1,2,3,4,5
ELESTRIN	Estradiol Patch	Estrogel Gel, Divigel Gel, Evamist Spray, Menostar Patch, Vivelle Dot Patch	1,2,4
ELIGARD	Leuprolide Acetate Kit		1,2,3,4,5
ENDOMETRIN		First-Progesterone Vaginal Suppositories, Crinone Gel	1,2,3,4
LITHOSTAT			1,2,3,4,5
MIRAPEX	Bromocriptine	Requip XL, Ropinirole	1,2,3,4
NIRAVAM	Alprazolam Tabs Generic		1,2,3
OXISTAT	Clotrimazole Cream, Ketoconazole Cream, Shampoo	Lamisil, Mentax, Halotin, Xolegel Gel	1,3
PAMINE	Methscopolamine Bromide tablets		1,2,3
PAMINE FORTE	Methscopolamine Bromide tablets		1,2,3
PAMINE FQ	Methscopolamine Bromide tablets		1,2,3
PHOSLO	Calcium Acetate Tabs	Eliphos Tabs, Renagel Tabs, Renvela Tabs	1,2,3,4
RHEUMATREX	Methotrexate dosepack		1,2,3
SALAGEN	Pilocarpine HCl Tab	Evoxac Caps	1,2,3
THALITONE	Chlorthalidone Tabs	Diuril Oral Susp	1,2,3,4
TINDAMAX			1,2,3,4,5
TRANSDERM-SCOP			1,2,3,4,5
ULTRAVATE PAC	Halobetasol cream, ointment, gel		1,
VIRAMUNE			1,2,3,4,5

1) Use of formulary alternatives is contraindicated; 2) Patient has experienced significant adverse effects from the formulary alternative; 3) The formulary agents have resulted in therapeutic failure; 4) The patient previously responded to non-formulary agent, and changing to the formulary agent would incur unacceptable risk; 5) There is no formulary alternative

Appendix D — National Defense Authorization Act (NDAA) Section 703 Affected Medications

Product Name	Definition	Manufacturer	Number of Active Patients
ARICEPT	Alzheimers medications	EISAI INC.	85107
ARICEPT ODT	Alzheimers medications	EISAI INC.	229
DILANTIN	Anticonvulsants / antimania medications	PFIZER US PHARM	512
EPIPEN	Misc respiratory medications	DEY LABS.	13232
EPIPEN JR	Misc respiratory medications	DEY LABS.	3216
FARESTON	Oral oncological agents	GTX INC.	49
HEXALEN	Oral oncological agents	EISAI INC.	18
MENOPUR	FSH/LH fertility agents	FERRING PH INC	850
MESNEX	Oral oncological agents	BAXTER HEALTHCA	6
QUALAQUIN	Antimalarials	AR SCIENTIFIC	10967

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
August 2009

I. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on August 12, 2009 and August 13, 2009 at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

II. ATTENDANCE

The attendance roster is found in Appendix A.

A. Review Minutes of Last Meetings

1. Revisions to the minutes — Revisions to the May 2009 minutes will be reviewed at the November 2009 DoD P&T Committee meeting.
2. Approval of May minutes — The minutes from the DoD P&T Committee meeting held May 13, 2009 are still undergoing review.

III. REVIEW OF RECENTLY FDA-APPROVED AGENTS

A. Targeted Immunomodulatory Biologics (TIBs) — Golimumab injection (Simponi)

Relative Clinical Effectiveness — Golimumab injection (Simponi) is a humanized monoclonal antibody that inhibits biological activity of tumor necrosis factor alpha (TNFα). Golimumab injection is classified in the Targeted Immunomodulatory Biologic (TIB) drug class, which was reviewed for Uniform Formulary (UF) placement in November 2007.

1. *Background* — The clinical evaluation for golimumab included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). Golimumab is administered subcutaneously (SQ) once a month. It is FDA-approved for the treatment of moderate to severely active rheumatoid arthritis (RA) in combination with methotrexate (MTX), moderate to severely active psoriatic arthritis (PsA) alone or in combination with MTX, and active ankylosing spondylitis (AS) in adults. The other injectable TNFα inhibitors with multiple FDA-approved indications for use include adalimumab (Humira), etanercept (Enbrel), and certolizumab (Cimzia).

2. *Efficacy and Safety* — Golimumab was superior to placebo in the treatment of RA, PsA, and AS in the pivotal phase III trials used to obtain FDA approval. There are no direct comparative clinical trials between golimumab and other TNFα inhibitors. There is insufficient evidence to

determine whether treatment with golimumab would result in greater clinical response than other TNF inhibitors. The safety profile of golimumab reflects that of the other anti-TNF agents currently on the market.

3. *Other Factors* — The Pharmacy Outcomes Research Team (PORT) reported results of an analysis evaluating patterns of use of adalimumab (Humira) and etanercept (Enbrel) among 6,257 new Military Health System (MHS) users. Overall, persistence at ~3 years ranged from 35% to 57%. Switching between the two drugs occurred relatively rarely, as 15% (938/6,257) of patients switched once, and 2% subsequently switched back to the original agent. Most patients who were on MTX prior to starting adalimumab or etanercept continued to receive MTX (2,327/3,027 = 77%), but it was relatively uncommon for MTX to be started with or after the TIB for patients who were MTX-naive (642/3,230 = 20%). Overall, about 5% of patients were considered to be potentially "dissatisfied" with the available multi-indication TIBs, based on switching between etanercept and adalimumab, followed by discontinuation. Based on these data, the P&T Committee agreed that clinical coverage in the TIB class appears adequate overall as relatively few patients (17%) switch between the two multi-use TIBs in the first ~3 years of treatment, and only about 5% discontinue treatment after trying both.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) that although golimumab injection (Simponi) requires less frequent administration than the other multi-indication TIBs, it did not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other TIBs currently included on the UF.

Relative Cost-Effectiveness — The P&T Committee evaluated the costs of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the multi-indication agents in the TIB class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2). A cost minimization analysis (CMA) was used to evaluate the cost-effectiveness of golimumab.

Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (12 for, 0 opposed, 0 abstained, 1 absent) golimumab injection (Simponi) was not cost effective compared to

other agents currently on the UF. Results of the CMA confirmed that adalimumab remains the most cost-effective TIB agent available on the UF.

a) ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness, relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 0 opposed, 0 abstained, 1 absent) golimumab injection (Simponi) be designated non-formulary on the UF. This recommendation was based on the clinical effectiveness conclusion and the determination that adalimumab (Humira) remains the most cost effective multi-indication TIB on the UF compared to golimumab (Simponi).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

b) ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** — Based on the clinical evaluation of golimumab injection (Simponi) and the conditions for establishing medical necessity (MN) of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (12 for, 0 opposed, 0 abstained, 1 absent) MN criteria for golimumab injection (Simponi). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

c) ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee voted (11 for, 0 opposed, 1 abstained, 1 absent) to recommend 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at Military Treatment Facilities (MTFs) no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

d) ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA*** — Currently PA requirements apply to etanercept (Enbrel), adalimumab (Humira) and the other TIBs. The P&T Committee agreed that the following PA criteria should apply to golimumab injection, consistent with the FDA-approved labeling and PA requirements for the other TIBs.

(1) Coverage would be approved for the treatment of adult patients with moderate to severely active RA in combination with MTX, moderate to severely active PsA alone or in combination with MTX, and active AS in adults.

(2) Coverage would not be provided for concomitant use with abatacept (Orencia), adalimumab (Humira), anakinra (Kineret), certolizumab (Cimzia), etanercept (Enbrel), infliximab (Remicade), or rituximab (Rituxan).

The P&T Committee voted (12 for, 0 opposed, 0 abstained, 1 absent) to recommend the PA criteria outlined above. See Appendix C for full PA criteria.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

e) ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) IMPLEMENTATION PLAN*** — The P&T Committee voted (11 for, 0 opposed, 1 abstained, 1 absent) to recommend the effective date for the golimumab injection (Simponi) be timed to coincide with that established for the UF decision for golimumab injection (Simponi).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

f) ***COMMITTEE ACTION: QUANTITY LIMITS*** — Quantity limits (QLs) or days supply limits currently apply to etanercept (Enbrel) and adalimumab (Humira) as outlined in Appendix C, and the other TIBs. The P&T Committee voted (12 for, 0 opposed, 0 abstained, 1 absent) to recommend QLs for golimumab injection (Simponi) consistent with FDA-approved labeling and the requirements for the other TIBs. See Appendix C for full recommended QLs.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Targeted Immunomodulatory Biologics (TIBs) — Certolizumab Injection (Cimzia)

Relative Clinical Effectiveness — Certolizumab injection (Cimzia) is a TNFα inhibitor that is conjugated to polyethylene glycol to increase the duration of action. Certolizumab injection is classified in the Targeted Immunomodulatory Biologic (TIB) drug class that was reviewed for Uniform Formulary (UF) placement in November 2007.

1. *Background* — The certolizumab (Cimzia) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). Certolizumab (Cimzia) is available as a lyophilized powder for reconstitution and a solution for SQ injection. It is dosed once monthly for Crohn's disease and every two weeks (with the option of once monthly dosing) for RA. Certolizumab (Cimzia) is FDA-approved for reducing signs and symptoms of Crohn's disease and maintaining clinical response in adult patients with moderate to severely active disease refractory to conventional therapy. It is also approved for the treatment of moderate to severely active RA in adults.

2. *Efficacy and Safety* — There are no direct comparative clinical trials between certolizumab and other TNF inhibitors. Phase III trials demonstrated that certolizumab (Cimzia) was more effective than placebo in achieving and maintaining clinical response in Crohn's disease and RA, and was also more effective than placebo in delaying the progression of structural damage in patients with active RA. There is insufficient evidence to determine whether certolizumab would result in greater response than other anti-TNF agents, and pegylation did not appear to confer added benefits in efficacy or toxicity profile. In general, the safety profile of certolizumab is similar to that of the other TNF inhibitors.

3. *Other Factors* — Based on the Pharmacy Outcomes Research Team (PORT) analysis previously discussed, the P&T Committee agreed that clinical coverage in the TIB class appears adequate overall as relatively few patients (17%) switch between the two multi-use TIBs in the first ~3 years of treatment, and only about 5% discontinue treatment after trying both.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (12 for, 0 opposed, 0 abstained, 1 absent) that although certolizumab injection (Cimzia) has the potential for less frequent administration than adalimumab (Humira) and etanercept (Enbrel), it did not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other TIBs currently included on the UF.

Relative Cost-Effectiveness — The P&T Committee evaluated the costs of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the multi-indication agents in the TIBs class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2). A cost minimization analysis (CMA) was used to evaluate the cost-effectiveness of certolizumab (Cimzia).

Relative Cost-Effectiveness Conclusion — The P&T Committee concluded (12 for, 0 opposed, 0 abstained, 1 absent) certolizumab injection (Cimzia) is not cost effective relative to other formulary TIBs agents.

a) ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 0 opposed, 0 abstained, 1 absent) that certolizumab

injection (Cimzia) be designated non-formulary on the UF. This recommendation was based on the clinical effectiveness conclusion and the determination that adalimumab (Humira) remains the most cost effective multi-indication TIB on the UF compared to certolizumab injection (Cimzia).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

b) ***COMMITTEE ACTION: MN CRITERIA*** — Based on the clinical evaluation of certolizumab (Cimzia) and the conditions for establishing MN of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (12 for, 0 opposed, 0 abstained, 1 absent) MN criteria for certolizumab injection (Cimzia). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

c) ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee voted (12 for, 0 opposed, 0 abstained, 1 absent) to recommend 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at Military Treatment Facilities (MTFs) no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

d) ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA*** — Currently PA requirements apply to etanercept (Enbrel), adalimumab (Humira) and the other TIBs. The P&T Committee agreed that the following PA criteria should apply to certolizumab injection (Cimzia), consistent with the FDA-approved labeling and PA requirements for the other TIBs.

(1) Coverage would be approved for reducing signs and symptoms of Crohn's disease, maintaining clinical response in adult patients with moderate to severely active disease refractory to conventional therapy, and for the treatment of moderate to severely active RA in adults.

(2) Coverage would not be provided for concomitant use with abatacept (Orencia), adalimumab (Humira), anakinra (Kineret), etanercept (Enbrel), golimumab (Simponi), infliximab (Remicade), or rituximab (Rituxan).

The P&T Committee voted (11 for, 0 opposed, 1 abstained, 1 absent) to recommend the PA criteria outlined above. See Appendix C for full PA criteria.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

e) ***COMMITTEE ACTION: PA IMPLEMENTATION PLAN*** — The P&T Committee voted (12 for, 0 opposed, 0 abstained, 1 absent) to recommend the effective date for the certolizumab injection (Cimzia) be timed to coincide with that established for the UF decision for certolizumab Cimzia).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

f) ***COMMITTEE ACTION: QUANTITY LIMITS*** —The P&T Committee voted (12 for, 0 opposed, 0 abstained, 1 absent) to recommend QLs for certolizumab injection (Cimzia) consistent with FDA-approved labeling and the requirements for the other TIBs. See Appendix C for full recommended QLs.

ActingDirector, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

C. Alpha Blockers for Benign Prostatic Hyperplasia (BPH) — Silodosin capsules (Rapaflo)

Relative Clinical Effectiveness — Silodosin (Rapaflo) is an alpha blocker FDA-approved for the treatment of the signs and symptoms of benign prostatic hyperplasia (BPH). The alpha blockers for BPH were last reviewed for UF placement in November 2007. Silodosin (Rapaflo) is similar to tamsulosin (Flomax); it is a highly selective antagonist of α1A-adrenoceptors (α1A-AR) in the prostate. Alfuzosin (Uroxatral) is the third uroselective alpha blocker for BPH in the class.

The silodosin capsules (Rapaflo) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). There are no direct comparative clinical trials between silodosin and the other alpha blockers for BPH, and no trials are available that evaluate outcomes other than changes in signs and symptoms of BPH. The clinical trials used to obtain FDA approval reported silodosin is effective at reducing International Prostate Symptom Score (IPSS) (which signifies reduction in symptoms) and increasing maximum urinary flow rate (Qmax) in patients with BPH. Improvements in the IPSS score and Qmax are comparable to the changes seen with the other alpha blockers. The safety profile of silodosin (Rapaflo) appears to be comparable to other uroselective agents.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) silodosin capsules (Rapaflo) do not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other alpha blockers for BPH currently included on the UF.

Relative Cost-Effectiveness — The P&T Committee evaluated the costs of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the Alpha Blocker class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2). Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of silodosin capsules (Rapaflo) relative to other UF alpha blocking agents. Results from the CMA showed the projected weighted average cost per day for silodosin (Rapaflo) is higher than alfuzosin (Uroxatral). The CMA also revealed the projected weighted average cost per day for silodosin (Rapaflo) is lower than the non-formulary alpha blocking agent, tamsulosin (Flomax). Alfuzosin (Uroxatral) remains the most cost effective alpha blocking agents on the UF.

Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 0 absent) that silodosin capsules (Rapaflo) are not cost effective relative to other alpha blockers for BPH included on the UF. Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded the following:

1. Results of the CMA revealed that silodosin (Rapaflo) was more cost effective than tamsulosin (Flomax) and was not cost-effective compared to alfuzosin (Uroxatral).

2. Results of the CMA confirmed that alfuzosin (Uroxatral) remains the most cost-effective alpha blocking agent available on the UF.

a) ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness, relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 0 abstained, 0 absent) that silodosin capsules (Rapaflo) be designated non-formulary on the UF. This recommendation was based on the clinical effectiveness conclusion and the

determination that alfuzosin (Uroxatral) remains the most cost effective uroselective alpha blocker for BPH on the UF compared to silodosin capsules (Rapaflo).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

b) ***COMMITTEE ACTION: MN CRITERIA*** — Based on the clinical evaluation of silodosin and the conditions for establishing MN of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 0 absent) MN criteria for silodosin capsules (Rapaflo) when use of formulary alternatives is contraindicated, when the patient has experienced significant adverse effects from formulary alternatives, when formulary agents have resulted in therapeutic failure, or when the patient requires a drug that can be crushed or sprinkled on food. (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

c) ***COMMITTEE ACTION: UF IMPLEMENTATION PERIOD*** — The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at Military Treatment Facilities (MTFs) no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

d) ***COMMITTEE ACTION: PA CRITERIA*** —An automated prior authorization (APR) or *step therapy* is currently in effect and requires use of UF alfuzosin (Uroxatral) before other non-formulary alpha blockers for BPH, unless there is therapeutic failure, intolerance, or hypersensitivity. The Committee agreed that the following PA criteria should apply to silodosin capsules (Rapaflo). Coverage would be approved if the patient met any of the following criteria:

(1) Automated PA criteria:

(a) The patient has received a prescription for either silodosin (Rapaflo) or alfuzosin (Uroxatral) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.

(2) PA criteria if automated criteria are not met:

(a) The patient has tried alfuzosin (Uroxatral) and had an inadequate response or was unable to tolerate treatment due to adverse effects.

(b) Treatment with alfuzosin (Uroxatral) is contraindicated.

(c) The patient requires an alpha blocker that can be crushed and sprinkled on food.

e) ***COMMITTEE ACTION:*** The P&T Committee voted (12 for, 0 opposed, 1 abstained, 0 absent) to recommend the PA criteria outlined above.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

f) ***COMMITTEE ACTION: PA IMPLEMENTATION PLAN*** — The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend the effective date for the silodosin (Rapaflo) PA be timed to coincide with that established for the UF decision for silodosin.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

D. Narcolepsy/Attention Deficit Hyperactivity Disorder (ADHD) — Armodafinil tablets (Nuvigil)

Relative Clinical Effectiveness — Armodafinil (Nuvigil) is a non-amphetamine wakefulness promoting agent. It is the single R-enantiomer of modafinil (Provigil), which is a racemic mixture. The R-enantiomer has been shown to have a longer half-life than its S-counterpart; however, the half-lives of armodafinil and modafinil are similar. The subclass of narcolepsy agents was last reviewed in November 2006 as part of the ADHD and narcolepsy drug class. The other narcolepsy agents on the uniform formulary are modafinil (Provigil) and sodium oxybate.

Armodafinil (Nuvigil) is FDA-approved for the treatment of excessive sleepiness associated with narcolepsy, obstructive sleep apnea/hypopnea syndrome, and shift work sleep disorder. These are the same FDA indications as the current UF agent modafinil (Provigil). Generic formulations of modafinil (Provigil) are expected in mid-2010.

The armodafinil (Nuvigil) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). There are no head-to-head trials comparing armodafinil (Nuvigil) to modafinil (Provigil) and there is no conclusive data to support longer-lasting effects of armodafinil (Nuvigil) as compared to modafinil (Provigil). After review of the clinical literature, armodafinil (Nuvigil) does not have compelling clinical advantages over existing narcolepsy agents on the UF. There is currently insufficient data to conclude that armodafinil (Nuvigil) offers improved efficacy, safety, or tolerability compared to modafinil (Provigil).

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (12 for, 0 opposed, 1 abstained, 0 absent) there is currently insufficient data to conclude that armodafinil (Nuvigil) offers improved efficacy, safety, or tolerability compared to the UF product modafinil (Provigil).

Relative Cost-Effectiveness — The P&T Committee evaluated the costs of the agent in relation to the efficacy, safety, tolerability, and clinical outcomes of the Narcolepsy/ADHD class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2). A cost minimization analysis (CMA) was used to evaluate the cost-effectiveness of armodafinil tablets (Nuvigil).

Relative Cost-Effectiveness Conclusion — The P&T Committee, based upon its collective professional judgment, voted (10 for, 2 opposed, 0 abstained, 1 absent) that armodafinil tablets (Nuvigil) are cost effective relative to modafinil (Provigil). Results of the CMA revealed that armodafinil was more cost effective than modafinil, the only UF agent.

a) ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 0 opposed, 1 abstained, 0 absent) that armodafinil tablets (Nuvigil) be designated formulary on the UF.

Acting Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

b) ***COMMITTEE ACTION: BCF RECOMMENDATION*** — Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (13 for, 0 opposed, 0 abstained, and 0 absent) to recommend armodafinil (Nuvigil) not be added to the BCF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

c) ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA*** — Taking into consideration the clinical review, the P&T Committee recommended the following PA criteria should apply to armodafinil (Nuvigil). Coverage would be approved if a patient met any of the following criteria and would expire in 1 year:

(1) Narcolepsy associated with persistent and excessive daytime sleepiness as diagnosed by polysomnogram or mean sleep latency time (MSLT) objective testing;

(2) Obstructive sleep apnea associated with persistent and excessive daytime sleepiness (CPAP treatment adequately titrated and patient is compliant with treatment); and

(3) Nightshift worker with diagnosis of shift-work sleep disorder associated with excessive sleepiness.

d) ***COMMITTEE ACTION:*** The P&T Committee voted (12 for, 1 opposed, 0 abstained, 0 absent) to recommend PA criteria for armodafinil (Nuvigil) as outlined above.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

e) ***COMMITTEE ACTION: PA IMPLEMENTATION PLAN*** — The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Allen P. Rubley

IV. UNIFORM FORMULARY DRUG CLASS REVIEWS

A. Phosphodiesterase-Type 5 (PDE-5) Inhibitors

Relative Clinical Effectiveness — The P&T Committee evaluated the clinical effectiveness of the Phosphodiesterase Type-5 (PDE-5) inhibitors for the treatment of erectile dysfunction (ED). The drug class was previously reviewed for UF placement in May 2005. The class is comprised of two subclasses, PDE-5 inhibitors for ED; sildenafil (Viagra), tadalafil (Cialis), vardenafil (Levitra); and those for pulmonary artery hypertension (PAH): sildenafil (Revatio) and tadalafil (Adcirca). The PDE-5 inhibitors for PAH will be evaluated at a future P&T Committee meeting.

Information regarding the safety, effectiveness, and clinical outcomes of the PDE-5s for ED subclass was considered. The clinical review included, but was not limited to, the requirements stated in the UF Rule, 32 CFR 199.21(e)(1).

MHS expenditures for the PDE-5 inhibitors exceeded $54M in FY 2008 (MTF: $9.75M; TRICARE Retail Network [TRRx]: $36M; and TRICARE Mail Order Pharmacy [TMOP]: $9M). At the MTFs, vardenafil (Levitra) designated an Extended Core Formulary agent, is the highest utilized PDE-5 inhibitor, while sildenafil (Viagra) is the highest utilized drug at the TRRx.

Relative Clinical Effectiveness Conclusion — The P&T Committee recommended the following clinical effectiveness conclusions regarding PDE-5 inhibitors:

1. With regard to efficacy, the following conclusions were made:
   a) ED: Sildenafil (Viagra), tadalafil (Cialis), and vardenafil (Levitra) are FDA-approved for the treatment of ED. There are no head-to-head trials comparing the three PDE-5 inhibitors.

      (1) There is insufficient evidence to conclude that there are clinically relevant differences in efficacy of PDE-5 inhibitors for ED. Although all PDE-5s are clinically superior to placebo, the variability in study design, demographics, and outcome measures

precludes the ability to designate one PDE-5 as clinically superior.

(2) Based on meta-analyses by Agency for Healthcare Research and Quality, the Cochrane reviewers, and BioMed Central, indirect comparisons suggest that there are similar improvements between the three PDE-5 inhibitors in endpoints or International Index of Erectile Function (IIEF) domain change score for erectile function, the percentage of patients responding "yes" on the Global Assessment Questionnaire, question one, the percentage of patients with improved erections, and numbers needed to treat for these endpoints.

(3) One Cochrane analysis found that PDE-5 inhibitors improve erections in diabetic patients.

(4) There is insufficient evidence to conclude that daily therapy for ED is superior to on-demand therapy.

b) PAH: Sildenafil (under the trade name Revatio), and tadalafil (under the trade name Adcirca) both have FDA-approved indications for treating PAH.

c) Preservation/restoration of erectile function after prostatectomy: The P&T Committee agreed that the evidence, based on positive results from published clinical trials, was supportable for daily use of the PDE-5 inhibitors for this off-label indication.

d) Raynaud's Phenomenon: Although results are conflicting and larger, longer-term trials are needed, benefits have been shown with daily use of PDE-5 inhibitors in terms of improvements in digital blood flow in patients with Raynaud's disease. The P&T Committee agreed that this was a supportable off-label use.

e) Other off-label uses: The P&T Committee agreed that the current published literature is insufficient to support use of PDE-5 inhibitors for female sexual dysfunction, hypertension, esophageal motility disorders, ocular blood flow disorders, Eisenmenger's Syndrome, premature ejaculation, recurrent ischemic priapism, and lower urinary tract symptoms due to benign prostatic hypertrophy (BPH).

2. With regards to safety and tolerability, the P&T Committee agreed that there is insufficient evidence to conclude that there are clinically relevant differences in safety between PDE-5s for ED. The product labeling for the three drugs is similar with regard to contraindications, precautions, and warnings. The causal relationship of PDE-5 inhibitors to non-arteritic anterior ischemic optic neuropathy or hearing loss are uncertain at this time.

3. With regards to other factors between the PDE-5s, results from a questionnaire sent to a convenience sample of MTF providers found that about 34% of the respondents ranked sildenafil (Viagra) as their first choice of PDE-5 for treating ED; over 25% stated no preference; 22% ranked tadalafil (Cialis) as their first choice; and 19% ranked vardenafil (Levitra) as their first choice. Approximately 82% of providers felt that on-demand therapy was sufficient to meet the needs of their patients, and approximately 73% of respondents did not feel that it was important to have a PDE-5 inhibitor approved for daily therapy available on the UF. About half of respondents (49%) indicated that the current quantity limit of PDE-5 for ED (6 tablets per month) was appropriate. However, for providers who felt the quantity limit should be increased, the median and mode response was 10 tablets/30 days. Currently, PDE-5 inhibitors do not require prior authorization (PA) for organic ED in men over 50 years old. Responses showed a majority (63%) of providers felt that the current age limit is not appropriate. Over half of respondents (55%) indicated a new automated prior authorization age limit of 40 years was appropriate.

   (1) ***COMMITTEE ACTION:*** The P&T Committee voted (11 for, 0 opposed, 0 abstained, 2 absent) to accept the clinical effectiveness conclusions stated above.

Relative Cost Effectiveness — In considering the relative cost-effectiveness of pharmaceutical agents in the PDE-5 for ED subclass, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the subclass. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2). Cost minimization analysis (CMA) and budget impact analysis (BIA) were used to evaluate the cost effectiveness of the PDE-5 agents.

Relative Cost Effectiveness Conclusion — Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) the following. Results from the CMA of PDE-5s for ED agents revealed that vardenafil (Levitra) was the most cost effective PDE-5 agent. The potential impact of scenarios with selected PDE-5 was evaluated with a BIA. Results from the BIA of PDE-5s for ED revealed that placing vardenafil (Levitra) on the UF in conjunction with a PA requiring a trial of Levitra for new patients was the most cost effective scenario overall. Lowering the age limit for automatic PA approval of the treatment of typical organic erectile dysfunction in

males from 50 to 40 years old would add about 3.7% to the cost of each scenario reviewed. Increasing the quantity limits would increase the cost.

(2) ***COMMITTEE ACTION:*** The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to accept the cost effectiveness conclusions stated above.

(3) ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 0 abstained, 0 absent):

(a) Vardenafil (Levitra 2.5 mg, 5 mg, 10 mg, and 20 mg) be classified as formulary on the UF.

(b) Sildenafil (Viagra 25 mg, 50 mg, and 100 mg) and tadalafil (Cialis 2.5 mg, 5 mg, 10 mg, and 20 mg) be designated as nonformulary under the UF, based on cost effectiveness.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

(4) ***COMMITTEE ACTION: MN CRITERIA*** — Based on the clinical evaluation of sildenafil (Viagra) and tadalafil (Cialis) and the conditions for establishing medical necessity (MN) of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 0 absent) MN criteria for Viagra and Cialis. (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

(5) ***COMMITTEE ACTION: UNIFORM FORMULARY (UF) IMPLEMENTATION PERIOD*** — The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

(6) ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) CRITERIA*** — The P&T Committee recommended (13 for, 0 opposed, 0 abstained, 0 absent, with the exceptions noted below) the following PA criteria should apply to PDE-5 inhibitors other than vardenafil (Levitra). Coverage would be approved if a patient met any of the following criteria, and would expire in one year:

(a) Automated PA criteria:
- (i) The patient has received a prescription for sildenafil (Viagra), tadalafil (Cialis), or vardenafil (Levitra) at any MHS pharmacy point of service (MTFs, retail network pharmacies, or mail order) during the previous 180 days.
- (ii) The patient is a male, aged 40 years or older (12 for, 1 opposed, 0 abstained, 0 absent)

(b) PA if automated criteria are not met:
- (i) The patient has tried vardenafil (Levitra) and has had an inadequate response or was unable to tolerate treatment due to adverse effects.
- (ii) Treatment with vardenafil (Levitra) is contraindicated.
- (iii) Sildenafil (Viagra or Revatio) or tadalafil (Cialis or Adcirca) is for treatment of Pulmonary Artery Hypertension (PAH).

(iv) Use is for preservation/restoration of erectile function after prostatectomy.

(v) Use is for Raynaud's Phenomenon (12 for, 1 opposed, 0 abstained, 0 absent).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

(7) ***COMMITTEE ACTION: PRIOR AUTHORIZATION (PA) IMPLEMENTATION PLAN*** — The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend an implementation plan for the PA be timed to coincide with that established for the UF decision for sildenafil and tadalafil.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

(8) ***COMMITTEE ACTION: QUANTITY LIMITS*** — The P&T Committee considered the QL for the treatment of ED as well as QL for other indications. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (13 for, 0 opposed, 0 abstained, and 0 absent) to recommend maintaining the existing QL for the treatment of typical organic ED of a collective 18 tablets/90 days in the TMOP and 6 tablets/30 days in the TRRx and to accommodate daily therapy for PAH, preservation or restoration of erectile function after prostatectomy, and Raynaud's Phenomenon by setting QLs at a 90-day supply in the TMOP and a 30-day supply in the TRRx.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

(9) ***COMMITTEE ACTION: BASIC CORE FORMULARY DECISION*** — The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend that vardenafil (Levitra) 2.5 mg, 5 mg, 10 mg, and 20 mg tablets be designated as BCF immediately on signing of the August 2009 P&T Committee minutes by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

V. UTILIZATION MANAGEMENT — PRIOR AUTHORIZATIONS (PA) / Quantity Limits (QL) / MEDICAL NECESSITY (MN)

A. Modafinil (Provigil) — Prior Authorization. New data published since the original Narcolepsy drug class review in November 2006 was evaluated to determine if the modafinil (Provigil) PA required updating. The P&T Committee agreed the evidence for using modafinil (Provigil) for sleepiness associated with Parkinson's disease was not supportable. Recommendations for treating fatigue associated with traumatic brain injury (TBI) were mentioned in a recent VA/DoD guideline, and this usage was deemed supportable by the P&T Committee. In the one published, double-blinded, randomized, controlled trial conducted in patients with varying severities of TBI, there was no difference in fatigue or sleepiness associated with TBI between the modafinil groups and placebo. The VA/DoD guidelines pertaining to mild TBI state there is no evidence regarding use of medications in patients recovering from mild TBI and recommend avoiding medications; however, modafinil would be a first-line agent for fatigue based on expert opinion, if medications were initiated. The P&T Committee also recommended updating the criteria used for objectively diagnosing narcolepsy via polysomnogram or mean sleep latency testing (MSLT).

1. ***COMMITTEE ACTION — PA CRITERIA:*** The Committee voted (11 for, 2 opposed, 0 abstained, 0 absent) the following PA criteria should apply to modafinil (Provigil). Coverage would be approved if a patient met any of the following criteria and would expire in 1 year.

a) Narcolepsy associated with persistent and excessive daytime sleepiness as diagnosed by polysomnogram or MSLT objective testing;

b) Obstructive sleep apnea associated with persistent and excessive daytime sleepiness AND continuous positive airway pressure (CPAP) treatment adequately titrated and patient compliant with treatment;

c) Nightshift worker with diagnosis of shift work sleep disorder associated with excessive sleepiness;

d) Multiple sclerosis with excessive fatigue and secondary causes have been addressed;

e) Myotonic dystrophy associated with excessive fatigue;

f) A diagnosis of depression AND primary antidepressant therapy (defined as 4–6 week trial of at least one antidepressant agent) has failed AND the use of other stimulant augmentation (such as methylphenidate products) is contraindicated due to adverse effects, previous failure, or hypersensitivity;

g) Idiopathic hypersomnia diagnosed by a sleep specialist;

h) Fatigue associated with mild traumatic brain injury.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

2. ***COMMITTEE ACTION — PA IMPLEMENTATION PLAN:*** The Committee voted (12 for, 0 opposed, 1 abstained, 0 absent) to recommend an implementation date effective date of the first Wednesday one week after the minutes are signed. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

B. Tramadol extended release (Ryzolt) — QL: A new extended-release formulation of tramadol extended release (ER) (Ryzolt) has been marketed. Tramadol ER will be reviewed for UF status at an upcoming P&T Committee meeting as a newly-approved drug. QLs are currently in place for both immediate and extended-release tramadol (Ultram, Ultram ER, generics), which are consistent with the product labeling.

1. ***COMMITTEE ACTION — QL:*** The Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend QLs for Ryzolt as outlined in Appendix D.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. QL Updates: In anticipation of the forthcoming TPHARM contract implementation, the P&T Committee updated the quantity limits (QLs) for several drugs: mometasone dry powder inhaler (Asmanex Twisthaler), fluticasone dry powder inhaler (Flovent diskus), fluoxetine for weekly dosing (Prozac weekly), azelastine (Astelin), and azelastine with sucrose nasal inhalers (Astepro), which is consistent with QLs for other drugs in the class, and approved product dosing. See Appendix D.

1. ***COMMITTEE ACTION:*** The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend the QLs for mometasone dry powder inhaler (Asmanex Twisthaler), fluticasone dry powder inhaler (Flovent Diskus), fluoxetine for weekly dosing (Prozac Weekly), azelastine (Astelin) and azelastine with sucrose (Astepro) nasal inhalers, as outlined in Appendix D.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VI. NATIONAL DEFENSE AUTHORIZATION ACT (NDAA) SECTION 703 — INCLUSION OF TRICARE RETAIL PHARMACY PROGRAM IN FEDERAL PROCUREMENT OF PHARMACEUTICALS UPDATE

The committee reviewed drugs that were not included on a Department of Defense Retail Refund Pricing Agreement; these drugs are not compliant with FY2008 National Defense Authorization Act, Section 703. The law stipulates that if a drug is not compliant with Section 703, these drugs will be designated non-formulary under the Uniform Formulary and will require a pre-authorization prior to use in the retail point of service and medical necessity in military treatment facilities. These non-formulary drugs will remain available in the mail order point of service (POS) without pre-authorization. Pre-authorization will be determined at the November 2009 DoD P&T Committee meeting. Drugs with and without pricing agreements were systematically classified based along therapeutic and pharmacologic lines. The classification system was based on the American Hospital Formulary System Classification and First Data Bank classification. See Appendix E for the full list of affected medications.

A. ***COMMITTEE ACTION — DRUGS RETAINING UF STATUS:*** The P&T Committee voted (11 for, 1 against, 0 abstained, 1 absent) to recommend the drugs listed in Appendix E, Section A to retain formulary status on the Uniform Formulary.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

B. ***COMMITTEE ACTION — DRUGS DESIGNATED OR RETAINED AS NON-FORMULARY:*** The P&T Committee voted (11 for, 1 against, 0 abstained, 1 absent) to recommend the drugs listed in Appendix E, Section B to retain non-formulary status or be designated non-formulary on the Uniform Formulary.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

Ellen P. Embrey

C. ***COMMITTEE ACTION — IMPLEMENTATION DATE FOR PRE-AUTHORIZATION:*** The P&T Committee voted (13 for, 0 against, 0 abstained, 0 absent) to recommend the implementation date will not be prior to 1 January 2010 and not later than 180 days after the minutes of this meeting are signed. Formulary status of a drug in these lists will revert back to previous formulary status if Price Agreements are received prior to October 14, 2009.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. ***COMMITTEE ACTION — TRANSITION DATE AT THE MTF POS:*** The P&T Committee voted (13 for, 0 against, 0 abstained, 0 absent) to recommend a transition period at the MTF POS as ending no later than 1 January 2011.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

VII. ADJOURNMENT

The meeting adjourned at 1600 hours on August 12, 2009, and at 1300 hours on August 13, 2009. The next meeting will be in November 2009.

Appendix B — Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
Sildenafil (Viagra) Tadalafil (Cialis) **Phosphodiesterase-5 (PDE-5) Inhibitors**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives. • Formulary agents have resulted in therapeutic failure • There is no formulary alternative available for patients with pulmonary arterial hypertension (note: does not apply to erectile dysfunction).
Certolizumab injection (Cimzia) Golimumab injection (Simponi) **Targeted Immunomodulatory Biologics (TIBs)**	• Use of formulary alternatives is contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure. • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk
Silodosin capsules (Rapaflo) **Alpha Blockers for BPH**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives. • Formulary agents have resulted in therapeutic failure. • There is no alternative formulary agent, and the patient requires a drug that can be crushed or sprinkled on food.

Appendix C —Existing Prior Authorization Criteria and Quantity Limits and Recommended PAs and QLs for the Multi-indication Targeted Immunomodulatory Biologics

	Adalimumab (Humira)	Etanercept (Enbrel)	Certolizumab (Cimzia)	Golimumab (Simponi)
Prior Authorization (approved PAs are good indefinitely)	Coverage provided for the treatment of: ▪ Moderately to severely active RA in patients 18 years of age or older. ▪ Active arthritis in patients with PsA 18 years of age or older. ▪ Active AS in patients 18 years of age or older. ▪ Mod to severe active polyarticular JIA (pediatric patients: 4-17 years. ▪ Chronic moderate to severe plaque psoriasis when the patient has tried and failed traditional therapy, such as phototherapy (e.g. UVB, PUVA) or systemic therapy (e.g., methotrexate, acitretin or cyclosporine) OR is not a candidate for phototherapy or systemic therapy. ▪ Moderately to severely active Crohn's disease following an inadequate response to conventional therapy, loss of response to infliximab, or an inability to tolerate infliximab in patients 18 years of age or older. ▪ Coverage NOT provided for concomitant use with anakinra, etanercept, infliximab, abatacept, rituximab, golimumab, or certolizumab.	Coverage provided for the treatment of: ▪ Moderately to severely active RA ▪ Active PsA ▪ Active AS ▪ JRA when the patient has an inadequate response to at least one DMARD ▪ Chronic moderate to severe plaque psoriasis when the patient has tried and failed traditional therapy, such as phototherapy (e.g. UVB, PUVA) or systemic therapy (e.g., methotrexate, acitretin or cyclosporine) OR is not a candidate for phototherapy or systemic therapy ▪ Coverage NOT provided for concomitant use with anakinra, etanercept, infliximab, 31batacept, rituximab, golimumab, or certolizumab	Coverage provided for the treatment of: ▪ Moderately to severely active rheumatoid arthritis in patients 18 years of age or older. ▪ Moderate to severely active Crohn's Disease following inadequate response to conventional therapy in patients 18 years of age or older. ▪ Coverage NOT provided for concomitant use with abatacept, adalimumab, anakinra, etanercept, golimumab, infliximab or rituximab.	Coverage provided for the treatment of the following conditions in patients 18 years of age or older: ▪ Mod to severe active RA in combination with MTX ▪ Mod to severe active PsA ▪ Active AS ▪ Coverage NOT provided for concomitant use with abatacept, adalimumab, anakinra, certolizumab, etanercept, infliximab or rituximab
Quantity Limits	Retail Network: 4 wks supply (2 packs of 2 syringes) Mail Order: 8 wks supply (4 packs of 2 syringes) Other Issues: Crohn's disease starter pack includes 6 pens for first 4 wks, no refills	Retail Network: 4 wks supply (based on instructions for use) Mail Order: 8 wks supply (based on instructions for use)	Retail Network: 4 wks supply (3 packs of 2 syringes) Mail Order: 8 wks supply (3 packs of 2 syringes) Other Issues: 3 packs of 2 syringes will allow for loading dose at initiation of therapy	Retail Network: 4 wks supply (1 autoinjector or 1 syringe) Mail Order: 8 wks supply (2 auto-injectors or 2 syringes)

AS: ankylosing spondylitis; DMARD: disease-modifying anti-rheumatic drug; JIA: juvenile idiopathic arthritis; JRA: juvenile rheumatoid arthritis; MTX: methotrexate; PsA: psoriatic arthritis; RA: rheumatoid arthritis

Appendix D — Quantity Limit Updates

Drug	Quantity Limits	Comments
Mometasone (Asmanex Twisthaler) 110 mcg dry powder inhaler	Retail: 2 inhaler/30 days TMOP: 6 inhalers/90 days	Max dose (adults) is 2 puffs/day
Fluticasone (Flovent Diskus) 50-, 100-, and 250 mcg dry powder inhaler	Retail: 1 inhaler/30 days; TMOP: 3 inhalers/90 days	Diskus has 60 doses per inhaler; recommended dose is 1 puff twice daily
Fluoxetine 90 mg (Prozac Weekly)	Retail: 4 capsules/28 days; TMOP: 12 capsules/84 days	Packing issue: each capsule is a 7 day supply with 4 capsules /box for a 28 day supply; will decrease "refill too soon" rejected claims
Azelastine (Astelin) nasal inhaler; Azelastine with sucralose (Astepro) nasal inhaler	Retail: 2 inhalers/30 days TMOP 6 inhalers/90 days	In line with ESI best commercial practices QL applies to both drugs collectively
Tramadol extended release tablets 100-, 200-, and 300 mg(Ryzolt)	Retail: 30 tablets/30 days TMOP: 90 tablets/90 days	Safety issue; consistent with recommended dosing instructions from product labeling

Section 703 Affected Medications

A. Drugs Retained as Formulary on the Uniform Formulary			
Product Name	**Subclass**	**Manufacturer**	**Number of Affected Patients**
ACTIMMUNE	Immunomodulators	INTERMUNE	25
APOKYN	Parkinson's medications	TERCICA INC	47
DERMA-SMOOTHE-FS	Topical corticosteroids	HILL DERM	1,421
DERMOTIC	Otic medications anti-inflammatory	HILL DERM	1,886
INTAL	Mast cell stabilizers, inhalation	KING PHARM	439
PANRETIN	Topical antineoplastic & premalignant lesion medic	EISAI INC.	1
RADIOGARDASE	Radiation exposure (cesium, thallium)	HEYLTEX CORPORA	
STROMECTOL	Antihelmintic	MERCK & CO.	514
THIOLA	Kidney stone agents	MISSION PHARM.	12
VANCOCIN HCL	Misc antibiotics	VIROPHARMA INCO	1,491
B. Drugs moved to or retained as non-formulary on the Uniform Formulary			
Product Name	**Subclass**	**Manufacturer**	**Number of Affected Patients**
ACIPHEX	PPIs	EISAI INC.	25,129
ACLOVATE	Topical corticosteroids	Pharmaderm	1
AGRYLIN	Platelet reducing agents	SHIRE US INC.	8
ALA-HIST	1st gen AH	POLY PHARM.	216
ALA-HIST D	1st gen AH-decongestant	POLY PHARM.	590
ALTACE	ACE inhibitors	MONARCH PHRM	69
ANAPROX	NSAIDs	ROCHE LABS.	
ANAPROX DS	NSAIDs	ROCHE LABS.	3
ANDROID	Androgens/anabolic steroids	VALEANT	57
APTIVUS	HIV antivirals, protease inhibitors	BOEHRINGER ING.	6
ATROVENT	Nasal anticholinergics	BOEHRINGER ING.	11
ATROVENT HFA	Inhaled anticholinergics	BOEHRINGER ING.	3,565
AZOR	ARB / CCB combo	DAIICHI SANKYO,	4,471
BREVOXYL-4	Keratolytics	STIEFEL LABS.	296
BREVOXYL-8	Keratolytics	STIEFEL LABS.	325

B. Drugs moved to or retained as non-formulary on the Uniform Formulary (cont)			
Product Name	**Subclass**	**Manufacturer**	**Number of Affected Patients**
BROVEX	1st gen antihistamines	MCR/AMERICAN PH	1
BROVEX CT	1st gen antihistamines	MCR/AMERICAN PH	
BROVEX SR	1st gen AH-decongestant	MCR/AMERICAN PH	
BROVEX-D	1st gen AH-decongestant	MCR/AMERICAN PH	
BUPHENYL	Ammonia inhibitors	MEDICIS DERM	7
CADUET	Statin/CCB combo	PFIZER US PHARM	129
CARBATROL	Anticonvulsants	SHIRE US INC.	1,311
CARNITOR	Metabolic deficiency agents	SIGMA-TAU	15
CARNITOR SF	Metabolic deficiency agents	SIGMA-TAU	2
CATAPRES	Sympatholytics	BOEHRINGER ING.	19
CETROTIDE	LHRH (GNRH) antagonist, pituitary suppressant agent	EMD SERONO, INC	34
CHROMAGEN	Iron replacement	THER-RX	511
CHROMAGEN FORTE	Iron replacement	THER-RX	225
CORDRAN	Topical corticosteroids	AQUA PHARMACEUT	145
CORGARD	Beta blockers	KING PHARM	42
CORTISPORIN	Otic medications, anti-infective	MONARCH PHRM	3
CORTISPORIN	Topical antibiotics & combos	MONARCH PHRM	298
CUTIVATE	Topical corticosteroids	Pharmaderm	1,355
CYTOMEL	Thyroid replacement	KING PHARM	2,955
CYTOXAN	Alkylating agents	BMS ONCO/IMMUN	
DAYTRANA	ADHD medications	SHIRE US INC.	2,700
DECLOMYCIN	Tetracycline	STONEBRIDGE PHA	2
DEGARELIX	Antineoplastic LHRH agonists	FERRING PH INC	
DEPAKENE	Anticonvulsants	ABBOTT LABS.	12
DERMA-SMOOTHE-FS	Topical corticosteroids	HILL DERM	2,239
DIBENZYLINE	Alpha blockers, cardiovascular	WELLSPRING PHAR	46
DIPENTUM	Medications for inflammatory bowel disease	ALAVEN PHARMACE	3
DYNEX 12	antitussive-decongestant	ATHLON PHARM	
DYNEX LA	decongestant-expectorant	ATHLON PHARM	4
DYNEX VR	antitussive-expectorant	ATHLON PHARM	
DYRENIUM	Potassium sparing diuretics	WELLSPRING PHAR	277

Appendix F — Implementation Status of UF Class Review Recommendations / Decisions

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (implementation period)
Aug 09 (update; original review Nov 2007)	Targeted Immunomodulatory Biologics	**Recommended for non-formulary status Aug 09; no change to non-formulary status from Nov 07** ▪ golimumab injection (Simponi) ▪ certolizumab injection (Cimzia)	ECF	**No changes to ECF recommendation Nov 07**	pending approval	pending approval
		▪ etanercept injection (Enbrel) ▪ anakinra injection (Kineret)	ECF	▪ adalimumab injection (Humira)	13 Feb 08	18 Jun 08 (120 days)
Aug 09 (update; original review May 05)	Phosphodiesterase Type-5 Inhibitors	**No change to non-formulary status from May 05** Automated PA requiring trial of vardenafil (Levitra) applies to new users of non-formulary PDE5s (no use of PDE5s in last 180 days)	Now BCF	Previously ECF Class ▪ vardenafil (Levitra)	pending approval	pending approval
		▪ sildenafil (Viagra) ▪ tadalafil (Cialis)	ECF	▪ vardenafil (Levitra)	14 Jul 05	12 Oct 05 (90 days)
Aug 09 (update; updated Nov 07; original review Aug 05)	Alpha Blockers for BPH	**Recommended for non-formulary status Aug 09; no change to non-formulary status from Nov 07 or Aug 05** ▪ silodosin (Rapaflo)	BCF	**No changes to BCF recommendation Nov 07**	pending approval	pending approval
		▪ tamsulosin (Flomax) Automated PA requiring trial of alfuzosin (Uroxatral) applies to new users of tamsulosin (no use of uroselective alpha blockers in last 180 days)	BCF	▪ terazosin tablets or capsules ▪ alfuzosin tablets (Uroxatral)	13 Feb 08	16 Apr 08 (60 days)
Aug 09 (update; updated Nov 07; original review Nov 06)	ADHD / Narcolepsy Agents	**No change to non-formulary status from Aug 05 or Nov 07**	BCF	**No changes to BCF recommendation from Aug 05**	pending approval	pending approval
		Recommended for non-formulary status Nov 07 ▪ lisdexamfetamine (Vyvanse)	BCF	No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
		To remain NF ▪ dexmethylphenidate IR (Focalin) ▪ dexmethylphenidate SODAS (Focalin XR) ▪ methylphenidate transdermal system (Daytrana)		Currently on the BCF ▪ methylphenidate OROS (Concerta) ▪ mixed amphetamine salts ER (Adderall XR) ▪ methylphenidate IR (Ritalin)	17 Jan 07	18 Apr 07
May 09 (update; reviewed Jun 08; original review May 07)	Antilipidemic Agents-II	**Recommended for non-formulary status May 09; no change to non-formulary status in Jun 08** ▪ fenofibrate acid (Trilipix)	BCF	No changes to BCF recommendation May 09	17 Aug 09	28 Oct 09
		No changes to NF recommended Jun 08	BCF	**Recommended for addition to BCF Jun 08** ▪ fenofibrate meltdose (Fenoglide), to replace fenofibrate IDD-P (Triglide) (Note: fenofibrate IDD-P (Triglide) removed from BCF but still UF)	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
		To remain NF ▪ fenofibrate nanocrystallized (Tricor) ▪ fenofibrate micronized (Antara) ▪ omega-3 fatty acids (Omacor) ▪ colesevelam (Welchol)	BCF	Currently BCF ▪ gemfibrozil	24 July 07	21 Nov 07 (120 days)
May 09 update; reviewed Aug 08; Feb 06 original review)	Overactive Bladder Drugs	**Recommended for non-formulary status May 09; no change to non-formulary status in Aug 08** ▪ fesoterodine (Toviaz)	BCF	No changes to BCF recommendation May 09	17 Aug 09	28 Oct 09
		▪ tolterodine IR (Detrol) ▪ trospium IR (Sanctura)	BCF	▪ tolterodine ER (Detrol LA) ▪ oxybutynin ER (Ditropan XL, generics) (Note: oxybutynin IR [generic Ditropan] removed from BCF, but still UF)	24 Oct 08	4 Feb 09 (90 days)
May 09 (update; reviewed Nov 08) update to include nasal antihistamines; nasal steroids	Nasal Allergy Drugs	**Recommended for non-formulary status May 09; no change to non-formulary status in Nov 08** ▪ azelastine with sucralose (Astepro)	BCF	No changes to BCF recommendation May 09	17 Aug 09	28 Oct 09

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
reviewed Nov 05 & Aug 07 for Veramyst)		▪ olopatadine (Patanase) ▪ ciclesonide (Omnaris) ▪ fluticasone furoate (Veramyst) ▪ beclomethasone (Beconase AQ) ▪ budesonide (Rhinocort Aqua) ▪ triamcinolone (Nasacort AQ)	BCF	▪ Fluticasone propionate (generic Flonase) ▪ Azelastine (Astelin)	10 Feb 09	8 Apr 09 (60 days)
May 09 (update; reviewed May 07& Feb 05)	Proton Pump Inhibitors	**Recommended for non-formulary status May 09 no change to non-formulary status in May 07** ▪ Dexlansoprazole (Kapidex)	BCF	No changes to BCF recommendation May 09	17 Aug 09	28 Oct 09
		▪ lansoprazole (Prevacid) ▪ omeprazole/sodium bicarbonate (Zegerid) ▪ pantoprazole (Protonix) ▪ rabeprazole (Aciphex) Automated PA requiring trial of omeprazole OR esomeprazole (Nexium) applies to new users of non-formulary PPIs (no use of PPIs in last 180 days)	BCF	▪ generic omeprazole 10 mg and 20 mg (excludes Prilosec 40 mg) ▪ esomeprazole (Nexium)	24 July 07	24 Oct 07 (90 days)
May 09 (update; reviewed May 06)	Antiemetics	**Recommended for non-formulary status May 09; no change to non-formulary status in** ▪ granisetron transdermal system (Sancuso)	BCF	No changes to BCF recommendation May 09	17 Aug 09	28 Oct 09
		▪ dolasetron (Anzemet)	BCF	▪ promethazine (oral and rectal)	26 Jul 06	27 Sep 06 (60 days)
Feb 09	Inhaled Corticosteroids	▪ Beclomethasone HFA MDI (Qvar) ▪ Budesonide MFA MDI (Pulmicort Flexhaler) ▪ Ciclesonide HFA MDI (Alvesco) ▪ Flunisolide CFC MDI (Aerobid, Aerobid M) ▪ Triamcinolone CFC MDI (Azmacort)	BCF	▪ Fluticasone DPI (Flovent Diskus) ▪ Fluticasone HFA MDA (Flovent HFA) ▪ Mometasone DPI (Asmanex Twisthaler)	12 May 2009	16 Sep 09 (120 days)
Feb 09	Long-Acting Beta Agonists	▪ formoterol inhalation solution (Perforomist)	BCF	▪ Salmeterol DPI (Serevent Diskus)	12 May 2009	16 Sep 09 (120 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (implementation period)
Feb 09	Inhaled Corticosteroids / Long-Acting Beta Agonist Combinations	(No ICS/LABA combinations recommended for NF placement Feb 09)	BCF	▪ Fluticasone/salmeterol DPI (Advair Diskus) ▪ Fluticasone/salmeterol HFA MDI (Advair HFA)	12 May 2009	16 Sep 09 (120 days)
Nov 08	Short-Acting Beta Agonists	▪ albuterol chlorofluorocarbon (CFC) metered dose inhaler (MDI) (no longer manufactured) ▪ metaproterenol (Alupent) CFC MDI (no longer marketed) ▪ metaproterenol inhalation solution ▪ pirbuterol (Maxair) MDI	BCF	▪ Ventolin HFA (albuterol hydrofluoroalkane (HFA) MDI ▪ Albuterol inhalation solution; Note – does not include the following: Accuneb 0.021% [0.63 mg/mL] Accuneb 0.042% [1.25 mg/3mL] Albuterol 0.5% [2.5 mg/0.5 mL in 0.5 unit dose vial]	10 Feb 09	8 Apr 09 (60 days)
Nov 08 & Aug 08 (update; reviewed Nov 05)	Antidepressants I	**Recommended for non-formulary status Aug 08; no change to non-formulary status in Nov 08** ▪ desvenlafaxine (Pristiq)	BCF	No changes to BCF recommended Aug 08	10 Feb 09; original signing date 24 Oct 08	7 Jan 09 (60 days)
		To remain NF ▪ paroxetine HCl CR (Paxil) ▪ fluoxetine 90 mg weekly admin. (Prozac Weekly) ▪ fluoxetine in special packaging for PMDD (Sarafem) ▪ escitalopram (Lexapro) ▪ duloxetine (Cymbalta) ▪ bupropion extended release (Wellbutrin XL)	BCF	Currently BCF ▪ citalopram ▪ fluoxetine (excluding weekly regimen & special packaging for PMDD) ▪ sertraline (Zoloft) ▪ trazodone ▪ bupropion sustained release	19 Jan 06	19 Jul 06 (180 days)
Nov 08	ACE inhibitors – Renin Angiotensin Antihypertensives	Previously non-formulary, recommended for UF status Nov 08 ▪ ramipril (Altace generic)	BCF	▪ No changes recommended to BCF at Nov 08 meeting; ramipril removed from Non-formulary status and designated as Uniform Formulary immediately upon signing of the minutes	10 Feb 09	N/A
Oct 08 (interim teleconference meeting) & Jun 08	Triptans	▪ almotriptan (Axert) ▪ frovatriptan (Frova) ▪ naratriptan (Amerge)	BCF	▪ rizatriptan (Maxalt), immediate upon signing of the minutes ▪ sumatriptan oral and one injectable formulation, when multi-source generics are available	24 Oct 08;; original signing date: 27 Aug 08	26 Nov 08 (90 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Aug 08	Self-Monitoring Blood Glucose Systems (SMBGS) test strips	▪ OneTouch Ultra 2 strips (for OneTouch Ultra 2, Ultra Mini, and Ultra Smart meters) ▪ TrueTrack strips (for TrueTrack meter) ▪ Accu-chek Comfort Curve strips (for Accu-chek Advantage meter) ▪ Accu-chek Compact Plus drum (for Accu-check Compact Plus meter) ▪ Accu-chek Simplicity, Ascensia Autodisk, Ascensia Breeze 2, Ascensia Elite, Assure, Assure 3, Assure II, Assure Pro, Bd Test Strips, Chemstrip Bg, Control AST, Dextrostix Reagent, Easygluco, Easypro, Fast Take, Freestyle test strips (other than Freestyle Lite), Glucofilm, Glucolab, Glucometer Dex, Glucometer Elite, Glucose Test Strip, Glucostix, Optium, Precision Pcx, Precision Pcx Plus, Precision Q-I-D, Precision Sof-Tact, Prestige Smart System, Prodigy, Quicktek, Sidekick, Sof-Tact, Surestep, Surestep Pro, Test Strip, Relion Ultima, Uni-Check ▪ Plus all other store/private label brand strips not included on the UF (see BCF/ECF column)	BCF	**Basic Core Formulary SMBGS test strips** ▪ Precision Xtra strips (for Precision Xtra meter) **Uniform Formulary SMBGS test strips** ▪ Accu-chek Aviva (for Accu-chek Aviva meter) ▪ Ascensia Contour (for Ascensia Contour meter) ▪ Freestyle Lite (for Freestyle Freedom Lite and Freestyle Lite meters)	24 Oct 08	17 Mar 09 (120 days)
Aug 08 (update; reviewed Aug 05; also updated Nov 07)	Calcium Channel Blockers	**Recommended for non-formulary status Aug 08** ▪ nisoldipine geomatrix (Sular geomatrix)	BCF	No changes to BCF recommended Aug 08	24 Oct 08	7 Jan 09 (60 days)
		Previously non-formulary, recommended for UF status Nov 07 ▪ amlodipine besylate (Norvasc generic)		Recommended for addition to BCF Nov 07 ▪ amlodipine besylate tablets	13 Feb 08	13 Feb 08
		To Remain Non-Formulary ▪ isradipine IR, ER (Dynacirc; Dynacirc CR) ▪ nicardipine IR (Cardene, generics) ▪ nicardipine SR (Cardene SR) ▪ verapamil ER (Verelan) ▪ verapamil ER HS dosing (Verelan PM, Covera HS) ▪ diltiazem ER for bedtime dosing (Cardizem LA)		Currently BCF ▪ amlodipine besylate (Norvasc, generics) (Recommended at Nov 07 meeting) ▪ nifedipine ER (Adalat CC, generics) ▪ verapamil SR ▪ diltiazem ER (Tiazac, generics)	13 Oct 05	15 Mar 06 (150 days)
Jun 08	Osteoporosis Agents	▪ calcitonin salmon nasal spray (Miacalcin)	BCF	▪ alendronate (Fosamax) ▪ ibandronate (Boniva) (Note: raloxifene (Evista) removed from BCF, but still UF)	27 Aug 08	26 Nov 08 (90 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (implementation period)
Jun 08 (update; reviewed Nov 07)	Adrenergic Blocking Agents	**Recommended for non-formulary status Jun 08** ▪ nebivolol (Bystolic)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
		(No ABAs selected for NF placement at Nov 07 meeting)		Currently BCF ▪ atenolol tablets ▪ metoprolol tartrate IR tablets ▪ carvedilol IR tablets ▪ metoprolol succinate ER tablets	13 Feb 08	-
Jun 08 (update; reviewed Aug 07	Newer Antihistamines	**Recommended for non-formulary status Jun 08** ▪ levocetirizine (Xyzal)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
		To remain NF ▪ desloratadine (Clarinex) ▪ desloratadine/pseudoephedrine (Clarinex D)		▪ MTFs required to carry at least one single ingredient agent from the newer antihistamine class (loratadine, cetirizine, or fexofenadine) on their local formulary, including at least one dosage form suitable for pediatric use	17 Oct 07	16 Jan 08 (90 days)
Jun 08 (update; reviewed Aug 07)	Leukotriene Modifiers	**Recommended for non-formulary status Jun 08** ▪ Zileuton ER (Zyflo CR)	BCF	No changes to BCF rec Jun 08	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
		To remain NF ▪ zileuton (Zyflo)		Currently BCF ▪ montelukast (Singulair)	17 Oct 07	16 Jan 08 (90 days)
Jun 08 (update) Original reviews ▪ ACE inhibitors: Aug 05 ▪ Miscellaneous antihypertensives,	Renin Angiotensin Antihypertensives	**Recommended for non-formulary status Jun 08** ▪ olmesartan/amlodipine (Azor)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (implementation period)
including ACE/CCB combos. Feb 06 ▪ ARBs: May 07 ▪ Renin inhibitors. Aug 07 ▪ CCB/ARB combos Nov 07 update		To remain NF ▪ valsartan amlodipine (Exforge)		No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ACE inhibitors ▪ Moexipril +/- HCTZ (Univasc; Uniretic) ▪ perindopril (Aceon) ▪ ramipril (Altace) ACE/CCB combos ▪ felodipine/enalapril (Lexxel) (D/C'd from market) ▪ verapamil/trandolapril (Tarka) ARBs ▪ eprosartan +/- HCTZ (Teveten; Teveten HCT) ▪ irbesartan+/- HCTZ (Avapro, Avalide) ▪ olmesartan +/- HCTZ (Benicar; Benicar HCT) ▪ valsartan +/- (Diovan; Diovan HCT)		Currently on the BCF ACE inhibitors ▪ captopril ▪ lisinopril ▪ lisinopril / HCTZ ACE/CCB combos ▪ amlodipine/benazepril (Lotrel, generics) ARBs ▪ telmisartan (Micardis) ▪ telmisartan HCTZ (Micardis HCT)	ACE inhibitors ▪ 13 Oct 05 ACE/CCB combos ▪ 26 Apr 06 ARBs ▪ 24 July 07	ACE inhibitors ▪ 15 Feb 06 ACE/CCB combos ▪ 26 Jul 06 ARBs ▪ 21 Nov 07
Nov 07 (update, original review May 06)	Contraceptives	**Recommended for non-formulary status Nov 07** ▪ EE 20 mcg/levonorgestrel 0.09 mg in special packaging for continuous use (Lybrel)	BCF	No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ▪ EE 30 mcg / levonorgestrel 0.15 mg in special packaging for extended use (Seasonale) ▪ EE 25 mcg / norethindrone 0.4 mg (Ovcon 35) ▪ EE 50 mcg / norethindrone 1 mg (Ovcon 50) ▪ EE 20/30/35 mcg / noreth. 1 mg (Estrostep Fe)		Currently on the BCF ▪ EE 20 mcg / 3 mg drospirenone (Yaz) ▪ EE 20 mcg / 0.1 mg levonorgestrel (Lutera, Sronyx, or equivalent) ▪ EE 30 mcg / 3 mg drospirenone (Yasmin) ▪ EE 30 mcg / 0.15 mg levonorgestrel (Nordette or equivalent / excludes Seasonale) ▪ EE 35 mcg / 1 mg norethindrone (Ortho-Novum 1/35 or equivalent) ▪ EE 35 mcg / 0.25 mg norgestimate (Ortho-Cyclen or equivalent) ▪ EE 25 mcg / 0.18/0.215/0.25 mg norgestimate (Ortho Tri-Cyclen Lo) ▪ EE 35 mcg / 0.18/0.215/0.25 mg norgestimate (Ortho Tri-Cyclen or equivalent) ▪ 0.35 mg norethindrone (Nor-QD, Ortho Micronor, or equivalent)	26 Jul 06	24 Jan 07
		▪ EE 30/10 mcg / 0.15 mg levonorgestrel in special packaging for extended use (Seasonique) ▪ EE 20 mcg / 1 mg norethindrone (Loestrin 24 Fe)			17 Jan 07	18 Mar 07
Aug 07	Growth Stimulating Agents	▪ somatropin (Genotropin, Genotropin Miniquick) ▪ somatropin (Humatrope) ▪ somatropin (Omnitrope) ▪ somatropin (Saizen)	ECF	▪ somatropin (Norditropin)	17 Oct 07	19 Dec 07 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
May 07	5-Alpha Reductase Inhibitors	▪ dutasteride (Avodart)	BCF	▪ finasteride	24 July 07	24 Oct 07 (90 days)
Feb 07	Newer Sedative Hypnotics	▪ zolpidem ER (Ambien CR) ▪ zaleplon (Sonata) ▪ ramelteon (Rozerem) Automated PA requiring trial of zolpidem IR applies to new users of eszopiclone (Lunesta), ramelteon (Rozerem), zaleplon (Sonata), or zolpidem ER (Ambien CR) (new users = no use of newer sedative hypnotics in last 180 days)	BCF	▪ zolpidem IR (Ambien)	02 May 07	01 Aug 07 (90 days)
Feb 07	Monoamine Oxidase Inhibitors	▪ selegiline transdermal patch (Emsam)	ECF	▪ phenelzine (Nardil)	02 May 07	01 Aug 07 (90 days)
Feb 07	Narcotic Analgesics	▪ tramadol ER (Ultram ER)	BCF	▪ morphine sulfate IR 15 mg, 30 mg ▪ morphine sulfate 12-hour ER (MS Contin or equivalent) 15, 30, 60 mg ▪ oxycodone/APAP 5/325 mg ▪ hydrocodone/APAP 5/500 mg ▪ codeine/APAP 30/300 mg ▪ codeine/APAP elixir 12/120 mg/5 mL ▪ tramadol IR	02 May 07	01 Aug 07 (90 days)
Feb 07	Ophthalmic Glaucoma Agents	▪ travoprost (Travatan, Travatan Z) ▪ timolol maleate for once daily dosing (Istalol) ▪ timolol hemihydrate (Betimol) ▪ brinzolamide (Azopt)	BCF	▪ latanoprost (Xalatan) ▪ brimonidine (Alphagan P); excludes 0.1% ▪ timolol maleate ▪ timolol maleate gel-forming solution ▪ pilocarpine	02 May 07	01 Aug 07 (90 days)
Nov 06	Older Sedative Hypnotics	-	BCF	▪ temazepam 15 and 30 mg	17 Jan 07	-
Nov 06 (update; reviewed Nov 06)	Dermatologic Topical Antifungals*	**Recommended for non-formulary status Nov 06:** 0.25% miconazole / 15% zinc oxide / 81.35% white petrolatum ointment (Vusion)	BCF	No change to BCF recommended Nov 06	14 Jul 05	17 Aug 05 (30 days)
		▪ econazole ▪ ciclopirox ▪ oxiconazole (Oxistat) ▪ sertaconazole (Ertaczo) ▪ sulconazole (Exelderm)		▪ nystatin ▪ clotrimazole	17 Jan 07	18 Mar 07 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Aug 06	H2 Antagonists / GI protectants	-	BCF	▪ ranitidine (Zantac) – excludes gelcaps and effervescent tablets	23 Oct 06	-
Aug 06	Antilipidemic Agents I	▪ rosuvastatin (Crestor) ▪ atorvastatin / amlodipine (Caduet)	BCF	▪ simvastatin (Zocor) ▪ pravastatin ▪ simvastatin / ezetimibe (Vytorin) ▪ niacin extended release (Niaspan)	23 Oct 06	1 Feb 07 (90 days)
Feb 06	GABA-analogs	▪ pregabalin (Lyrica)	BCF	▪ gabapentin	26 Apr 06	28 Jun 06 (60 days)
Nov 05	Alzheimer's Drugs	▪ tacrine (Cognex)	ECF	▪ donepezil (Aricept)	19 Jan 06	19 Apr 06 (90 days)
Nov 05	Macrolide/ Ketolide Antibiotics	▪ azithromycin 2 gm (Zmax) ▪ telithromycin (Ketek)	BCF	▪ azithromycin (Z-Pak) ▪ erythromycin salts and bases	19 Jan 06	22 Mar 06 (60 days)
May 05	MS-DMDs	-	ECF	▪ interferon beta-1a intramuscular injection (Avonex)	14 Jul 05	-

BCF = Basic Core Formulary; ECF = Extended Core Formulary; MN = Medical Necessity; TMOP = TRICARE Mail Order Pharmacy; TRRx = TRICARE Retail Pharmacy program; UF = Uniform Formulary
CFC = chlorofluorocarbon; ER = extended release; HFA = hydrofluoroalkane; IR = immediate release; SR = sustained release; IDD-P = insoluble drug delivery-microParticle;
AD-1s: Antidepressant-1 Drugs; ADHD = Attention Deficit Hyperactivity Disorder; ARBs = Angiotensin Receptor Blockers; ACE Inhibitors = Angiotensin Converting Enzyme Inhibitors; BPH = Benign Prostatic Hyperplasia; CCBs = Calcium Channel Blockers; EE = ethinyl estradiol; GI = gastrointestinal; GABA = gamma-aminobutyric acid; H2 = Histamine-2 receptor; HCTZ = hydrochlorothiazide; LIP-1 = Antihyperlipidemic-1 Drugs; LIP-2 = Antihyperlipidemic-2 Drugs; MDIs = metered dose inhalers; MOAIs = Monoamine Oxidase Inhibitor Drugs; MS-DMDs = Multiple Sclerosis Disease-Modifying Drugs; NADs = Nasal Allergy Drugs; OABs = Overactive Bladder Medications; PDE5 Inhibitors = Phosphodiesterase- type 5 inhibitors; PPIs = Proton Pump Inhibitors; RAAs = Renin Angiotensin Antihypertensives Drugs; SABAs = Short-Acting Beta Agonists; SMBGS: Self-Monitoring Blood Glucose Systems; TIBs = Targeted Immunomodulatory Biologics; TZDs= Thiazolidinediones
*The Dermatologic Topical Antifungal drug class excludes vaginal products and products for onychomycosis (e.g., ciclopirox topical solution [Penlac])

Appendix G — Table of Abbreviations

ADHD	Attention Deficit Hyperactivity Disorder drug class
AE	adverse event
APR	Automated profile review
AS	ankylosing spondylitis
BAP	Beneficiary Advisory Panel
BCF	Basic Core Formulary
BPH	benign prostatic hyperplasia
BIA	budget impact analysis
CEA	Cost-effectiveness analysis
CFR	Code of Federal Regulations
CHCS	Composite Health Care System
CMA	cost minimization analysis
CPAP	continuous positive airway pressure
DoD	Department of Defense
ECF	Extended Core Formulary
ED	erectile dysfunction
ER	extended release
ESI	Express Scripts, Inc
FCP	Federal Ceiling Price
FDA	Food and Drug Administration
FSS	Federal Supply Schedule Price
FY	fiscal year
HA	Health Affairs
IPSS	International Prostate Symptom Score
MHS	Military Health System
MN	medical necessity
MSLT	mean sleep latency testing
MTF	Military Treatment Facility
MTX	methotrexate
NDAA	National Defense Authorization Act
OMB	Office of Management and Budget
P&T	Pharmacy and Therapeutics
PA	prior authorization
PAH	pulmonary arterial hypertension
PDE-5	Phosphodiesterase-type 5 inhibitor drug class
PEC	Pharmacoeconomic Center
PORT	Pharmaceutical Outcomes Research Team
POS	point of service
PsA	psoriatic arthritis
QL	quantity limit
Qmax	maximum urine flow rate
RA	rheumatoid arthritis
SQ	subcutaneous
TBI	traumatic brain injury
TIB	Targeted Immunomodulatory Drug Class
TNF-α	Tumor necrosis factor alpha
TFL	TRICARE for life beneficiary
TMA	TRICARE Management Activity
TMOP	TRICARE Mail Order Pharmacy
TRRx	TRICARE Retail Pharmacy Network
UF VARR	Uniform Formulary Voluntary Agreement for Retail Refunds

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
May 2009

1) CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened a web conference at 10:00 on May 13, 2009.

2) ATTENDANCE

The attendance roster is found in Appendix A.

3) REVIEW MINUTES OF LAST MEETINGS

A. Revisions to the minutes—Revisions to the February 2009 minutes will be reviewed at the August 2009 DoD P&T Committee meeting.

B. Approval of February minutes—Ms. Ellen P. Embrey, performing the duties of the Assistant Secretary of Defense, Health Affairs, approved the minutes of the November 2008 DoD P&T Committee meeting on May 12, 2009.

4) REVIEW OF RECENTLY FDA-APPROVED AGENTS

A. Antilipidemic-II Agents (LIP-2)—Fenofibrate acid capsules (Trilipix)

Relative Clinical Effectiveness—Fenofibrate acid (Trilipix) is the choline salt of fenofibrate; the active moiety is the same as the other fenofibrate formulations. The fenofibrates are classified in the Antilipidemic-II (LIP-2) drug class that was reviewed for Uniform Formulary (UF) placement in May 2007. Fenofibrate acid is Food and Drug Administration (FDA)-approved for use as monotherapy, and in combination with a statin to lower triglycerides (TGs) and increase high density lipoprotein (HDL) cholesterol in patients with coronary heart disease (CHD) or CHD risk equivalent to those who are receiving optimal statin therapy.

The fenofibrate acid (Trilipix) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, Title 32, Code of Federal Regulations (CFR), Section 199.21(e)(1). There are no comparative clinical trials between fenofibrate acid and the other LIP-2 drugs, and no trials evaluating outcomes other than changes in lipid parameters. The clinical trials used to obtain FDA approval reported fenofibrate acid combined with either a low-dose or moderate-dose statin resulted in additive effects on raising HDL cholesterol and lowering TGs, compared to the statin administered alone. The safety profile of fenofibrate acid reflects that of the other fenofibrate products.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) that although fenofibrate acid (Trilipix) is the only fenofibrate drug specifically approved by the FDA for use in combination with a statin, there was insufficient evidence to compare its safety in combination with a statin versus the other fenofibrates. The P&T Committee concluded fenofibrate acid (Trilipix) did not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other fenofibrate formulations currently included on the UF because they all contain the same active ingredient.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of fenofibrate acid capsules (Trilipix) in relation to efficacy, safety, tolerability, and clinical outcomes of other agents in the class, particularly to the following LIP-2 medications: micronized fenofibrate (Lofibra/generic), fenofibrate meltdose (Fenoglide), and nanomicronized fenofibrate (Tricor). Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

Cost minimization analysis (CMA) was used to evaluate the relative cost-effectiveness of fenofibrate acid capsules (Trilipix) relative to other UF LIP-2s. Results from the CMA showed the projected weighted average cost per day for fenofibrate acid capsules (Trilipix) is higher than fenofibrate micronized (Lofibra/generics) and fenofibrate meltdose (Fenoglide). The CMA also revealed the projected weighted average cost per day for fenofibrate acid capsules (Trilipix) is slightly lower than the non-formulary LIP-2 agent, nanomicronized fenofibrate (Tricor). Micronized fenofibrate (Lofibra/generic) and fenofibrate meltdose (Fenoglide) remain the most cost effective LIP-2 agents on the UF compared to fenofibrate acid capsules (Trilipix).

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 0 absent) that fenofibrate acid capsules (Trilipix) are not cost effective relative to other formulary LIP-2 agents.

1) ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 0 abstained, 0 absent) fenofibrate acid capsules (Trilipix) be designated non-formulary on the UF. This

recommendation was based on the clinical effectiveness conclusion and the determination that micronized fenofibrate (Lofibra/generic) and fenofibrate meltdose (Fenoglide) remain the most cost effective LIP-2 agents on the UF compared to fenofibrate acid capsules (Trilipix).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

2) ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of fenofibrate acid capsules (Trilipix) and the conditions for establishing medical necessity (MN) of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 0 absent) MN criteria for fenofibrate acid capsules (Trilipix). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD***—The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at military treatment facilities (MTFs) no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

B. Overactive Bladder Drugs—Fesoterodine extended release (ER) tablets (Toviaz)

Relative Clinical Effectiveness—The muscarinic antagonist fesoterodine (Toviaz) is a prodrug that undergoes conversion by plasma esterases to the same active metabolite as tolterodine (Detrol, Detrol LA). Like the other OAB

drugs, fesoterodine extended release (ER) tablets are FDA-approved for the treatment of overactive bladder (OAB) with symptoms of urge urinary incontinence, urgency, and frequency. The OAB drug class was previously reviewed for UF placement in August 2008 and February 2006.

The fesoterodine ER tablets (Toviaz) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). There are no direct comparative clinical trials between fesoterodine ER and the other OAB drugs. Statistically significant improvements in the endpoints of urinary frequency, urge urinary incontinence, and urinary urgency vs. placebo were noted in the clinical trials used to obtain FDA approval. The incidence of dry mouth and constipation reported with fesoterodine ER 8 milligrams (mg) was higher than tolterodine ER (Detrol LA) 4 mg in the one indirect active comparator trial available. Product labeling states that fesoterodine does not prolong the QT interval.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) fesoterodine ER tablets (Toviaz) did not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other OAB drugs currently included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of fesoterodine ER tablets (Toviaz) in relation to efficacy, safety, tolerability, and clinical outcomes of other agents in the class, particularly to oxybutynin XL (Detrol XL/generics), tolterodine LA (Detrol LA), solifenacin (Vesicare), and darifenacin (Enablex). Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of fesoterodine (Toviaz) relative to other UF OABs. Results from the CMA showed the projected weighted average cost per day for fesoterodine (Toviaz) is higher than other UF OABS.

Relative Cost-Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) fesoterodine ER tablets (Toviaz) are not cost effective relative to other formulary OAB agents.

1) ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 0 abstained, 0 absent) that fesoterodine ER tablets (Toviaz) be designated non-formulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

2) ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of fesoterodine ER tablets (Toviaz) and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 0 absent) MN criteria for fesoterodine extended release (ER) tablets (Toviaz). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD***—The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

C. Nasal Allergy Drugs (NADs)—Azelastine with sucralose nasal spray (Astepro)

Relative Clinical Effectiveness—Azelastine with sucralose nasal spray (Astepro) is a Nasal Allergy Drug (nasal antihistamine) containing the same active ingredient (azelastine) and dosage strength as Astelin nasal spray. Sucralose and sorbitol have been added to the Astepro formulation to help mask the bitter taste reported with Astelin. Astepro is FDA-approved for treating seasonal allergic rhinitis (SAR) in patients 12 years of age and older. Astelin has additional indications (SAR in patients ≥5 years, and non-allergic rhinitis). The Nasal Allergy Drugs (NADs) were previously reviewed for UF placement in November 2008.

The azelastine with sucralose nasal spray (Astepro) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). One unpublished study reported statistically significant improvements in nasal congestion, rhinorrhea, sneezing, and nasal itching with both Astepro and Astelin, compared to the placebo vehicle. The improvements in nasal symptoms were similar with Astepro and Astelin. Bitter taste and epistaxis are the adverse events reported most frequently with Astepro.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) azelastine with sucralose nasal spray (Astepro) does not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other NADs currently included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of azelastine with sucralose nasal spray (Astepro) in relation to efficacy, safety, tolerability, and clinical outcomes of the other nasal antihistamine subclass agents in the NAD class, particularly to azelastine (Astelin) and olopatadine (Patanase). Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the relative cost-effectiveness of azelastine with sucralose nasal spray (Astepro) relative to other nasal antihistamine subclass agents in the NAD class. Results from the CMA showed the projected weighted average cost per day for azelastine with sucralose nasal spray (Astepro) is higher than azelastine (Astelin) but less than olopatadine (Patanase), which is a non-formulary medication.

Relative Cost-Effectiveness Conclusion–P&T Committee, based upon its collective professional judgment, voted (12 for, 0 opposed, 0 abstained, 1 absent) that azelastine with sucralose nasal spray (Astepro) is not cost effective relative to other UF nasal antihistamine subclass agents in the NAD class.

1) ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (12 for, 1 opposed, 0 abstained, 0 absent) that azelastine with sucralose nasal spray (Astepro) be designated non-formulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

2) ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of azelastine with sucralose nasal spray (Astepro) and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 0 absent) MN criteria for azelastine with sucralose nasal spray (Astepro). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD***—The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at MTFs no later than a 60-day implementation period; and

2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑Approved ☐ Disapproved

Approved, but modified as follows:

D. Proton Pump Inhibitors—Dexlansoprazole delayed release capsules (Kapidex)

Relative Clinical Effectiveness—The Proton Pump Inhibitor (PPI) dexlansoprazole (Kapidex) is a sustained-release formulation of the R-enantiomer of lansoprazole (Prevacid). Generic formulations of lansoprazole are anticipated in late 2009. The PPIs were reviewed for UF placement in May 2007 and February 2005.

The dexlansoprazole delayed release (DR) capsules (Kapidex) evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). Dexlansoprazole DR capsules are FDA-approved for use in adults for healing of erosive esophagitis (EE), maintenance of EE healing, and gastroesophageal reflux disease. Lansoprazole (Prevacid) has additional FDA-approved indications. The clinical studies used to obtain FDA-approval compared dexlansoprazole DR 60 mg capsules with lansoprazole 30 mg capsules or with placebo; there are no studies directly comparing the drug with other PPIs. The most common adverse events with dexlansoprazole DR capsules are diarrhea, nausea, and abdominal pain, which are similar to the other PPIs.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) dexlansoprazole DR capsules (Kapidex) did not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other PPI drugs currently included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of dexlansoprazole DR capsules (Kapidex) in relation to efficacy, safety, tolerability, and clinical outcomes of selected UF agents in the PPI class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

CMA was used to evaluate the cost-effectiveness of dexlansoprazole DR capsules (Kapidex) relative to selected PPIs, including omeprazole (Prilosec) and esomeprazole (Nexium). Results from the CMA showed the projected weighted average cost per day for dexlansoprazole DR capsules (Kapidex) is higher than all other comparators.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 0 absent) that dexlansoprazole DR capsules (Kapidex) are not cost effective relative to other formulary PPI agents.

1) ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 0 abstained, 0 absent) that dexlansoprazole DR capsules (Kapidex) be designated non-formulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

2) ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of dexlansoprazole DR capsules (Kapidex) and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 0 absent) MN criteria for dexlansoprazole DR capsules (Kapidex). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD***—The P&T Committee voted (13 for, 0 opposed, 0 abstained, 0 absent) to recommend 1) an effective date of the first Wednesday 1 week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at MTFs no later than a 60-day implementation period; and 2)

TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

E. Antidepressant-1 Agents—Venlafaxine Extended Release Tablets

Relative Clinical Effectiveness—Relative Clinical Effectiveness—Venlafaxine is a serotonin norepinephrine reuptake inhibitor (SNRI) antidepressant. The Antidepressant-I (AD-1) drug class was reviewed for UF placement in November 2005. Venlafaxine Extended Release (ER) Tablets (brand name) contain the same active ingredient as venlafaxine ER capsules (Effexor XR), but employ a different mechanism to extend the dosing interval. The FDA does not consider Venlafaxine ER Tablets an AB-rated generic formulation of Effexor XR capsules. Venlafaxine ER Tablets and Effexor XR capsules are not considered therapeutically interchangeable by the FDA due to the different marketed dosage formulations (i.e., capsule vs. tablet). AB-rated generic formulations of Effexor XR capsules are expected in 2010–2011. Venlafaxine ER Tablets have demonstrated bioequivalence with Effexor XR capsules in pharmacokinetic studies.

The Venlafaxine ER Tablets clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). Venlafaxine ER Tablets are FDA-approved for treating Major Depressive Disorder and Social Anxiety Disorder; Effexor XR has additional indications. No clinical trials have been conducted with Venlafaxine ER Tablets. Venlafaxine ER Tablets were FDA-approved under Section 505(b)(2) of the Federal Food, Drug, and Cosmetic Act, based on demonstrated bioequivalence with Effexor XR. Adverse events with Venlafaxine ER Tablets reflect those contained in the Effexor XR product labeling.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (12 for, 1 opposed, 0 abstained, 0 absent) there was no evidence to suggest there are clinically relevant differences in the efficacy, safety, and clinical outcomes of Venlafaxine ER Tablets compared to Effexor XR capsules because both products contain the same active ingredient.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of Venlafaxine ER Tablets in relation to efficacy, safety,

tolerability, and clinical outcomes of selected formulary SSRIs and other SNRI subclass agents in the AD-1 class. Information considered by the P&T Committee included, but was not limited to sources of information listed in 32 CFR 199.21 (e) (2).

CMA was used to evaluate the relative cost-effectiveness of Venlafaxine ER Tablets relative to selected SSRIs, particularly to sertraline (Zoloft/generics) citalopram (Celexa/generics), and other SNRI subclass agents in the AD-1 class. The SNRIs reviewed in the CMA were venlafaxine ER capsules (Effexor XR), duloxetine (Cymbalta), and desvenlafaxine (Pristiq). Results from the CMA showed the projected weighted average cost per day for Venlafaxine ER Tablets is higher than both SSRIs reviewed. The CMA also revealed Venlafaxine ER Tablets are the most cost-effective agent in the SNRI subclass.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 0 absent) that Venlafaxine ER Tablets are cost effective relative to other UF SNRI subclass agents in the AD-1 class.

1) ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 0 abstained, 0 absent) that Venlafaxine ER Tablets remain formulary on the UF.

Acting Director, TMA, Decision ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

2) ***COMMITTEE ACTION: BCF RECOMMENDATION***—Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (13 for, 0 opposed, 0 abstained, and 0 absent) to recommend Venlafaxine ER Tablets not be added to the BCF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

F. Antiemetics—Granisetron transdermal system (Sancuso)

Relative Clinical Effectiveness—The granisetron transdermal system (TDS) (Sancuso) is a serotonin subtype-3 (5-HT3) receptor antagonist. It is the only newer antiemetic available in a transdermal dosage form. Granisetron (Kytril, generics) is also available in tablets, an oral solution, and intravenous formulation. The newer antiemetics were evaluated for UF placement in May 2006.

Granisetron TDS is FDA-approved for the prevention of nausea and vomiting in adult patients receiving moderately or highly emetogenic chemotherapy regimens lasting for ≤5 consecutive days. Other newer antiemetics (granisetron and ondansetron [Zofran, generics]) have indications in addition to chemotherapy-induced nausea and vomiting (CINV).

The granisetron TDS (Sancuso) clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1). In clinical studies, granisetron TDS has shown non-inferiority (but not superiority) to oral granisetron in controlling nausea and vomiting associated with CINV. There is insufficient evidence to determine whether granisetron TDS would control nausea and vomiting to a greater extent than the other 5-HT3 antagonists. There are no studies evaluating differences in the adverse events between granisetron TDS and 5-HT3 antagonists other than oral granisetron.

Relative Clinical Effectiveness Conclusion—The P&T Committee concluded (13 for, 0 opposed, 0 abstained, 0 absent) although granisetron TDS (Sancuso) is the only newer antiemetic available in a transdermal formulation, it does not have a significant, clinically meaningful therapeutic advantage in terms of effectiveness, safety, and clinical outcomes compared to other newer antiemetics currently included on the UF.

Relative Cost-Effectiveness—The P&T Committee evaluated the relative cost-effectiveness of granisetron TDS (Sancuso) in relation to efficacy, safety, tolerability, and clinical outcomes of selected UF agents in the antiemetic class. Information considered by the P&T Committee included, but was not limited to sources of information listed in 32 CFR 199.21 (e) (2).

CMA was used to evaluate the relative cost-effectiveness of granisetron TDS (Sancuso) relative to ondansetron (Zofran/generics) oral and oral dissolving tablets and granisetron (Kytril/generics) tablets. Results from the CMA showed the projected weighted average cost per week for granisetron TDS (Sancuso) is higher than all other comparators.

Relative Cost-Effectiveness Conclusion—The P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 0 absent) that granisetron TDS (Sancuso) is not cost effective relative to other antiemetic agents.

1) ***COMMITTEE ACTION: UF RECOMMENDATION***—Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 0 abstained, 0 absent) granisetron TDS (Sancuso) be designated as non-formulary on the UF.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

2) ***COMMITTEE ACTION: MN CRITERIA***—Based on the clinical evaluation of granisetron TDS (Sancuso) and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 0 absent) MN criteria for granisetron TDS (Sancuso). (See Appendix B for full MN criteria).

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P. Embrey

*3) **COMMITTEE ACTION: IMPLEMENTATION PERIOD***—The P&T Committee voted (11 for, 0 opposed, 0 abstained, 2 absent) to recommend 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows: Ellen P Embrey

5) UTILIZATION MANAGEMENT—PRIOR AUTHORIZATIONS (PA) / Quantity Limits (QL) / MEDICAL NECESSITY (MN)

A. PPI—Prior Authorization / Medical Necessity Criteria (MN): The P&T Committee reviewed current published literature, national guidelines/expert consensus statements, and FDA guidance related to reports of a drug interaction between clopidogrel (Plavix) and PPIs, and the corresponding potential for decreased antiplatelet effect and adverse cardiovascular outcomes. An automated prior authorization (APR) or *step therapy* is currently in effect and requires use of UF generic omeprazole or esomeprazole (Nexium) before other non-formulary PPIs, unless there is therapeutic failure, intolerance, or hypersensitivity. MN criteria also applies to non-formulary PPIs. The P&T Committee concluded the evidence was not sufficient at this time to recommend a change in the current PA/MN criteria, but agreed with continued monitoring of the literature for possible changes to the PA/MN criteria.

1) ***COMMITTEE ACTION:*** The Committee voted (12 for, 0 opposed, 1 abstained, 0 absent) to recommend no change to the existing PPI PA/MN criteria.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. QL Updates: In anticipation of the forthcoming TPHARM contract implementation, the P&T Committee updated the quantity limits (QLs) for several drugs. See Appendix C.

1) ***COMMITTEE ACTION:*** The P&T Committee voted (11 for, 0 opposed, 0 abstained, 2 absent) to recommend the QLs for ondansetron (Zofran), dasatinib (Sprycel), budesonide nebulizer solution (Pulmicort Respules), cromolyn inhaler (Intal), azelastine nasal spray (Astelin), azelastine with sucralose nasal spray (Astepro), metaproterenol nebulizer solution (Alupent, generics), ipratropium/albuterol inhaler (Combivent), methylnaltrexone subcutaneous injection (Relistor), as outlined in Appendix C.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. **Extended Core Formulary (ECF) Clarification**—The P&T Committee was briefed in August 2008 on efforts to implement electronic prescribing in the Military Health System (MHS). As part of the ongoing plan to systematically review drugs represented on the Basic Core Formulary (BCF)/Extended Core Formulary (ECF), the P&T Committee periodically reviews recommendations for changes to the BCF/ECF. At this meeting, the ECF was reviewed because greater specificity in the drug listings is required to assist with e-prescribing efforts. Appendix D outlines drugs currently designated as ECF.

1) ***COMMITTEE ACTION:*** The P&T Committee voted (11 for, 0 opposed, 1 abstained, 1 absent) to recommend the listing of the ECF drugs, as outlined in Appendix D.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. **Oral Fentanyl Citrate Automated PA**—The P&T Committee was briefed on an analysis examining MHS utilization of oral fentanyl citrate buccal lozenges (Actiq) and buccal tablets (Fentora) among opioid-naïve patients (i.e., those without prior opioid exposure). Both Actiq and Fentora are indicated for breakthrough pain in combination with long-acting opioids in opioid-tolerant patients. A total of 1,217 TRICARE beneficiaries received prescriptions for oral fentanyl citrate during the 5-month observation period from November 1, 2009 to May 31, 2009. The oral fentanyl prescriptions were dispensed in majority (89 percent) from the TRRx. Forty percent of patients (492/1,217) were identified as new oral fentanyl citrate users. A total of 375 (76 percent) new users received an opioid prescription within the last 60-days of their first oral fentanyl citrate prescription; 81 percent of new users had prior exposure to a strong opioid. In total, 10 percent (117/1,217) of all oral fentanyl citrate users were opioid-naïve. Sensitivity analysis showed results to be dependent on length of look-back period.

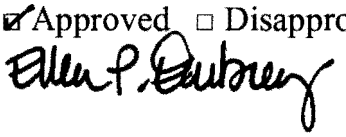
Due to potential patient safety and inappropriate prescribing concerns, the P&T Committee recommended inclusion of oral fentanyl citrate products (Actiq and Fentora) in the current Automated Profile Review (APR) for transdermal fentanyl. The APR is available at retail and mail order points of service and allows pharmacists to override the requirement for evidence of a previous opioid prescription in the 60-day look- back period with intervention and outcome codes (to avoid disrupting chronic therapy). The fentanyl APR

process differs from other PAs that require review by ESI (Express Scripts, Inc., DoD contractor for retail and mail order), have more stringent criteria to allow overrides, and take longer to resolve. The Pharmacy Program Office has requested and will begin testing a similar function in the Composite Health Care System for the MTF pharmacies.

1) ***COMMITTEE ACTION:*** The P&T Committee voted (11 for, 0 opposed, 0 abstained, 2 absent) to recommend addition of the oral formulations of fentanyl citrate, Actiq and Fentora be added to the automated PA.

Acting Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:



6) FUTURE UF DRUG CLASS REVIEWS

A drug class overview for the Phosphodiesterase type-5 inhibitors (PDE-5s) was presented to the P&T Committee. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the Pharmacoeconomic Center to use in completing the clinical effectiveness reviews and developing appropriate cost-effectiveness models. The clinical and economic analyses of this drug class will be completed for August 2009 P&T Committee meeting.

7) ITEMS FOR INFORMATION

A. **National Defense Authorization Act (NDAA) Section 703—Inclusion of TRICARE Retail Pharmacy Program in Federal Procurement of Pharmaceuticals Update**—The Office of General Counsel (OGC) updated the P&T Committee on the litigation and status of the final rule that will implement Section 703 of the 2008 NDAA. The judge has not rendered a decision regarding the current litigation. The final rule is at the Office of Management and Budget (OMB). Key members from the TMA Pharmacy Operations Department and OGC have met with OMB personnel. The timetable for approval and impact on the DoD P&T Committee process are not known.

8) ADJOURNMENT

The meeting adjourned at 3:00 on March 13, 2009. The next meeting will be in August 2009.

SUBMITTED BY:

17 Aug 09

COL John Kugler, MC, USA
DoD P&T Committee Chair

DECISION ON RECOMMENDATIONS

Acting Director, TMA, decisions are as annotated above.

Ellen P. Embrey
Performing the Duties of the
Assistant Secretary of Defense,
Health Affairs

08/17/09
(Date)

Appendix A — Attendance

Voting Members Present	
COL John Kugler, MC	DoD P&T Committee Chair
LTC Stacia Spridgen, MSC	DoD P &T Committee Recorder
COL Doreen Lounsbery , MC	Army, Internal Medicine Physician, Alternate
COL Peter Bulatao *for Col Isiah Harper, MSC*	Army, Pharmacy Officer, Alternate
CAPT Stephanie Simon, MSC	Navy, Pharmacy Officer
CAPT Vernon Lew	Coast Guard, Pharmacy Officer
LTC Bruce Lovins	Army, Family Practice Physician, Alternate
CDR Walter Downs, MC	Navy, Internal Medicine Physician, Alternate
CDR David Tanen, MC	Navy, Physician at Large
Lt Col Thomas Bacon, BSC *for Col Everett McAllister*	Chief, Pharmaceutical Operations Directorate
Lt Col Michael Lee, BSC *for Col Mark Butler*	Consultant to the AF/SG
Lt Col Brian Crownover, MC	Air Force, Physician at Large
Major Jeremy King, MC	Air Force, OB/GYN Physician
Voting Members Absent	
COL Carole Labadie, MS	Army, Pharmacy Officer
COL Ted Cieslak, MC	Army, Physician at Large
Mr. Joe Canzolino	Department of Veterans Affairs
Nonvoting Members Present	
CDR James Ellzy	DoD P&T Vice Chairman
Mr. David Hurt	Deputy General Counsel, TMA
Nonvoting Members Absent	
COL Kent Maneval, MS	Defense Medical Standardization Board
Mr. William Davies	TRRx/TMOP COR
Maj Peter Trang	Defense Supply Center Philadelphia
Guests	
LCDR Tracie Patten *for CDR Robert Hayes*	Indian Health Service
Others Present	
CDR Matthew Carlberg	DoD Pharmacoeconomic Center
Lt Col James McCrary, MC	DoD Pharmacoeconomic Center
MAJ Misty Carlson, MC	DoD Pharmacoeconomic Center
LCDR Joe Lawrence	DoD Pharmacoeconomic Center

Appendix A — Attendance — (continued)

Others Present	
Maj Joshua Devine, BSC	DoD Pharmacoeconomic Center
LCDR Marisol Martinez	DoD Pharmacoeconomic Center
Dr. Shana Trice	DoD Pharmacoeconomic Center
Dr. Eugene Moore	DoD Pharmacoeconomic Center
Dr. Angela Allerman	DoD Pharmacoeconomic Center
Dr. David Meade	DoD Pharmacoeconomic Center
Dr. Teresa Anekwe	DoD Pharmacoeconomic Center
Dr. Jeremy Briggs	DoD Pharmacoeconomic Center
Dr. Brian Beck	DoD Pharmacy Operations Center contractor
Dr. Dean Valibhai	DoD Pharmacy Operations Center contractor
Dr. Carl R. Summers	DoD Pharmacy Outcomes Research Team contractor
Dr. Esmond Nwokeji	DoD Pharmacy Outcomes Research Team contractor
Dr. Roger Potyk	DoD Pharmacy Outcomes Research Team contractor
Mr. Stephen Yarger	DoD Pharmacy Outcomes Research Team contractor
Ms. Deborah Garcia	DoD Pharmacy Outcomes Research Team contractor

Appendix B — Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
Azelastine with sucralose nasal spray (Astepro) **Nasal Allergy Drugs (NADs)**	• Use of formulary alternatives is contraindicated
Dexlansoprazole delayed release capsules (Kapidex) **Proton Pump Inhibitors (PPIs)**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives.
Fenofibrate acid delayed release capsules (Trilipix) **Antilipidemic-II Drugs (LIP-2s)**	• Use of formulary alternatives is contraindicated
Fesoterodine extended release tablets (Toviaz) **Overactive Bladder Drugs (OABs)**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives.
Granisetron transdermal system (Sancuso) **Antiemetics**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives. • Formulary agents have resulted in therapeutic failure. • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.

Appendix C — Quantity Limit Updates

Drug	TMOP QL	TRRx QL	Comments
Ondansetron (Zofran) 24 mg tablets	3 tabs/Rx	1 tab/Rx	-Indicated for single dose highly emetogenic chemo; -Not studied in multiple-day regimens -Other strengths of ondansetron are available for delayed nausea and vomiting
Dasatinib (Sprycel) 100 mg tablets	90 tabs/45 days	60 caps / 30 days	-Starting dose is 100mg/d -Max dose is 200mg/d in advanced phase CML -Therapy is continued until disease worsens or patient can't tolerate
Budesonide (Pulmicort Respules) nebulizer soln 1 mg/ml	180 ml (90 ampules) / 90 days	60 ml (30 ampules) / 30 days	Max dose is 1 mg (2ml) per day
Cromolyn (Intal) inhaler 8.1 gm	9 inhalers / 90 days	3 inhalers / 30 days	112 puffs/inhaler, max 240 inhalations/month
Azelastine (Astelin) nasal spray	6 bottles / 90 days	2 bottles / 30 days	Clarified TMOP quantity for consistency
Azelastine with sucralose (Astepro) nasal spray	6 bottles / 90 days	2 bottles/30 days	New product in already reviewed class
Metaproterenol nebulizer solution	600 amps / 90 days	200 amps/30 days	Max dose based on labeling
Ipratropium /albuterol (Combivent) inhaler 14.7 gm	6 inhalers / 90 days	2 inhalers/30 days	Max dose based on labeling
Methylnaltrexone SQ Injection (Relistor)	No Refills	No Refills	Intended for palliative care

Appendix D — Extended Core Formulary Clarification

Therapeutic Category	Generic Name	Brand Name	Dosage	Dosage Form	P&T Meeting
ANTIARTHRITICS	ADALIMUMAB	HUMIRA	40 MG/0.8ML	KIT	Nov 2007 & Feb 2008
AUTONOMIC DRUGS	DONEPEZIL HCL	ARICEPT	10 MG	TABLET	Nov 2005
AUTONOMIC DRUGS	DONEPEZIL HCL	ARICEPT	5 MG	TABLET	Nov 2005
UNCLASSIFIED DRUG PRODUCTS	INTERFERON BETA-1A	AVONEX	30 MCG/.5ML	KIT	May 2005
PSYCHOTHERAPEUTIC DRUGS	PHENELZINE SULFATE	NARDIL	15 MG	TABLET	Feb 2007
HORMONES	SOMATROPIN	NORDITROPIN	5 MG/1.5ML	CARTRIDGE	Aug 2007
HORMONES	SOMATROPIN	NORDITROPIN NORDIFLEX	5 MG/1.5ML	PEN INJCTR	Aug 2007
HORMONES	SOMATROPIN	NORDITROPIN NORDIFLEX	10 MG/1.5ML	PEN INJCTR	Aug 2007
HORMONES	SOMATROPIN	NORDITROPIN	15 MG/1.5ML	CARTRIDGE	Aug 2007
HORMONES	SOMATROPIN	NORDITROPIN NORDIFLEX	15 MG/1.5ML	PEN INJCTR	Aug 2007

Appendix E — Implementation Status of UF Class Review Recommendations / Decisions

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
May 09 (update; reviewed Jun 08; original review May 07)	Antilipidemic Agents-II	**Recommended for non-formulary status May 09; no change to non-formulary status in Jun 08** ▪ fenofibrate acid (Trilipix)	BCF	No changes to BCF recommendation May 09	pending approval	pending approval
Jun 08 (update; reviewed May 07)	Antilipidemic - Agents II	No changes to NF recommended Jun 08	BCF	**Recommended for addition to BCF Jun 08** ▪ fenofibrate meltdose (Fenoglide), to replace fenofibrate IDD-P (Triglide) (Note: fenofibrate IDD-P (Triglide) removed from BCF but still UF)	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
Jun 08 (update; reviewed May 07)	Antilipidemic Agents II	To remain NF ▪ fenofibrate nanocrystallized (Tricor) ▪ fenofibrate micronized (Antara) ▪ omega-3 fatty acids (Omacor) ▪ colesevelam (Welchol)	BCF	Currently BCF ▪ gemfibrozil	24 July 07	21 Nov 07 (120 days)
May 09 update; reviewed Aug 08; Feb 06 original review)	Overactive Bladder Drugs	**Recommended for non-formulary status May 09; no change to non-formulary status in Aug 08** ▪ fesoterodine (Toviaz)	BCF	No changes to BCF recommendation May 09	pending approval	pending approval
Aug 08 (re-review; Feb 06 original review)	Overactive Bladder (OAB) Agents	▪ tolterodine IR (Detrol) ▪ trospium IR (Sanctura)	BCF	▪ tolterodine ER (Detrol LA) ▪ oxybutynin ER (Ditropan XL, generics) (Note: oxybutynin IR [generic Ditropan] removed from BCF, but still UF)	24 Oct 08	4 Feb 09 (90 days)
May 09 (update; reviewed Nov 08)	Nasal Allergy Drugs	**Recommended for non-formulary status May 09; no change to non-formulary status in Nov 08** ▪ azelastine with sucralose (Astepro)	BCF	No changes to BCF recommendation May 09	pending approval	pending approval

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Nov 08 (update to include nasal antihistamines; nasal steroids reviewed Nov 05 & Aug 07 for Veramyst)	Nasal Allergy Drugs	▪ olopatadine (Patanase) ▪ ciclesonide (Omnaris) ▪ fluticasone furoate (Veramyst) ▪ beclomethasone (Beconase AQ) ▪ budesonide (Rhinocort Aqua) ▪ triamcinolone (Nasacort AQ)	BCF	▪ Fluticasone propionate (generic Flonase) ▪ Azelastine (Astelin)	10 Feb 09	8 Apr 09 (60 days)
May 09 (update; reviewed May 07& Feb 05)	Proton Pump Inhibitors	**Recommended for non-formulary status May 09 no change to non-formulary status in May 07** ▪ Dexlansoprazole (Kapidex)	BCF	No changes to BCF recommendation May 09	pending approval	pending approval
May 07 re-review (Feb 05 original)	PPIs	▪ lansoprazole (Prevacid) ▪ omeprazole/sodium bicarbonate (Zegerid) ▪ pantoprazole (Protonix) ▪ rabeprazole (Aciphex) Automated PA requiring trial of omeprazole OR esomeprazole (Nexium) applies to new users of non-formulary PPIs (no use of PPIs in last 180 days)	BCF	▪ generic omeprazole 10 mg and 20 mg (excludes Prilosec 40 mg) ▪ esomeprazole (Nexium)	24 July 07	24 Oct 07 (90 days)
May 09 (update; reviewed May 06)	Antiemetics	**Recommended for non-formulary status May 09; no change to non-formulary status in** ▪ granisetron transdermal system (Sancuso)	BCF	No changes to BCF recommendation May 09	pending approval	pending approval
May 06	Antiemetics	▪ dolasetron (Anzemet)	BCF	▪ promethazine (oral and rectal)	26 Jul 06	27 Sep 06 (60 days)
Feb 09	Inhaled Corticosteroids	▪ Beclomethasone HFA MDI (Qvar) ▪ Budesonide MFA MDI (Pulmicort Flexhaler) ▪ Ciclesonide HFA MDI (Alvesco) ▪ Flunisolide CFC MDI (Aerobid, Aerobid M) ▪ Triamcinolone CFC MDI (Azmacort)	BCF	▪ Fluticasone DPI (Flovent Diskus) ▪ Fluticasone HFA MDA (Flovent HFA)	12 May 2009	16 Sep 09 (120 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	**Decision Date** (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	**Effective Date for Non-Formulary Medications** (Implementation period)
Feb 09	Long-Acting Beta Agonists	▪ formoterol inhalation solution (Perforomist)	BCF	▪ Salmeterol DPI (Serevent Diskus)	12 May 2009	16 Sep 09 (120 days)
Feb 09	Inhaled Corticosteroids / Long-Acting Beta Agonist Combinations	(No ICS/LABA combinations recommended for NF placement Feb 09)	BCF	▪ Fluticasone/salmeterol DPI (Advair Diskus) ▪ Fluticasone/salmeterol HFA MDI (Advair HFA)	12 May 2009	16 Sep 09 (120 days)
Nov 08	Short-Acting Beta Agonists	▪ albuterol chlorofluorocarbon (CFC) metered dose inhaler (MDI) (no longer manufactured) ▪ metaproterenol (Alupent) CFC MDI (no longer marketed) ▪ metaproterenol inhalation solution ▪ pirbuterol (Maxair) MDI	BCF	▪ Ventolin HFA (albuterol hydrofluoroalkane (HFA) MDI ▪ Albuterol inhalation solution; Note – does not include the following: Accuneb 0.021% [0.63 mg/mL] Accuneb 0.042% [1.25 mg/3mL] Albuterol 0.5% [2.5 mg/0.5 mL in 0.5 unit dose vial]	10 Feb 09	8 Apr 09 (60 days)
Nov 08 (update to include nasal antihistamines; nasal steroids reviewed Nov 05 & Aug 07 for Veramyst)	Nasal Allergy Drugs	▪ olopatadine (Patanase) ▪ ciclesonide (Omnaris) ▪ fluticasone furoate (Veramyst) ▪ beclomethasone (Beconase AQ) ▪ budesonide (Rhinocort Aqua) ▪ triamcinolone (Nasacort AQ)	BCF	▪ Fluticasone propionate (generic Flonase) ▪ Azelastine (Astelin)	10 Feb 09	8 Apr 09 (60 days)
Nov 08 & Aug 08 (update; reviewed Nov 05)	Antidepressants I	**Recommended for non-formulary status Aug 08; no change to non-formulary status in Nov 08** ▪ desvenlafaxine (Pristiq)	BCF	No changes to BCF recommended Aug 08	10 Feb 09; original signing date 24 Oct 08	7 Jan 09 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Aug 08 (update; reviewed Nov 05)	Antidepressants I	To remain NF ▪ paroxetine HCl CR (Paxil) ▪ fluoxetine 90 mg weekly admin. (Prozac Weekly) ▪ fluoxetine in special packaging for PMDD (Sarafem) ▪ escitalopram (Lexapro) ▪ duloxetine (Cymbalta) ▪ bupropion extended release (Wellbutrin XL)	BCF	Currently BCF ▪ citalopram ▪ fluoxetine (excluding weekly regimen & special packaging for PMDD) ▪ sertraline (Zoloft) ▪ trazodone ▪ bupropion sustained release	19 Jan 06	19 Jul 06 (180 days)
Nov 08	ACE inhibitors – Renin Angiotensin Antihypertensives	Previously non-formulary, recommended for UF status Nov 08 ▪ ramipril (Altace generic)	BCF	▪ No changes recommended to BCF at Nov 08 meeting; ramipril removed from Non-formulary status and designated as Uniform Formulary immediately upon signing of the minutes	10 Feb 09	N/A
Oct 08 (interim teleconference meeting) & Jun 08	Triptans	▪ almotriptan (Axert) ▪ frovatriptan (Frova) ▪ naratriptan (Amerge)	BCF	▪ rizatriptan (Maxalt), immediate upon signing of the minutes ▪ sumatriptan oral and one injectable formulation, when multi-source generics are available	24 Oct 08;; original signing date: 27 Aug 08	26 Nov 08 (90 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Aug 08	Self-Monitoring Blood Glucose Systems (SMBGS) test strips	▪ OneTouch Ultra 2 strips (for OneTouch Ultra 2, Ultra Mini, and Ultra Smart meters) ▪ TrueTrack strips (for TrueTrack meter) ▪ Accu-chek Comfort Curve strips (for Accu-chek Advantage meter) ▪ Accu-chek Compact Plus drum (for Accu-check Compact Plus meter) ▪ Accu-chek Simplicity, Ascensia Autodisk, Ascensia Breeze 2, Ascensia Elite, Assure, Assure 3, Assure II, Assure Pro, Bd Test Strips, Chemstrip Bg, Control AST, Dextrostix Reagent, Easygluco, Easypro, Fast Take, Freestyle test strips (other than Freestyle Lite), Glucofilm, Glucolab, Glucometer Dex, Glucometer Elite, Glucose Test Strip, Glucostix, Optium, Precision Pcx, Precision Pcx Plus, Precision Q-I-D, Precision Sof-Tact, Prestige Smart System, Prodigy, Quicktek, Sidekick, Sof-Tact, Surestep, Surestep Pro, Test Strip, Relion Ultima, Uni-Check ▪ Plus all other store/private label brand strips not included on the UF (see BCF/ECF column)	BCF	**Basic Core Formulary SMBGS test strips** ▪ Precision Xtra strips (for Precision Xtra meter) **Uniform Formulary SMBGS test strips** ▪ Accu-chek Aviva (for Accu-chek Aviva meter) ▪ Ascensia Contour (for Ascensia Contour meter) ▪ Freestyle Lite (for Freestyle Freedom Lite and Freestyle Lite meters)	24 Oct 08	17 Mar 09 (120 days)
Aug 08 (re-review; Feb 06 original review)	Overactive Bladder (OAB) Agents	▪ tolterodine IR (Detrol) ▪ trospium IR (Sanctura)	BCF	▪ tolterodine ER (Detrol LA) ▪ oxybutynin ER (Ditropan XL, generics) (Note: oxybutynin IR [generic Ditropan] removed from BCF, but still UF)	24 Oct 08	4 Feb 09 (90 days)
Aug 08 (update; reviewed Aug 05; also updated Nov 07)	Calcium Channel Blockers	**Recommended for non-formulary status Aug 08** ▪ nisoldipine geomatrix (Sular geomatrix)	BCF	No changes to BCF recommended Aug 08	24 Oct 08	7 Jan 09 (60 days)
		Previously non-formulary, recommended for UF status Nov 07 ▪ amlodipine besylate (Norvasc generic)		Recommended for addition to BCF Nov 07 ▪ amlodipine besylate tablets	13 Feb 08	13 Feb 08
		To Remain Non-Formulary ▪ isradipine IR, ER (Dynacirc; Dynacirc CR) ▪ nicardipine IR (Cardene, generics) ▪ nicardipine SR (Cardene SR) ▪ verapamil ER (Verelan) ▪ verapamil ER HS dosing (Verelan PM, Covera HS) ▪ diltiazem ER for bedtime dosing (Cardizem LA)		Currently BCF ▪ amlodipine besylate (Norvasc, generics) (Recommended at Nov 07 meeting) ▪ nifedipine ER (Adalat CC, generics) ▪ verapamil SR ▪ diltiazem ER (Tiazac, generics)	13 Oct 05	15 Mar 06 (150 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Jun 08	Osteoporosis Agents	▪ calcitonin salmon nasal spray (Miacalcin)	BCF	▪ alendronate (Fosamax) ▪ ibandronate (Boniva) (Note: raloxifene (Evista) removed from BCF, but still UF)	27 Aug 08	26 Nov 08 (90 days)
Jun 08 (update; reviewed May 07)	Antilipidemic Agents II	No changes to NF recommended Jun 08	BCF	**Recommended for addition to BCF Jun 08** ▪ fenofibrate meltdose (Fenoglide), to replace fenofibrate IDD-P (Triglide) (Note: fenofibrate IDD-P (Triglide) removed from BCF but still UF)	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
Jun 08 (update; reviewed May 07)	Antilipidemic Agents II	To remain NF ▪ fenofibrate nanocrystallized (Tricor) ▪ fenofibrate micronized (Antara) ▪ omega-3 fatty acids (Omacor) ▪ colesevelam (Welchol)	BCF	Currently BCF ▪ gemfibrozil	24 July 07	21 Nov 07 (120 days)
Jun 08 (update; reviewed Nov 07)	Adrenergic Blocking Agents	**Recommended for non-formulary status Jun 08** ▪ nebivolol (Bystolic)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
		(No ABAs selected for NF placement at Nov 07 meeting)		Currently BCF ▪ atenolol tablets ▪ metoprolol tartrate IR tablets ▪ carvedilol IR tablets ▪ metoprolol succinate ER tablets	13 Feb 08	-
Jun 08 (update; reviewed Aug 07	Newer Antihistamines	**Recommended for non-formulary status Jun 08** ▪ levocetirizine (Xyzal)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
		To remain NF ▪ desloratadine (Clarinex) ▪ desloratadine/pseudoephedrine (Clarinex D)		▪ MTFs required to carry at least one single ingredient agent from the newer antihistamine class (loratadine, cetirizine, or fexofenadine) on their local formulary, including at least one dosage form suitable for pediatric use	17 Oct 07	16 Jan 08 (90 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Jun 08 (update; reviewed Aug 07)	Leukotriene Modifiers	**Recommended for non-formulary status Jun 08** ▪ Zileuton ER (Zyflo CR)	BCF	No changes to BCF rec Jun 08	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
		To remain NF ▪ zileuton (Zyflo)		Currently BCF ▪ montelukast (Singulair)	17 Oct 07	16 Jan 08 (90 days)
Jun 08 (update) Original reviews ▪ ACE inhibitors: Aug 05 ▪ Miscellaneous antihypertensives, including ACE/CCB combos. Feb 06 ▪ ARBs: May 07 ▪ Renin inhibitors. Aug 07 ▪ CCB/ARB combos Nov 07 update	Renin Angiotensin Antihypertensives	**Recommended for non-formulary status Jun 08** ▪ olmesartan/amlodipine (Azor)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation date: 26 Nov 08 original implementation date: 29 Oct 08 (60 days)
		To remain NF ▪ valsartan amlodipine (Exforge)		No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ACE inhibitors ▪ Moexipril +/- HCTZ (Univasc; Uniretic) ▪ perindopril (Aceon) ▪ ramipril (Altace) ACE/CCB combos ▪ felodipine/enalapril (Lexxel) (D/C'd from market) ▪ verapamil/trandolapril (Tarka) ARBs ▪ eprosartan +/- HCTZ (Teveten; Teveten HCT) ▪ irbesartan+/- HCTZ (Avapro, Avalide) ▪ olmesartan +/- HCTZ (Benicar; Benicar HCT) ▪ valsartan +/- (Diovan; Diovan HCT)		Currently on the BCF ACE inhibitors ▪ captopril ▪ lisinopril ▪ lisinopril / HCTZ ACE/CCB combos ▪ amlodipine/benazepril (Lotrel, generics) ARBs ▪ telmisartan (Micardis) ▪ telmisartan HCTZ (Micardis HCT)	ACE inhibitors ▪ 13 Oct 05 ACE/CCB combos ▪ 26 Apr 06 ARBs ▪ 24 July 07	ACE inhibitors ▪ 15 Feb 06 ACE/CCB combos ▪ 26 Jul 06 ARBs ▪ 21 Nov 07
Nov 07	Targeted Immunomodulatory Biologics	▪ etanercept (Enbrel) ▪ anakinra (Kineret)	ECF	▪ adalimumab (Humira) injection	13 Feb 08	18 Jun 08 (120 days)
Nov 07 re-review (Aug 05 original)	BPH Alpha Blockers	▪ tamsulosin (Flomax) Automated PA requiring trial of alfuzosin (Uroxatral) applies to new users of tamsulosin (no use of uroselective alpha blockers in last 180 days)	BCF	▪ terazosin tablets or capsules ▪ alfuzosin tablets (Uroxatral)	13 Feb 08	16 Apr 08 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Nov 07 (update, original review Nov 06)	ADHD / Narcolepsy Agents	**Recommended for non-formulary status Nov 07** ▪ lisdexamfetamine (Vyvanse)	BCF	No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ▪ dexmethylphenidate IR (Focalin) ▪ dexmethylphenidate SODAS (Focalin XR) ▪ methylphenidate transdermal system (Daytrana)		Currently on the BCF ▪ methylphenidate OROS (Concerta) ▪ mixed amphetamine salts ER (Adderall XR) ▪ methylphenidate IR (Ritalin)	17 Jan 07	18 Apr 07
Nov 07 (update, original review May 06)	Contraceptives	**Recommended for non-formulary status Nov 07** ▪ EE 20 mcg/levonorgestrel 0.09 mg in special packaging for continuous use (Lybrel)	BCF	No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ▪ EE 30 mcg / levonorgestrel 0.15 mg in special packaging for extended use (Seasonale) ▪ EE 25 mcg / norethindrone 0.4 mg (Ovcon 35) ▪ EE 50 mcg / norethindrone 1 mg (Ovcon 50) ▪ EE 20/30/35 mcg / noreth. 1 mg (Estrostep Fe)		Currently on the BCF ▪ EE 20 mcg / 3 mg drospirenone (Yaz) ▪ EE 20 mcg / 0.1 mg levonorgestrel (Lutera, Sronyx, or equivalent) ▪ EE 30 mcg / 3 mg drospirenone (Yasmin) ▪ EE 30 mcg / 0.15 mg levonorgestrel (Nordette or equivalent / excludes Seasonale)	26 Jul 06	24 Jan 07
		▪ EE 30/10 mcg / 0.15 mg levonorgestrel in special packaging for extended use (Seasonique) ▪ EE 20 mcg / 1 mg norethindrone (Loestrin 24 Fe)		▪ EE 35 mcg / 1 mg norethindrone (Ortho-Novum 1/35 or equivalent) ▪ EE 35 mcg / 0.25 mg norgestimate (Ortho-Cyclen or equivalent) ▪ EE 25 mcg / 0.18/0.215/0.25 mg norgestimate (Ortho Tri-Cyclen Lo) ▪ EE 35 mcg / 0.18/0.215/0.25 mg norgestimate (Ortho Tri-Cyclen or equivalent) ▪ 0.35 mg norethindrone (Nor-QD, Ortho Micronor, or equivalent)	17 Jan 07	18 Mar 07
Aug 07	Growth Stimulating Agents	▪ somatropin (Genotropin, Genotropin Miniquick) ▪ somatropin (Humatrope) ▪ somatropin (Omnitrope) ▪ somatropin (Saizen)	ECF	▪ somatropin (Norditropin)	17 Oct 07	19 Dec 07 (60 days)

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
February 2009

1. CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on 18 February 2009 at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

2. ATTENDANCE

The attendance roster is found in Appendix A.

3. REVIEW MINUTES OF LAST MEETINGS

A. Revisions to the minutes — There were no revisions to the November 2008 DoD P&T Committee meeting minutes.

B. Approval of November minutes — S. Ward Casscells, III, MD, approved the minutes of the November 2008 DoD P&T Committee meeting on 10 February 2009.

4. REVIEW OF RECENTLY FDA-APPROVED AGENTS

Self-Monitored Blood Glucose System (SMBGS) Test Strips — TRUETest Test Strip

Relative Clinical Effectiveness — The self-monitored blood glucose system (SMBGS) test strips were evaluated for Uniform Formulary (UF) placement at the August 2008 DoD P&T Committee meeting. The other SMBGS test strips designated as formulary on the UF include Accu-chek Aviva, Precision Xtra, Freestyle Lite, and Ascensia Contour. The TRUEtest SMBGS test strip was approved by the FDA in late August 2008 and, therefore, was not included in the original UF decision. The TRUEtest test strip clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1).

The TRUEtest SMBGS test strip meets the requirements for accuracy by the FDA and the International Standard for Organization, does not require coding, is compatible with 2 SMBGS meters (TRUEresult and TRUE2go meters), requires a 0.5 microliter blood sample size, is approved for both fingertip and forearm testing, and provides results in 4 to 10 seconds. The TRUEtest SMBGS test strip employs glucose dehydrogenase pyrroloquinolinequinone (GDH-PQQ) as the reagent. Other SMBGS test strips with GDH-PQQ have been rarely associated with falsely high blood glucose readings and potential patient harm when used concurrently with products containing maltose (e.g., dialysis patients receiving icodextrin dialysate solutions). The TRUEtest package label contains warnings for this interaction.

Relative Clinical Effectiveness Conclusion — The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent): 1) the TRUEtest SMBGS test strip is similar to other SMBGS test strips included on the UF, in terms of meeting the minimum technical requirements; 2) there is a high degree of therapeutic interchangeability between TRUEtest and the other SMBGS test strips included on the UF; and 3) in

terms of safety, TRUEtest is similar to other SMBGS test strips included on the UF that also use the GDH-PQQ reagent.

Relative Cost-Effectiveness — The P&T Committee evaluated the relative cost-effectiveness of TRUEtest SMBGS test strips in relation to efficacy, safety, tolerability, and clinical outcomes of the other test strips in the SMBGS class. Information considered by the P&T Committee included, but was not limited to, sources of information listed in 32 CFR 199.21(e)(2).

A cost minimization analysis (CMA) was employed to evaluate the cost-effectiveness of TRUEtest blood glucose strips. The cost-effectiveness of TRUEtest was evaluated relative to the following agents: Accu-chek Aviva, Contour, Freestyle Lite, OneTouch Ultra, Precision Xtra, and TrueTrack. The results of the CMA showed that the projected weighted average daily cost of TRUEtest was significantly lower than the weighted average daily cost of all the other SMBGS test strips.

Relative Cost-Effectiveness Conclusion — The P&T Committee concluded (14 for, 0 opposed, 1 abstained, 0 absent) that the TRUEtest SMBGS test strip for the TRUEresult and TRUE2go meters is cost effective relative to the other SMBGS test strips included on the UF when future market conditions were considered.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 0 opposed, 1 abstained, 0 absent) that the TRUEtest SMBGS test strip remain designated as formulary on the UF.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: BCF RECOMMENDATION*** — Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (14 for, 0 opposed, 1 abstained, and 0 absent) to recommend: 1) the TRUEtest test strips not be added to the BCF.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

5. DRUG CLASS REVIEW — PULMONARY I AGENTS — INHALED CORTOCOSTEROIDS (ICS)

Relative Clinical Effectiveness — The P&T Committee evaluated the clinical effectiveness of the inhaled corticosteroids (ICS) as part of the Pulmonary I drug

class. The ICS are available in several dosage formulations, including pressurized metered-dose inhalers (MDIs) and dry powder inhalers (DPIs). The MDIs use either chlorofluorocarbon (CFC) or hydrofluoroalkane (HFA) as the propellant. The ICS available as oral inhalers include beclomethasone HFA MDI (QVAR), budesonide DPI (Pulmicort Flexhaler), ciclesonide HFA MDI (Alvesco), flunisolide CFC MDI (Aerobid, Aerobid-M [menthol added to improve taste]), fluticasone HFA MDI (Flovent HFA), fluticasone DPI (Flovent Diskus), mometasone DPI (Asmanex Twisthaler), and triamcinolone CFC MDI (Azmacort). Budesonide (Pulmicort Respules) is also available as an inhalation solution.

The current ICS Basic Core Formulary (BCF) products are budesonide inhalation solution (Pulmicort Respules as the specified product), fluticasone oral inhaler, and triamcinolone oral inhaler. None of the oral ICS inhalers are available as generic formulations. One authorized generic formulation of budesonide inhalation solution became available in December 2008.

The US Food and Drug Administration (FDA) recommended the removal of ICS metered-dose inhalers containing a CFC propellant (flunisolide and triamcinolone) by 31 December 2009. A final decision regarding this proposed date is pending.

The Military Health System (MHS) spent over $35M on oral ICS inhalers and over $13M on ICS inhalation solutions in FY 2008. In FY 2008, for the oral ICS inhalers, expenditures in the Military Treatment Facilities (MTFs) were $16.6M, expenditures in the TRICARE Retail Network (TRRx) were $15.2M, and expenditures in the TRICARE Mail Order Pharmacy (TMOP) were $3.5M. Expenditures for the inhalation solutions in FY 2008 are as follow: MTF $2.4M, TRRx $10.0M, and TMOP $0.8M. In terms of numbers of prescriptions dispensed, fluticasone (Flovent) is the highest utilized ICS in the MHS, followed by triamcinolone (Azmacort).

Information regarding the safety, effectiveness, and clinical outcomes of the ICS was considered by the Committee. The clinical review included, but was not limited to, the requirements stated in the UF Rule, 32 CFR 199.21(e)(1). The P&T Committee was advised that there is a statutory presumption that pharmaceutical agents in a therapeutic class are clinically effective and should be included on the UF, unless the P&T Committee finds by a majority vote that a pharmaceutical agent does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over the pharmaceutical agents included on the UF in that therapeutic class.

Relative Clinical Effectiveness Conclusion — The P&T Committee voted (15 for, 0 opposed, 0 abstained, 0 absent), as part of the Pulmonary I overall relative clinical effectiveness conclusion, to accept the following regarding the clinical effectiveness of the ICS products:

A. With regard to efficacy/clinical effectiveness of the ICS, the following conclusions were made:

- FDA-approved indications — The Committee recognized that the ICS products are approved only for the maintenance treatment of asthma, and FDA-approved age ranges for pediatric patients differ between the products.

- Clinical Practice Guidelines — Evidence-based guidelines from the National Asthma Education and Preventive Program (NAEPP) consider the ICS the preferred treatment for the maintenance treatment of persistent asthma. Guidelines for the use of ICS in Chronic Obstructive Pulmonary Disease (COPD) generally recommend an ICS for severe or very severe disease. The Guidelines do not state a preference for one ICS over another.
- Pharmacodynamic/pharmacokinetic properties — The Committee concluded that despite differences in topical potency, receptor binding affinity, pulmonary bioavailability, and systemic bioavailability, the overall clinical response does not appear to vary significantly between the ICS, when equipotent doses are compared.
- Overall clinical efficacy for asthma — The Committee concluded that for asthma, there is fair-to-moderate evidence that ICS do not differ with regards to symptom control, need for rescue medication, and exacerbations in patients with asthma.
- Overall clinical efficacy for COPD — The Committee concluded that for COPD, there is insufficient evidence to conclude there are clinically relevant differences regarding the efficacy of ICS in patients with COPD.

B. With regards to safety and tolerability, the following conclusions were made:

- Minor adverse events — There do not appear to be clinically relevant differences in the incidence and severity of common adverse events associated with the ICS, such as dysphonia and oral candidiasis.
- Pharmacodynamic/pharmacokinetic properties — Differences in binding affinity, lipophilicity, pulmonary bioavailability, and systemic bioavailability between the ICS products have not correlated to clinically relevant differences in safety.
- Systemic adverse effects — For systemic adverse effects of hypothalamic-pituitary-adrenal (HPA) axis suppression, growth suppression, cataract formation, fracture risk, and pneumonia risk in COPD, there is insufficient evidence to determine whether one ICS is more likely to cause these effects than another. When given in recommended doses, the ICS are not generally associated with clinically significant systemic adverse effects. Providers and patients must assess the risks and benefits if higher than recommended doses are required.
- Overall safety/tolerability — The Committee concluded there is insufficient evidence to determine whether there are clinically relevant differences between ICS in terms of minor adverse events or systemic adverse events

C. With regards to differences in other factors, the following conclusions were made:

- Special Populations – Pregnancy — Budesonide is the only ICS with a pregnancy category B rating (low evidence of risk) from the FDA; the other ICS are rated pregnancy category C. The pregnancy category B rating for

budesonide was granted based on information from 3 Swedish registries and 1 prospective study. However, national guidelines for asthma from the NAEPP state there is no data to indicate the other ICS preparations are unsafe during pregnancy, and that untreated asthma in pregnancy poses a risk to the fetus, including intrauterine growth retardation, premature delivery, and low birth weight.

- Special Populations – Children — Budesonide inhalation solution (Pulmicort Respules) is approved for treating asthma in children ranging between the ages of 1 and 8 years. Fluticasone (Flovent Diskus and Flovent HFA) and mometasone (Asmanex) are approved for treating asthma in children 4 years of age and older.
- Clinical Coverage — Responses from a survey of MTF providers revealed that to meet the needs of the majority of MHS beneficiaries, both HFA metered-dose inhalers and dry powder inhalers are required for inclusion on the UF.
- Therapeutic Interchangeability — There is a high degree of therapeutic interchangeability between the ICS products.

Relative Cost-Effectiveness — In considering the relative cost-effectiveness of pharmaceutical agents in the ICS as part of the Pulmonary I class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2). Cost minimization analysis (CMA) and budget impact analysis (BIA) were used to evaluate the cost-effectiveness of the ICS.

ICS Relative Cost-Effectiveness Conclusion — Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded the following:

A. Results of the CMA revealed that beclomethasone DPI (QVAR) was the most cost-effective ICS based on acquisition cost; and

B. Results of the BIA revealed that the ICS formulary scenario that included budesonide inhalation solution, fluticasone HFA metered-dose inhaler (Flovent HFA), fluticasone dry powder inhaler (Flovent DPI), and mometasone dry powder inhaler (Asmanex Twisthaler) was the most cost-effective overall.

1) ***COMMITTEE ACTION:*** The P&T Committee voted (15 for, 0 opposed, 0 abstained, 0 absent) to accept the cost-effectiveness conclusions stated above.

2) ***COMMITTEE ACTION: UF RECOMMENDATION*** — In view of the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations of the ICS products and other relevant factors, the P&T

Committee, based upon its collective professional judgment, voted (8 for, 5 opposed, 2 abstained, 0 absent) to recommend:

a) Budesonide inhalation solution (Pulmicort Respules, generic), fluticasone HFA MDI (Flovent HFA), fluticasone DPI (Flovent Diskus), and mometasone DPI (Asmanex Twisthaler) be classified as formulary under the UF; and

b) Beclomethasone HFA MDI (QVAR), budesonide DPI (Pulmicort Flexhaler), ciclesonide HFA MDI (Alvesco), flunisolide CFC MDI (Aerobid, Aerobid M) and triamcinolone CFC MDI (Azmacort) be designated as non-formulary on the UF, based on cost-effectiveness.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3) ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** — Based on the clinical evaluation for beclomethasone HFA MDI (QVAR), budesonide DPI (Pulmicort Flexhaler), ciclesonide HFA MDI (Alvesco), flunisolide CFC MDI (Aerobid, Aerobid M), triamcinolone CFC MDI (Azmacort), and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for beclomethasone HFA MDI (QVAR), budesonide DPI (Pulmicort Flexhaler), ciclesonide HFA MDI (Alvesco), flunisolide CFC MDI (Aerobid, Aerobid M) and triamcinolone CFC MDI (Azmacort). (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** — The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent): 1) an effective date of the first Wednesday one week following a 120-day implementation period in the TMOP and TRRx, and at the MTFs no later than a 120-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin the first Wednesday one week following approval by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

5) ***COMMITTEE ACTION: BCF RECOMMENDATION*** — The P&T Committee considered the BCF status of the ICS agents. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted 14 for, 0 opposed, 1 abstained, 0 absent) to recommend: 1) fluticasone HFA MDI and DPI (Flovent HFA and Flovent Diskus) oral inhalers remain designated as BCF; and 2) mometasone DPI (Asmanex Twisthaler) be designated as BCF immediately upon signing of the February 2009 DoD P&T Committee minutes by the Director, TMA. As a result of the above actions, budesonide inhalation solution (Pulmicort Respules) would no longer be designated as BCF, but maintained as formulary on the UF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

6. DRUG CLASS REVIEW — PULMONARY I AGENTS – LONG-ACTING BETA AGONISTS (LABAs)

Relative Clinical Effectiveness — The P&T Committee evaluated the clinical effectiveness of the long-acting beta agonists (LABAs), as part of the Pulmonary I drug class. The LABAs include 2 DPIs, salmeterol (Serevent Diskus) and formoterol (Foradil Aerolizer), and 2 inhalation solutions, formoterol solution (Perforomist) and arformoterol solution (Brovana). There are no generic formulations available for the LABAs. The current BCF LABA is salmeterol DPI (Serevent Diskus).

MHS expenditures for the LABAs in FY 2008 in the entire MHS exceeded $9.1M ($1.6M in the MTFs, $5.8M in the TRRx, and $1.7M in the TMOP). Salmeterol DPI (Serevent Diksus) is the most frequently used LABA in the entire MHS with approximately 250,000 prescriptions dispensed monthly. However overall, there is a trend for decreasing LABA use in the MHS.

Relative Clinical Effectiveness Conclusion — The P&T Committee voted (15 for, 0 opposed, 0 abstained, 0 absent), as part of the Pulmonary I overall relative clinical effectiveness conclusion, to accept the following regarding the clinical effectiveness of the LABA products:

A. With regard to efficacy/clinical effectiveness between the LABA oral inhalers, salmeterol DPI (Serevent Diskus) and formoterol DPI (Foradil Aerolizer), the following conclusions were made:

- FDA-approved indications — Salmeterol and formoterol have similar FDA-approved indications (asthma, COPD, and exercise-induced bronchospasm [EIB]), with the exception that their pediatric-approved ages for asthma differ.
- Pharmacokinetics — Formoterol has a faster onset of action than salmeterol, but clinical efficacy is similar for changes in forced expiratory volume in one second (FEV_1) and peak expiratory flow (PEF).

- Guidelines — Evidence-based guidelines from the NAEPP for asthma and the Global Initiative for Obstructive Lung Disease (GOLD) for COPD do not state a preference for one LABA over another.
- Asthma — For treating asthma, both salmeterol and formoterol have been shown to reduce the occurrence of asthma symptoms and reduce the need for rescue medications, when compared to placebo. Head-to-head studies show no difference between salmeterol and formoterol in relieving asthma symptoms, reduced use of rescue medications, or improvement in spirometry measures.
- COPD and EIB — There is insufficient evidence to determine if clinically relevant differences exist when treating COPD or EIB.

B. With regard to efficacy/clinical effectiveness between the LABA-inhaled solutions, formoterol solution (Perforomist), and arformoterol solution (Brovana), the following conclusions were made:

- COPD — There is insufficient evidence to determine if clinically relevant differences exist when treating COPD.
- Place in therapy — The LABA inhalation solutions are relatively new additions to the market. Recommendations regarding their most appropriate use in patients with COPD have not been discussed in national guidelines.

C. With regard to safety between the LABA oral inhalers, salmeterol DPI (Serevent Diskus), and formoterol DPI (Foradil Aerolizer):

- In patients with asthma, a higher risk of death was associated with salmeterol and formoterol use. This is based on data from the Salmeterol Multicenter Asthma Research Trial, an FDA meta-analysis conducted in 2008, and 2 Cochrane reviews. The risk of death is highest in subpopulations of African American patients and children 4 to 11 years of age. Using a LABA with an ICS reduces the risk of death in asthma. The FDA Advisory subcommittee is recommending removal of the LABA indication for asthma. These recommendations are pending approval at the FDA.
- In patients with COPD, 1 meta-analyses (Rodrigo 2008) and 1 pooled analysis have reported no increased risk of death with salmeterol or formoterol.
- For other serious adverse events, there do not appear to be clinically relevant differences between salmeterol and formoterol, based on similar numbers needed to harm (188 vs. 179, respectively) from 2 Cochrane reviews.

D. With regard to safety between the LABA-inhaled solutions, formoterol solution (Perforomist) and arformoterol solution (Brovana) for treating COPD, there is insufficient evidence to determine if clinically relevant differences exist in the adverse effect profile. The LABA-inhaled solutions are not approved for treating asthma.

E. With regard to other factors between the LABAs, the following conclusions were made:

- Ease of use: The formoterol DPI (Foradil Aerolizer) is more difficult for patients to use than salmeterol DPI (Serevent Diskus).
- Special Populations: For asthma, salmeterol is approved for a younger patient population (approved for children as young as 4 years old) compared to formoterol (approved for children as young as 5 years old).
- Storage conditions: Storage conditions are more favorable with formoterol inhalation solution (Perforomist), which is stable at room temperature for up to 12 weeks vs. 6 weeks with arformoterol inhalation solution (Brovana).
- Clinical Coverage: A survey of MTF providers showed that the majority of respondents require a LABA oral inhaler to treat their patients with COPD.
- Therapeutic Interchangeability: The Committee concluded there is a high degree of therapeutic interchangeability between the two LABA inhalation solutions and, with the exception of convenience/ease of use, there is a high degree of therapeutic interchangeability between the two LABA oral inhalers.
- Use of LABAs without concomitant use of ICS in MHS:
  - Results of a preliminary analysis reported by the Pharmacy Outcomes Research Team (PORT) indicated that of the 13,533 DoD beneficiaries who filled at least 1 prescription for a LABA during a 6-month study period (June – November 2008) at any DoD point of service, 6,118 (45%) had not filled a prescription for an ICS or an ICS/LABA combination during the 180 days prior to or the 60 days following the date of their first LABA prescription during the study period. The pronounced skew in this group toward older ages (mean: 69 years [SD 14]; median age: 72 years) and the fact that about 30% had filled an anticholinergic prescription during the same time period suggested a predominantly COPD population. Patients under 55 years of age who had not filled an anticholinergic prescription (characteristics suggesting asthma rather than COPD) made up only about 11% (655 patients) of this group. The analysis included both new and previous LABA users. It did not control for use of other health insurance or starting/stopping TRICARE coverage, both of which could result in missing data regarding concomitant ICS use.
  - The Committee agreed that the great majority of DoD beneficiaries receiving LABAs without concomitant ICS are probably COPD patients, in whom "unopposed" use of LABAs has not been associated with safety concerns, and that the absolute number of asthma patients in this category is likely to be small. However, they suggested that further analysis utilize asthma or COPD diagnoses (e.g., medical claims data or patient records) to identify patient groups and that available data be analyzed to investigate anecdotal reports of asthmatic patients discontinuing use of ICS without the knowledge of their providers after being placed on a LABA (either

because of greater perceived symptom relief or because of the difficulty of keeping up with multiple inhalers).

Relative Cost-Effectiveness — In considering the relative cost-effectiveness of pharmaceutical agents in the LABAs as part of the Pulmonary I class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2). Cost minimization analysis (CMA) and budget impact analysis (BIA) were used to evaluate the cost-effectiveness of the LABAs.

LABA Relative Cost-Effectiveness Conclusion — Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded the following:

A. Results of the CMA of the LABA oral inhalers revealed that formoterol DPI (Foradil Aerolizer) was the most cost-effective LABA oral inhaler overall;

B. Results of the CMA of the LABA inhalation solutions revealed that arformoterol solution (Brovana) was the most cost-effective overall; and

C. The BIA evaluated the potential impact of scenarios with selected LABA agents designated formulary or non-formulary on the UF. Results from the BIA revealed that the scenario that designated formoterol inhalation solution (Perforomist) non-formulary under the UF was most favorable to the MHS.

1) ***COMMITTEE ACTION:*** The P&T Committee voted (15 for, 0 opposed, 0 abstained, 0 absent) to accept the cost-effectiveness conclusions stated above.

2) ***COMMITTEE ACTION: UF RECOMMENDATION*** — In view of the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations of the LABA products and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend that:

   1. Salmeterol DPI (Serevent Diskus), formoterol DPI (Foradil Aerolizer) and arformoterol inhalation solution (Brovana) be classified as formulary under the UF; and

   2. Formoterol inhalation solution (Perforomist) be designated as non-formulary on the UF, based on cost-effectiveness.

Director, TMA, Decision: Ellen P. Embrey ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3) ***COMMITTEE ACTION: MN CRITERIA*** — Based on the clinical evaluation for formoterol inhalation solution (Perforomist) and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 1 opposed, 1 abstained, 0 absent) MN criteria for formoterol inhalation solution (Perforomist). (See Appendix B for full MN criteria).

Director, TMA, Decision: Allen P. Aubrey ☑ Approved ☐ Disapproved

Approved, but modified as follows:

4) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** — The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent): 1) an effective date of the first Wednesday one week following a 120-day implementation period in the TMOP and TRRx, and at the MTFs no later than a 120-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin the first Wednesday one week following approval by the Director, TMA.

Director, TMA, Decision: Allen P. Aubrey ☑ Approved ☐ Disapproved

Approved, but modified as follows:

5) ***COMMITTEE ACTION: BCF RECOMMENDATION*** — The P&T Committee considered the BCF status of the LABA agents. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (13 for, 0 opposed, 2 abstained and 0 absent) to recommend that salmeterol DPI (Serevent Diskus) remain designated as BCF.

Director, TMA, Decision: Allen P. Aubrey ☑ Approved ☐ Disapproved

Approved, but modified as follows:

7. DRUG CLASS REVIEW — PULMONARY I AGENTS – INHALED CORTICOSTEROID / LONG-ACTING BETA AGONIST COMBINATIONS (ICS/LABA COMBINATIONS)

Relative Clinical Effectiveness — The P&T Committee evaluated the clinical effectiveness of the ICS/LABA combinations, as part of the Pulmonary I drug class. There are 2 ICS/LABA combinations available. Fluticasone/salmeterol (Advair Diskus) is available as both a dry powder inhaler and as an HFA metered-dose inhaler (Advair HFA). Budesonide/formoterol (Symbicort) is available as an HFA metered-dose inhaler. MHS expenditures for the ICS/LABA combinations exceeded $153M

in FY 2008 (MTF $55.2M, TRRx $75.1M, TMOP $23.4M). In terms of number of prescriptions dispensed, fluticasone/salmeterol DPI (Advair Diskus) is by far the highest utilized ICS/LABA across all 3 points of service. The current BCF product is fluticasone/salmeterol (Advair).

Relative Clinical Effectiveness Conclusion — The P&T Committee voted (15 for, 0 opposed, 0 abstained, 0 absent), as part of the Pulmonary I overall relative clinical effectiveness conclusion, to accept the following regarding the clinical effectiveness of the ICS/LABA combination oral inhalers:

A. With regard to efficacy/clinical effectiveness between the ICS/LABA oral inhalers, the following conclusions were made:

- FDA-approved Indications — The Committee recognized that the ICS/LABA combinations are all approved for the long-term treatment of asthma, and that pediatric age ranges differ between the products. Additionally, fluticasone/salmeterol DPI (Advair Diskus) dry powder inhaler is FDA-approved to reduce air flow obstruction and reduce exacerbations in COPD. These FDA indications for COPD apply only to the fluticasone 250 mcg /salmeterol 50 mcg Advair Diskus dosage strength. Note: Following the meeting on 27 Feb 2009, the FDA approved formoterol/budesonide DPI (Symbicort) for treating COPD.

- Efficacy/clinical effectiveness for asthma — The Committee concluded that there was fair evidence to suggest that there are no clinically relevant differences in efficacy between fluticasone/salmeterol and budesonide/formoterol for the treatment of asthma. This is based on the conclusions of 2 systematic reviews (Cochrane and the state of Oregon Drug Effectiveness Review Project) and head-to-head trials showing similar improvements in PEF, mean reduction of asthma exacerbations, and increases in the percentage of symptom-free days.

- Efficacy/clinical effectiveness for COPD — The Committee concluded that there was insufficient evidence to determine whether there are clinically relevant differences in efficacy between fluticasone/salmeterol and budesonide/formoterol for the treatment of COPD.

B. With regard to safety/tolerability:

- Product labeling — The Committee recognized that the safety information contained in the product labeling for the ICS/LABA combinations closely reflects the product labels for the individual ICS and LABA components.

- Minor adverse events — Comparative trials of the ICS/LABA combinations show that the products are generally well-tolerated. The most common adverse events are nasopharyngitis, headache, upper respiratory infection, oral candidiasis, and dysphonia. Adverse events for ICS/LABA combination are similar to those reported with an equipotent dose of the individual ICS component.

C. With regard to other factors between the ICS/LABA combination oral inhalers:

- Clinical Coverage – The Committee concluded that, to meet the needs of the majority of MHS beneficiaries, MHS providers require availability of both a metered-dose inhaler and dry powder inhaler formulation of the ICS/LABA combinations.
- Therapeutic Interchangeability — The Committee concluded that there is a high degree of therapeutic interchangeability between fluticasone/salmeterol (Advair) and budesonide/formoterol (Symbicort).
- DoD Persistence Data —
    - The PORT reported preliminary results of an analysis of persistence on treatment among DoD beneficiaries who are new users of ICS/LABA combinations (Advair or Symbicort). The study sample consisted of 3,857 patients randomly sampled from the population of DoD beneficiaries who 1) received at least 1 prescription for an ICS/LABA combination from 1 Jul 2007 to 31 Dec 2007; 2) had not received an ICS/LABA prescription in the last 365 days; 3) were between 12–55 years of age (to focus on use in adults and adolescents with asthma); and 4) were enrolled in TRICARE Prime or Plus with prescription coverage throughout the study. Persistence was measured as percentage of days covered (PDC) over 1 year. Based on ICD-9 diagnosis codes from medical claims data during the baseline and accrual periods and prescription fills for anticholinergics (indicative of COPD), 72% of the study sample had a diagnosis of asthma and 12% had a diagnosis of COPD or had received an anticholinergic prescription, with 8% of patients falling into both groups. Of the remaining 24% (n=920), about two-thirds had diagnoses for acute respiratory illness and/or allergic rhinitis, while about one-third did not have a claim coded for any study diagnosis.
    - Persistence was low compared to those found for other chronic medications, with a mean PDC over 1 year of 28.3% (SD 25.2%). Overall, only 7% of patients had a PDC of at least 80% (i.e., a cumulative days supply of at least 292 days), while 16% had a PDC of at least 50%. These findings were influenced by patients who received only an initial ICS/LABA prescription (47%), with no other fills during the 365-day follow-up period. Notably, the percentage of patients receiving only 1 ICS/LABA prescription was greatest (69%) among the 920 patients without an asthma or COPD diagnosis, compared to about 40% among the 2,957 patients who did not have asthma or COPD diagnosis. This group was also less likely than the asthma or COPD groups to be treated with any other controller medication (ICS, LABAs, leukotrienes, methylxanthines, or anticholinergics). These results suggest that a considerable proportion of ICS/LABA use may be for acute rather than chronic conditions.
    - The Committee suggested that MTFs may wish to review appropriateness of ICS/LABA combination use at their facilities,

particularly with regard to acute vs. chronic use. They also agreed that formulary management documents sent to MTFs should call attention to the potential for low persistence among new users of ICS/LABAs, even those diagnosed with chronic conditions such as asthma or COPD. They agreed with plans for further analysis in this area.

Relative Cost-Effectiveness — In considering the relative cost-effectiveness of pharmaceutical agents in the ICS/LABA combination oral inhalers as part of the Pulmonary I class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2). Cost minimization analysis (CMA) and budget impact analysis (BIA) were used to evaluate the cost-effectiveness of the ICS/LABA combinations.

LABA Relative Cost-Effectiveness Conclusion — Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded the following:

A. Results of the CMA of the ICS/LABA combination oral inhalers revealed that budesonide/ formoterol (Symbicort) was the most cost-effective combination inhaler agent overall; and

B. The BIA evaluated the potential impact of scenarios with selected ICS/LABA combination agents designated formulary or non-formulary on the UF. Results from the BIA revealed that the scenario that designated budesonide/ formoterol (Symbicort) inhaler non-formulary (with an automated prior authorization) under the UF was most favorable to the MHS.

1) ***COMMITTEE ACTION:*** The P&T Committee voted (15 for, 0 opposed, 0 abstained, 0 absent) to accept the cost-effectiveness conclusions stated above.

2) ***COMMITTEE ACTION: UF RECOMMENDATION*** — In view of the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations of the ICS/LABA combination products and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (12 for, 2 opposed, 1 abstained, 0 absent) to recommend that:

   1. Fluticasone/salmeterol HFA (Advair HFA) and DPI (Advair Diskus) and budesonide/formoterol (Symbicort) inhaler be classified as formulary on the UF; and

   2. That no ICS/LABA combination agents be designated as non-formulary under the UF, based on cost-effectiveness.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3) ***COMMITTEE ACTION: BCF RECOMMENDATION*** — The P&T Committee considered the BCF status of the ICS/LABA agents. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (13 for, 0 opposed, 1 abstained and 1 absent) to recommend that fluticasone/salmeterol DPI (Advair Diskus) and fluticasone/salmeterol HFA MDI (Advair HFA) remain designated as BCF immediately on signing of the February 2009 DoD P&T Committee minutes by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

8. UTILIZATION MANAGEMENT — PRIOR AUTHORIZATIONS (PA) / Quantity Limits (QL) / MEDICAL NECESSITY (MN)

A. Nasal Allergy Drugs — Quantity Limits (QLs): The Nasal Allergy Drugs were reviewed for UF placement at the November 2008 DoD P&T Committee meeting. The class is comprised of the nasal inhaled corticosteroids, nasal antihistamines, and nasal anticholinergic agents. The 2 newest products in the class are the nasal corticosteroid ciclesonide (Omnaris) and the nasal antihistamine olopatadine (Patanase). QLs are in place for the other members of the nasal allergy drug class, which take into account FDA-approved dosing. The Committee recommended QLs for ciclesonide and olopatadine nasal inhalers, consistent with the other members in the class.

1) ***COMMITTEE ACTION:*** The Committee voted (13 for, 1 opposed, 1 abstained, 0 absent) to recommend quantity limits for ciclesonide nasal inhaler (Omnaris) of 6 bottles per 90 days in the TMOP, and 2 bottles per 30 days in the TRRx; and for olopatadine nasal inhaler (Patanase) of 6 bottles per 90 days in the TMOP, and 2 bottles per 30 days in the TRRx.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Fluticasone/salmeterol Oral HFA MDI (Advair HFA) — QLs: The ICS/LABA combination oral inhalers have QLs in place that take into account FDA-approved dosing and safety information. The fluticasone/salmeterol oral DPI (Advair Diskus) has current QLs of 3 inhalers (180 doses) per 90 days in the TMOP, and 1 inhaler (60 doses)/30 days in the TRRx.

1) ***COMMITTEE ACTION:*** The P&T Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend QLs for fluticasone/salmeterol HFA MDI (Advair HFA) of 2 inhalers per 30 days in the TRRx, and 6 inhalers per 90 days in the TMOP.

Director, TMA, Decision: Ellen P. Embrey ☑ Approved ☐ Disapproved
Approved, but modified as follows:

C. **Antifungal Prior Authorization** — The prior authorization (PA) was reviewed for terbinafine (Lamisil and generics), itraconazole (Sporanox and generics) and ciclopirox lacquer (Penlac and generics). The PA was placed due to the high cost of the drugs and potential hepatotoxic adverse effects. With the introduction of generic products, the price of the drugs has significantly fallen. COL Trinka Coster, MD, from the Pharmacovigilance Center presented data that indicated the rates for signals for these drugs in the safety databases were very low.

1) ***COMMITTEE ACTION:*** The P&T Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend removing the Antifungal Prior Authorization requirement for terbinafine (Lamisil), itraconazole (Sporonax), and ciclopirox nail lacquer (Penlac).

Director, TMA, Decision: Ellen P. Embrey ☑ Approved ☐ Disapproved
Approved, but modified as follows:

9. ITEMS FOR INFORMATION

A. **Ezetimibe / Simvastatin (Vytorin) Safety Update** — LtCol James McCrary provided the Committee with an update on recent safety information for ezetimibe/simvastatin (Vytorin). The Antilipidemic I class, which includes the statins, ezetimibe, niacin and their combination products, will be re-reviewed for UF status at an upcoming meeting

B. **MTF and TMOP Pricing Update** — Contracts for products with Federal Supply Schedule prices are in the review stage of the contract cycle. The contracts are reviewed at the Veteran's Administration National Acquisition Center (VA NAC). As of 1 February 2009, the VA NAC had completed 200 out of 246 contract reviews. Drug manufacturers are able to adjust prices due to changes in market conditions. A review of the impact of price changes on spending indicated that spending in the MTFs could increase by approximately 7% and spending at the TMOP point of service could increase by 6%. These price changes should have little effect on spending in TRRx.

C. **Patient Safety / Pharmacovigilance** — COL Coster provided the Committee with information on data mining in the Adverse Event Reporting System (AERS) database. The goal of data mining is to detect increased signals of adverse events that can be further evaluated for significance. Definitions and term hierarchy of the Medical Dictionary for Regulated Activities were presented. Limitations were discussed; e.g., no denominator data, missing data, drug name errors, underreporting, over reporting

due to publicity, lack of consistent diagnostic criteria. AERS data mining information will be presented during initial drug class committee presentations.

D. Extended Core Formulary (ECF) — The PEC had previously briefed the Committee on efforts to implement electronic prescribing in the MHS. As part of the ongoing plan to systematically review drugs represented on the BCF and ECF, the Committee periodically reviews recommendations for changes to the BCF and ECF, which will also assist with electronic prescribing. The Committee previously reviewed changes to the BCF at the November 2008 DoD P&T Committee meeting. Further information will be presented at an upcoming meeting for recommendations for changes to the ECF; no action necessary.

10) ADJOURNMENT

The meeting adjourned at 1700 hours on 18 February 2009. The next meeting will be 13–14 May 2009.

Appendix B – Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
Beclomethasone HFA MDI (Qvar) Budesonide MFA MDI (Pulmicort Flexhaler) Ciclesonide HFA MDI (Alvesco) Flunisolide CFC MDI (Aerobid, Aerobid M) Triamcinolone CFC MDI (Azmacort) **Inhaled Corticosteroids (ICS)**	• Use of formulary alternatives is contraindicated • Formulary agents have resulted or are likely to result in therapeutic failure. • No alternative formulary agent is available - specifically applies to budesonide, as it is pregnancy category B.
Formoterol (Perforomist) inhalation solution **Long-Acting Beta Agonists (LABAs)**	• Use of formulary alternatives is contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.

CFC: chlorofluorocarbon

HFA: hydrofluroalkane

MDI: metered dose inhaler

*: CFC-containing pressurized MDIs likely will cease marketing as of 31 Dec 2009

Appendix C – Implementation Status of UF Class Review Recommendations / Decisions

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	**Decision Date** (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	**Effective Date for Non-Formulary Medications** (Implementation period)
Feb 09	Inhaled Corticosteroids	▪ Beclomethasone HFA MDI (Qvar) ▪ Budesonide MFA MDI (Pulmicort Flexhaler) ▪ Ciclesonide HFA MDI (Alvesco) ▪ Flunisolide CFC MDI (Aerobid, Aerobid M) ▪ Triamcinolone CFC MDI (Azmacort)	BCF	▪ Fluticasone DPI (Flovent Diskus) ▪ Fluticasone HFA MDA (Flovent HFA)	pending approval	pending approval
Feb 09	Long-Acting Beta Agonists	▪ formoterol inhalation solution (Perforomist)	BCF	▪ Salmeterol DPI (Serevent Diskus)	pending approval	pending approval
Feb 09	Inhaled Corticosteroids / Long-Acting Beta Agonist Combinations	(No ICS/LABA combinations recommended for NF placement Feb 09)	BCF	▪ Fluticasone/salmeterol DPI (Advair Diskus) ▪ Fluticasone/salmeterol HFA MDI (Advair HFA)	pending approval	pending approval
Nov 08	Short-Acting Beta Agonists	▪ albuterol chlorofluorocarbon (CFC) metered dose inhaler (MDI) (no longer manufactured) ▪ metaproterenol (Alupent) CFC MDI (no longer marketed) ▪ metaproterenol inhalation solution ▪ pirbuterol (Maxair) MDI	BCF	▪ Ventolin HFA (albuterol hydrofluoroalkane (HFA) MDI ▪ Albuterol inhalation solution; Note – does not include the following: Accuneb 0.021% [0.63 mg/mL] Accuneb 0.042% [1.25 mg/3mL] Albuterol 0.5% [2.5 mg/0.5 mL in 0.5 unit dose vial]	10 Feb 09	8 Apr 09 (60 days)

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
November 2008

1) CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on 18 November 2008 and at 0730 on 19 November 2008 at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

2) ATTENDANCE

The attendance roster is found in Appendix A.

3) REVIEW MINUTES OF LAST TWO MEETINGS

A. Updates to the minutes — Updates to the June 2008 DoD P&T Committee meeting minutes for the reviewed drug classes' implementation dates were discussed. Implementation dates from the June 2008 meeting for the designated non-formulary drugs delayed to 26 November 2008.

B. Approval of August minutes — S. Ward Casscells, III, MD, approved the minutes of the August 2008 DoD P&T Committee meeting on 24 October 2008.

C. Interim October meeting — An interim teleconference meeting was held on 27 October 2008 to re-analyze the cost effectiveness of the triptan drug class for Uniform Formulary (UF) placement. The recommendations from the interim meeting were reviewed by CDR James Ellzy. The Committee agreed to maintain the original medical necessity (MN) criteria and implementation date (90 days; 26 November 2008). The minutes are under review by TMA.

4) REVIEW OF RECENTLY FDA APPROVED AGENTS

A. Re-review of Antidepressant-1 (AD-1) - Desvenlafaxine (Pristiq)

The committee re-reviewed the cost-effectiveness and Uniform Formulary (UF) status of desvenlafaxine (Pristiq) that was originally conducted at the August 2008 meeting. Manufacturers were offered the opportunity to re-submit Uniform Formulary Voluntary Agreement for Retail Refunds (UF VARR) submissions that exceeded the Federal Ceiling Price. A revised UF VARR was submitted for desvenlafaxine. The August 2008 DoD P&T Committee meeting minutes were originally signed by the Director, TMA on 24 October 2008.

Relative Clinical Effectiveness — The committee agree that there was no reason to repeat the review since there was no significant new information in the intervening three months. The relative clinical effectiveness of desvenlafaxine (Pristiq) was reviewed at the August 2008 meeting. Desvenlafaxine (Pristiq) is a Serotonin Norepinephrine Reuptake Inhibitor (SNRI) that is included in the Antidepressant-1 (AD-1) drug class. The AD-1 drug class was originally reviewed for UF placement in November 2005. Desvenlafaxine is an extended release (ER) formulation of the major active metabolite of venlafaxine ER (Effexor XR), and is approved solely for treating major depressive disorder in adults. Generic formulations of venlafaxine ER are

expected in 2010.

Relative Clinical Effectiveness Conclusion — At the November 2008 meeting the committee agreed to accept the conclusion from the August 2008 meeting. August 2008 P&T Committee meeting members concluded (15 for, 0 opposed, 0 abstained, 0 absent) that desvenlafaxine does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other AD-1 agents currently included on the UF. A review of the literature from August 2008 to the present found no new data to alter the previous clinical conclusion.

Cost Effectiveness — A cost minimization analysis (CMA) was used to evaluate the cost effectiveness of desvenlafaxine relative to the UF AD-1s: citalopram (Celexa, generics), sertraline (Zoloft, generics), venlafaxine immediate release (Effexor, generics), venlafaxine ER (Effexor XR), and the nonformulary (NF) AD-1s bupropion ER (Wellbutrin XL, generics), and duloxetine (Cymbalta). The analysis included pricing to reflect the offered UF VARR. Results of the CMA showed that the projected weighted average daily cost of desvenlafaxine was significantly higher than the current market drug mix of AD-1 class comparators, when future market conditions were considered.

Relative Cost Effectiveness Conclusion — The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) that desvenlafaxine (Pristiq) is not cost effective relative to the other AD-1s included on the UF when future market conditions were considered.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 2 opposed, 1 abstained, 0 absent) that desvenlafaxine (Pristiq) remain designated as nonformulary on the UF. This recommendation was based on the clinical effectiveness conclusion and the cost determination when future market conditions were considered. Citalopram, sertraline, venlafaxine, and venlafaxine ER (Effexor XR) remain the most cost effective AD-1 agents on the UF compared to desvenlafaxine.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** —At the November 2008 meeting the Committee agreed to maintain the original MN criteria from the August 2008 meeting. Based on the clinical evaluation of desvenlafaxine and the conditions for establishing MN of a nonformulary medication provided for in the UF rule, the P&T Committee recommended in June 2008 (June vote:14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for desvenlafaxine (Pristiq). (See Appendix B for full MN criteria.)

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** —At the November 2008 meeting the committee agreed not to change the original 60-day implementation period from the August 2008 meeting (August vote: of 14 for, 0 opposed, 1 abstained, 0 absent). The implementation date will be effective 07 January 2009. TMA will send a letter to beneficiaries affected by this UF decision.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

5) DRUG CLASS REVIEW — SHORT-ACTING BETA AGONISTS (SABAs)

Relative Clinical Effectiveness — The P&T Committee evaluated the clinical effectiveness of the inhaled Short-Acting Beta Agonists (SABAs). There are four SABA products marketed in the US that are formulated as pressurized metered dose inhalers (MDIs) or solutions for inhalation: albuterol (a racemic mixture), levalbuterol (the (R)-enantiomer form of albuterol), metaproterenol, and pirbuterol. The SABA inhaled solutions include albuterol (Accuneb, generics; various concentrations), levalbuterol (Xopenex), and metaproterenol (Alupent, generics).

As of 31 December 2008, hydrofluoroalkane (HFA) will replace chlorofluorocarbon (CFC) as the propellant in albuterol MDIs. The SABA MDI formulations include albuterol HFA (Ventolin HFA, Proventil HFA, ProAir), levalbuterol HFA (Xopenex), and pirbuterol (Maxair). Generic formulations of albuterol MDI and metaproterenol CFC (Alupent) using the CFC propellant are no longer manufactured, but supplies have not yet been exhausted. The three albuterol HFA products are not considered therapeutically interchangeable by the FDA.

In the past fiscal year, over $43M was spent on the SABAs at all three points of service in the Military Health System (MHS), with $30M spent in TRICARE Pharmacy Retail Network (TRRx), $10M in the Military Treatment Facilities (MTFs), and $3M in the TRICARE Mail Order Pharmacy (TMOP). In terms of numbers of prescriptions dispensed in the MTFs, Proventil HFA is the highest utilized SABA, followed by Xopenex HFA, Ventolin HFA, and Proair HFA. In the TRRx, the top three drugs in terms of numbers of prescriptions dispensed are generic albuterol CFC MDI (but has declining usage due to dwindling stock), ProAir HFA MDI, and Xopenex HFA MDI.

Information regarding the safety, effectiveness, and clinical outcomes of the SABAs was considered by the Committee. The clinical review included, but was not limited to, the requirements stated in the UF Rule, 32 CFR 199.21(e)(1). The P&T Committee was advised that there is a statutory presumption that pharmaceutical agents in a therapeutic

class are clinically effective and should be included on the UF, unless the P&T Committee finds by a majority vote that a pharmaceutical agent does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over the pharmaceutical agents included on the UF in that therapeutic class. The clinical effectiveness review for the SABAs was limited to the outpatient setting; emergency department (ED) use was evaluated only when pertinent.

Relative Clinical Effectiveness Conclusion — The P&T Committee voted (16 for, 0 opposed, 0 abstained, 0 absent) to accept the following clinical effectiveness conclusion:

a) In terms of efficacy/clinical effectiveness, there is little evidence to suggest there are clinically significant differences between agents for their FDA approved indications. Other conclusions regarding efficacy include the following:

- Clinical Practice Guidelines – Evidence based guidelines from the VA/DoD Clinical Practice Group, Global Initiative for Asthma, National Heart, Lung and Blood Institute/National Asthma Education & Prevention Program, and Global Initiative for Chronic Obstructive Lung Disease do not list a preference for one SABA over another for treating asthma, exercise-induced bronchospasm (EIB) or chronic obstructive pulmonary disease (COPD).
- Asthma
  - *MDI and inhalation solution administration – placebo-controlled studies*: For asthma, all the SABA agents were more efficacious than placebo at improving the change in forced expiratory volume in one second (FEV1) $\geq$ 12% from baseline, whether administered via MDI or inhalational solution.
  - *MDI administration – albuterol vs. levalbuterol*: There are no studies in adults or children assessing efficacy of albuterol vs. levalbuterol when administered by metered-dose inhaler in the outpatient setting.
  - *Inhalation administration – albuterol vs. levalbuterol in adults:* For adults with asthma, there is little evidence to suggest there are clinically relevant differences between albuterol and levalbuterol when administered via inhaled solutions (e.g., nebulized route) in either the outpatient or emergency department (ED) settings in terms of number of puffs of rescue medication used daily or hospitalization admission rates from the ED.
  - *Inhalation administration – albuterol vs. levalbuterol in children*: There are conflicting and inconclusive results as to whether there are efficacy differences between albuterol and levalbuterol inhalation solution when administered in the outpatient or ED settings to children with asthma. Some studies reported no clinically significant differences in outcomes such as changes in asthma symptom score, symptom-free days, rescue medication use, and hospitalization rates between albuterol and levalbuterol. However, levalbuterol treatment resulted in statistically significant results in terms of more asthma-controlled days, higher quality of life scores, and lower hospitalization admission rates from the

ED compared to albuterol. Interpretation of the results of these studies is complicated by the low patient enrollment, varying definitions of criteria for hospitalization, and enrollment of patients as old as 18-21 years.

- EIB – Placebo controlled trials with albuterol administered via MDI 15 to 30 minutes before exercise reported statistically significant results in terms of preventing exercise-related symptoms compared to placebo. Although levalbuterol MDI (Xopenex) is not currently approved by the FDA for EIB, the results of placebo-controlled phase III trials do not suggest that the effect of levalbuterol at preventing EIB symptoms would differ from albuterol.
- COPD - There is insufficient evidence to compare the SABAs when used in COPD.
- CFC vs. HFA efficacy - HFA products were as effective as CFC products when evaluated in head-to-head studies. Placebo-controlled trials assessing efficacy of HFA albuterol with CFC albuterol have reported similar effects on percentage change in FEV1.

b) With regards to safety/tolerability, the following conclusions were made:

- *Discontinuation rates due to adverse events (AEs)* - SABAs are associated with similar systemic adverse effects. A systematic review found no clinically relevant differences in discontinuation rates due to changes in heart rate, blood pressure, palpitations, nervousness, anxiety, tremor, hyperglycemia or hypokalemia between albuterol and levalbuterol inhalation solution.
- *Rare but serious AEs* – There do not appear to be clinically relevant differences between the SABAs in terms of serious adverse effects (e.g., paradoxical bronchospasm, cardiac effects).
- *Inhalation solution administration – albuterol vs. levalbuterol* - In the outpatient setting, in both adults and children, the incidence of the withdrawal rates due to AEs and overall AE rates were similar between albuterol and levalbuterol inhaled solutions. However, in children there is insufficient evidence from the outpatient studies to determine whether there are clinically relevant differences in the incidence of tachycardia, as conflicting results were reported. One study reported a lower incidence of tachycardia with albuterol compared to levalbuterol, while another reported that both drugs resulted in a change of heart rate of 4 beats per minute.
- *MDI administration – albuterol vs. levalbuterol* - There is insufficient data with the SABA MDI formulations to assess safety differences between albuterol and levalbuterol.
- *Drug-Drug interactions*- Drug-drug interactions between the SABAs are well-known and considered a class effect.
- *FDA Adverse Event Reporting System (AERS)* – FDA AERS data shows higher signals than expected with device malfunction/failure for Proair HFA MDI and Proventil HFA MDI. However, this is observational data only and these safety signals have not been validated.

c) With regards to differences between the SABAs in terms of other factors, the following conclusions were made:

- Special populations – The Committee recognized that the pediatric FDA-approved age ranges differ between the products. All four SABAs are labeled as category C drugs for pregnancy and breast feeding, and infant risk cannot be ruled out.
- CFC Phase out – By 31 December 2008, all albuterol CFC metered-dose inhalers will no longer be available. Metaproterenol CFC MDIs (Alupent) will also cease manufacturing by the end of 2008. It is likely that pirbuterol CFC MDIs (Maxair) will also be removed from the market.
- HFA formulations - There are only minor differences between the HFA formulations of albuterol and levalbuterol, including presence of a dose counter (Ventolin HFA is the only product with a dose counter), requirements for priming, storage conditions, and excipients (Ventolin HFA is the only SABA that does not contain alcohol). However, per FDA ruling, the HFA albuterol agents are not interchangeable.
- Delivery devices - There are no clinically relevant difference among the SABAs in terms of alternative delivery devices (MDI with a spacer/holding chamber, nebulizer, dry powder inhalers) compared with a standard MDI in stable asthma or COPD.
- Provider Survey – A survey of MTF providers found that albuterol HFA MDI was preferred over levalbuterol HFA MDI (Xopenex) in the outpatient setting for relief of bronchospasm.

COMMITTEE ACTION: The P&T Committee voted (16 for, 0 opposed, 0 abstained, 0 absent) to accept the clinical effectiveness conclusions stated above.

Relative Cost Effectiveness — In considering the relative cost-effectiveness of pharmaceutical agents in the SABA drug class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2). Cost minimization analysis (CMA) and budget impact analysis (BIA) were used to evaluate the cost effectiveness of the SABA agents.

Relative Cost Effectiveness Conclusion - Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded the following:

a) Results from the CMA of SABA MDIs revealed that Ventolin HFA was the most cost effective SABA MDI agent overall.

b) Results from the CMA of SABA inhalant solutions revealed that albuterol inhalation solution (generic; 2.5 mg/3mLconcentration) was the most cost effective agent overall.

c) The potential impact of scenarios with selected SABA agents designated formulary or nonformulary on the UF was evaluated with the BIA. Albuterol CFC

inhaler and metaproterenol inhaler were not included in the BIA as they are no longer being manufactured. BIA results designated pirbuterol (Maxair) CFC MDI and metaproterenol inhalant solution (generic) nonformulary on the UF as the most favorable scenario for the MHS.

COMMITTEE ACTION: The P&T Committee voted (16 for, 0 opposed, 0 abstained, 0 absent) to accept the cost effectiveness conclusions stated above.

A. ***COMMITTEE ACTION: UF RECOMMENDATION*** — In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the SABA agents, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (14 for, 1 opposed, 1 abstained, and 0 absent) to recommend that:

1. Albuterol HFA inhaler (Ventolin HFA, Proventil HFA, Proair HFA), levalbuterol inhaler (Xopenex HFA), albuterol inhalation solution (Accuneb, generics), and levalbuterol inhalant solution (Xopenex unit dose nebulizer solution) be classified as formulary on the UF; and
2. Pirbuterol CFC inhaler (Maxair) and metaproterenol inhalation solution (Alupent, generics) be designated as nonformulary on the UF, based on cost effectiveness.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. ***COMMITTEE ACTION: MN CRITERIA*** — Based on the clinical evaluation for pirbuterol inhaler (Maxair)and metaproterenol inhalation solution (Alupent, generics), and the conditions for establishing medical necessity for a nonformulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) MN criteria for pirbuterol inhaler (Maxair) and metaproterenol inhalation solution (Alupent, generics). Albuterol CFC inhaler and metaproterenol CFC inhaler (Alupent) will not be included on the MN criteria as they will not be available after 31 Dec 08. (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** — The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday one week following a 60-day implementation period in the TMOP and TRRx, and at the MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin the first Wednesday one week following approval by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. COMMITTEE ACTION: BCF RECOMMENDATION — The P&T Committee considered the BCF status of the SABA agents. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (15 for, 0 opposed, 1 abstained, and 0 absent) to recommend that albuterol inhalant solution (generics, excludes Accuneb and the 0.5% [2.5 mg/0.5ml] unit dose vial) and the Ventolin HFA brand of albuterol HFA MDI be designated as BCF immediately on signing of the November 2008 P&T Committee minutes by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

E. COMMITTEE ACTION: QUANTITY LIMITS - The P&T Committee updated the quantity limits (QLs) for the SABAs. The P&T Committee voted (15 for, 0 opposed, 1 abstained, and 0 absent) to recommend the QLs outlined in Appendix E.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

6) DRUG CLASS REVIEW — NASAL ALLERGY DRUGS (NADs)

Relative Clinical Effectiveness — The P&T Committee evaluated the clinical effectiveness of the Nasal Allergy Drugs (NADs). The class is comprised of three subclasses as listed below. The nasal corticosteroids were previously reviewed for UF placement in November 2005 and August 2007.

- *Nasal corticosteroids*: beclomethasone (Beconase AQ), budesonide (Rhinocort AQ), ciclesonide (Omnaris), flunisolide (Nasarel, generics), fluticasone furoate (Veramyst), fluticasone propionate (Flonase, generics), mometasone furoate (Nasonex), and triamcinolone (Nasacort AQ)
- *Nasal Antihistamines*: azelastine (Astelin) and olopatadine (Patanase)
- *Nasal Anticholinergics*: ipratropium (Atrovent, generics)

Information regarding the safety, effectiveness, and clinical outcomes of these drugs was considered. The clinical review included, but was not limited to, the requirements stated in the UF Rule, 32 CFR 199.21(e)(1).

MHS expenditures for the NAD class exceeded $63M in FY 2008 (MTF: $18.6M, TRRx $37.5M, TMOP $7M). In terms of numbers of prescriptions dispensed, generic fluticasone propionate (Flonase) is the highest utilized nasal allergy drug in the MTFs,

followed by mometasone furoate (Nasonex), and azelastine (Astelin). This utilization pattern is also seen in the TRRx.

Relative Clinical Effectiveness Conclusion — The P&T Committee voted (16 for, 0 opposed, 0 abstained, 0 absent) to accept the following clinical effectiveness conclusion:

Nasal corticosteroids

a) With regards to efficacy/clinical effectiveness of the nasal corticosteroids, the following conclusions were made:

- FDA-approved indications – The Committee recognized that there were minor differences among the drugs with regard to FDA-approved uses for seasonal allergic rhinitis (SAR), perennial allergic rhinitis (PAR), prophylaxis of allergic rhinitis (AR) symptoms, nonallergic rhinitis, and nasal polyps. Additionally, the pediatric FDA-approved age ranges differ between the products.
- Clinical Practice Guidelines – Evidence-based guidelines from the American Academy of Allergy, Asthma and Immunology (AAAAI) consider the nasal corticosteroids as the most effective drug class at reducing allergic rhinitis symptoms of sneezing, rhinorrhea, nasal congestion, and itching.
- Pharmacodynamic/pharmacokinetic properties – The AAAAI guidelines concluded that despite differences in topical potency, lipid solubility, receptor binding affinity, and systemic bioavailability, the overall clinical response does not appear to vary significantly between drugs.
- Efficacy for SAR/PAR – The Committee concluded there was no new data to change the previous conclusion from the 2005 meeting that there was no evidence of clinically relevant differences between beclomethasone, budesonide, flunisolide, fluticasone propionate, mometasone, and triamcinolone at relieving AR symptoms.
- Efficacy of newer agents – Fluticasone furoate (Veramyst) was non-inferior to fluticasone propionate (Flonase, generics) at relieving symptoms of SAR; there was no new data to change this conclusion. The newest nasal corticosteroid, ciclesonide (Omnaris) does not have published data comparing efficacy to other nasal corticosteroids. Placebo-controlled trials with ciclesonide report statistically significant improvements in patients with SAR and PAR.
- Relief of ocular symptoms - None of the nasal corticosteroids are FDA-approved for use in reducing ocular symptoms of itching, tearing or erythema. However, all of the agents, with the exception of ciclesonide, have shown efficacy at reducing ocular symptoms in placebo-controlled trials.
- Nasal polyps – Data from clinical trials conducted with beclomethasone, budesonide, and fluticasone propionate report reductions in the size of nasal polyps. Both mometasone furoate and beclomethasone are FDA-approved for nasal polyps.

b) With regards to regards to safety and tolerability, the following conclusions were made:

- Local effects - Nasal irritation, epistaxis, and rhinorrhea are the most common local AEs and are equally likely to occur with any of the nasal corticosteroids.
- Pharmacodynamic/pharmacokinetic properties – Minor differences in binding affinity, lipophilicity, and bioavailability between the products have not correlated to clinically relevant differences in safety. Pharmacokinetic studies report that the newer agents would be expected to pose fewer risks than the older agents (flunisolide, beclomethasone, budesonide, and triamcinolone).
- Systemic effects- For systemic effects of hypothalamic pituitary adrenal-axis suppression, growth suppression, and cataract formation, there is insufficient evidence to determine whether one nasal corticosteroid is more likely to cause these effects than another. When given in recommended doses, the nasal corticosteroids are not generally associated with clinically significant systemic adverse effects. Providers and patients must assess the risks to benefits, if higher than recommended doses are required.
- Tolerability and patient preferences - Patient preferences may play a role in differentiating between the nasal corticosteroids. However, the available clinical data is poor, and no nasal corticosteroid has proven superior to the others in patient preference trials. More well-designed head-to-head trials are needed to support superiority of a nasal corticosteroid based on tolerability and compliance.

c) With regards to differences in other factors, the following conclusions were made:

- Special populations – Budesonide (Rhinocort AQ) is the only nasal corticosteroid with a pregnancy category B rating by the FDA (low evidence of risk to humans), which was based on a retrospective review of data from three Swedish registries and one prospective study. All the nasal corticosteroids have a class labeling that these drugs should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus.
- Provider survey – A survey of MTF providers found that the majority of prescribers (49%) preferred fluticasone propionate (Flonase, generics) as their first choice of nasal corticosteroid, followed by no preference (17%), and mometasone (15%). Providers showed no preference for differences in formulations between the products (e.g., hypotonic formulation, ergonomic design, prodrug active ingredient, scent-free product, or preservative-free product).

Nasal antihistamines

a) With regards to efficacy/clinical effectiveness of the nasal antihistamines, the following conclusions were made:

- FDA-approved indications – The Committee recognized that there were minor differences between olopatadine (Patanase) and azelastine (Astelin) with

regard to FDA-approved uses for SAR and nonallergic rhinitis (e.g., vasomotor rhinitis [VMR]), and pediatric approval.

- Clinical Practice Guidelines – AAAAI guidelines state that nasal antihistamines are generally less effective than nasal corticosteroids for treating AR, but may be considered for use as first-line treatment for AR and nonallergic rhinitis. Nasal antihistamines are associated with a clinically significant effect on nasal congestion.
- Efficacy for SAR – Both nasal antihistamines are superior to placebo in relieving symptoms of SAR. Determining whether there are relevant clinical differences in efficacy between olopatadine and azelastine is difficult because different rating scores were used in the individual placebo-controlled trials.
- Efficacy for VMR: Only azelastine is FDA-approved for treating the symptoms of VMR, which consist of postnasal drip, sneezing, rhinorrhea, and nasal congestion. FDA-approval was based on the results of two placebo-controlled studies in 200 patients that used a rating scale not previously seen in the literature.
- Head to head study- The one head-to-head trial comparing the use of olopatadine with azelastine was conducted in an allergan exposure unit, making applicability to the clinical setting difficult.

b) With regards to safety and tolerability of the nasal antihistamines, the following conclusions were made:

- Local adverse effects: package insert data- For safety data, package insert data report a higher incidence of bitter taste and somnolence with azelastine, while olopatadine has a higher incidence of epistaxis.
- Local adverse effects: AAAAI guidelines – the AAAAI guidelines recognize that the two nasal antihistamines can cause sedation and can inhibit skin test reactions, due to systemic absorption.
- Patient preferences and tolerability – There is insufficient evidence to determine whether clinically relevant differences exist between the nasal antihistamines with respect to patient preferences and tolerability. The available clinical data is sparse, and is limited to manufacturer-sponsored studies that are not yet available in peer-reviewed publications.

c) With regards to other factors,

- Provider survey - A survey of MTF providers found that 37% of responders preferred a nasal corticosteroid over a nasal antihistamine for managing AR and nonallergic rhinitis.
- Onset and duration of action – The Committee recognized that the onset of action to relieve AR symptoms was slightly faster with olopatadine compared to the package insert data for azelastine (0.5 - 1 hour vs. 2-3 hours). However, the onset of action with both nasal antihistamines is faster than that reported overall with nasal corticosteroids (2-3 days).

Nasal anticholinergic agents

a) With regards to efficacy/clinical effectiveness, safety, tolerability and other factors of the ipratropium nasal spray (Atrovent, generics), the following conclusions were made:

- FDA-approved indications – Ipratropium is solely indicated for the relief of SAR in adults and children 12 years of age and older.
- Clinical Practice Guidelines – AAAAI guidelines state that nasal anticholinergics may effectively reduce rhinorrhea, but have no effect on other nasal symptoms. Although AEs are minimal, dryness of the nasal membranes may occur.
- Efficacy - Further head-to-head trials are needed to prove the superiority of a nasal anticholinergic over a nasal antihistamine or nasal corticosteroid in the treatment of rhinorrhea.

COMMITTEE ACTION: The P&T Committee voted (16 for, 0 opposed, 0 abstained, 0 absent) to accept the clinical effectiveness conclusions stated above.

Relative Cost Effectiveness – In considering the relative cost-effectiveness of pharmaceutical agents in the NAD drug class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included, but was not limited, to sources of information listed in 32 CFR 199.21(e)(2). CMA and BIA were used to evaluate the cost effectiveness of the NAD agents.

Relative Cost Effectiveness Conclusion — Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 0 absent) the following:

a) Results from the CMA of nasal corticosteroid agents revealed that flunisolide was the most cost effective nasal corticosteroid agent overall.

b) Results from the CMA of nasal antihistamines agents revealed that azelastine was the most cost effective nasal antihistamine agent overall.

COMMITTEE ACTION: The P&T Committee voted (16 for, 0 opposed, 0 abstained, 0 absent) to accept the cost effectiveness conclusions stated above.

A. ***COMMITTEE ACTION: UF RECOMMENDATION*** — In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the NADs, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (14 for, 1 opposed, 1 abstained, and 0 absent) to recommend that:

1) Fluticasone propionate (Flonase, generics), flunisolide (Nasarel generics), mometasone (Nasonex), azelastine (Astelin), and ipratropium nasal spray (Atrovent, generics) be classified as formulary on the UF.

2) Beclomethasone dipropionate (Beconase AQ), budesonide (Rhinocort Aqua), ciclesonide (Omnaris), fluticasone furoate (Veramyst), olopatadine HCl (Patanase), and triamcinolone acetonide (Nasacort AQ) be designated as nonformulary under the UF, based on cost effectiveness.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. COMMITTEE ACTION: MN CRITERIA — Based on the clinical evaluation for Beclomethasone dipropionate (Beconase AQ), budesonide (Rhinocort Aqua), ciclesonide (Omnaris), fluticasone furoate (Veramyst), olopatadine HCl (Patanase), triamcinolone acetonide (Nasacort AQ), and the conditions for establishing medical necessity for a nonformulary medication provided for in the UF rule, the P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) MN criteria for beclomethasone dipropionate (Beconase AQ), budesonide (Rhinocort Aqua), ciclesonide (Omnaris), fluticasone furoate (Veramyst), olopatadine HCl (Patanase), and triamcinolone acetonide (Nasacort AQ). (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. COMMITTEE ACTION: IMPLEMENTATION PERIOD — The P&T Committee recommended (15 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday one week following a 60-day implementation period in the TMOP and TRRx, and in the MTFs, no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin the first Wednesday one week following the approval by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. COMMITTEE ACTION: BCF RECOMMENDATION — The P&T Committee considered the BCF status of the NADs. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (9 for, 5 opposed, 1 abstained, and 1 absent) to recommend that fluticasone propionate (Flonase, generics) and azelastine (Astelin) be designated as BCF immediately on signing of the November 2008 P&T Committee minutes by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

7) UTILIZATION MANAGEMENT — PRIOR AUTHORIZATIONS (PA)/ Quantity Limits (QL) / MEDICAL NECESSITY (MN)

A. Serotonin subtype 3 receptor-blocking agents – QLs

Palonosetron capsules (Aloxi) – The serotonin subtype 3 receptor-blocking agent (5-HT3 antagonist) palonosetron was previously available only in an intravenous solution. The antiemetic is now approved as a 0.5 mg capsule for the prevention of chemotherapy induced nausea and vomiting (CINV) associated with initial and repeat courses of chemotherapy. It is administered as one capsule one hour prior to moderately emetogenic chemotherapy. There is no published data to support the chronic continuous use of palonosetron for prevention of nausea and vomiting. Palonosetron has the longest half-life of the 5-HT3 antagonists (37 - 48 hours), vs. 4-5 hours with ondansetron, 8 hours with oral granisetron, and 9-11 hours with dolasetron. Quantity limits apply to the other 5-HT3 receptor antagonists. The Committee recommended a QL of 1 capsule per fill in both the TRRx and TMOP, due to the long half-life and limited FDA-approved indication for palonosetron (solely for prevention of CINV). A new prescription would be required for each course of chemotherapy.

Granisetron transdermal (Sancuso) – Granisetron is now available in a new transdermal formulation, in addition to tablets (Kytril, generics) and an oral solution. The transdermal system is approved for the prevention of CINV for patients receiving moderately to highly emetogenic chemotherapy regimens. Granisetron is available as a 34.3 mg patch that delivers 3.1 mg per 24 hours for up to 7 days. It is applied as a single patch to the arm 24 hours prior to receiving chemotherapy, and removed 24 hours after completion of chemotherapy; it can be worn for up to 7 days, depending on the duration of chemotherapy. The Committee recommended a QL of 1 patch per fill in both the TRRx and TMOP, due to the long duration of action and limited FDA-approved indication for granisetron transdermal system (solely for prevention of CINV). A new prescription would be required for each course of chemotherapy.

COMMITTEE ACTION: The Committee voted (15 for, 0 opposed, 1 abstained, 0 absent) to recommend quantity limits for palonosetron of 1 capsule per prescription fill in the TMOP and TRRx, and for granisetron transdermal system of 1 patch per prescription fill in the TMOP and TRRx.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Ciclesonide oral inhaler (Alvesco) – QL: Ciclesonide is an oral inhaled corticosteroid approved for the treatment of asthma in patients 12 year of age and older. It is dosed twice daily. There are existing QLs for the other oral inhaled corticosteroids. The Committee recommended QLs for ciclesonide, consistent with the limits imposed on other inhaled corticosteroids in the class.

COMMITTEE ACTION: The P&T Committee voted (15 for, 0 opposed, 1 abstained, 0 absent) to recommend QLs for ciclesonide oral inhaler of 2 inhalers per 30 days in the TRRx, and 6 inhalers per 90 days in the TMOP.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

8) STATUS OF RAMIPRIL ON THE UF

On an ongoing basis, the DoD PEC monitors changes in the clinical information, current costs and utilization trends to determine whether the UF status of agents designated as non-formulary needs to be readdressed. The P&T Committee reevaluated the UF status of ramipril (Altace, generics) in light of recent price reductions in the generic formulations across all three points of service.

Clinical Effectiveness Conclusion — The angiotensin converting enzyme (ACE) inhibitors were evaluated for UF status at the August 2005 meeting. At that meeting, the Committee concluded, in general, that ramipril had similar clinical effectiveness relative to other ACE inhibitors in regards to efficacy for treating hypertension, safety, and tolerability. The P&T Committee recognized that there were differences in clinical outcomes for myocardial infarction, heart failure, diabetic nephropathy, and patients at high cardiovascular risk.

Cost Effectiveness Conclusion — The P&T Committee voted (16 for, 0 opposed, 0 abstained, 0 absent) that ramipril has similar cost effectiveness relative to the other UF ACE inhibitors.

COMMITTEE ACTION: UF DECISION — Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional

judgment, voted (15 for, 0 opposed, 1 abstained, and 0 absent) that ramipril be immediately reclassified as generic on the UF. Ramipril was included on the "list of non-formulary drugs for re-evaluation of UF status" presented to the BAP in January 2008 and approved by the Director, TMA on 13 February 2008. As such, no further approval is needed.

9) BASIC CORE FORMULARY / EXTENDED CORE FORMULARIES (ECF) ISSUES

The Committee was briefed at the August 2008 meeting on the efforts to implement electronic prescribing in the MHS. As part of the ongoing plan to systematically review drugs represented on the BCF/ECF, the Committee periodically reviews recommendations for changes to the BCF/ECF. At this meeting, the BCF was reviewed, as greater specificity in the drug listings is required to assist with e-prescribing efforts. Several BCF deletions were recommended by the Committee, due to such factors as low MHS utilization, therapeutic duplication, change in prescribing patterns (e.g., newer therapies causing existing drugs to be outdated), availability of generic formulations, and VA/DoD joint contracts. Appendix F outlines those drugs recommended for deletion from the BCF.

COMMITTEE ACTION: The P&T Committee voted (14 for, 1 opposed, 1 abstained, 0 absent) to recommend the BCF deletions as outlined in Appendix F.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

10) ITEMS FOR INFORMATION

A. Outcomes Research Reports — The Pharmacy Outcomes Research Team (PORT) reported on the status of two large outcomes studies that focused on the effects of UF changes to DoD beneficiaries and are currently underway in conjunction with the MHS Scientific Advisory Panel (SAP).

1) *Hypertension/Diabetes* — The study focuses on hypertension management among DoD beneficiaries with diabetes. One arm is designed to assess the effect of the February 2006 formulary changes in the ACE inhibitor class (i.e., classification of moexipril, moexipril/hydrochlorothiazide (HCTZ), perindopril, quinapril, quinapril/HCTZ, and ramipril as Tier 3 [nonformulary] under the UF) on blood pressure control among DoD beneficiaries receiving care at MTFs. In late October 2008, medical record abstraction for this arm was approximately 81% complete. The study will also assess cardiovascular event and procedure rates among beneficiaries who were receiving Tier 3 (nonformulary) ACE inhibitors before February 2006 and were affected by changes in the formulary status of these agents in comparison to those who were receiving formulary ACE inhibitors. Results of the study will be reported to the DoD P&T Committee in FY09.

2) *Proton Pump Inhibitor (PPI)* — The study assesses the effect of the step therapy/prior authorization program instituted in the PPI class on 24 October 2007. The UF changes placed lansoprazole (Prevacid), omeprazole/sodium bicarbonate (Zegerid) pantoprazole (Protonix), and rabeprazole (Aciphex) in Tier 3 of the UF, with generic omeprazole and branded esomeprazole (Nexium) both available at a $3 copay in TRRx and TMOP. Beneficiaries presenting prescriptions at the retail and mail order points of service for nonformulary (Tier 3) PPIs who had not received a PPI prescription in the last 180 days (new users) were required to first try omeprazole or Nexium or meet MN criteria.

   The study will assess effects of the step therapy/prior authorization program on clinical outcomes (e.g., occurrence of serious gastrointestinal (GI) events) among TRICARE for Life (TFL) beneficiaries (age 65 and older) who were new users of omeprazole or Nexium (and would not have encountered a step therapy rejection) vs. those who were new users of PPIs subject to the step therapy/prior authorization program. The analysis plan for the study is currently under development; final results are expected in FY10.

B. Joint Forces Pharmacy Seminar – LTC Spridgen gave an abridged version of the PEC plenary presentation given at the 2008 Joint Forces Pharmacy Seminar. She highlighted the trends in MHS spending and utilization of the pharmacy benefit. Also identified were trends in MTF formulary management that resulted in significant cost avoidance at the individual points of service (MTF, TMOP, TRRX).

C. National Defense Authorization Act (NDAA) Section 703 Inclusion of TRICARE Retail Pharmacy Program In Federal Procurement Of Pharmaceuticals Update - CAPT Blanche updated the committee on the litigation and status of the final rule that will implement Section 703 of the 2008 NDAA. With regards to the current litigation, the judge had not rendered a decision. The final rule is at the Office of Management and Budget (OMB). Key members from the TMA Pharmacy Operations Department and Office of General Council have met with OMB personnel. The time table for approval and the impact on the DoD P&T process are not known.

11) UF DRUG CLASS OVERVIEWS

The drug class overviews for the Pulmonary I drug class (comprised of the long-acting beta agonists, inhaled corticosteroids, and combination long-acting beta agonists/inhaled corticosteroids), Antilipidemic-Is (statins, ezetimibe, niacin, and combination products) and Fluoroquinolones were presented to the P&T Committee. The Committee provided the PEC with expert opinion regarding those clinical outcomes considered most important to use in completing the clinical effectiveness review and developing appropriate cost effectiveness models. The clinical and economic analyses of this drug class will be completed at upcoming DoD P&T Committee meetings.

12) ADJOURNMENT

The second day of the meeting adjourned at 1100 hours on 19 November 2008. The next meeting will be 18-19 February 2009.

Appendix A – Attendance
Appendix B – Table of Medical Necessity Criteria
Appendix C – Implementation Status of UF Recommendations/Decisions
Appendix D – Table of Abbreviations
Appendix E – Quantity Limit Criteria - SABAs
Appendix F – Basic Core Formulary Deletions

LTC Stacia Spridgen, MSC	Director DoD Pharmacoeconomic Center (Recorder)
COL Ted Cieslak, MC	Army, Physician at Large
COL Peter Bulatao *for Col Isiah Harper, MSC*	Army, Pharmacy Officer, Alternate
CAPT Bill Blanche, MSC	Chief, Pharmaceutical Operations Directorate
CAPT Stephanie Simon, MSC	Navy, Pharmacy Officer
CAPT Vernon Lew	Coast Guard, Pharmacy Officer
Col Mark Butler, BSC	Consultant to the AF/SG
LTC Michael Wynn *for LTC Bruce Lovins*	Army, Family Practice Physician, Alternate
LTC Jack Lewi *for COL Doreen Lounsbery*	Army, Internal Medicine Physician, Alternate
CDR Walter Downs, MC *for LCDR Scott Akins*	Navy, Internal Medicine Physician, Alternate
CDR David Tanen, MC	Navy, Physician at Large
Lt Col Brian Crownover, MC	Air Force, Physician at Large
LCDR Ron Garcia	Navy, Internal Medicine Physician
Major Jeremy King, MC	Air Force, OB/GYN Physician
Mr. Joe Canzolino	Department of Veterans Affairs
Voting Members Absent	
LCDR Michelle Perrello, MC	Navy, Internal Medicine Physician
COL Isiah Harper, MS	Army, Pharmacy Officer
Major William Hannah, MC	Air Force, Internal Medicine Physician
LTC Bruce Lovins, MC	Army, Family Practice Physician
LCDR Scott Akins, MC	Navy, Pediatrics Physician Alternate
COL Doreen Lounsbery, MC	Army, Internal Medicine Physician
Nonvoting Members Present	
CDR James Ellzy	DoD P&T Vice Chairman
Lt Col Paul Hoerner	Deputy Director, DoD Patient Safety Center
Ms. Carol Cooper	Deputy General Counsel, TMA
Nonvoting Members Absent	
COL Kent Maneval, MS	Defense Medical Standardization Board
LCDR Thomas Jenkins	TMA Aurora
Maj Peter Trang	Defense Supply Center Philadelphia

Appendix A – Attendance – (continued)

Guests	
LT Joe Bryant	Indian Health Service
Mr. Tom Emmendorfer	Department of Veterans Affairs PBM
Ms. Brenna Mann	University of Texas Pharmacy Student
Others Present	
CDR Matthew Carlberg	DoD Pharmacoeconomic Center
Lt Col James McCrary, MC	DoD Pharmacoeconomic Center
MAJ Misty Carlson, MC	DoD Pharmacoeconomic Center
Maj Joshua Devine, BSC	DoD Pharmacoeconomic Center
LCDR Joe Lawrence	DoD Pharmacoeconomic Center
Dr. Shana Trice	DoD Pharmacoeconomic Center
Dr. Eugene Moore	DoD Pharmacoeconomic Center
Dr. Angela Allerman	DoD Pharmacoeconomic Center
Dr. David Meade	DoD Pharmacoeconomic Center
Dr. Harsha Mistry	DoD Pharmacoeconomic Center
Dr. Jeremy Briggs	DoD Pharmacy Operations Center contractor
Dr. Stephen Yarger	DoD Pharmacy Outcomes Research Team contractor
Dr. Esmond Nwokeji	DoD Pharmacy Outcomes Research Team contractor
Ms. Deborah Garcia	DoD Pharmacy Outcomes Research Team contractor

Appendix B – Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
Olopatadine (Patanase) Beclomethasone (Beconase AQ) Budesonide (Rhinocort Aqua) Ciclesonide (Omnaris) Fluticasone furoate (Veramyst) Triamcinolone (Nasacort AQ) **Nasal Allergy Drugs**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure.
Pirbuterol CFC* MDI (Maxair) Metaproterenol inhalation solution **Short-Acting Beta Agonists**	• Use of formulary alternatives is contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • The patient previously responded to nonformulary agent and changing to a formulary agent would incur unacceptable risk.
Desvenlafaxine (Pristiq) **(Antidepressant-1s)**	• The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.

CFC: chlorofluorocarbon

MDI: metered dose inhaler

*: CFC-containing pressurized MDIs likely will cease marketing as of 31 Dec 2008

Appendix C – Implementation Status of UF Class Review Recommendations / Decisions

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	**Decision Date** (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	**Effective Date for Non-Formulary Medications** (Implementation period)
Nov 08	Short-Acting Beta Agonists	▪ albuterol chlorofluorocarbon (CFC) metered dose inhaler (MDI) (no longer manufactured) ▪ metaproterenol (Alupent) CFC MDI (no longer marketed) ▪ metaproterenol inhalation solution ▪ pirbuterol (Maxair) MDI	BCF	▪ Ventolin HFA (albuterol hydrofluoroalkane (HFA) MDI ▪ Albuterol inhalation solution; Note – does not include the following: Accuneb 0.021% [0.63 mg/mL] Accuneb 0.042% [1.25 mg/3mL] Albuterol 0.5% [2.5 mg/0.5 mL in 0.5 unit dose vial]	pending approval	pending approval
Nov 08 (update to include nasal antihistamines; nasal steroids reviewed Nov 05 & Aug 07 for Veramyst)	Nasal Allergy Drugs	▪ olopatadine (Patanase) ▪ ciclesonide (Omnaris) ▪ fluticasone furoate (Veramyst) ▪ beclomethasone (Beconase AQ) ▪ budesonide (Rhinocort Aqua) ▪ triamcinolone (Nasacort AQ)	BCF	▪ Fluticasone propionate (generic Flonase) ▪ Azelastine (Astelin)	pending approval	pending approval
Nov 08 & Aug 08 (update; reviewed Nov 05)	Antidepressants I	**Recommended for non-formulary status Aug 08; no change to non-formulary status in Nov 08** ▪ desvenlafaxine (Pristiq)	BCF	No changes to BCF recommended Aug 08	Nov 08: pending approval; original signing date 24 Oct 08	26 Nov 08 (60 days)
Aug 08 (update; reviewed Nov 05)	Antidepressants I	To remain NF ▪ paroxetine HCl CR (Paxil) ▪ fluoxetine 90 mg weekly admin. (Prozac Weekly) ▪ fluoxetine in special packaging for PMDD (Sarafem) ▪ escitalopram (Lexapro) ▪ duloxetine (Cymbalta) ▪ bupropion extended release (Wellbutrin XL)	BCF	Currently BCF ▪ citalopram ▪ fluoxetine (excluding weekly regimen & special packaging for PMDD) ▪ sertraline (Zoloft) ▪ trazodone ▪ bupropion sustained release	19 Jan 06	19 Jul 06 (180 days)
Nov 08	ACE inhibitors – Renin Angiotensin Antihypertensives	Previously non-formulary, recommended for UF status Nov 08 ▪ ramipril (Altace generic)	BCF	▪ No changes recommended to BCF at Nov 08 meeting; ramipril removed from Non-formulary status and designated as Uniform Formulary immediately upon signing of the minutes	pending approval	N/A

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Oct 08 (interim teleconference meeting) & Jun 08	Triptans	▪ almotriptan (Axert) ▪ frovatriptan (Frova) ▪ naratriptan (Amerge)	BCF	▪ rizatriptan (Maxalt), immediate upon signing of the minutes ▪ sumatriptan oral and one injectable formulation, when multi-source generics are available	Nov 08 meeting pending approval: ; original signing date: 27 Aug 08	26 Nov 08 (90 days)
Aug 08	Self-Monitoring Blood Glucose Systems (SMBGS) test strips	▪ One Touch Ultra 2 strips (for One Touch Ultra 2, Ultra Mini, and Ultra Smart meters) ▪ TrueTrack strips (for TrueTrack meter) ▪ Accu-chek Comfort Curve strips (for Accu-chek Advantage meter) ▪ Accu-chek Compact Plus drum (for Accu-check Compact Plus meter) ▪ Accu-chek Simplicity, Ascensia Autodisk, Ascensia Breeze 2, Ascensia Elite, Assure, Assure 3, Assure II, Assure Pro, Bd Test Strips, Chemstrip Bg, Control AST, Dextrostix Reagent, Easygluco, Easypro, Fast Take, Freestyle test strips (other than Freestyle Lite), Glucofilm, Glucolab, Glucometer Dex, Glucometer Elite, Glucose Test Strip, Glucostix, Optium, Precision Pcx, Precision Pcx Plus, Precision Q-I-D, Precision Sof-Tact, Prestige Smart System, Prodigy, Quicktek, Sidekick, Sof-Tact, Surestep, Surestep Pro, Test Strip, Relion Ultima, Uni-Check ▪ Plus all other store/private label brand strips not included on the UF (see BCF/ECF column)	BCF	**Basic Core Formulary SMBGS test strips** ▪ Precision Xtra strips (for Precision Xtra meter) **Uniform Formulary SMBGS test strips** ▪ Accu-chek Aviva (for Accu-chek Aviva meter) ▪ Ascensia Contour (for Ascensia Contour meter) ▪ Freestyle Lite (for Freestyle Freedom Lite and Freestyle Lite meters)	24 Oct 08	17 Mar 09 (120 days)
Aug 08 (re-review; Feb 06 original review)	Overactive Bladder (OAB) Agents	▪ tolterodine IR (Detrol) ▪ trospium IR (Sanctura)	BCF	▪ tolterodine ER (Detrol LA) ▪ oxybutynin ER (Ditropan XL, generics) (Note: oxybutynin IR [generic Ditropan] removed from BCF, but still UF)	24 Oct 08	4 Feb 09 (90 days)
Aug 08 (update; reviewed Aug 05; also updated Nov 07)	Calcium Channel Blockers	**Recommended for non-formulary status Aug 08** ▪ nisoldipine geomatrix (Sular geomatrix)	BCF	No changes to BCF recommended Aug 08	24 Oct 08	7 Jan 09 (60 days)
		Previously non-formulary, recommended for UF status Nov 07 ▪ amlodipine besylate (Norvasc generic)		Recommended for addition to BCF Nov 07 ▪ amlodipine besylate tablets	13 Feb 08	13 Feb 08

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
		To Remain Non-Formulary ▪ isradipine IR, ER (Dynacirc; Dynacirc CR) ▪ nicardipine IR (Cardene, generics) ▪ nicardipine SR (Cardene SR) ▪ verapamil ER (Verelan) ▪ verapamil ER HS dosing (Verelan PM, Covera HS) ▪ diltiazem ER for bedtime dosing (Cardizem LA)		Currently BCF ▪ amlodipine besylate (Norvasc, generics) (Recommended at Nov 07 meeting) ▪ nifedipine ER (Adalat CC, generics) ▪ verapamil SR ▪ diltiazem ER (Tiazac, generics)	13 Oct 05	15 Mar 06 (150 days)
Jun 08	Osteoporosis Agents	▪ calcitonin salmon nasal spray (Miacalcin)	BCF	▪ alendronate (Fosamax) ▪ ibandronate (Boniva) (Note: raloxifene (Evista) removed from BCF, but still UF)	27 Aug 08	26 Nov 08 (90 days)
Jun 08 (update; reviewed May 07)	Antilipidemic Agents II	No changes to NF recommended Jun 08	BCF	**Recommended for addition to BCF Jun 08** ▪ fenofibrate meltdose (Fenoglide), to replace fenofibrate IDD-P (Triglide) (Note: fenofibrate IDD-P (Triglide) removed from BCF but still UF)	27 Aug 08	Revised implementation da 26 Nov 08 original implementation da 29 Oct 08 (60 days)
		To remain NF ▪ fenofibrate nanocrystallized (Tricor) ▪ fenofibrate micronized (Antara) ▪ omega-3 fatty acids (Omacor) ▪ colesevelam (Welchol)		Currently BCF ▪ gemfibrozil	24 July 07	21 Nov 07 (120 days)
Jun 08 (update; reviewed Nov 07)	Adrenergic Blocking Agents	**Recommended for non-formulary status Jun 08** ▪ nebivolol (Bystolic)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation da 26 Nov 08 original implementation da 29 Oct 08 (60 days)
		(No ABAs selected for NF placement at Nov 07 meeting)		Currently BCF ▪ atenolol tablets ▪ metoprolol tartrate IR tablets ▪ carvedilol IR tablets ▪ metoprolol succinate ER tablets	13 Feb 08	-
Jun 08 (update; reviewed Aug 07	Newer Antihistamines	**Recommended for non-formulary status Jun 08** ▪ levocetirizine (Xyzal)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation da 26 Nov 08 original implementation da 29 Oct 08 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
		To remain NF • desloratadine (Clarinex) • desloratadine/pseudoephedrine (Clarinex D)		• MTFs required to carry at least one single ingredient agent from the newer antihistamine class (loratadine, cetirizine, or fexofenadine) on their local formulary, including at least one dosage form suitable for pediatric use	17 Oct 07	16 Jan 08 (90 days)
Jun 08 (update; reviewed Aug 07)	Leukotriene Modifiers	**Recommended for non-formulary status Jun 08** • Zileuton ER (Zyflo CR)	BCF	No changes to BCF rec Jun 08	27 Aug 08	Revised implementation da 26 Nov 08 original implementation da 29 Oct 08 (60 days)
		To remain NF • zileuton (Zyflo)		Currently BCF • montelukast (Singulair)	17 Oct 07	16 Jan 08 (90 days)
Jun 08 (update) Original reviews • ACE inhibitors: Aug 05 • Miscellaneous antihypertensives, including ACE/CCB combos. Feb 06 • ARBs: May 07 • Renin inhibitors. Aug 07 • CCB/ARB combos Nov 07 update	Renin Angiotensin Antihypertensives	**Recommended for non-formulary status Jun 08** • olmesartan/amlodipine (Azor)	BCF	No change to BCF recommended Jun 08	27 Aug 08	Revised implementation da 26 Nov 08 original implementation da 29 Oct 08 (60 days)
		To remain NF • valsartan amlodipine (Exforge)		No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ACE inhibitors • Moexipril +/- HCTZ (Univasc; Uniretic) • perindopril (Aceon) • ramipril (Altace) ACE/CCB combos • felodipine/enalapril (Lexxel) (D/C'd from market) • verapamil/trandolapril (Tarka) ARBs • eprosartan +/- HCTZ (Teveten; Teveten HCT) • irbesartan+/- HCTZ (Avapro, Avalide) • olmesartan +/- HCTZ (Benicar; Benicar HCT) • valsartan +/- (Diovan; Diovan HCT)		Currently on the BCF ACE inhibitors • captopril • lisinopril • lisinopril / HCTZ ACE/CCB combos • amlodipine/benazepril (Lotrel, generics) ARBs • telmisartan (Micardis) • telmisartan HCTZ (Micardis HCT)	ACE inhibitors • 13 Oct 05 ACE/CCB combos • 26 Apr 06 ARBs • 24 July 07	ACE inhibitors • 15 Feb 06 ACE/CCB combos • 26 Jul 06 ARBs • 21 Nov 07
Nov 07	Targeted Immunomodulatory Biologics	• etanercept (Enbrel) • anakinra (Kineret)	ECF	• adalimumab (Humira) injection	13 Feb 08	18 Jun 08 (120 days)
Nov 07 re-review (Aug 05 original)	BPH Alpha Blockers	• tamsulosin (Flomax) Automated PA requiring trial of alfuzosin (Uroxatral) applies to new users of tamsulosin (no use of uroselective alpha blockers in last 180 days)	BCF	• terazosin tablets or capsules • alfuzosin tablets (Uroxatral)	13 Feb 08	16 Apr 08 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (implementation period)
Nov 07 (update, original review Nov 06)	ADHD / Narcolepsy Agents	**Recommended for non-formulary status Nov 07** ▪ lisdexamfetamine (Vyvanse)	BCF	No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ▪ dexmethylphenidate IR (Focalin) ▪ dexmethylphenidate SODAS (Focalin XR) ▪ methylphenidate transdermal system (Daytrana)		Currently on the BCF ▪ methylphenidate OROS (Concerta) ▪ mixed amphetamine salts ER (Adderall XR) ▪ methylphenidate IR (Ritalin)	17 Jan 07	18 Apr 07
Nov 07 (update, original review May 06)	Contraceptives	**Recommended for non-formulary status Nov 07** ▪ EE 20 mcg/levonorgestrel 0.09 mg in special packaging for continuous use (Lybrel)	BCF	No change to BCF recommended Nov 07	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ▪ EE 30 mcg / levonorgestrel 0.15 mg in special packaging for extended use (Seasonale) ▪ EE 25 mcg / norethindrone 0.4 mg (Ovcon 35) ▪ EE 50 mcg / norethindrone 1 mg (Ovcon 50) ▪ EE 20/30/35 mcg / noreth. 1 mg (Estrostep Fe)		Currently on the BCF ▪ EE 20 mcg / 3 mg drospirenone (Yaz) ▪ EE 20 mcg / 0.1 mg levonorgestrel (Lutera, Sronyx, or equivalent) ▪ EE 30 mcg / 3 mg drospirenone (Yasmin) ▪ EE 30 mcg / 0.15 mg levonorgestrel (Nordette or equivalent / excludes Seasonale) ▪ EE 35 mcg / 1 mg norethindrone (Ortho-Novum 1/35 or equivalent) ▪ EE 35 mcg / 0.25 mg norgestimate (Ortho-Cyclen or equivalent) ▪ EE 25 mcg / 0.18/0.215/0.25 mg norgestimate (Ortho Tri-Cyclen Lo) ▪ EE 35 mcg / 0.18/0.215/0.25 mg norgestimate (Ortho Tri-Cyclen or equivalent) ▪ 0.35 mg norethindrone (Nor-QD, Ortho Micronor, or equivalent)	26 Jul 06	24 Jan 07
		▪ EE 30/10 mcg / 0.15 mg levonorgestrel in special packaging for extended use (Seasonique) ▪ EE 20 mcg / 1 mg norethindrone (Loestrin 24 Fe)			17 Jan 07	18 Mar 07
Aug 07	Growth Stimulating Agents	▪ somatropin (Genotropin, Genotropin Miniquick) ▪ somatropin (Humatrope) ▪ somatropin (Omnitrope) ▪ somatropin (Saizen)	ECF	▪ somatropin (Norditropin)	17 Oct 07	19 Dec 07 (60 days)
May 07 re-review (Feb 05 original)	PPIs	▪ lansoprazole (Prevacid) ▪ omeprazole/sodium bicarbonate (Zegerid) ▪ pantoprazole (Protonix) ▪ rabeprazole (Aciphex) Automated PA requiring trial of omeprazole OR esomeprazole (Nexium) applies to new users of non-formulary PPIs (no use of PPIs in last 180 days)	BCF	▪ generic omeprazole 10 mg and 20 mg (excludes Prilosec 40 mg) ▪ esomeprazole (Nexium)	24 July 07	24 Oct 07 (90 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
May 07 re-review (Feb 05 original)	ARBs	• eprosartan +/- HCTZ (Teveten; Teveten HCT) • irbesartan +/-HCTZ (Avapro; Avalide) • olmesartan +/- HCTZ (Benicar; Benicar HCT) • valsartan +/- HCTZ (Diovan; Diovan HCT)	BCF	• telmisartan (Micardis) • telmisartan HCTZ (Micardis HCT)	24 July 07	21 Nov 07 (120 days)
May 07	5-Alpha Reductase Inhibitors	• dutasteride (Avodart)	BCF	• finasteride	24 July 07	24 Oct 07 (90 days)
Feb 07	Newer Sedative Hypnotics	• zolpidem ER (Ambien CR) • zaleplon (Sonata) • ramelteon (Rozerem) Automated PA requiring trial of zolpidem IR applies to new users of eszopiclone (Lunesta), ramelteon (Rozerem), zaleplon (Sonata), or zolpidem ER (Ambien CR) (new users = no use of newer sedative hypnotics in last 180 days)	BCF	• zolpidem IR (Ambien)	02 May 07	01 Aug 07 (90 days)
Feb 07	Monoamine Oxidase Inhibitors	• selegiline transdermal patch (Emsam)	ECF	• phenelzine (Nardil)	02 May 07	01 Aug 07 (90 days)
Feb 07	Narcotic Analgesics	• tramadol ER (Ultram ER)	BCF	• morphine sulfate IR 15 mg, 30 mg • morphine sulfate 12-hour ER (MS Contin or equivalent) 15, 30, 60 mg • oxycodone/APAP 5/325 mg • hydrocodone/APAP 5/500 mg • codeine/APAP 30/300 mg • codeine/APAP elixir 12/120 mg/5 mL • tramadol IR	02 May 07	01 Aug 07 (90 days)
Feb 07	Ophthalmic Glaucoma Agents	• travoprost (Travatan, Travatan Z) • timolol maleate for once daily dosing (Istalol) • timolol hemihydrate (Betimol) • brinzolamide (Azopt)	BCF	• latanoprost (Xalatan) • brimonidine (Alphagan P); excludes 0.1% • timolol maleate • timolol maleate gel-forming solution • pilocarpine	02 May 07	01 Aug 07 (90 days)
Nov 06	Older Sedative Hypnotics	-	BCF	• temazepam 15 and 30 mg	17 Jan 07	-
Nov 06 (update; reviewed Nov 06)	Dermatologic Topical Antifungals*	**Recommended for non-formulary status Nov 06:** 0.25% miconazole / 15% zinc oxide / 81.35% white petrolatum ointment (Vusion)	BCF	No change to BCF recommended Nov 06	14 Jul 05	17 Aug 05 (30 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
		▪ econazole ▪ ciclopirox ▪ oxiconazole (Oxistat) ▪ sertaconazole (Ertaczo) ▪ sulconazole (Exelderm)		▪ nystatin ▪ clotrimazole	17 Jan 07	18 Mar 07 (60 days)
Aug 06	H2 Antagonists / GI protectants	-	BCF	▪ ranitidine (Zantac) – excludes gelcaps and effervescent tablets	23 Oct 06	-
Aug 06	Antilipidemic Agents I	▪ rosuvastatin (Crestor) ▪ atorvastatin / amlodipine (Caduet)	BCF	▪ simvastatin (Zocor) ▪ pravastatin ▪ simvastatin / ezetimibe (Vytorin) ▪ niacin extended release (Niaspan)	23 Oct 06	1 Feb 07 (90 days)
May 06	Antiemetics	▪ dolasetron (Anzemet)	BCF	▪ promethazine (oral and rectal)	26 Jul 06	27 Sep 06 (60 days)
Feb 06 (re-classified Aug 07; and updated Jun 08; see above)	Misc Antihypertensive Agents (ACE/CCB combos now part of RAAs class)	(ACE/CCB combos now part of RAAs class) ▪ felodipine/enalapril (Lexxel) ▪ verapamil/trandolapril (Tarka)	BCF	(ACE/CCB combos now part of RAAs class) ▪ amlodipine/benazepril (Lotrel) ▪ hydralazine ▪ clonidine tablets	26 Apr 06	26 Jul 06 (90 days)
Feb 06	GABA-analogs	▪ pregabalin (Lyrica)	BCF	▪ gabapentin	26 Apr 06	28 Jun 06 (60 days)
Nov 05	Alzheimer's Drugs	▪ tacrine (Cognex)	ECF	▪ donepezil (Aricept)	19 Jan 06	19 Apr 06 (90 days)
Nov 05	Macrolide/ Ketolide Antibiotics	▪ azithromycin 2 gm (Zmax) ▪ telithromycin (Ketek)	BCF	▪ azithromycin (Z-Pak) ▪ erythromycin salts and bases	19 Jan 06	22 Mar 06 (60 days)
May 05	PDE5 Inhibitors	▪ sildenafil (Viagra) ▪ tadalafil (Cialis)	ECF	▪ vardenafil (Levitra)	14 Jul 05	12 Oct 05 (90 days)
May 05	MS-DMDs	-	ECF	▪ interferon beta-1a intramuscular injection (Avonex)	14 Jul 05	-

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)

BCF = Basic Core Formulary; ECF = Extended Core Formulary; MN = Medical Necessity; TMOP = TRICARE Mail Order Pharmacy; TRRx = TRICARE Retail Pharmacy program; UF = Uniform Formulary
CFC = chlorofluorocarbon; ER = extended release; HFA = hydrofluoroalkane; IR = immediate release; SR = sustained release; IDD-P = insoluble drug delivery-microParticle;
AD-1s: Antidepressant-1 Drugs; ADHD = Attention Deficit Hyperactivity Disorder; ARBs = Angiotensin Receptor Blockers; ACE Inhibitors = Angiotensin Converting Enzyme Inhibitors; BPH = Benign Prostatic Hyperplasia; CCBs = Calcium Channel Blockers; EE = ethinyl estradiol; GI = gastrointestinal; GABA = gamma-aminobutyric acid; H2 = Histamine-2 receptor; HCTZ = hydrochlorothiazide; LIP-1 = Antihyperlipidemic-1 Drugs; LIP-2 = Antihyperlipidemic-2 Drugs; MDIs = metered dose inhalers; MOAIs = Monoamine Oxidase Inhibitor Drugs; MS-DMDs = Multiple Sclerosis Disease-Modifying Drugs; NADs = Nasal Allergy Drugs; OAB = Overactive Bladder Medications; PDE5 Inhibitors = Phosphodiesterase- type 5 inhibitors; PPIs = Proton Pump Inhibitors; RAAs = Renin Angiotensin Antihypertensives Drugs; SABAs = Short-Acting Beta Agonists; SMBGS: Self-Monitoring Blood Glucose Systems; TIBs = Targeted Immunomodulatory Biologics; TZDs= Thiazolidinediones
*The Dermatologic Topical Antifungal drug class excludes vaginal products and products for onychomycosis (e.g., ciclopirox topical solution [Penlac])

Appendix D – Table of Abbreviations

5-HT3	Serotonin subtype 3 receptor-blocking agents (5-HT3 antagonists)
ACE I / RAAs	Angiotensin Converting Enzyme Inhibitor / Renin Angiotensin Antihypertensive drug class
AD-1	Antidepressant-1 drug class
AE	adverse event
AERS	Adverse Event Reporting System
AAAAI	American Academy of Allergy, Asthma and Immunology
AR	allergic rhinitis
BAP	Beneficiary Advisory Panel
BCF	Basic Core Formulary
BIA	budget impact analysis
BID	twice daily
CEA	cost effectiveness analysis
CFC	chlorofluorocarbon
CFR	Code of Federal Regulations
CI	confidence interval
CINV	chemotherapy-induced nausea and vomiting
CMA	cost minimization analysis
COPD	chronic obstructive pulmonary disease
DoD	Department of Defense
ED	emergency department
EIB	exercise-induced bronchospasm
ER	Extended release
ESI	Express Scripts, Inc
FCP	Federal Ceiling Price
FDA	Food and Drug Administration
FEV1	forced expiratory volume in one second
FSS	Federal Supply Schedule Price
FY	fiscal year
HA	Health Affairs
HCTZ	hydrochlorothiazide
HFA	hydrofluoroalkane
IR	immediate release
LIP-1	Antilipidemic-1 drug class
MDI	metered dose inhaler (pressurized)
MHS	Military Health System
MN	medical necessity
MTF	military treatment facility
NAD	Nasal Allergy drug class
NDAA	National Defense Authorization Act
OMB	Office of Management and Budget
P&T	Pharmacy and Therapeutics
PA	prior authorization
PAR	Perennial allergic rhinitis
PEC	Pharmacoeconomic Center
PORT	Pharmaceutical Outcomes Research Team
PPI	Proton Pump Inhibitor
QD	once daily
QL	quantity limit
SABAs	Short-Acting Beta Agonist drug class
SAR	Seasonal allergic rhinitis
SNRI	Serotonin Norepinephrine Reuptake Inhibitor

Appendix D – Table of Abbreviations (continued)

TFL	TRICARE for life beneficiary
TMA	TRICARE Management Activity
TMOP	TRICARE Mail Order Pharmacy
TRRx	TRICARE Retail Pharmacy Network
UF VARR	Uniform Formulary Voluntary Agreement for Retail Refunds
VMR	vasomotor rhinitis

Appendix E – Table of Short-Acting Beta Agonists Quantity Limits

Drug	TMOP QL	TRRx QL
Current Quantity Limits		
Albuterol (AccuNeb; generic) soln 0.63mg/3mL & 1.25 mg/3mL	1650 mL per 90 days (550 unit-dose vials)	600 mL per 30 days (200 unit-dose vials)
Albuterol (generic) soln 0.083% 2.5 mg/3 mL	1650 mL per 90 days (550 unit-dose vials)	600 mL per 30 days (200 unit-dose vials)
Albuterol (generic) soln 0.5% 2.5 mg/0.5 mL (20 mL)	180 mL per 90 days (9 bottles)	60 mL per 30 days (3 bottles)
Levalbuterol (Xopenex) soln 0.63 mg/3 mL & 1.25 mg/3 mL	1080 mL per 90 days (360 unit-dose vials)	360 mL per 30 days (120 unit-dose vials)
Albuterol CFC (generic) 90 mcg MDI	102 gm per 90 days (17 gm MDI: 6 inhalers)	34 gm per 30 days (17 gm MDI: 2 inhalers)
Proposed Quantity Limits (in addition to current QLs)		
Levalbuterol (Xopenex) soln 0.31 mg/3 mL	1080 mL per 90 days (360 unit-dose vials)	360 mL per 30 days (120 unit-dose vials)
Levalbuterol HFA (Xopenex) 45 mcg MDI (8.4 gm MDI)	50.4 gm per 90 days (8.4 gm MDI: 6 inhalers)	16.8 gm per 30 days (8.4 gm MDI: 2 inhalers)
Levalbuterol HFA (Xopenex) 45 mcg MDI (15 gm MDI)	90 gm per 90 days (15 gm MDI: 6 inhalers)	30 gm per 30 days (15 gm MDI: 2 inhalers)
Albuterol HFA (Ventolin HFA) 90 mcg MDI	108 gm per 90 days (18 gm MDI: 6 inhalers)	36 gm per 30 days (18 gm MDI: 2 inhalers)
Albuterol HFA (Proventil HFA) 90 mcg MDI	40.2 gm per 90 days (6.7 gm MDI: 6 inhalers)	13.4 gm per 30 days (6.7 gm MDI: 2 inhalers)
Albuterol HFA (ProAir HFA) 90 mcg MDI	51 gm per 90 days (8.5 gm MDI: 6 inhalers)	17 gm per 30 days (8.5 gm MDI: 2 inhalers)

CFC: chlorofluorocarbon
HFA: hydrofluoroalkane
MDI: metered dose inhaler
Soln: solution

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE
RECOMMENDATIONS
INTERIM MEETING
Oct 2008

DRUG CLASS REVIEW – 5-HYDROXYTRYPTAMINE AGONISTS (TRIPTANS)

The P&T Committee held an interim teleconference meeting on 27 Oct 2008 during which it re-reviewed the cost-effectiveness of the triptan drug class that was originally conducted at the June 2008 meeting. Nine voting Committee members, who constituted a majority of the entire voting Committee members, participated. All triptan drugs originally recommended for inclusion on the UF were covered by Uniform Formulary Voluntary Agreement for Retail Refunds (UF VARR) submissions at or below the Federal Ceiling Price (FCP). (One of the triptan drugs recommended for non-formulary status was also covered by a UF-VARR at or below the FCP, but was not considered cost-effective.) However this meeting was held because manufacturers were offered the opportunity to re-submit Uniform Formulary Voluntary Agreement for Retail Refunds submissions to include offers that would exceed the Federal Ceiling Price and to re-evaluate the clinical and cost-effectiveness of the drugs after resubmissions were received. A revised UF VARR was submitted for one drug. The 12-13 June 2008 DoD P&T Committee meeting minutes were originally signed by the Director, TMA on 27 August 2008.

Relative Clinical Effectiveness: The relative clinical effectiveness of the triptan drugs was previously reviewed at the June 2008 meeting; there were no changes to the clinical effectiveness conclusion at the interim Oct 2008 teleconference meeting. The relative clinical effectiveness review presented at the June 2008 meeting is provided below.

The P&T Committee evaluated the relative clinical effectiveness of the eight marketed 5-hydroxytryptamine agonists (triptans) in the US, almotriptan (Axert), eletriptan (Relpax), frovatriptan (Frova), naratriptan (Amerge), sumatriptan (Imitrex), sumatriptan/naproxen (Treximet), rizatriptan (Maxalt), and zolmitriptan (Zomig). None of the triptans are available in generic formulations, although generic formulations of sumatriptan are expected in early 2009.

MHS expenditures for the triptans were approximately $70 million for the time period of May 2007 to April 2008. In terms of total quantity dispensed between May 2007 and April 2008, sumatriptan is the highest utilized triptan in the MHS (~150,000 tablets dispensed/month), followed by zolmitriptan (~60,000 tablets/month), and rizatriptan (~45,000 tablets/month). To review the full clinical effectiveness evaluation, see the Triptan DoD Drug Class Review found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion: The P&T Committee voted in June 2008 (15 for, 0 opposed, 0 abstained, 0 absent) to accept the following clinical effectiveness conclusion:

a) With regards to efficacy at providing pain relief at 2 hours,1) rizatriptan 10 mg (Maxalt) appears superior to the other triptans; 2) almotriptan (Axert), eletriptan (Relpax), sumatriptan (Imitrex) and zolmitriptan (Zomig) have comparable relative effectiveness; 3) frovatriptan (Frova) appears inferior to the other triptans, although these results are based on limited data; 4) naratriptan (Amerge) appears inferior to the other triptans; and 5) sumatriptan/naproxen (Treximet) appears superior to sumatriptan 85 mg, but there is insufficient evidence to suggest clinically relevant differences between Treximet and the other triptans.

b) With regards to other efficacy endpoints, 1) rizatriptan 10 mg (Maxalt) and almotriptan 12.5 mg (Axert) are superior to the other triptans for pain free response at 24 hours; and 2) rizatriptan 10 mg is superior to the other triptans for pain-free response at 2 hours.

c) With regards to safety and tolerability, almotriptan (Axert) and naratriptan (Amerge) had the most favorable adverse event profiles compared to the other triptans. There is only limited data for frovatriptan from the product labeling.

Relative Cost Effectiveness: The DoD P&T Committee evaluated the relative cost effectiveness of the triptans at the interim 28 October 2008 teleconference meeting. In considering the relative cost-effectiveness of pharmaceutical agents in this class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost Effectiveness Conclusion: The cost effectiveness of the triptan agents was evaluated by CMA, cost effectiveness analysis (CEA), and by budget impact analysis (BIA). Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (9 for, 0 opposed, 0 abstained, 0 absent) the following:

a) Results from the triptan CMA revealed that sumatriptan/naproxen (Treximet) was the most cost effective agent overall. However, sumatriptan (Imitrex) is expected to become the most cost-effective triptan when generic formulations reach the market in early 2009.

b) Results from the 2 hour pain response CEA revealed that 1) sumatriptan/naproxen (Treximet) and rizatriptan (Maxalt) are the most cost-effective agents; and 2) when the price for generic formulations of sumatriptan (Imitrex) drops below 70% of the current price, sumatriptan will become the most cost-effective agent.

c) Results from the 2 hour pain-free response CEA revealed that 1) sumatriptan/naproxen (Treximet), eletriptan (Relpax) and rizatriptan (Maxalt) are the most cost-effective agents; and 2) when the price for generic formulations of sumatriptan (Imitrex) drops below 70% of the current price, sumatriptan will become the most cost-effective agent.

d) The BIA evaluated the potential impact of scenarios with selected triptans designated formulary or non-formulary on the UF. Results from the BIA revealed that the scenario that designated almotriptan (Axert), frovatriptan (Frova), and naratriptan (Amerge) as non-formulary under the UF was more favorable to the MHS.

A. COMMITTEE ACTION: UF RECOMMENDATION – In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the triptans, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (8 for, 0 opposed, 1 abstained, and 0 absent) to recommend that:

1) Sumatriptan (Imitrex), sumatriptan/naproxen (Treximet), eletriptan (Relpax), rizatriptan (Maxalt), and zolmitriptan (Zomig) be classified as formulary on the UF.

2) Almotriptan (Axert), frovatriptan (Frova), and naratriptan (Amerge) be designated as non-formulary under the UF, based on cost effectiveness.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. COMMITTEE ACTION: MN CRITERIA – The Committee agreed to maintain the original MN criteria from the June 2008 meeting. Based on the clinical evaluation for almotriptan (Axert), frovatriptan (Frova), and naratriptan (Amerge), and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended in June (13 for, 0 opposed, 1 abstained, 1 absent) MN criteria for almotriptan, frovatriptan, and naratriptan. (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. COMMITTEE ACTION: IMPLEMENTATION PERIOD – There was no change to the original 90-day implementation period from the June 2008 meeting (vote in June of 13 for, 0 opposed, 1 abstained, 1 absent). The implementation date will be effective 26 November 2008. TMA will send a letter to beneficiaries affected by this UF decision.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. COMMITTEE ACTION: BCF RECOMMENDATION – The P&T Committee considered the BCF status of the triptan agents at the October interim teleconference meeting. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (8 for, 0 opposed, 1 abstained, and 0 absent) to recommend that 1) rizatriptan (Maxalt) be designated as BCF immediately upon signing of the

interim October 2008 DoD P&T Committee minutes by the Director, TMA; 2) sumatriptan (Imitrex oral tablets and one injectable sumatriptan formulation be designated as BCF when multi-source generic formulations that are cost effective reach the marketplace. As a result of the above actions, zolmitriptan (Zomig) would no longer be designated as BCF, but maintained as formulary on the UF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

E. COMMITTEE ACTION: QUANTITY LIMIT (QL) RECOMMENDATIONS – There was no change to the quantity limits from the June 2008 meeting. The P&T Committee voted (13 for, 0 opposed, 1 abstained, 1 absent) to 1) to recommend QLs for sumatriptan 85 mg/naproxen 500 mg (Treximet) of 9 tablets per 30 days and 27 tablets per 90 days; 2) to recommend QLs for sumatriptan (Imitrex) 4 mg injection of 9 syringes per 30 days and 24 syringes per 90 days; and 3) to maintain the existing QLs for the other triptans.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

SUBMITTED BY:

COL John Kugler, USA, MC
DoD P&T Committee Chair

DECISION ON RECOMMENDATIONS

Director, TMA, decisions are as annotated above.

DEC - 2 2008

S. Ward Casscells, MD

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
August 2008

1) CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 0800 hours on 12-13 Aug 2008 at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

2) ATTENDANCE

The attendance roster is found in Appendix A.

3) REVIEW MINUTES OF LAST MEETING

A. Corrections to the minutes – Corrections to the June 2008 DoD P&T Committee meeting minutes were tabled until the next meeting.

B. Approval of June minutes – Dr. Samuel Ward Casscells, III., M.D., will review the minutes of the June 2008 DoD P&T Committee meeting on 27 Aug 2008.

4) REVIEW OF RECENTLY APPROVED AGENTS

A. Antidepressant -1 (AD-1) – Desvenlafaxine (Pristiq)

Relative Clinical Effectiveness –Desvenlafaxine (Pristiq) is a Serotonin Norepinephrine Re-Uptake Inhibitor (SNRI) that is classified as part of the Antidepressant-1 (AD-1) drug class. The AD-1s were reviewed for Uniform Formulary (UF) placement in November 2005. Other SNRIs included on the UF are venlafaxine immediate release (Effexor, generics) and venlafaxine extended release (ER) (Effexor XR). The desvenlafaxine clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1).

Desvenlafaxine is FDA-approved for the treatment of major depressive disorder in adults. Desvenlafaxine is an extended release formulation of the major active metabolite of venlafaxine ER. Generic formulations of venlafaxine ER (Effexor XR) are expected in 2010. To review the full clinical effectiveness evaluation of desvenlafaxine, see the Desvenlafaxine New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder DoD P&T library. Note that rxnet is restricted to those with a ".mil" e-mail address.)

Relative Clinical Effectiveness Conclusion – The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) that desvenlafaxine does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other AD-1 agents currently included on the UF.

Relative Cost Effectiveness – The P&T Committee evaluated the relative cost effectiveness of desvenlafaxine (Pristiq) in relation to efficacy, safety, tolerability, and clinical outcomes of the other agents in the AD-1 class, particularly to the following medications: citalopram (Celexa, generics), sertraline (Zoloft, generics), venlafaxine (Effexor, generics), venlafaxine ER (Effexor XR), bupropion ER

(Wellbutrin XL), and duloxetine (Cymbalta). Information considered by the P&T Committee included, but was not limited to sources of information listed in 32 CFR 199.21 (e)(2).

A cost minimization analysis (CMA) was employed to evaluate the cost effectiveness of desvenlafaxine relative to the UF AD-1s citalopram, sertraline, venlafaxine, and venlafaxine ER, and the Non-formulary (NF) AD-1s bupropion ER, and duloxetine. Results of the CMA showed that the projected weighted average daily cost of desvenlafaxine was significantly higher than its AD-1 class comparators.

Relative Cost Effectiveness Conclusion – The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) that desvenlafaxine (Pristiq) is not cost effective relative to the other AD-1s included on the UF.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (14 for, 0 opposed, 1 abstained, 0 absent) that desvenlafaxine (Pristiq) be designated as non-formulary on the UF. This recommendation was based on the clinical effectiveness conclusion, and the determination that citalopram (Celexa, generics), sertraline (Zoloft, generics), venlafaxine (Effexor, generics), and venlafaxine ER (Effexor XR) remain the most cost effective AD-1 agents on the UF compared to desvenlafaxine.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation of desvenlafaxine and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for desvenlafaxine (Pristiq). (See Appendix B for full MN criteria).

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** – The P&T Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend: 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Pharmacy Network (TRRx), and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Calcium Channel Blockers (CCBs) – Nisoldipine (Sular geomatrix)

Relative Clinical Effectiveness – Nisoldipine (Sular geomatrix) is a dihydropyridine calcium channel blocker (DHP CCB) approved for treating hypertension. The CCBs were reviewed for UF placement at the August 2005 P&T Committee meeting. Other anti-hypertensive DHP CCBs included on the UF are amlodipine (Norvasc, generics), felodipine (Plendil, generics), nisoldipine coat core (Sular, generics), and nifedipine ER (Adalat CC, generics). The nisoldipine geomatrix clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1).

Nisoldipine geomatrix employs a different extended-release mechanism than the original nisoldipine product, nisoldipine coat core; both products are dosed once daily. Generic formulations of the original coat core product recently became commercially available. The geomatrix delivery system allows for a 15% lower dosage than the coat core product. To review the full clinical effectiveness evaluation of nisoldipine geomatrix, see the Nisoldipine geomatrix New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder DoD P&T library. Note that rxnet is restricted to those with a ".mil" e-mail address.)

Relative Clinical Effectiveness Conclusion – The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) that there is no evidence to suggest that there are clinically relevant differences in the efficacy, safety, and clinical outcomes of nisoldipine geomatrix (Sular geomatrix) compared to nisoldipine coat core, as both products contain the same active ingredient. Additionally, the Committee agreed that nisoldipine geomatrix does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other CCB agents currently included on the UF.

Relative Cost Effectiveness – The P&T Committee evaluated the relative cost effectiveness of nisoldipine (Sular Geomatrix) in relation to efficacy, safety, tolerability, and clinical outcomes of other DHP CCBs, particularly to amlodipine (Norvasc, generics), felodipine (Plendil, generics) and nisoldipine (Sular coat core, generics). Information considered by the P&T Committee included, but was not limited to sources of information listed in 32 CFR 199.21 (e)(2).

A CMA was employed to determine the relative cost effectiveness of nisoldipine geomatrix relative to other UF DHP CCBs (nisoldipine coat core, felodipine, amlodipine). The results from the CMA revealed that the projected weighted average cost per day for therapy for nisoldipine geomatrix (Sular Geomatrix) is significantly higher than other UF CCBs amlodipine, felodipine, and nisoldipine (Sular coat core, generics).

Relative Cost Effectiveness Conclusion – P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 0 absent) that

nisoldipine geomatrix (Sular Geomatrix) is not cost effective relative to other UF DHP CCB agents.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness of nisoldipine geomatrix, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend that nisoldipine geomatrix (Sular geomatrix) be designated as non-formulary on the UF. This recommendation was based on the clinical effectiveness conclusion, and the determination that amlodipine (Norvasc, generics), felodipine (Plendil, generics) and generic nisoldipine coat core remain the most cost effective CCB agents on the UF compared to Sular Geomatrix.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation of nisoldipine geomatrix and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for nisoldipine geomatrix (Sular geomatrix). (See Appendix B for full MN criteria).

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** – The P&T Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend: 1) an effective date of the first Wednesday one week after the minutes are signed, following a 60-day implementation period in TMOP and TRRx, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

5) DRUG CLASS REVIEW – OVERACTIVE BLADDER AGENTS (OABs)

Relative Clinical Effectiveness: The DoD P&T Committee evaluated the clinical effectiveness of the Overactive Bladder Agents (OABs); this class was first reviewed for UF placement in February 2006. There are nine marketed anticholinergic drugs for overactive bladder (OAB) in the US, darifenacin (Enablex), oxybutynin immediate release (IR) (Ditropan, generics), oxybutynin extended release (ER) (Ditropan XL; generics), oxybutynin transdermal (Oxytrol patch) solifenacin (Vesicare), tolterodine IR (Detrol), tolterodine ER (Detrol LA), trospium IR (Sanctura) and trospium ER (Sanctura XR).

Information regarding the safety, effectiveness, and clinical outcomes of these drugs was considered. The clinical review included, but was not limited to the requirements stated in the UF Rule, 32 CFR 199.21(e)(1). The P&T Committee was advised that there is a statutory presumption that pharmaceutical agents in a therapeutic class are clinically effective and should be included on the UF, unless the P&T Committee finds by a majority vote that a pharmaceutical agent does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over the pharmaceutical agents included on the UF in that therapeutic class.

All nine drugs are FDA approved for the treatment of OAB with symptoms of urge incontinence, urgency and urinary frequency. Oxybutynin ER is also approved for the treatment of patients aged 6-years and older with symptoms of detrusor overactivity associated with a neurological condition (e.g. spina bifida), but was not reviewed for this indication by the Committee. Only oxybutynin IR and ER are available in generic formulations.

Military Health System expenditures for the OAB class exceeded $74 million from July 07 to June 08. Tolterodine ER (Detrol LA) is the highest utilized OAB agent at the MTFs, followed by oxybutynin ER (Ditropan XL, generics). To review the full clinical effectiveness evaluation, see the OAB DoD Drug Class Review found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library. Note that rxnet is restricted to those with a ".mil" e-mail address.)

Relative Clinical Effectiveness Conclusion: The P&T Committee voted (15 for, 0 opposed, 0 abstained, 0 absent) to accept the following clinical effectiveness conclusion:

a) Evaluation of clinically relevant differences in efficacy of the OAB agents at relieving urinary symptoms is hampered by the high placebo response rate (30-50%), varying use of non-pharmacologic measures such as bladder training and behavioral modification, and differing outcome measures used in clinical trials.

b) With regards to efficacy at reducing the number of urge incontinent episodes, urgency episodes, and micturation frequency, the available evidence does not support clinically relevant differences between oxybutynin IR (Ditropan, generics), oxybutynin ER (Ditropan XL, generics), oxybutynin patch (Oxytrol), tolterodine IR (Detrol), tolterodine ER (Detrol LA), trospium IR (Sanctura), trospium ER (Sanctura XR), solifenacin (Vesicare), and darifenacin (Enablex).

c) With regards to safety and tolerability, the following conclusions were made:

- There are no differences between the OAB drugs in terms of black box warnings (e.g., acute urinary or gastric retention, acute angle-closure glaucoma, and myasthenia gravis), listed in the product labeling.
- Oxybutynin IR had higher rates of withdrawals of therapy due to adverse events and occurrence of dry mouth then the other OAB agents, but no single agent has shown a clearly superior profile.
- The incidence of adverse events including dry mouth, and constipation, overall was lower with extended release preparations compared with immediate release formulations of the agents. The oxybutynin patch has been associated with pruritis and rash.
- The newer agents (trospium IR and ER, solifenacin, and darifenacin) do not appear to have a significantly lower incidence of dry mouth or constipation compared to extended-release forms of the older agents (oxybutynin ER, and tolterodine ER).
- All the OAB agents may cross the blood brain barrier and result in significant central nervous system effects, although this may be less likely with trospium IR and ER.
- Drug-drug interactions are less likely with trospium than the other agents.

d) With regards to tolerability and persistence rates, the following conclusions were made:

- Persistence rates for OAB medications reported in the medical literature are in general low (<10%); and a 2005 PEC analysis reported that only about 11% of MHS patients continued to obtain prescriptions for OAB medications on a regular basis after 1 year.
- An updated analysis performed by the Pharmacy Outcomes Research Team (PORT) included 35,121 DoD beneficiaries who were new users of OAB medications at any DoD pharmacy point of service from 1 Dec 06 to 31 May 07. Trospium ER was not commercially available at the time of the review and was not included in the analysis. The reported 1-year persistence rate with OAB therapy was 14% overall, with generally higher persistence for patients receiving newer agents and extended release versions of older agents, compared to those receiving immediate release versions of tolterodine and oxybutynin. About 28% of patients who were considered to be non-persistent continued to occasionally obtain prescription refills, consistent with use on an "as needed" rather than routine basis.

e) With regard to special populations, only oxybutynin IR and oxybutynin ER are approved for use in children ages 6 years and older. For pregnancy, oxybutynin IR, oxybutynin ER, and the oxybutynin patch are labeled as category B drugs, while the other OAB drugs are labeled as category C drugs.

Relative Cost Effectiveness: In considering the relative cost-effectiveness of pharmaceutical agents in the OAB class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other

agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost Effectiveness Conclusion: The relative clinical effectiveness evaluation concluded that the newer OAB drugs darifenacin and solifenacin and the extended release formulations had higher persistence rates in the MHS than oxybutynin IR and tolterodine IR. Therefore, the cost effectiveness of the OAB agents was evaluated by CMA, cost effectiveness analysis (CEA), and by budget impact analysis (BIA). Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) the following:

a) Results from the CMA for the immediate release OAB agents (oxybutynin IR [Ditropan, generics], tolterodine IR [Detrol], and trospium IR [Sanctura]) revealed that oxybutynin IR was the most cost effective immediate release OAB agent overall.

b) Results from the CMA of extended release OAB agents (oxybutynin ER [Ditropan XL, generics], tolterodine ER [Detrol LA], trospium ER [Sanctura XR], oxybutynin transdermal [Oxytrol patch], darifenacin [Enablex], and solifenacin [Vesicare]) revealed that 1) trospium ER (Sanctura XR) was the most cost effective extended release OAB agent overall; and 2) when the price for generic formulations of oxybutynin ER (Ditropan XR) drops by 21.3% from the current price, oxybutynin ER will become the most cost-effective agent.

c) The results from a CEA comparing immediate release vs. extended release agents revealed that patients are more persistent with therapy when taking extended release products than when taking immediate release products. This is done at a significantly higher incremental cost per day of persistence gained by taking extended release products. However, the incremental cost per day of persistence gained is ~ 18% lower than when compared to MHS costs in 2005 when the OAB drugs were previously reviewed for UF placement.

d) The BIA evaluated the potential impact of scenarios with selected OAB agents designated formulary or non-formulary on the UF. Results from the BIA revealed that the scenario that designated tolterodine IR (Detrol) and trospium IR (Sanctura) as non-formulary under the UF was more favorable to the MHS.

A. COMMITTEE ACTION: UF RECOMMENDATION – In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the OAB agents, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (14 for, 0 opposed, 1 abstained, and 0 absent) to recommend to recommend that:

1) Oxybutynin IR (Ditropan, generics), oxybutynin ER (Ditropan XL, generics), oxybutynin patch (Oxytrol), tolterodine ER (Detrol LA), solifenacin (Vesicare), trospium ER (Sanctura XR), and darifenacin (Enablex) be classified as formulary on the UF.

2) Tolterodine IR (Detrol) and trospium IR (Sanctura) be designated as non-formulary under the UF, based on cost effectiveness.

All OAB drugs recommended for inclusion on the UF were covered by Uniform Formulary Voluntary Agreement for Retail Refunds (UF VARR) submissions at or below the Federal Ceiling Price (FCP).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. COMMITTEE ACTION: MN CRITERIA – Based on the clinical evaluation for tolterodine IR (Detrol) and trospium IR (Sanctura) and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for tolterodine IR (Detrol) and trospium IR (Sanctura). (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. COMMITTEE ACTION: IMPLEMENTATION PERIOD –The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday one week after the minutes are signed following a 90-day implementation period in the TMOP and TRRx, and at the MTFs no later than a 90-day implementation period. 2) That TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following the approval by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. COMMITTEE ACTION: BCF RECOMMENDATION – The P&T Committee considered the BCF status of the OAB agents. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (13 for, 1 opposed, 1 abstained, and 0 absent) to recommend that 1) tolterodine ER (Detrol LA) continue to be designated as BCF; 2) that oxybutynin ER (Ditropan XL, generics) be designated as BCF; and that 3) oxybutynin IR (Ditropan, generics) be removed from the BCF, but maintained as formulary on the UF, starting the first Wednesday one week after the signing of the August 2008 DoD P&T Committee minutes by the Director, TMA. As a result of the above actions oxybutynin IR (Ditropan, generics) would no longer be designated as BCF, but maintained as formulary on the UF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

6) DRUG CLASS REVIEW – SELF-MONITORING BLOOD GLUCOSE TEST SYSTEMS (SMBGS) TEST STRIPS

Relative Clinical Effectiveness: The P&T Committee evaluated the relative clinical effectiveness of the Self-Monitoring Blood Glucose Test Systems (SMBGS) test strips. The clinical evaluation included, but was not limited to, the requirements stated in the UF rule, 32 CFR 199.21(e)(1).The primary goal for the UF recommendation is to ensure uniform availability of quality SMBGS test strips across the MHS (MTF, TRRx, and TMOP points of service). SMBGS meters are not included as part of the TRICARE outpatient pharmacy benefit (they are included under the medical benefit) and are not the focus of the review; however provisions have been made to provide SMBGS meters at no cost to MHS beneficiaries.

The FDA classifies SMBGS test strips and meters as medical devices, rather than drugs, thus the focus of the clinical effectiveness review centered on differences in the technical aspects/attributes among the products. The P&T Committee had previously determined that all SMBGS test strips considered for inclusion on the UF must meet minimum technical standards relating to accuracy, blood sample size, availability of testing sites other than the fingertips, result time, memory capacity, ease of use (e.g., calibration and coding, large visual display), manufacturer customer support services, downloading capabilities, availability of data management software, and size.

The test strips included in the SMBGS class were those products approved by the FDA and available in the marketplace as of May 2008. Due to the complexity of evaluating the more than 40 commercially marketed SMBGS test strip brands, the number of test strips eligible of inclusion on the UF was determined by DoD P&T Committee minimum technical requirements, operational limitations of the existing TMOP and TRRx contract, and Federal Government contracting regulations.

Relative Clinical Effectiveness Conclusion: The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) that:

a) With regard to efficacy, all meters that are approved by the FDA for licensing in the USA must meet the FDA standard of accuracy, which is a total analytical error of <5%. The International Organization for Standardization (ISO) also has standards. All the SMBGS test strips meeting the minimum technical requirements for inclusion on the UF met both FDA and ISO standards. There was insufficient published clinical trial data to determine if there were clinically relevant differences between the SMBGS test strips with regard to accuracy. The most common cause of inaccurate SMBGS test results is operator error.

b) With regard to calibration and coding, the SMBGS test strips with the lowest risk of coding/calibration errors (as they do not require coding) are the Ascensia Contour and Freestyle Lite test strips. The Accu-chek Aviva, Precision Xtra, and TrueTrack test strips require insertion of a coding chip or strip. The One Touch Ultra test strip requires manual coding.

c) With regard to blood sample size, the Freestyle Lite test strip requires 0.3 microliter (µL) blood; the Accu-check Aviva, Ascensia Contour, and Precision

Xtra require 0.6 µL; and the One Touch Ultra and TrueTrack test strips require 1 µL blood.

d) With regard to alternate site testing, the Accu-chek Aviva and Freestyle Lite strips are FDA-approved for testing at 5 alternate sites other than the fingertips, the Ascensia Contour strip is approved for 4 alternate sites, the Precision Xtra and One Touch Ultra strips are approved for 3 alternate sites, and the TrueTrack strip is approved for one alternate testing site other than the fingertips.

e) With regard to test result time, the Accu-chek Aviva, Ascensia Contour, Freestyle Lite, Precision Xtra, and One Touch Ultra provide test results within 5 seconds, while the TrueTrack strips provide test results in 10 seconds.

f) With regard to SMBGS test strip degradation due to heat and humidity, the Precision Xtra test strips are individually foil-wrapped; however patients with dexterity problems may have difficulty opening the foil wrappers.

g) With regard to safety, the Accu-chek Aviva and Freestyle Lite SMBGS test strips employ technology using glucose dehydrogenase (GDH) pyrroloquinolinequinone, which may cause falsely elevated blood glucose readings in patients receiving concomitant therapy with icodextrin-containing substances (Extrarenal peritoneal dialysis solution and the IV immunoglobulin product Octagam). SMBGS strips using GDH nicotinamide adenine dinucleotide [Precision Xtra], GDH flavin adenine dinucleotide [Ascensia Contour] or glucose oxidase technology [One Touch Ultra and TrueTrack] do not interfere with Extrarenal or Octagam.

h) With regard to special populations, those patients requiring intensive blood glucose monitoring (e.g., women with gestational diabetes, Type 1 diabetics, children and adults using insulin pumps) may prefer SMBGS test strips used in certain meters that can communicate wirelessly with insulin pumps.

i) With regard to provider opinion, a survey of MTF providers reported that accuracy and small blood sample size were the two technical requirements considered most important when comparing SMBGS.

j) With regard to therapeutic interchangeability, there is a high degree of therapeutic interchangeability between the SMBGS test strips meeting the DoD P&T Committee minimum technical requirements.

Relative Cost Effectiveness: In considering the relative cost-effectiveness of pharmaceutical agents in the SMBGS test strip class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2).

The relative clinical effectiveness evaluation concluded that for those SMBGS test strips meeting the minimum technical criteria, there were no clinically relevant differences between the agents. As a result, a CMA and BIA were conducted.

Relative Cost Effectiveness Conclusion: The P&T Committee concluded (14 for, 0 opposed, 1 abstained, 0 absent) the following:

a) Results from the CMAs for the condition sets for both the 3 or less and 4 or more included on the UF revealed that Ascensia Contour was the most cost effective SMBG system while One Touch Ultra was the least cost effective. The ranking of most to least cost effective SMBGS test strips based on prices submitted for each condition set was: Ascensia Contour >TrueTrack > Freestyle Lite > Precision Xtra > Accu-chek Aviva > OneTouch Ultra.

b) The BIA evaluated the potential impact of scenarios with selected SMBGS products designated formulary or non-formulary on the UF. The BIA results showed that the scenario that designated the One Touch Ultra and TrueTrack self SMBGS as non-formulary on the UF was more favorable to the MHS.

*A. **COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost-effectiveness determinations of the SMBGS test strips, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (12 for, 2 opposed, 0 abstained, 1 absent) to recommend that:

1) Accu-chek Aviva, Precision Xtra, Freestyle Lite, and the Ascensia Contour SMBGS test strips be designated as formulary on the Uniform Formulary.

2) One Touch Ultra, TrueTrack, Accu-chek Comfort Curve, Accu-chek Compact Plus, Accu-chek Simplicity, Ascensia Autodisc, Ascensia Breeze 2, Ascensia Elite, Assure, Assure 3, Assure II, Assure Pro, Bd Test Strips, Chemstrip Bg, Control AST, Dextrostix Reagent, Easygluco, Easypro, Fast Take, Freestyle Test Strips (other than Freestyle Lite), Glucofilm, Glucolab, Glucometer Dex, Glucometer Elite, Glucose Test Strip, Glucostix, Optium, Precision Pcx, Precision Pcx Plus, Precision Q-I-D, Precision Sof-Tact, Prestige Smart System, Prodigy, Quicktek, Sidekick, Sof-Tact, Surestep, Surestep Pro, Test Strip, Relion Ultima, Uni-Check, and all store/private label brands not specified as formulary in "1" above be designated as non-formulary on the UF.

The SMBGS test strips are a medical device and subject to wholesale acquisition cost, rather than FCP pricing.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

*B. **COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation for he SMBGS and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for the non-formulary SMBG systems listed in section A 2 above. (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. COMMITTEE ACTION: IMPLEMENTATION PERIOD – The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday one week after the minutes are signed, following a 120-day implementation period in the TMOP and TRRx, and at the MTFs no later than a 120-day implementation period. 2) That TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following the approval by the Director, TMA

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. COMMITTEE ACTION: BCF RECOMMENDATION – The P&T Committee considered the BCF status of the SMBGS. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (13 for, 0 opposed, 1 abstained, and 1 absent) to recommend that Precision Xtra be designated as the BCF SMBGS the first Wednesday one week after the signing of the August 2008 DoD P&T Committee minutes by the Director, TMA

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

7) UTILIZATION MANAGEMENT – PRIOR AUTHORIZATIONS (PA)/ QUANTITY LIMITS (QL) / MEDICAL NECESSITY (MN)

Ondansetron (Zofran) – QL – Currently QLs are in place for the oral anti-emetics used for chemotherapy-induced and post-operative nausea and vomiting. Generic formulations of ondansetron tablets recently became available, with a corresponding reduction in cost. The current ondansetron QLs of 45 tabs per 90 days in the TMOP, and 15 tabs per 30 days in the TRRx are not sufficient to meet current FDA-approved dosage recommendations. The Committee recommended increasing the QLs for ondansetron 4 mg and 8 mg oral tablets and orally disintegrating tablets, to reflect the dosages recommended in the FDA-approved product labeling.

COMMITTEE ACTION: The P&T Committee voted (12 for, 2 opposed, 1 abstained, 0 absent) to approve ondansetron QLs of 60 tablets per 30 days at the retail point of service, and 180 tablets per 90 days at the mail order point of service.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

8) RE-EVALUATION OF NON-FORMULARY AGENTS

The P&T Committee's process for re-evaluation of non-formulary agents established at the May 2007 meeting was approved by the Director, TMA on 24 June 2007. At the August 2008 meeting, the P&T Committee reviewed an updated list of non-formulary drugs identified that were: 1) from drug classes in which UF status was NOT awarded based on condition sets that specified the number of similar agents on the UF (i.e., agents in the same class or subclass); and 2) determined to have similar relative clinical effectiveness (i.e., similar efficacy, safety and tolerability) compared to similar agents on the UF and not excluded from the UF based on clinical issues alone. The updated list is included in Appendix D.

COMMITTEE ACTION: The P&T Committee voted (14 for, 0 against, 1 abstained 0 absent) to recommend that the list of non-formulary agents in Appendix D be evaluated for UF status when pre-established criteria are met.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

9) ITEMS FOR INFORMATION

TRICARE Management Activity (TMA), DoD PEC staff members, and PORT members briefed the P&T Committee on the following:

A. **Beneficiary Advisory Panel (BAP) Briefing** – CDR Ellzy briefed the members of the P&T Committee regarding the July 2008 BAP meeting. The P&T Committee was briefed on the BAP comments regarding the DoD P&T Committee's Uniform Formulary (UF) and implementation guidelines.

B. **Outcomes Research Reports** – *Fentanyl Patch Safety Program* – The PORT reported results of an analysis of the Fentanyl Patch Safety Program, which went into effect 1 Aug 2007. The program uses an automated prior authorization (PA) process to "look-back" at patients' pharmacy profiles; the dispensing process is stopped with a warning message if patients may not be opioid-tolerant based on prior dispensing of strong opioids. Pharmacists may override the warning using standard intervention and outcome codes after consulting with the prescriber or patient and/or taking into account information not available to the Pharmacy Data Transaction Service (PDTS) (i.e., prescriptions not paid for by DoD). Currently the program returns automated warning messages only at the retail network and mail order points of service.

   In general, the program appeared to reduce the use of fentanyl patch among seemingly opioid-naïve patients, without placing an undue burden on patients who may have been wrongly identified as opioid-naïve. Results of the analysis will be presented to the MHS Clinical Quality Forum.

C. **Implementation Status of UF Decisions** – The PEC briefed the members of the P&T Committee on the progress of implementation of drug classes reviewed for UF status since February 2005.

D. **Basic Core Formulary (BCF) / Extended Core Formulary (ECF) Review** – The PEC briefed the DoD P&T Committee on the efforts to implement electronic prescribing in the MHS. As part of the ongoing plan to systematically drugs represented on the BCF and ECF, the Committee periodically reviews recommendations for changes to the BCF and ECF, which will also assist with electronic prescribing. Further information will be presented at an upcoming meeting; no action necessary.

10)CLASS OVERVIEWS

Class overviews for the Nasal Allergy Drugs (comprised of the nasal antihistamines and nasal corticosteroids) and the inhaled Short Acting Beta Agonists were presented to the P&T Committee. The P&T Committee provided expert opinion regarding those clinical outcomes considered most important for the PEC to use in completing the clinical effectiveness reviews and developing the appropriate cost effectiveness models. The clinical and economic analyses of these classes will be completed during the November 2008 meeting.

11)ADJOURNMENT

The second day of the meeting adjourned at 1200 hours on 13 Aug 2008. The next meeting will be 18-19 Nov 2008.

Appendix B – Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
Desvenlafaxine (Pristiq) (Antidepressant-1s)	• The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.
Nisoldipine geomatrix (Sular geomatrix) (Dihydropyridine Calcium Channel Blockers)	• The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.
Tolterodine IR (Detrol), Trospium (Sanctura) (Overactive Bladder Drugs)	• Use of formulary alternatives is contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure. • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.
One Touch Ultra TrueTrack Accu-chek Comfort Curve Accu-chek Compact Plus Accu-chek Simplicity Ascensia Autodisk, Ascensia Breeze 2, Ascensia Elite Assure, Assure 3, Assure II, Assure Pro Bd Test Strips Chemstrip Bg Control AST Dextrostix Reagent Easygluco, Easypro Fast Take Freestyle test strips (other than Freestyle Lite) Glucofilm, Glucolab, Glucometer Dex, Glucometer Elite, Glucose Test Strip, Glucostix Optium Precision Pcx, Precision Pcx Plus, Precision Q-I-D, Precision Sof-Tact Prestige Smart System Prodigy Quicktek Sidekick Sof-Tact Surestep Surestep Pro Test Strip Relion Ultima Uni-Check Plus all other store/private label brand strips not included on Uniform Formulary (see BCF/ECF column in Appendix C) **(Self-Monitoring Blood Glucose System (SMBGS) test strips)**	• Use of formulary alternatives is contraindicated • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.

Appendix C – Implementation Status of UF Class Review Recommendations / Decisions

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Aug 08	Self-Monitoring Blood Glucose Systems (SMBGS) test strips	▪ One Touch Ultra 2 strips (for One Touch Ultra 2, Ultra Mini, and Ultra Smart meters) ▪ TrueTrack strips (for TrueTrack meter) ▪ Accu-chek Comfort Curve strips (for Accu-chek Advantage meter) ▪ Accu-chek Compact Plus drum (for Accu-check Compact Plus meter) ▪ Accu-chek Simplicity, Ascensia Autodisk, Ascensia Breeze 2, Ascensia Elite, Assure, Assure 3, Assure II, Assure Pro, Bd Test Strips, Chemstrip Bg, Control AST, Dextrostix Reagent, Easygluco, Easypro, Fast Take, Freestyle test strips (other than Freestyle Lite), Glucofilm, Glucolab, Glucometer Dex, Glucometer Elite, Glucose Test Strip, Glucostix, Optium, Precision Pcx, Precision Pcx Plus, Precision Q-I-D, Precision Sof-Tact, Prestige Smart System, Prodigy, Quicktek, Sidekick, Sof-Tact, Surestep, Surestep Pro, Test Strip, Relion Ultima, Uni-Check ▪ Plus all other store/private label brand strips not included on Uniform Formulary (see the BCF/ECF column)	BCF	▪ Precision Xtra strips (for Precision Xtra meter) **Uniform Formulary SMBGS test strips** ▪ Accu-chek Aviva (for Accu-chek Aviva meter) ▪ Ascensia Contour (for Ascensia Contour meter) ▪ Freestyle Lite (for Freestyle Freedom Lite and Freestyle Lite meters)	pending approval	pending approval
Aug 08 (re-review; Feb 06 original review)	Overactive Bladder (OAB) Agents	▪ tolterodine IR (Detrol) ▪ trospium IR (Sanctura)	BCF	▪ tolterodine ER (Detrol LA) ▪ oxybutynin ER (Ditropan XL, generics) (Note: oxybutynin IR [generic Ditropan] removed from BCF, but still UF)	pending approval	pending approval
Aug 08 (update; reviewed Nov 05)	Antidepressants I	**Recommended for non-formulary status Aug 08** ▪ Desvenlafaxine (Pristiq)		No changes to BCF recommended Aug 08	pending approval	pending approval
		To remain NF: ▪ paroxetine HCl CR (Paxil) ▪ fluoxetine 90 mg for weekly administration (Prozac Weekly) ▪ fluoxetine in special packaging for PMDD (Sarafem) ▪ escitalopram (Lexapro) ▪ duloxetine (Cymbalta) ▪ bupropion extended release (Wellbutrin XL)	BCF	Currently BCF ▪ citalopram ▪ fluoxetine (excluding weekly regimen and special packaging for PMDD) ▪ sertraline (Zoloft) ▪ trazodone ▪ bupropion sustained release	19 Jul 06	19 Jul 06 (180 days)

Aug 08 (update; reviewed Aug 05; also updated Nov 07)	Calcium Channel Blockers	**Recommended for non-formulary status Aug 08** ▪ nisoldipine geomatrix (Sular geomatrix)		No changes to BCF recommended Aug 08	pending approval	pending approval
		Previously non-formulary, recommended for UF status Nov 07 ▪ amlodipine besylate (Norvasc generic)		Recommended for addition to BCF Nov 07 ▪ amlodipine besylate tablets	13 Feb 08	13 Feb 08
		To Remain Non-Formulary ▪ isradipine IR (Dynacirc) ▪ isradipine ER (Dynacirc CR) ▪ nicardipine IR (Cardene, generics) ▪ nicardipine SR (Cardene SR) ▪ verapamil ER (Verelan) ▪ verapamil ER for bedtime dosing (Verelan PM, Covera HS) ▪ diltiazem ER for bedtime dosing (Cardizem LA)	BCF	Currently BCF ▪ amlodipine besylate (Norvasc, generics) (Recommended at Nov 07 meeting) ▪ nifedipine ER (Adalat CC, generics) ▪ verapamil SR ▪ diltiazem ER (Tiazac, generics)	13 Oct 05	15 Mar 06 (150 days)
Jun 08	Osteoporosis Agents	▪ calcitonin salmon nasal spray (Miacalcin)	BCF	▪ alendronate (Fosamax) ▪ ibandronate (Boniva) (Note: raloxifene (Evista) removed from BCF, but still UF)	27 Aug 08	26 Nov 08 (90 days)
Jun 08	Triptans	▪ almotriptan (Axert) ▪ frovatriptan (Frova) ▪ naratriptan (Amerge)	BCF	▪ rizatriptan (Maxalt), immediate upon signing of the minutes ▪ sumatriptan oral and one injectable formulation, when multi-source generics are available	27 Aug 08	26 Nov 08 (90 days)
Jun 08 (update; reviewed May 07)	Antilipidemic Agents II	No changes to NF recommended Jun 08	BCF	**Recommended for addition to BCF Jun 08** ▪ fenofibrate meltdose (Fenoglide), to replace fenofibrate IDD-P (Triglide) (Note: fenofibrate IDD-P (Triglide) removed from BCF but still UF)	27 Aug 08	29 Oct 08 (60 days)
		To remain NF ▪ fenofibrate nanocrystallized (Tricor) ▪ fenofibrate micronized (Antara) ▪ omega-3 fatty acids (Omacor) ▪ colesevelam (Welchol)		Currently BCF ▪ gemfibrozil	24 July 07	21 Nov 07 (120 days)
Jun 08 (update; reviewed Nov 07)	Adrenergic Blocking Agents	**Recommended for non-formulary status Jun 08** ▪ nebivolol (Bystolic)	BCF	No change to BCF recommended Jun 08	27 Aug 08	29 Oct 08 (60 days)
		(No ABAs selected for NF placement at Nov 07 meeting)		Currently BCF ▪ atenolol tablets ▪ metoprolol tartrate IR tablets ▪ carvedilol IR tablets ▪ metoprolol succinate ER tablets	13 Feb 08	-

Jun 08 (update; reviewed Aug 07	Newer Antihistamines	**Recommended for non-formulary status Jun 08** ▪ levocetirizine (Xyzal)	BCF	No change to BCF recommended Jun 08	27 Aug 08	29 Oct 08 (60 days)
		To remain NF ▪ desloratadine (Clarinex) ▪ desloratadine/pseudoephedrine (Clarinex D)		▪ MTFs required to carry at least one single ingredient agent from the newer antihistamine class (loratadine, cetirizine, or fexofenadine) on their local formulary, including at least one dosage form suitable for pediatric use	17 Oct 07	16 Jan 08 (90 days)

DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
June 2008

1) CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 1300 hours on 12 Jun 2008, and at 0800 hours on 13 Jun 2008 at the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

2) ATTENDANCE

The attendance roster is found in Appendix A.

3) REVIEW MINUTES OF LAST MEETING

A. **Corrections to the minutes** – February 2008 DoD P&T Committee meeting minutes were approved as written, with no corrections noted.

B. **Approval of February minutes** – Dr. Samuel Ward Casscells, III., M.D., approved the minutes of the February 2008 DoD P&T Committee meeting on 30 Apr 2008.

4) REVIEW OF RECENTLY APPROVED AGENTS

A. Antilipidemic-II (LIP-2) – Fenofibrate meltdose (Fenoglide)

Relative Clinical Effectiveness – Fenofibrate meltdose (Fenoglide) is a new formulation of fenofibrate that is FDA-approved for treating hyperlipidemia and mixed dyslipidemia. To review the full clinical effectiveness evaluation, see the Fenoglide New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library; note that rxnet is restricted to those with a ".mil" e-mail address).

Relative Clinical Effectiveness Conclusion – The P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) that 1) there is no evidence to suggest that there are clinically relevant differences in the efficacy, safety and clinical outcomes of fenofibrate meltdose compared to other fenofibrate formulations, as they all contain the same active ingredient. 2) In terms of packaging and storage requirements, fenofibrate meltdose has advantages over fenofibrate insoluble drug delivery microparticle (IDD-P; Triglide) in that it is available in 90 count bottles and does not require dispensing in moisture-proof containers.

Relative Cost Effectiveness – The P&T Committee evaluated the relative cost effectiveness of fenofibrate meltdose in relation to efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included, but was not limited to sources of information listed in 32 CFR 199.21 (e)(2).

A cost minimization analysis (CMA) was employed to evaluate the cost effectiveness of fenofibrate meltdose (Fenoglide). The cost effectiveness of Fenoglide was evaluated relative to the following agents: Triglide (currently the most cost effective UF fenofibrate) and Tricor. The results of the CMA showed that the projected

weighted average daily cost of Fenoglide was significantly lower than the weighted average daily cost of Triglide or Tricor.

Relative Cost Effectiveness Conclusion – The P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) that fenofibrate meltdose is cost effective relative to the evaluated agents in the LIP-2 class. The weighted average cost of Fenoglide is more cost effective relative to Triglide or Tricor.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, recommended (13 for, 0 opposed, 1 abstained, 1 absent) that: 1) fenofibrate meltdose (Fenoglide) be classified as formulary on the UF; and 2) the normal brand cost-share of $9.00 for fenofibrate meltdose (Fenoglide) be lowered to the generic formulary cost share of $3.00 in the retail and mail order points of service.

   The authority for the last recommendation is codified in 32 CFR 199.21(j)(3), which states that "when a blanket purchase agreement, incentive price agreement, Government contract, or other circumstances results in a brand pharmaceutical agent being the most cost effective agent for purchase by the Government, the P&T Committee may also designate that the drug be cost-shared at the generic rate." The objective is to maximize use of fenofibrate meltdose in the retail network and mail order, given its significantly lower cost relative to other fenofibrate products. Lowering the cost-share for brand name fenofibrate meltdose will provide a greater incentive for beneficiaries to use the most cost effective fenofibrate formulation in the purchased care arena.

Fenofibrate meltdose (Fenoglide) was covered by the UF VARR submission at or below the FCP.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2) ***COMMITTEE ACTION: BCF RECOMMENDATION*** – Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (13 for, 0 opposed, 1 abstained, and 1 absent) to recommend that 1) fenofibrate meltdose (Fenoglide) be added to the BCF; and 2) that gemfibrozil (Lopid, generics) be maintained on the BCF. As a result of the above actions, fenofibrate IDD-P (Triglide) would no longer be designated as BCF, but maintained as formulary on the UF.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** – The P&T Committee voted (13 for, 0 opposed, 1 abstained, 1 absent) to recommend: 1) for

immediate implementation of the addition of fenofibrate meltdose (Fenoglide) to the BCF and the $3.00 co-pay reduction upon signing of the June 2008 DoD P&T Committee minutes by the Director, TMA; 2) that the special $3.00 co-pay that applied to fenofibrate IDD-P (Triglide) be terminated the first Wednesday following a 90-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Network Pharmacy (TRRx) programs; and 3) that TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following the approval by the Director, TRICARE Management Activity (TMA).

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

B. Adrenergic Blocking Agents (ABAs) – Nebivolol (Bystolic)

Relative Clinical Effectiveness–Nebivolol is an Adrenergic Blocking Agent that is FDA-approved for treatment of hypertension. To review the full clinical effectiveness evaluation, see the Nebivolol New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion – The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) that nebivolol (Bystolic) does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other ABA agents currently included on the UF.

Relative Cost Effectiveness – The P&T Committee evaluated the relative cost effectiveness of nebivolol in relation to efficacy, safety, tolerability, and clinical outcomes of the other agents in the class, particularly to the following ABA medications: atenolol (Tenormin, generics), carvedilol extended release (Coreg CR) and metoprolol succinate extended release (Toprol XL, generics). Information considered by the P&T Committee included, but was not limited to sources of information listed in 32 CFR 199.21 (e)(2). A CMA was employed to determine the cost effectiveness of nebivolol (Bystolic) relative to atenolol, Coreg CR and metoprolol succinate ER. Results of the CMA showed that the projected weighted average daily cost of nebivolol was significantly higher than its ABA comparators.

Relative Cost Effectiveness Conclusion – P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 0 abstained, 0 absent) that the weighted average daily cost of nebivolol (Bystolic) was significantly higher than the weighted average daily cost of atenolol, carvedilol extended release (Coreg CR), or metoprolol succinate extended release (Toprol XL, generics)

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness of nebivolol, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend that nebivolol (Bystolic) be designated as non-formulary on the UF. This recommendation was based on the clinical

effectiveness conclusion, and the determination that atenolol, carvedilol extended release and metoprolol succinate extended release remain the most cost effective ABA agents on the UF compared to nebivolol.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

2) ***COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation of nebivolol and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for nebivolol (Bystolic). (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** – The P&T Committee voted (14 for, 0 opposed, 1 abstained, 0 absent) to recommend: 1) an effective date of the first Wednesday following a 60-day implementation period in TMOP and TRRx, and at MTFs no later than a 60-day implementation period; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. Newer Antihistamines (NAs)– Levocetirizine (Xyzal)

Relative Clinical Effectiveness – Levocetirizine is a Newer Antihistamine that is the R-enantiomer of cetirizine. It is FDA-approved in adults and in children as young as six years of age for the treatment of seasonal and perennial allergic rhinitis, and chronic idiopathic urticaria. To review the full clinical effectiveness evaluation, see the Levocetirizine New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that levocetirizine (Xyzal) did not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness or clinical outcome over other NAs included on the UF.

Relative Cost Effectiveness – The P&T Committee evaluated the relative cost effectiveness of levocetirizine (Xyzal) in relation to efficacy, safety, tolerability, and clinical outcomes of other agents in the class. A CMA was employed to determine the cost effectiveness of levocetirizine relative to other NAs: loratadine (OTC Claritin, generics), cetirizine (OTC Zyrtec, generics), fexofenadine (Allegra,

generics), and desloratadine (Clarinex). The results of the CMA revealed that the weighted average cost per day of levocetirizine is significantly higher than loratadine, cetirizine, and fexofenadine, but is significantly lower than the non-formulary NA desloratadine (Clarinex).

Relative Cost Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that levocetirizine (Xyzal) is not cost effective relative to the other UF NAs.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of levocetirizine (Xyzal) and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 2 absent) to recommend that levocetirizine be designated as non-formulary under the UF.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation of levocetirizine and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 2 absent) MN criteria for levocetirizine (Xyzal). (See Appendix B for full MN criteria).

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** – The P&T Committee voted (13 for, 0 opposed, 0 abstained, 2 absent): 1) an effective date of the first Wednesday following a 60-day implementation period in the TMOP and TRRx, and no later than a 60-day implementation period at MTFs; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by Director, TMA.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

D. Leukotriene Modifier (LM) – Zileuton extended release (Zyflo CR)

Relative Clinical Effectiveness– Zileuton extended release (Zyflo CR) is a new formulation of zileuton immediate release (Zyflo) that is dosed twice daily, rather than four times daily. It is FDA-approved for the treatment of asthma in adults and in children as young as 12 years of age. To review the full clinical effectiveness evaluation, see the Zileuton extended release New Drug in Previously Reviewed

Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that zileuton extended release (Zyflo CR) did not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness or clinical outcome over other LMs included on the UF.

Relative Cost Effectiveness – The Committee evaluated the relative cost effectiveness of zileuton extended release (Zyflo CR) in relation to efficacy, safety, tolerability, and clinical outcomes of the other agents in the LM class. A CMA was employed to evaluate the cost effectiveness of zileuton extended release relative to montelukast (Singulair), zafirlukast (Accolate), and zileuton immediate release (Zyflo). The results of the CMA demonstrated that the projected weighted average daily cost of zileuton extended release was significantly higher than the weighted average daily cost of the comparators within the LM class.

Relative Cost Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that zileuton extended release (Zyflo CR) is not cost effective relative to the other agents in the LM class. The weighted average cost of montelukast (Singulair), zafirlukast (Accolate) and zileuton immediate release (Zyflo) is more cost effective relative to zileuton extended release.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of zileuton extended release (Zyflo CR) and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 2 absent) to recommend that zileuton extended release be designated as non-formulary under the UF.

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation of zileuton extended release and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 0 abstained, 2 absent) MN criteria for zileuton extended release (Zyflo CR). (See Appendix B for full MN criteria).

   Director, TMA, Decision: ☒ Approved ☐ Disapproved

   Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** – The P&T Committee voted (13 for, 0 opposed, 0 abstained, 2 absent): 1) an effective date of the first Wednesday following a 60-day implementation period in the TMOP and TRRx, and no later than a 60-day implementation period at MTFs; and 2) TMA send a letter to beneficiaries affected by this UF decision. The

implementation period will begin immediately following approval by Director, TMA.

Director, TMA, Decision: ☒ Approved ☐ Disapproved
Approved, but modified as follows:

E. Antilipidemic – I (Lip-1) – Simvastatin/niacin extended release (Simcor)

Relative Clinical Effectiveness – Simcor is the combination of 40 mg simvastatin (Zocor, generics) with 500-, 750- or 1000- mg of niacin extended release (Niaspan). It is approved by the FDA for patients with hyperlipidemia to raise HDL concentrations, and to lower LDL, triglyceride, non-HDL, and total cholesterol concentrations, when monotherapy is inadequate. To review the full clinical effectiveness evaluation, see the Simcor New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that there is insufficient evidence to suggest if there are clinically relevant differences between simvastatin/niacin extended release (ER; Simcor) and the other statins and niacin in terms of efficacy, and that in terms of safety and tolerability, Simcor appears comparable to giving the simvastatin and niacin components separately.

Relative Cost Effectiveness - The P&T Committee evaluated the relative cost effectiveness of simvastatin/niacin ER (Simcor) in relation to efficacy, safety, tolerability, and clinical outcomes of other agents in the LIP-1 class. A CMA was employed to evaluate the cost effectiveness of simvastatin/niacin ER relative to simvastatin (Zocor, generics), niacin ER (Niaspan), lovastatin/niacin ER (Advicor) and the combination of the individual components of Simcor (simvastatin plus Niaspan). The results of the CMA showed that the projected weighted average daily cost of Simcor was significantly less than the weighted average daily cost of its comparators.

Relative Cost Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that simvastatin/niacin ER (Simcor) is cost effective relative to the evaluated agents in the LIP-1 class.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of simvastatin/niacin ER (Simcor) and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 2 absent) to recommend that simvastatin/niacin ER be classified as formulary on the UF.

Simvastatin/niacin ER was covered by a UF VARR submission at or below the FCP

Director, TMA, Decision: ☑ Approved ☐ Disapproved
Approved, but modified as follows:

F. Glaucoma Agents – Brimonidine 0.02% / timolol maleate 0.05% (Combigan)

Relative Clinical Effectiveness – Combigan is a combination ophthalmic product that contains the alpha-2 adrenergic agonist brimonidine 0.02% (Alphagan, generics) with the beta blocker timolol maleate 0.05% (Timoptic, generics). Combigan is approved for twice daily use for the reduction of elevated intraocular pressure in patients with ocular hypertension or glaucoma who require adjunctive or replacement therapy. To review the full clinical effectiveness evaluation, see the Combigan New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that while brimonidine/timolol (Combigan) offers a convenience to the patient in terms of ease of administration, there is currently insufficient evidence to suggest if there are clinically relevant differences between Combigan and the other Glaucoma Agents in terms of efficacy. In terms of safety and tolerability, Combigan appears comparable to administering brimonidine and timolol as separate products dosed twice daily.

Relative Cost Effectiveness – The P&T Committee evaluated the relative cost effectiveness of brimonidine/timolol ophthalmic solution (Combigan) in relation to efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. A CMA was employed to evaluate the cost effectiveness of Combigan relative to timolol maleate (Timoptic, generics), brimonidine (Alphagan, generics), dorzolamide/timolol (Cosopt), and the single ingredient agents of Combigan (timolol maleate and brimonidine). The results of the CMA showed that the projected weighted average daily cost of Combigan was significantly lower than its comparators.

Relative Cost Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that the projected weighted average daily cost of Combigan was significantly lower than the weighted average daily cost of dorzolamide/timolol (Cosopt), or the pairings of the individual brimonidine and timolol components.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of brimonidine/timolol maleate (Combigan) and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 2 absent) to recommend that brimonidine/timolol maleate be classified as formulary under the UF.

Brimonidine/timolol maleate was covered by the UF VARR submission at or below the FCP.

Director, TMA, Decision: ☑ Approved ☐ Disapproved
Approved, but modified as follows:

G. Renin Angiotensin Antihypertensives (RAAs) – Olmesartan / amlodipine (Azor)

Relative Clinical Effectiveness – Azor is the combination of the angiotensin receptor blocker (ARB) olmesartan with the dihydropyridine calcium channel blocker (DHP CCB) amlodipine. It is FDA-approved for treating hypertension. To review the full clinical effectiveness evaluation, see the Azor New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library). .

Relative Clinical Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that while olmesartan/amlodipine (Azor) offers a convenience to the patient in terms of decreased tablet burden and simplified medication regimen, it does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness or clinical outcome over other renin angiotensin antihypertensives included on the UF.

Relative Cost Effectiveness – The P&T Committee evaluated the relative cost effectiveness of olmesartan/amlodipine (Azor) in relation to efficacy, safety, tolerability, and clinical outcomes of the other agents in the RAA class, particularly the ARBs. A CMA was employed to evaluate the cost effectiveness of olmesartan/amlodipine relative to telmisartan (Micardis), the BCF ARB; generic amlodipine (Norvasc), a BCF DHP-CCB; valsartan/amlodipine (Exforge); and to the combination of the individual components of telmisartan plus generic amlodipine. The results of the CMA demonstrated that the projected weighted average daily cost of Azor was significantly higher than the weighted average daily cost of combined individual agents (telmisartan plus generic amlodipine).

Relative Cost Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that olmesartan/ amlodipine is not cost effective relative to the other UF agents in the RAA class. The weighted average cost of combined individual agents (the BCF ARB telmisartan and BCF generic DHP CCB amlodipine) is more cost effective relative to Azor.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of olmesartan/amlodipine (Azor) and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 2 absent) to recommend that olmesartan/amlodipine be designated as non-formulary under the UF.

   Director, TMA, Decision: ☑ Approved ☐ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation of olmesartan/amlodipine and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee

recommended (13 for, 0 opposed, 0 abstained, 2 absent) MN criteria for olmesartan/amlodipine (Azor). (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** – The P&T Committee voted (13 for, 0 opposed, 0 abstained, 2 absent): 1) an effective date of the first Wednesday following a 60-day implementation period in the TMOP and TRRx, and no later than a 60-day implementation period at MTFs; and 2) TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following approval by Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

H. Renin Angiotensin Antihypertensives (RAAs) – Aliskiren / hydrochlorothiazide (Tekturna HCT)

Background – Tekturna HCT contains the renin inhibitor aliskiren with the diuretic hydrochlorothiazide (HCTZ). It is FDA-approved for treating hypertension. Preliminary results of clinical outcomes trials with aliskiren evaluating benefits in addition to blood pressure reduction have been positive. To review the full clinical effectiveness evaluation, see the Tekturna HCT New Drug in Previously Reviewed Classes monograph found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that while aliskiren/HCTZ offers a convenience to the patient in terms of decreased tablet burden and simplified medication regimen, there is insufficient evidence to suggest that the blood pressure lowering effect of aliskiren/HCTZ would be significantly greater than that achieved with other antihypertensive fixed-dose combinations. In terms of safety and tolerability, Tekturna HCT appears comparable to administering the aliskiren and HCTZ components separately.

Relative Cost Effectiveness - The P&T Committee evaluated the relative cost effectiveness of aliskiren/HCTZ (Tekturna HCT) in relation to efficacy, safety, tolerability, and clinical outcomes of the other agents in the RAA class, particularly the ARBs. A CMA was employed to evaluate the cost effectiveness of aliskiren/HCTZ relative to the renin inhibitor aliskiren (Tekturna) and the ARBs, which were evaluated at the May and August 2007 DoD P&T Committee meetings. The results of the CMA showed that the projected weighted average daily cost of aliskiren/HCTZ was higher than the weighted average daily cost of the ARBs designated as formulary on the UF, but similar to the UF agent aliskiren (Tekturna).

Relative Cost Effectiveness Conclusion – The Committee voted (13 for, 0 opposed, 0 abstained, 2 absent) that the projected weighted average daily cost of aliskiren/HCTZ (Tekturna HCT) was comparable to the renin inhibitor aliskiren, and higher than the weighted average daily cost of ARBs designated as formulary within the RAA class on the UF.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of aliskiren/HCTZ (Tekturna HCT) and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, 2 absent) that although aliskiren/HCTZ was somewhat more costly relative to the ARBs designated as formulary in the RAA class, Tekturna HCT was recommended to be classified as formulary on the UF, due to the novel mechanism of action of the aliskiren component and preliminary positive outcomes data.

Aliskiren/hydrochlorothiazide was covered by the UF VARR submission at or below the FCP.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

5) DRUG CLASS REVIEW – 5-HYDROXYTRYPTAMINE AGONISTS (TRIPTANS)

Relative Clinical Effectiveness: The P&T Committee evaluated the relative clinical effectiveness of the eight marketed 5-hydroxytryptamine agonists (triptans) in the US, almotriptan (Axert), eletriptan (Relpax), frovatriptan (Frova), naratriptan (Amerge), sumatriptan (Imitrex), sumatriptan/naproxen (Treximet), rizatriptan (Maxalt), and zolmitriptan (Zomig). None of the triptans are available in generic formulations, although generic formulations of sumatriptan are expected in early 2009.

MHS expenditures for the triptans were approximately $70 million for the time period of May 2007 to April 2008. In terms of total quantity dispensed between May 2007 and April 2008, sumatriptan is the highest utilized triptan in the MHS (~150,000 tablets dispensed/month), followed by zolmitriptan (~60,000 tablets/month), and rizatriptan (~45,000 tablets/month). To review the full clinical effectiveness evaluation, see the Triptan DoD Drug Class Review found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion: The P&T Committee voted (15 for, 0 opposed, 0 abstained, 0 absent) to accept the following clinical effectiveness conclusion:

a) With regards to efficacy at providing pain relief at 2 hours,1) rizatriptan 10 mg (Maxalt) appears superior to the other triptans; 2) almotriptan (Axert), eletriptan (Relpax), sumatriptan (Imitrex) and zolmitriptan (Zomig) have comparable relative effectiveness; 3) frovatriptan (Frova) appears inferior to the other triptans, although these results are based on limited data; 4) naratriptan (Amerge) appears inferior to the other triptans; and 5) sumatriptan/naproxen (Treximet) appears superior to sumatriptan 85 mg, but there is insufficient evidence to suggest clinically relevant differences between Treximet and the other triptans.

b) With regards to other efficacy endpoints, 1) rizatriptan 10 mg (Maxalt) and almotriptan 12.5 mg (Axert) are superior to the other triptans for pain free response at 24 hours; and 2) rizatriptan 10 mg is superior to the other triptans for pain-free response at 2 hours.

c) With regards to safety and tolerability, almotriptan (Axert) and naratriptan (Amerge) had the most favorable adverse event profiles compared to the other triptans. There is only limited data for frovatriptan from the product labeling.

Relative Cost Effectiveness: In considering the relative cost-effectiveness of pharmaceutical agents in this class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2).

Relative Cost Effectiveness Conclusion: The cost effectiveness of the triptan agents was evaluated by CMA, cost effectiveness analysis (CEA), and by budget impact analysis (BIA). Based on the results of the cost analyses and other clinical and cost considerations, the P&T Committee concluded (14 for, 0 opposed, 0 abstained, 1 absent) the following:

a) Results from the triptan CMA revealed that sumatriptan/naproxen (Treximet) was the most cost effective agent overall. However, sumatriptan (Imitrex) is expected to become the most cost-effective triptan when generic formulations reach the market in early 2009.

b) Results from the 2 hour pain response CEA revealed that 1) sumatriptan/naproxen (Treximet), eletriptan (Relpax) and rizatriptan (Maxalt) formed the efficiency frontier and are the most cost-effective agents; and 2) when the price for generic formulations of sumatriptan (Imitrex) drops below 70% of the current price, sumatriptan and rizatriptan will become the most cost-effective agents.

c) Results from the 2 hour pain-free response CEA yielded results similar to the 2 hour pain response.

d) The BIA evaluated the potential impact of scenarios with selected triptans designated formulary or non-formulary on the UF. Results from the BIA revealed that the scenario that designated almotriptan (Axert), frovatriptan (Frova), and naratriptan (Amerge) as non-formulary under the UF was more favorable to the MHS.

A. COMMITTEE ACTION: UF RECOMMENDATION – In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the triptans, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 1 abstained, and 1 absent) to recommend that:

1) Sumatriptan (Imitrex), sumatriptan/naproxen (Treximet), eletriptan (Relpax), rizatriptan (Maxalt), and zolmitriptan (Zomig) be classified as formulary on the UF.

2) Almotriptan (Axert), frovatriptan (Frova), and naratriptan (Amerge) be designated as non-formulary under the UF, based on cost effectiveness.

All triptan drugs recommended for inclusion on the UF were covered by Uniform Formulary Voluntary Agreement for Retail Refunds (UF VARR) submissions at or below the Federal Ceiling Price (FCP). (One of the triptan drugs recommended for non-formulary status was also covered by a UF-VARR at or below the FCP, but was not considered cost-effective.)

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. COMMITTEE ACTION: MN CRITERIA – Based on the clinical evaluation for almotriptan (Axert), frovatriptan (Frova), and naratriptan (Amerge), and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) MN criteria for almotriptan, frovatriptan, and naratriptan. (See Appendix B for full MN criteria).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

C. COMMITTEE ACTION: IMPLEMENTATION PERIOD –The P&T Committee recommended (13 for, 0 opposed, 1 abstained, 1 absent) 1) an effective date of the first Wednesday following a 90-day implementation period in the TMOP and TRRx, and at the MTFs no later than a 90-day implementation period. 2) That TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following the approval by the Director, TMA.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. COMMITTEE ACTION: BCF RECOMMENDATION – The P&T Committee considered the BCF status of the triptan agents. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (12 for, 1 opposed, 1 abstained, and 1 absent) to recommend that 1) rizatriptan (Maxalt) be designated as BCF immediately upon signing of the June 2008 DoD P&T Committee minutes by the Director, TMA; 2) sumatriptan (Imitrex oral tablets and one injectable sumatriptan formulation be designated as BCF when multi-source generic formulations that are cost effective reach the marketplace. As a result of the above actions, zolmitriptan (Zomig) would no longer be designated as BCF, but maintained as formulary on the UF.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

E. COMMITTEE ACTION: QUANTITY LIMIT (QL) RECOMMENDATIONS – The P&T Committee voted (13 for, 0 opposed, 1 abstained, 1 absent) to 1) to recommend QLs for sumatriptan 85 mg/naproxen 500 mg (Treximet) of 9 tablets per 30 days and 27 tablets per 90 days; 2) to recommend QLs for sumatriptan (Imitrex) 4 mg injection of 9 syringes per 30 days and 24 syringes per 90 days; and 3) to maintain the existing QLs for the other triptans.

Director, TMA, Decision: ☒ Approved ☐ Disapproved

Approved, but modified as follows:

6) 6) DRUG CLASS REVIEW – OSTEOPOROSIS AGENTS

Relative Clinical Effectiveness: The P&T Committee evaluated the relative clinical effectiveness of the osteoporosis agents currently marketed in the US. The individual drugs included in the class are listed below:

- *Bisphosphonates*: alendronate (Fosamax), alendronate/vitamin D (Fosamax plus D), ibandronate (Boniva), risedronate (Actonel), and risedronate/calcium (Actonel with calcium). Intravenous (IV) zoledronic acid (Reclast) and IV ibandronate (Boniva) were not part of the UF review, as they are not included as a TRICARE pharmacy benefit.

  Selective estrogen receptor modulators (SERMs): raloxifene (Evista)

- *Parathyroid hormone(PTH) 1-34 amino acids:* teriparatide (Forteo)

- *Calcitonin nasal sprays:* calcitonin-salmon (Miacalcin) and recombinant calcitonin (Fortical)

Generic formulations of alendronate 2800 IU (Fosamax) became commercially available in 2008. There are no generic formulations of any of the other osteoporosis agents. All the agents are approved for treating osteoporosis; raloxifene (Evista) is also approved for the reduction in risk of invasive breast cancer in postmenopausal women with osteoporosis or those at high risk of invasive breast cancer.

MHS expenditures from May 2007 to April 2008 exceeded $200 million, of which over $151 million was attributed to the bisphosphonates alone. In terms of 30-day equivalent prescriptions dispensed, alendronate is the highest utilized osteoporosis agent (approximately 120,000/month), followed by risedronate (approximately 40,000/month) and raloxifene (less than 40,000/month). To review the full clinical effectiveness evaluation, see the Osteoporosis DoD Drug Class Review found at https://rxnet.army.mil/ (Forum: File Library; Folder: DoD P&T library).

Relative Clinical Effectiveness Conclusion: The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 0 absent) that:

a) With regard to changes in bone mineral density (BMD), all the drugs in the bisphosphonates, SERMs, PTH derivative, and calcitonin subclasses increase

BMD, but superiority of one drug over another cannot be determined by BMD changes alone.

b) With regard to fracture risk reduction, 1) the supporting evidence for the bisphosphonates is stronger than that available for raloxifene (Evista), teriparatide (Forteo) and the calcitonin nasal sprays (Fortical and Miacalcin); and 2) there is insufficient evidence to determine if there are clinically relevant differences between the drugs in each osteoporosis subclass.

c) With regard to the orally administered bisphosphonates, 1) the bisphosphonates reduce the risk of vertebral fractures to a similar degree, but the data is limited to daily dosing and there is insufficient evidence to determine if there are clinically relevant differences in fracture risk reduction with extended interval dosing regimens; 2) risedronate (Actonel) and IV zoledronic acid have evidence from adequately powered clinical trials that they reduce the risk of non-vertebral and hip fractures compared to the other bisphosphonates; and 3) there is insufficient evidence to suggest clinically relevant differences between the orally administered bisphosphonates in preventing fractures.

d) With regard to the SERM raloxifene (Evista) and the calcitonin nasal sprays, 1) both subclasses reduce the risk of vertebral fractures, but the data is more limited than that available with the bisphosphonates; and 2) there is no data to suggest clinically relevant efficacy differences between calcitonin-salmon (Miacalcin) and recombinant calcitonin (Fortical).

e) With regard to the PTH derivative teriparatide (Forteo), 1) there is evidence from one clinical trial supporting vertebral and non-vertebral fracture risk reduction; and 2) teriparatide is potentially beneficial in reducing fracture risk in patients experiencing fractures despite bisphosphonate therapy.

f) With regard to safety of the oral bisphosphonates, 1) there is no evidence to suggest that there are clinically relevant differences between alendronate (Fosamax), risedronate (Actonel) and ibandronate (Boniva) in the incidence of gastrointestinal complaints; 2) the overall incidence of osteonecrosis of the jaw with the oral agents is low; and 3) long-term safety data extending out to 10 years is available with alendronate (Fosamax).

g) With regard to tolerability of the oral bisphosphonates, a retrospective observational cohort analysis of 23,044 DoD beneficiaries performed by the Pharmacy Operations Outcomes Team (PORT) compared medication persistence between weekly vs. monthly dosing regimens, based on prescription claims during the year following the initial prescription. The study included all DoD beneficiaries filling initial prescriptions for bisphosphonates at the retail and mail order points of service from 1 Aug 06 to 31 Jan 07. Results of the multivariate logistic regression model were adjusted for age, gender, point of service, TRICARE region, and number of concomitant maintenance medications. The odds of a patient being persistent with treatment (≥80% of days covered based on cumulative days supply) were 18% higher among monthly users compared to weekly users of bisphosphonates (OR 1.18; 95% CI 1.12-1.25). Improved persistence on bisphosphonate therapy has been shown to be associated with a

reduced risk of fracture based on observational data, although data from randomized controlled trials supporting a causal relationship are not yet available.

h) With regard to safety and tolerability of the other osteoporosis subclasses, each subclass (SERM, calcitonin and PTH derivative) has unique adverse event profiles.

i) With regard to other factors of the calcitonin nasal sprays, there are no clinically relevant differences between calcitonin-salmon (Miacalcin) and recombinant calcitonin (Fortical), with the exception of differences in the preservative and ease of administration.

Relative Cost Effectiveness: In considering the relative cost-effectiveness of pharmaceutical agents in this class, the P&T Committee evaluated the costs of the agents in relation to the efficacy, safety, tolerability, and clinical outcomes of the other agents in the class. Information considered by the P&T Committee included but was not limited to sources of information listed in 32 CFR 199.21(e)(2).

The relative clinical effectiveness evaluation concluded that: 1) the bisphosphonates are highly clinically interchangeable with each other for the treatment of osteoporosis; 2) there is evidence that the extended dosing interval (monthly) bisphosphonates may yield greater rates of persistence than the weekly formulations; 3) the two calcitonin products are formulated with identical molecules and are highly clinically interchangeable for their osteoporosis indications; and 4) teriparatide and raloxifene occupy treatment niches for selected patients. As a result, CMAs were conducted for the bisphosphonate and calcitonin subclasses to compare the relative cost effectiveness of these agents. Additionally a CEA was performed to evaluate the extended dosing interval bisphosphonates. The SERM and parathyroid agents were compared to the other subclasses in a further cost analysis.

Relative Cost Effectiveness Conclusion: The P&T Committee concluded (14 for, 1 opposed, 0 abstained, 0 absent) the following:

a) Results from the bisphosphonate CMA revealed that ibandronate (Boniva) was the most cost effective agent overall. However, generic formulations of alendronate (Fosamax) have recently become available, and alendronate is expected to become the most cost effective oral bisphosphonate when the generic exclusivity period ends in the third quarter, 2008.

b) Results from the nasal calcitonin CMA revealed that recombinant calcitonin (Fortical) is significantly more cost effective than salmon-calcitonin (Miacalcin).

c) Results from the extended dosing interval bisphosphonate CEA revealed: 1) based on available published literature, improved persistence with extended cycle bisphosphonates would likely result in a small decrease in the risk of fractures; 2) the incremental annual cost per patient using extended dosing interval bisphosphonates is modest; and 3) while extended dosing interval products are slightly more costly, these agents remain cost effective for the treatment of osteoporosis.

d) The cost comparison of teriparatide (Forteo) and raloxifene (Evista) to the other osteoporosis subclasses concluded that 1) raloxifene is slightly more costly than

the bisphosphonates and calcitonin; and 2) teriparatide is significantly more costly than bisphosphonates and calcitonin.

e) The BIA evaluated the potential impact of scenarios with selected bisphosphonates, teriparatide (Forteo), and calcitonin products designated formulary or non-formulary on the UF. The BIA results showed that the scenario that designated the salmon-calcitonin (Miacalcin) as non-formulary on the UF was more favorable to the MHS.

*A. **COMMITTEE ACTION: UF RECOMMENDATION*** – In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the osteoporosis agents, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (12 for, 1 opposed, 2 abstained, and 0 absent) to recommend that: 1) alendronate (Fosamax), alendronate/vitamin D (Fosamax plus D), risedronate (Actonel), risedronate with calcium (Actonel with calcium), ibandronate (Boniva), raloxifene (Evista), teriparatide (Forteo), and recombinant calcitonin (Fortical) be maintained as formulary on the UF and that 2) salmon-calcitonin (Miacalcin) be designated as non-formulary on the UF. The Committee member casting the dissenting vote felt that an additional agent, teriparatide, should also be classified as NF, due to existing low MHS utilization (less than 5,000 patients); that its clinical niche would allow for unique MN criteria specific to this agent; and that NF placement would allow for additional cost avoidance.

Despite the higher cost of raloxifene (Evista) and teriparatide (Forteo) compared to the other osteoporosis agents, the Committee recommended designating these agents as formulary on the UF, due their clinical niche (reduction in risk of invasive breast cancer; and non-oral administration route and approval for severe osteoporosis, respectively), and the expectation that several SERMs and PTH hormone derivatives currently under investigation will reach the marketplace in 2009-2010.

All osteoporosis drugs recommended for inclusion on the UF were covered by Uniform Formulary Voluntary Agreement for Retail Refunds (UF VARR) submissions at or below the Federal Ceiling Price (FCP), with the exception of raloxifene, teriparatide, and recombinant calcitonin. These three osteoporosis agents were recommended for inclusion on the UF without UF VARR quotes, due to their unique indications and place in therapy.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

*B. **COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation for salmon-calcitonin (Miacalcin) and the conditions for establishing medical necessity for a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) MN criteria for Miacalcin. (See Appendix B for full MN criteria).

Director, TMA, Decision: ☒ Approved ☐ Disapproved
Approved, but modified as follows:

*C. **COMMITTEE ACTION: IMPLEMENTATION PERIOD*** –The P&T Committee recommended (14 for, 0 opposed, 1 abstained, 0 absent) 1) an effective date of the first Wednesday following a 90-day implementation period in the TMOP and TRRx, and at the MTFs no later than a 90-day implementation period. 2) That TMA send a letter to beneficiaries affected by this UF decision. The implementation period will begin immediately following the approval by the Director, TMA.

Director, TMA, Decision: ☒ Approved ☐ Disapproved
Approved, but modified as follows:

*D. **COMMITTEE ACTION: BCF RECOMMENDATION*** – The P&T Committee considered the BCF status of the osteoporosis agents. Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (9 for, 4 opposed, 2 abstained, and 0 absent) to recommend that alendronate (Fosamax) and ibandronate (Boniva) be designated as BCF. As a result of the above actions, raloxifene (Evista) would no longer be designated as BCF, but maintained as formulary on the UF.

Director, TMA, Decision: ☒ Approved ☐ Disapproved
Approved, but modified as follows:

7) UTILIZATION MANAGEMENT - PRIOR AUTHORIZATIONS (PA)/ QL / MEDICAL NECESSITY (MN)

A. Targeted Immunomodulatory Biologics (TIBs)

Adalimumab (Humira) Juvenile Idiopathic Arthritis (JIA) new indication - Administrative Action – Adalimumab received an additional indication from the FDA for children aged 4 to 17 years to reduce the signs and symptoms of moderate to severely active polyarticular JIA. Adalimumab may be used with or without methotrexate for this indication. The FDA-approved JIA indication will be added to the PA for Humira.

B. Phosphodiesterase type 5 inhibitors (PDE5s)

Tadalafil (Cialis) QL – Administrative Action – Tadalafil was recently approved in 2.5 mg and 5 mg dosages for daily use for erectile dysfunction (ED). Health Affairs Policy 98-04 was rescinded in Nov 2003 to state that prior authorization was no longer required for PDE-5 inhibitors in the treatment of ED for males older than 50 years of age. The HA policy still maintains QLs collectively for all strengths of sildenafil, tadalafil and vardenafil of no more than 18 tablets of any combination of these medications per 90-day supply in the TMOP, and no more than 6 tablets of any

combination of these medications per 30-day supply in the Retail Network. The existing QLs for tadalafil will apply to the new 2.5 mg and 5 mg dosages.

C. **LIP-2s – Colesevelam (Welchol) MN Criteria** – The Committee discussed the MN criteria for colesevelam with regard to a new FDA-approved indication for use as an adjunct to diet and exercise to improve glycemic control in adult patients with type 2 diabetes mellitus (T2DM). The LIP-2 drug class was previously reviewed for UF placement in May 2007; at the time of the meeting, colesevelam was solely approved for lowering elevated LDL concentrations in primary hyperlipidemia. The clinical trial used to gain FDA-approval of colesevelam for T2DM evaluated the drug as adjunctive therapy to other glucose-lowering drugs, and did not evaluate colesevelam use as monotherapy. The Committee agreed that there were other treatments for T2DM with greater efficacy than colesevelam.

COMMITTEE ACTION: The P&T Committee voted (14 for, 0 opposed, 0 abstained, 1 absent) to maintain the current MN criteria for colesevelam.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

D. **Aprepitant (Emend) – QL** – Aprepitant was approved by the FDA in a new 40 mg strength solely indicated for prevention of post-operative nausea and vomiting. Currently, QLs apply to the aprepitant formulation approved for prevention of chemotherapy-induced nausea and vomiting; QLs also apply to other antiemetics.

COMMITTEE ACTION: The P&T Committee voted (14 for, 0 opposed, 0 abstained, 1 absent) to approve the QLs for aprepitant 40 mg of 1 capsule/prescription fill at the retail and mail order points of service.

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

8) ITEMS FOR INFORMATION

A. Outcomes Research Reports

1) *Step Therapy* – To support the P&T Committee's consideration of a potential step therapy requirement in the triptan drug class, the PORT reported results of an analysis of changes in medication usage attributable to step therapy/prior authorization requirements for newer sedative hypnotics (effective date 1 Aug 07) and proton pump inhibitors (effective date 24 Oct 07). The step therapy / prior authorization program, which requires new users of non-preferred medications to try a preferred agent before receiving a non-preferred agent, appears highly effective at promoting use of preferred agents. However, the Committee agreed that more information is needed concerning the effect of the program on beneficiaries. A study of outcomes associated with step therapy interventions is

under development and is currently being considered by the MHS Scientific Advisory Panel.

2) *Fentanyl Patch Safety Program* – The PORT notified the P&T Committee of implementation issues detected during data collection for a study of the Fentanyl Patch Safety Program. These issues were corrected, bringing the program into line with requirements previously set by the P&T Committee. Preliminary results of the analysis are scheduled for the next P&T meeting.

9) ADJOURNMENT

The second day of the meeting adjourned at 1400 hours on 13 Jun 2008. The next meeting will be 12-13 Aug 2008.

Appendix B – Medical Necessity Criteria

Drug / Drug Class	Medical Necessity Criteria
Levocetirizine (Xyzal) **Newer Antihistamines**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives. • Formulary agents have resulted in therapeutic failure.
Nebivolol (Bystolic) **Adrenergic Blocking Agent**	• Use of formulary alternatives is contraindicated • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.
Olmesartan / amlodipine (Azor)	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives.
Calcitonin-salmon nasal spray (Miacalcin) **Osteoporosis Agents**	• Use of formulary alternatives is contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure. • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.
Almotriptan (Axert), Frovatriptan (Frova), Naratriptan (Amerge) **Triptans**	• Use of formulary alternatives is contraindicated • The patient has experienced or is likely to experience significant adverse effects from formulary alternatives. • Formulary agents have resulted or are likely to result in therapeutic failure. • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.
Zileuton extended release (Zyflo CR) **Leukotriene Modifiers**	• Use of formulary alternatives is contraindicated • The patient has experienced significant adverse effects from formulary alternatives. • Formulary agents have resulted in therapeutic failure. • The patient previously responded to non-formulary agent and changing to a formulary agent would incur unacceptable risk.

Appendix C – Implementation Status of UF Class Review Recommendations / Decisions

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Jun 08	Osteoporosis Agents	▪ calcitonin salmon nasal spray (Miacalcin)	BCF	▪ alendronate (Fosamax) ▪ ibandronate (Boniva) ▪ (Note: raloxifene (Evista) removed from BCF, but still UF)	Pending approval	Pending approval
Jun 08	Triptans	▪ almotriptan (Axert) ▪ frovatriptan (Frova) ▪ naratriptan (Amerge)	BCF	▪ rizatriptan (Maxalt), immediate upon signing of the minutes ▪ sumatriptan oral and one injectable formulation, when multi-source generics are available	Pending approval	Pending approval

BCF = Basic Core Formulary; ECF = Extended Core Formulary; MN = Medical Necessity; TMOP = TRICARE Mail Order Pharmacy; TRRx = TRICARE Retail Pharmacy program; UF = Uniform Formulary
ER = extended release; IR = immediate release; SR = sustained release; IDD-P = insoluble drug delivery-microParticle
ADHD = Attention Deficit Hyperactivity Disorder; ARBs = Angiotensin Receptor Blockers; ACE Inhibitors = Angiotensin Converting Enzyme Inhibitors; BPH = Benign Prostatic Hyperplasia; CCBs = Calcium Channel Blockers; EE = ethinyl estradiol; GI = gastrointestinal; GABA = gamma-aminobutyric acid; H2 = Histamine-2 receptor; HCTZ = hydrochlorothiazide; MS-DMDs = Multiple Sclerosis Disease-Modifying Drugs; OABs = Overactive Bladder Medications; PDE5 Inhibitors = Phosphodiesterase- type 5 inhibitors; PPIs = Proton Pump Inhibitors; TZDs= Thiazolidinediones
*The topical antifungal drug class excludes vaginal products and products for onychomycosis (e.g., ciclopirox topical solution [Penlac])

Appendix D – Table of Abbreviations

ABA	Adrenergic Beta Antagonist drug class
AE	adverse event
ARB	angiotensin receptor blocker
BAP	Beneficiary Advisory Panel
BCF	Basic Core Formulary
BIA	budget impact analysis
BID	twice daily
BMD	bone mineral density
BP	blood pressure
CCB	calcium channel blocker
CEA	cost effectiveness analysis
CFR	Code of Federal Regulations
CI	confidence interval
CMA	cost minimization analysis
CR	controlled release (extended release)
DHP	dihydropyridine
DoD	Department of Defense
CI	confidence interval
ED	erectile dysfunction
FCP	Federal Ceiling Price
FDA	Food and Drug Administration
FY	fiscal year
GA	Glaucoma Agent drug class
HA	Health Affairs
HCTZ	hydrochlorothiazide
HDL	high density lipoprotein cholesterol
IDD-P	Insoluble drug delivery microparticle
IR	immediate release
IU	international unit
JIA	juvenile idiopathic arthritis
LDL	low density lipoprotein cholesterol
LIP-1s	Antilipidemic -1 drug class
LIP-2s	Antilipidemic -2 drug class
LM	Leukotriene Modifier drug class
MHS	Military Health System
MN	medical necessity
MTF	military treatment facility
OR	odds ratio
P&T	Pharmacy and Therapeutics
PA	prior authorization
PDE5	phosphodiesterase type 5
PEC	Pharmacoeconomic Center
PORT	Pharmaceutical Outcomes Research Team
PTH	parathyroid hormone
QD	once daily
QL	quantity limit
SERM	selective estrogen receptor modulator
TC	total cholesterol
T2DM	Type 2 diabetes mellitus
TMA	TRICARE Management Activity
UF VARR	Uniform Formulary Voluntary Agreement for Retail Refund

DECISION PAPER
DEPARTMENT OF DEFENSE
PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS
February 2008

1) CONVENING

2) ATTENDANCE

3) REVIEW MINUTES OF LAST MEETING

4) ITEMS FOR INFORMATION

A. National Defense Authorization Act (NDAA) 2008 Sec. 703. Inclusion of TRICARE Retail Pharmacy Program In Federal Procurement Of Pharmaceuticals - LTC Kelly provided the P&T Committee an overview of NDAA 2008 Sec. 703, which addresses the inclusion of TRICARE Retail Pharmacy Program (TRRx) in Federal Procurement of Pharmaceuticals. This law requires that "any prescription filled on or after the date of the enactment of the National Defense Authorization Act for Fiscal Year 2008, the TRICARE retail pharmacy program shall be treated as an element of the Department of Defense for purposes of the procurement of drugs by Federal agencies under section 8126 of title 38 to the extent necessary to ensure that pharmaceuticals paid for by the Department of Defense that are provided by pharmacies under the program to eligible covered beneficiaries under this section are subject to the pricing standards in such section 8126.'' The presentation included: 1) NDAA 2008 Section 703 background; 2) a description and estimate of Federal Ceiling Price (FCP) relative to other prices paid by DoD to manufacturers for brand-name medications; 3) the evolution of FCP in the TRRx; and 4) formulary management strategy going forward in light of NDAA 2008 Section 703 legislation.

B. Outcomes Research Initiatives – Lt Col Bacon briefed the P&T Committee on the establishment of an Outcomes Research Team, the Team's objectives, ongoing research projects, and potential outcomes research initiatives.

C. Re-Evaluation of Quinapril and Quinapril/Hydrochlorothiazide(HCTZ)'s UF Status

The P&T Committee re-evaluated the UF status of quinapril (Accupril) and quinapril/HCTZ (Accuretic), in light of recent price reductions in the generic formulations across all three points of service. This marked the first re-evaluation of a non-formulary agent for 1st tier UF status using the P&T Committee's process for the re-evaluation of non-formulary agents, which was established at the May 2007 meeting and approved by the Director, TMA on 24 June 2007. The Pharmacoeconomic Center (PEC) identified quinapril and quinapril/HCTZ as candidates for UF consideration upon application of the process criteria to the approved list of non-formulary drug agents for re-evaluation of UF status (See Table 1).

Clinical Effectiveness Conclusion - At the August 2005 P&T Committee meeting, the Committee concluded that, in general, quinapril and quinapril/HCTZ had similar clinical effectiveness relative to other angiotensin converting enzyme (ACE) inhibitors in regards to efficacy, safety, tolerability, and clinical outcomes.

Cost Effectiveness Conclusion – The P&T Committee voted (13 for, 0 opposed, 0 abstained, 4 absent) that quinapril and quinapril/HCTZ have similar cost-effectiveness relative to the other UF ACE inhibitors.

COMMITTEE ACTION: UF DECISION – In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the ACE inhibitor and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, and 4 absent) that quinapril and quinapril/HCTZ be immediately reclassified as generic on the UF. (See paragraph 4E on page 9 of the P&T Committee minutes). This agent was on the "list of non-formulary drugs for re-evaluation of UF status" presented to the BAP in January 2008 and approved by Director, TMA on 13 February 2008. As such, no further approval is needed.

5) REVIEW OF RECENTLY APPROVED AGENTS

A. Recently Approved Agents in Classes Not Yet Reviewed for the UF

The P&T Committee was briefed on one new drug recently approved by the FDA (see Appendix B). The P&T Committee determined that this new drug fell into a drug class that has not yet been reviewed for UF status. Therefore, UF consideration was deferred until the drug class review is completed. The P&T Committee discussed the need for a days supply quantity limit (QL) (no multiple fills for multiple co-pays) for sapropterin tablets (Kuvan) based on dosing and laboratory monitoring recommendations in the package insert.

COMMITTEE ACTION: QL – The P&T Committee voted (13 for, 0 opposed, 0 abstained, 4 absent) to recommend a QL for sapropterin tablets of a 45 days supply in the TRICARE Mail Order Pharmacy Program (TMOP) and a 30 days supply in the TRRx (no multiple fills for multiple co-pays). (See paragraph 5A on page 10 of the P&T Committee minutes).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Recently Approved Agents in Classes Previously Reviewed for the UF

The Committee was briefed on newly approved drugs that fall into classes previously reviewed for the UF. The clinical and economic analyses of these classes will be completed for a future meeting. The Committee took no action.

6) UTILIZATION MANAGEMENT – PRIOR AUTHORIZATIONS (PAs)/(QLs)/ MEDICAL NECESSITY (MNs)

A. Renin-Angiotensin Antihypertensives (RAAs) – Valsartan MN Criteria – The Committee discussed the MN criteria for valsartan with regard to a new FDA-approved indication for use for pediatric hypertension. The Angiotensin Receptor Blocker (ARB) drug class was previously reviewed for UF placement in May 2007. At the time of the meeting, losartan (Cozaar) was the only FDA-approved ARB for treating hypertension in children aged 6 – 16 years of age. Valsartan (Diovan) is now FDA-approved for treating children aged 6 – 16 years with hypertension; it is not approved for treating children with heart failure. FDA approval for valsartan was based on a study in 261 children with hypertension who received valsartan for two weeks. At the end of the two week study period, valsartan treatment resulted in statistically significant reductions in both systolic and diastolic blood pressure.

The Committee recommended that MN be approved for children between the ages of 6 and 16 years who have failed to respond adequately to treatment with losartan or who have experienced adverse effects to losartan.

COMMITTEE ACTION: The P&T Committee voted (9 for, 3 opposed, 1 abstained, 4 absent) to approve the MN criteria for valsartan. (See paragraph 6A on page 11 of the P&T Committee minutes).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Targeted Immunomodulatory Biologics (TIBs)

1) Administrative Action - PA for Adalimumab (Humira)

At the November 2007 DoD P&T committee meeting, adalimumab (Humira) was chosen as the Extended Core Formulary (ECF) agent, as it was the most cost effective TIB with multiple FDA-approved indications. Alefacept (Amevive) and efalizumab (Raptiva) were placed on the UF. Etanercept (Enbrel), the other multi-indication TIB, was made non-formulary along with anakinra (Kineret). Infliximab (Remicade), abatacept (Orencia), and rituximab (Rituxan) were not affected by the UF decision, since these medications fall under the TMA medical benefit and are not part of the pharmacy benefit, given their route of intravenous (IV) administration. The TIB UF decisions have a scheduled implementation date of June 18th 2008.

In January 2008, the FDA approved Humira for treatment of plaque psoriasis. At the time of the November 2007 Committee meeting, Humira was FDA-approved for rheumatoid arthritis (RA), ankylosing spondylitis (AS), psoriatic arthritis (PsA), and Crohn's disease (adults). Enbrel is FDA-approved for RA, juvenile RA, AS, PsA, and plaque psoriasis.

The FDA approved Humira's indication for plaque psoriasis based on two recently published clinical trials; the CHAMPION trial, published in December 2007, and Menter, et al published in January 2008. The CHAMPION trial was a randomized, placebo- and methotrexate-controlled trial in 261 patients with mild to moderate plaque psoriasis. The primary endpoint was Psoriasis Areas and

Severity Index (PASI) 75% response. At the end of 16 weeks, 79.6% of Humira-treated patients achieved a PASI 75 response, compared to only 35.5% and 18.9% of the methotrexate- and placebo-treated patients, respectively.

The Menter et al study included 1,212 patients with moderate to severe psoriasis randomized to receive either Humira or placebo for an initial 16 week double-blinded treatment phase. At the end of that period, 71% of Humira-treated patients achieved a PASI 75% response, compared to 7% of placebo-treated patients. With regard to safety and tolerability, both studies demonstrated a similar safety profile to that established in previous Humira clinical trials.

The FDA-approved plaque psoriasis indication will be added to the PA for Humira.

2) *QL for TIBs*

Currently, quantity and/or days supply limits apply to Enbrel (etanercept), Humira (adalimumab), and Kineret (anakinra), as outlined in Appendix C. In general, patients are limited to a 4-week supply of these medications at retail network pharmacies at any one time with no multiple fills for multiple copays. Patients are slso limited to a 6- to 8-week supply at the TMOP, based on product labeling and packaging. The intent of the QL is to limit potential wastage in the event medications are discontinued or changed.

A change in the QLs for the TIBs was recommended to establish consistent and uniform amounts supplied in the TRRx and TMOP points of service across the drug class. Currently only Enbrel, Humira and Kineret have QLs at TRRx and TMOP. A four-week supply for Enbrel and Humira is allowed at the TRRx, with a six week supply allowed in the TMOP. However, for Kineret, an 8 week supply is allowed at TMOP. A change in the QL was proposed to allow a QL for Humira, Amevive, Raptiva, Enbrel, and Kineret of four weeks supplied at TRRX. In the TMOP, the proposal was a QL for Humira, Raptiva, Enbrel and Kineret of an 8 week supply. No QL is proposed for Amevive in the TMOP, since it is not supplied through that point of service. The number of syringes/vials supplied under these limits is reflected in Table 2.

COMMITTEE ACTION: The P&T Committee voted (13 for, 0 opposed, 0 abstained, 4 absent) to approve the QLs outlined above in Table 2 to allow adalimumab (Humira), etanercept (Enbrel), and anakinra (Kineret) a four weeks supply via TRRx and 8 weeks supply via TMOP. The Committee voted to add the same limits to efalizumab (Raptiva). A four weeks supply limit was agreed for Alefacept (Amevive) at TRRx, with no QL in the TMOP, as Amevive is not available through the TMOP. (See paragraph 6B on page 12 of the P&T Committee minutes).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

7) BCF / ECF REVIEW

A. Clarification of Basic Core Formulary (BCF) Listing - As part of an ongoing plan to systematically review drug classes represented on the BCF, the P&T Committee made recommendations for clarifying BCF listings in four BCF drug classes: antibiotics (nitrofurantoin monohydrate/macrocrystals [MacroBid]), proton pump inhibitors (esomeprazole [Nexium] powder packets), cough and cold preparations (chlorpheniramine 8 mg/pseudoephedrine 120 mg sustained release [Deconamine SR]), and miscellaneous migraine medications (isometheptene 65 mg/dichloralphenazone 100 mg/ acetaminophen 325 mg [Midrin]).

COMMITTEE ACTION: The P&T Committee recommended (votes on Table 3) the following changes to the current BCF drug classes as outlined in Table 3. (See paragraph 7 on page 13 of the P&T Committee minutes and Appendix D on page 24).

Table 3 - Recommended BCF / ECF Changes

Drug class or potential drug class	Current BCF/ECF listing	Recommendation	Vote			
			For	Opposed	Abstained	Absent
Antibiotics	Nitrofurantoin macrocrystals oral (Does not include MacroBid)	Clarify BCF listing to: "Nitrofurantoin oral (50 mg macrocrystals, 100 mg monohydrate/macrocrystals)"	13	0	0	4
Cough and Cold Preparations	Chlorpheniramine 8 mg / pseudoephedrine 120 mg sustained release (Deconamine SR)	Remove BCF listing: "Chlorpheniramine 8 mg / pseudoephedrine 120 mg sustained release" (specific brand name is Deconamine SR)	13	0	0	4
Miscellaneous Migraine Medications	Isometheptene 65 mg / dichloralphenazone 100 mg / acetaminophen 325 mg (Midrin)	Remove BCF listing:" Isometheptene 65 mg / dichloralphenazone 100 mg / acetaminophen 325 mg" (specific brand name is Midrin)	10	3	0	4
Proton Pump Inhibitors	Esomeprazole (Nexium)	Clarify BCF listing to: "esomeprazole (Nexium) 20 and 40 mg capsule"	13	0	0	4

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

B. Administrative Action - The PEC obtained recommendations from members of the P&T Committee regarding clarification of the BCF listing for the following medications: antibiotics (amoxicillin oral, doxycycline oral, and cephalexin oral), antifungals (nystatin oral), inhaled asthma agents (albuterol oral inhaler), contraceptives, miscellaneous respiratory medications (insect allergy kits), and ophthalmic antibiotics and combinations (sulfacetamide sodium 10% ophthalmic ointment). Administrative changes will include removal of obsolete medications and more comprehensive delineation of BCF listings. (See Appendix D on page 24 of the P&T Committee minutes).

Director, TMA, Decision: ☑ Approved ☐ Disapproved

Approved, but modified as follows:

8) UPDATE ON SIMVASTATIN/EZETIMIBE – ENHANCE STUDY

The P&T Committee was briefed on the "effect of combination ezetimibe and high-dose simvastatin vs. simvastatin alone on the atherosclerotic process in subjects with heterozygous familial hypercholesterolemia" (ENHANCE) study. The ENHANCE study compared simvastatin/ezetimibe (Vytorin) 80/10 mg with simvastatin 80 mg in patients with heterozygous familial hypercholesterolemia who had baseline low-density lipoprotein levels exceeding 300 mg/dL. The primary endpoint of the trial was the change in carotid intima media thickness (CIMT). The trial did not evaluate clinical outcomes (e.g., mortality, myocardial infarction). There was no significant difference between the two groups with regard to changes in CIMT. Three ongoing studies are addressing outcomes with simvastatin/ezetimibe. No action necessary.

Appendix A – Implementation Status of UF Recommendations / Decisions

Appendix B – Newly Approved Drugs

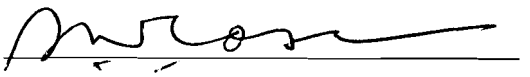
Appendix C – Existing Quantity Limits and Recommended QLs for TIBS

Appendix D – BCF/ECF Review

Appendix E – Table of Abbreviations

DECISION ON RECOMMENDATIONS

Director, TMA, decisions are as annotated above.



S. Ward Casscells, III, M.D.

Department of Defense
Pharmacy and Therapeutics Committee Minutes
February 2008

1) CONVENING

The Department of Defense (DoD) Pharmacy and Therapeutics (P&T) Committee convened at 1000 (EST) hours on 13 Feb 2008 via a teleconference hosted by the DoD Pharmacoeconomic Center (PEC), Fort Sam Houston, Texas.

2) ATTENDANCE

A. Voting Members Present

Col John Kugler, MC, USA	DoD P&T Committee Chair
LTC Brett Kelly, MSC, USA	DoD P&T Committee Recorder
Capt Jeremy King, MC	Air Force, OB/GYN Physician
Lt Col Brian Crownover, MC	Air Force, Physician at Large
Col Everett McAllister, BSC	Air Force, Pharmacy Officer
CDR Walter Downs, MC *for* LCDR Michelle Perelló, MC	Navy, Internal Medicine Physician
CDR David Tanen, MC	Navy, Physician at Large
CAPT David Price, MSC	Navy, Pharmacy Officer
COL Doreen Lounsbery, MC	Army, Internal Medicine Physician
Col Karl R. Kerchief, MC	Army, Family Practice Physician
COL Ted Cieslak, MC	Army, Physician at Large
LTC (P) Peter Bulatao, MSC *for* COL Isiah Harper, MSC	Army, Pharmacy Officer
CAPT Vernon Lew, USPHS	Coast Guard, Pharmacy Officer

B. Voting Members Absent

Major William Hannah, MC	Air Force, Internal Medicine Physician
CAPT William Blanche, MSC, USN	DoD Pharmacy Programs, TMA
LCDR Scott Akins, MC	Navy, Pediatrics Physician
Mr. Joe Canzolino, RPh.	Department of Veterans Affairs

C. Non-Voting Members Present

COL Kent Maneval, MSC, USA	Defense Medical Standardization Board
Lt Col Paul Hoerner, BSC, USAF	Deputy Director, DoD Patient Safety Center
CDR Kim Lefebvre, MSC	Defense Supply Center Philadelphia
Mr. Howard Altschwager	Deputy General Counsel, TMA
LT Thomas Jenkins, MSC, USN	TMA Aurora

D. Non-Voting Members Absent

Martha Taft	Health Plan Operations, TMA

E. Others Present

CDR Matthew Carlberg, MC, USN	DoD PEC
Lt Col James McCrary, MC, USAF	DoD PEC
LTC Chris Conrad, MC, USA	DoD PEC
Maj Wade Tiller, BSC, USAF	DoD PEC
Maj Josh Devine, BSC, USAF	DoD PEC
CPT Josh Napier, MC, USA	DoD PEC
Angela Allerman, Pharm.D.	DoD PEC
Julie Liss, Pharm.D.	DoD PEC
David Meade, Pharm.D.	DoD PEC
Harsha Mistry, Pharm.D.	DoD PEC
Eugene Moore, Pharm.D.	DoD PEC
Shana Trice, Pharm.D.	DoD PEC
Nancy Misel, RPh	Director, Air Force High Dollar Program
LCDR James Ellzy, MC, USN	Vice DoD P&T Committee Chair
Lt Col Thom Bacon	TMA Pharmaceutical Operations Directorate
CDR Rob Hayes	USPHS/IHS
Major Peter Trang, BSC, USAF	Defense Supply Center Philadelphia
Major Mike Lee, BSC	Air Force, Alternate Pharmacist Officer
Carol Cooper	Associate General Counsel, TMA

3) REVIEW MINUTES OF LAST MEETING

A. Corrections to the Minutes – Nov 2007 DoD P&T Committee meeting minutes were approved as written, with no corrections noted.

B. Approval of Nov Minutes – Dr. Samuel Ward Casscells, III., M.D., approved the minutes of the Nov 2007 DoD P&T Committee meeting on February 13, 2008.

4) ITEMS FOR INFORMATION

TRICARE Management Activity (TMA) and DoD PEC staff members briefed the P&T Committee on the following:

A. **Beneficiary Advisory Panel (BAP) Briefing** – LCDR Ellzy, Lt Col Bacon, and LTC Kelly briefed the members of the P&T Committee regarding the Nov 2007 BAP meeting. The P&T Committee was briefed on BAP comments regarding the DoD P&T Committee's Uniform Formulary (UF) and implementation recommendations.

B. **Implementation Status of UF Decisions** – The PEC staff briefed the members of the P&T Committee on the progress of implementation for drug classes reviewed for UF status since August 2007 (Appendix A).

C. **National Defense Authorization Act (NDAA) 2008 Sec. 703. Inclusion of TRICARE Retail Pharmacy Program In Federal Procurement Of Pharmaceuticals** - LTC Kelly provided the P&T Committee an overview of NDAA 2008 Sec. 703, which addresses the inclusion of TRICARE Retail Pharmacy Program (TRRx) in Federal Procurement of Pharmaceuticals. This law requires that "any prescription filled on or after the date of the enactment of the National Defense Authorization Act for Fiscal Year 2008, the TRICARE retail pharmacy program shall be treated as an element of the Department of Defense for purposes of the procurement of drugs by Federal agencies under section 8126 of title 38 to the extent necessary to ensure that pharmaceuticals paid for by the Department of Defense that are provided by pharmacies under the program to eligible covered beneficiaries under this section are subject to the pricing standards in such section 8126." The presentation included: 1) NDAA 2008 Section 703 background; 2) a description and estimate of FCP relative to other prices paid by DoD to manufacturers for brand-name medications; 3) the evolution of FCP in the TRRx; and 4) formulary management strategy going forward in light of NDAA 2008 Section 703 legislation.

D. **Outcomes Research Initiatives** – Lt Col Bacon briefed the P&T Committee on the establishment of an Outcomes Research Team, the Team's objectives, ongoing research projects, and potential outcomes research initiatives.

E. **Re-Evaluation of Quinapril and Quinapril/Hydrochlorothiazide (HCTZ)'s UF Status**

The P&T Committee re-evaluated the UF status of quinapril (Accupril) and quinapril/HCTZ (Accuretic), in light of recent price reductions in the generic formulations across all three points of service. This marked the first re-evaluation of a non-formulary agent for 1st tier UF status using the P&T Committee's process for the re-evaluation of non-formulary agents, which was established at the May 2007 meeting and approved by the Director, TMA on 24 June 2007. The PEC identified quinapril and quinapril/HCTZ as candidates for UF consideration upon application of the process criteria to the approved list of non-formulary drug agents for re-evaluation of UF status (Table 1).

Table 1 – Non-Formulary Agents for Re-Evaluation

Generic Name	Brand Name	UF Class	Generics Shipping
EE 30 mcg; 0.15 mg levonorgestrel	Seasonale	BCs (M30)	Y
EE 30/10 mcg; 0.15 mg levonorgestrel	Seasonique	BCs (M20)	N
EE 35 mcg; 0.4 mg norethindrone	Ovcon-35	BCs (M35)	Y
EE 50 mcg; 1 mg norethindrone	Ovcon-50	BCs (M50)	N
EE 20 mcg; 0.1 mg norethindrone	Loestrin 24 FE	BCs (M20)	N
ciclopirox	Loprox	AF-DERMs	Y
econazole	Spectazole	AF-DERMs	Y
moexipril	Univasc	ACEs	Y
ramipril	Altace	ACEs	N
quinapril, quinapril/HCTZ	Accupril, Accuretic	ACEs	Y
amlodipine	Norvasc	CCBs	Y
nicardipine	Cardene	CCBs	Y
nicardipine SR	Cardene SR	CCBs	N
isradipine IR	Dynacirc	CCBs	Y
isradipine CR	Dynacirc CR	CCBs	N
diltiazem ER HS	Cardizem LA	CCBs	N
verapamil ER HS	Verelan /Covera HS	CCBs	N
bupropion XL	Wellbutrin XL	AD1s	Y (300mg only)
paroxetine CR	Paxil CR	AD1s	N
escitalopram	Lexapro	AD1s	N
verapamil ER / trandolapril	Tarka	Misc HTNs	N
tramadol ER	Ultram ER	Narcotic analgesics	N
timolol maleate	Istalol	EYE-1s	N
timolol hemihydrate	Betimol	EYE-1s	N
tolterodine IR	Detrol IR	OABs	N

Clinical Effectiveness Conclusion - At the August 2005 P&T Committee meeting, the Committee concluded that, in general, quinapril and quinapril/HCTZ had similar clinical effectiveness relative to other angiotensin converting enzyme (ACE) inhibitors in regards to efficacy, safety, tolerability, and clinical outcomes.

Cost Effectiveness Conclusion – The P&T Committee voted (13 for, 0 opposed, 0 abstained, 4 absent) that quinapril and quinapril/HCTZ have similar cost-effectiveness relative to the other UF ACE inhibitors.

COMMITTEE ACTION: UF DECISION – In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the ACE inhibitor and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 0 opposed, 0 abstained, and 4 absent) that quinapril and quinapril/HCTZ be immediately reclassified as generic on the UF.

5) REVIEW OF RECENTLY APPROVED AGENTS

A. Recently Approved Agents in Classes Not Yet Reviewed for the UF

The P&T Committee was briefed on one new drug recently approved by the FDA (see Appendix B). The P&T Committee determined that this new drug fell into a drug class that has not yet been reviewed for UF status. Therefore, UF consideration

was deferred until the drug class review is completed. The P&T Committee discussed the need for a days supply quantity limit (QL) (no multiple fills for multiple co-pays) for sapropterin tablets (Kuvan) based on dosing and laboratory monitoring recommendations in the package insert.

COMMITTEE ACTION: QL – The P&T Committee voted (13 for, 0 opposed, 0 abstained, 4 absent) to recommend a QL for sapropterin tablets of a 45 days supply in the TRICARE Mail Order Pharamcy Program (TMOP) and a 30 days supply in the TRRx (no multiple fills for multiple co-pays).

B. Recently Approved Agents in Classes Previously Reviewed for the UF

The Committee was briefed on newly approved drugs that fall into classes previously reviewed for the UF. The clinical and economic analyses of these classes will be completed for a future meeting. The Committee took no action.

6) UTILIZATION MANAGEMENT – PRIOR AUTHORIZATIONS (PAs)/(QLs)/ MEDICAL NECESSITY (MNs)

A. Renin-Angiotensin Antihypertensives (RAAs) – Valsartan MN Criteria – The Committee discussed the MN criteria for valsartan with regard to a new FDA-approved indication for use for pediatric hypertension. The Angiotensin Receptor Blocker (ARB) drug class was previously reviewed for UF placement in May 2007. At the time of the meeting, losartan (Cozaar) was the only FDA-approved ARB for treating hypertension in children aged 6 – 16 years of age. Valsartan (Diovan) is now FDA-approved for treating children aged 6 – 16 years with hypertension; it is not approved for treating children with heart failure. FDA approval for valsartan was based on a study in 261 children with hypertension who received valsartan for two weeks. At the end of the two week study period, valsartan treatment resulted in statistically significant reductions in both systolic and diastolic blood pressure.

The Committee recommended that MN be approved for children between the ages of 6 and 16 years who have failed to respond adequately to treatment with losartan or who have experienced adverse effects to losartan.

COMMITTEE ACTION: The P&T Committee voted (9 for, 3 opposed, 1 abstained, 4 absent) to approve the MN criteria for valsartan.

B. Targeted Immunomodulatory Biologics (TIBs)

1) Administrative Action - PA for Adalimumab (Humira)

At the November 2007 DoD P&T committee meeting, adalimumab (Humira) was chosen as the Extended Core Formulary (ECF) agent, as it was the most cost effective TIB with multiple FDA-approved indications. Alefacept (Amevive) and efalizumab (Raptiva) were placed on the UF. Etanercept (Enbrel), the other multi-indication TIB, was made non-formulary along with anakinra (Kineret). Infliximab (Remicade), abatacept (Orencia), and rituximab (Rituxan) were not affected by the UF decision, since these medications fall under the TMA medical benefit and are not part of the pharmacy benefit, given their route of intravenous (IV) administration. The TIB UF decisions have a scheduled implementation date of June 18th 2008.

In January 2008, the FDA approved Humira the treatment of plaque psoriasis. At the time of the November 2007 Committee meeting, Humira was FDA-approved for rheumatoid arthritis (RA), ankylosing spondylitis (AS), psoriatic arthritis (PsA), and Crohn's disease (adults). Enbrel is FDA-approved for RA, juvenile RA, AS, PsA, and plaque psoriasis.

The FDA approved Humira's indication for plaque psoriasis based on two recently published clinical trials; the CHAMPION trial, published in December 2007, and Menter, et al published in January 2008. The CHAMPION trial was a randomized, placebo- and methotrexate-controlled trial in 261 patients with mild to moderate plaque psoriasis. The primary endpoint was Psoriasis Areas and Severity Index (PASI) 75% response. At the end of 16 weeks, 79.6% of Humira-treated patients achieved a PASI 75 response, compared to only 35.5% and 18.9% of the methotrexate- and placebo-treated patients, respectively.

The Menter et al study included 1,212 patients with moderate to severe psoriasis randomized to receive either Humira or placebo for an initial 16 week double-blinded treatment phase. At the end of that period, 71% of Humira-treated patients achieved a PASI 75% response, compared to 7% of placebo-treated patients. With regard to safety and tolerability, both studies demonstrated a similar safety profile to that established in previous Humira clinical trials.

The FDA-approved plaque psoriasis indication will be added to the PA for Humira.

2) *QL for TIBs*

Currently, quantity and/or days supply limits apply to Enbrel (etanercept), Humira (adalimumab), and Kineret (anakinra), as outlined in Appendix C. In general, patients are limited to a 4-week supply of these medications at retail network pharmacies at any one time withno multiple fills for multiple copays. Patients are also limited to a 6- to 8-week supply at the TMOP, based on product labeling and packaging. The intent of the QL is to limit potential wastage in the event medications are discontinued or changed.

A change in the QLs for the TIBs was recommended to establish consistent and uniform amounts supplied in the TRRx and TMOP points of service across the drug class. Currently only Enbrel, Humira and Kineret have QLs at TRRx and TMOP. A four-week supply for Enbrel and Humira is allowed at the TRRx, with a six week supply allowed in the TMOP. However, for Kineret, an 8 week supply is allowed at TMOP. A change in the QL was proposed to allow a QL for Humira, Amevive, Raptiva, Enbrel, and Kineret of four weeks supplied at TRRX. In the TMOP, the proposal was a QL for Humira, Raptiva, Enbrel and Kineret of an 8 week supply. No QL is proposed for Amevive in the TMOP, since it is not supplied through that point of service. The number of syringes/vials supplied under these limits is reflected in Table 2.

Table 2 - Recommended Maximum Quantities Dispensed at One Time: TIBs

Point of Service / Notes	Adalimumab (Humira)	Etanercept (Enbrel)	Anakinra (Kineret)	Alefacept (Amevive)	Efalizumab (Raptiva)
Retail Network	4 wks supply (2 packs of 2 syringes)	4 wks supply (based on instructions for use)	4 wks supply (1 pack of 28 syringes)	4 wks supply (1 pack 4 syringes)	4 wks supply (based on instructions for use)
TMOP	8 wks supply (4 packs of 2 syringes)	8 wks supply (based on instructions for use)	8 wks supply (2 packs of 28 syringes)	Not supplied through TMOP	8 wks supply (based on instructions for use)
Other Issues	Crohn's disease starter pack includes 6 pens for 1st 4 wks, no refills	--	--	--	Not to exceed 200 mg/week 8 vials/ 4 wks 16 vials/ 8 wks

COMMITTEE ACTION: The P&T Committee voted (13 for, 0 opposed, 0 abstained, 4 absent) to approve the QLs outlined above in Table 2 to allow adalimumab (Humira), etanercept (Enbrel), and anakinra (Kineret) a four weeks supply via TRRx and 8 weeks supply via TMOP. The Committee voted to add the same limits to efalizumab (Raptiva). A four weeks supply limit was agreed for Alefacept (Amevive) at TRRx, with no QL in the TMOP, as Amevive is not available through the TMOP.

7) BCF / ECF REVIEW

A. Clarification of Basic Core Formulary (BCF) Listing - As part of an ongoing plan to systematically review drug classes represented on the BCF, the P&T Committee made recommendations for clarifying BCF listings in four BCF drug classes: antibiotics (nitrofurantoin monohydrate/macrocrystals [MacroBid]), proton pump inhibitors (esomeprazole [Nexium] powder packets), cough and cold preparations (chlorpheniramine 8 mg/pseudoephedrine 120 mg sustained release [Deconamine SR]), and miscellaneous migraine medications (isometheptene 65 mg/dichloralphenazone 100 mg/ acetaminophen 325 mg [Midrin]).

Esomeprazole powder packets were determined to not be cost-effective, thus the current BCF listing for esomeprazole was revised to specifically include only the 20 and 40 mg capsules. Chlorpheniramine 8 mg/pseudoephedrine 120 mg SR (Deconamine SR) was removed from the BCF due to availability issues from the wholesaler, resulting in low utilization (less than 300 prescriptions dispensed monthly at the MTFs). Midrin was also removed from the BCF due to ongoing shortages which will likely persist due in part to the FDA's campaign to halt the manufacturing of unapproved products containing ergotamine. The BCF listing for nitrofurantoin was revised to include nitrofurantoin monohydrate/macrocrystals (MacroBid), due to availability of cost-effective generic products, and decreasing availability of nitrofurantoin macrocrystals (Macrodantin). Details are outlined in Appendix D.

COMMITTEE ACTION: The P&T Committee recommended the following changes to the current BCF drug classes as outlined in Table 3. (See Appendix D for rationale).

Table 3 - Recommended BCF / ECF Changes

Drug class or potential drug class	Current BCF/ECF listing	Recommendation	Vote			
			For	Opposed	Abstained	Absent
Antibiotics	Nitrofurantoin macrocrystals oral (Does not include MacroBid)	Clarify BCF listing to: "Nitrofurantoin oral (50 mg macrocrystals, 100 mg monohydrate/macrocrystals)"	13	0	0	4
Cough and Cold Preparations	Chlorpheniramine 8 mg / pseudoephedrine 120 mg sustained release (Deconamine SR)	Remove BCF listing: "Chlorpheniramine 8 mg / pseudoephedrine 120 mg sustained release" (specific brand name is Deconamine SR)	13	0	0	4
Miscellaneous Migraine Medications	Isometheptene 65 mg / dichloralphenazone 100 mg / acetaminophen 325 mg (Midrin)	Remove BCF listing:" Isometheptene 65 mg / dichloralphenazone 100 mg / acetaminophen 325 mg" (specific brand name is Midrin)	10	3	0	4
Proton Pump Inhibitors	Esomeprazole (Nexium)	Clarify BCF listing to: "esomeprazole (Nexium) 20 and 40 mg capsule"	13	0	0	4

B. Administrative Action - The PEC obtained recommendations from members of the P&T Committee regarding clarification of the BCF listing for the following medications: antibiotics (amoxicillin oral, doxycycline oral, and cephalexin oral), antifungals (nystatin oral), inhaled asthma agents (albuterol oral inhaler), contraceptives, miscellaneous respiratory medications (insect allergy kits), and ophthalmic antibiotics and combinations (sulfacetamide sodium 10% ophthalmic ointment). Administrative changes will include removal of obsolete medications and more comprehensive delineation of BCF listings. Details are outlined in Appendix D.

8) UPDATE ON SIMVASTATIN/EZETIMIBE – ENHANCE STUDY

The P&T Committee was briefed on the "effect of combination ezetimibe and high-dose simvastatin vs. simvastatin alone on the atherosclerotic process in subjects with heterozygous familial hypercholesterolemia" (ENHANCE) study. The ENHANCE study compared simvastatin/ezetimibe (Vytorin) 80/10 mg with simvastatin 80 mg in patients with heterozygous familial hypercholesterolemia who had baseline low-density lipoprotein levels exceeding 300 mg/dL. The primary endpoint of the trial was change in carotid intima media thickness (CIMT); clinical outcomes (e.g., mortality, myocardial infarction) were not evaluated. There was no significant difference between the two groups with regard to changes in CIMT. Three ongoing studies are addressing outcomes with simvastatin/ezetimibe. No action necessary.

9) ADJOURNMENT

The meeting adjourned at 1330 hours on 13 Feb 2008. The next meeting will be 12-13 June 2008.

John Kugler, M.D.
Colonel, Medical Corps, U.S. Army
Chairperson

Appendix A – Implementation Status of UF Class Review Recommendations / Decisions

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Nov 07	Targeted Immunomodulatory Biologics	▪ etanercept (Enbrel) ▪ anakinra (Kineret)	ECF	▪ adalimumab (Humira) injection	13 Feb 08	18 Jun 08 (120 days)
Nov 07 re-review (Aug 05 original)	BPH Alpha Blockers	▪ tamsulosin (Flomax) Automated PA requiring trial of alfuzosin (Uroxatral) applies to new users of tamsulosin (no use of uroselective alpha blockers in last 180 days)	BCF	▪ terazosin tablets or capsules ▪ alfuzosin tablets (Uroxatral)	13 Feb 08	16 Apr 08 (60 days)
Nov 07	Adrenergic Beta-Blocking Agents	-	BCF	▪ atenolol tablets ▪ metoprolol tartrate IR tablets ▪ carvedilol IR tablets ▪ metoprolol succinate ER tablets	13 Feb 08	-
Nov 07 (update, original review Aug 05)	Calcium Channel Blockers	**Currently non-formulary, recommended for UF status Nov 07** ▪ amlodipine (Norvasc generic)	BCF	**Recommended for addition to BCF Nov 07** ▪ amlodipine besylate tablets	13 Feb 08	13 Feb 08
		To Remain Non-Formulary ▪ isradipine IR (Dynacirc) ▪ isradipine ER (Dynacirc CR) ▪ nicardipine IR (Cardene, generics) ▪ nicardipine SR (Cardene SR) ▪ verapamil ER (Verelan) ▪ verapamil ER for bedtime dosing (Verelan PM, Covera HS) ▪ diltiazem ER for bedtime dosing (Cardizem LA)		Currently on the BCF ▪ nifedipine ER (Adalat CC) ▪ verapamil SR ▪ diltiazem ER (Tiazac)	13 Oct 05	15 Mar 06 (150 days)
Nov 07 (update, original review Nov 06)	ADHD / Narcolepsy Agents	**Recommended for non-formulary status Nov 07** ▪ lisdexamfetamine (Vyvanse)	BCF	-	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ▪ dexmethylphenidate IR (Focalin) ▪ dexmethylphenidate SODAS (Focalin XR) ▪ methylphenidate transdermal system (Daytrana)		Currently on the BCF ▪ methylphenidate OROS (Concerta) ▪ mixed amphetamine salts ER (Adderall XR) ▪ methylphenidate IR (Ritalin)	17 Jan 07	18 Apr 07
Nov 07 (update, original review May 06)	Contraceptives	**Recommended for non-formulary status Nov 07** ▪ EE 20 mcg/levonorgestrel 0.09 mg in special packaging for continuous use (Lybrel)	BCF	-	13 Feb 08	16 Apr 08 (60 days)

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
		To remain NF ▪ EE 30 mcg / levonorgestrel 0.15 mg in special packaging for extended use (Seasonale) ▪ EE 25 mcg / norethindrone 0.4 mg (Ovcon 35) ▪ EE 50 mcg / norethindrone 1 mg (Ovcon 50) ▪ EE 20/30/35 mcg / norethindrone 1 mg (Estrostep Fe)		Currently on the BCF ▪ EE 20 mcg / 3 mg drospirenone (Yaz) ▪ EE 20 mcg / 0.1 mg levonorgestrel (Lutera, Sronyx, or equivalent) ▪ EE 30 mcg / 3 mg drospirenone (Yasmin) ▪ EE 30 mcg / 0.15 mg levonorgestrel (Nordette or equivalent / excludes Seasonale) ▪ EE 35 mcg / 1 mg norethindrone (Ortho-Novum 1/35 or equivalent) ▪ EE 35 mcg / 0.25 mg norgestimate (Ortho-Cyclen or equivalent) ▪ EE 25 mcg / 0.18/0.215/0.25 mg norgestimate (Ortho Tri-Cyclen Lo) ▪ EE 35 mcg / 0.18/0.215/0.25 mg norgestimate (Ortho Tri-Cyclen or equivalent) ▪ 0.35 mg norethindrone (Nor-QD, Ortho Micronor, or equivalent)	26 Jul 06	24 Jan 07
		▪ EE 30/10 mcg / 0.15 mg levonorgestrel in special packaging for extended use (Seasonique) ▪ EE 20 mcg / 1 mg norethindrone (Loestrin 24 Fe)			17 Jan 07	18 Mar 07
Nov 07 (update) Original reviews ▪ ACE inhibitors: Aug 05 ▪ Miscellaneous antihypertensives, including ACE/CCB combos. Feb 06 ▪ ARBs: May 07 ▪ Renin inhibitors. Aug 07	Renin Angiotensin Antihypertensives	**Recommended for non-formulary status Nov 07** ▪ valsartan/amlodipine (Exforge)	BCF	-	13 Feb 08	16 Apr 08 (60 days)
		To remain NF ACE inhibitors ▪ moexipril (Univasc), ▪ moexipril / HCTZ (Uniretic) ▪ perindopril (Aceon) ▪ quinapril (Accupril) ▪ quinapril / HCTZ (Accuretic) ▪ ramipril (Altace) ACE/CCB combos ▪ felodipine/enalapril (Lexxel) ▪ verapamil/trandolapril (Tarka) ARBs ▪ eprosartan (Teveten) ▪ eprosartan HCTZ (Teveten HCT) ▪ irbesartan (Avapro) ▪ irbesartan HCTZ (Avalide) ▪ olmesartan (Benicar) ▪ olmesartan HCTZ (Benicar HCT) ▪ valsartan (Diovan) ▪ valsartan HCTZ (Diovan HCT)		Currently on the BCF ACE inhibitors ▪ captopril ▪ lisinopril ▪ lisinopril / HCTZ ACE/CCB combos ▪ amlodipine/benazepril (Lotrel) ARBs ▪ telmisartan (Micardis) ▪ telmisartan HCTZ (Micardis HCT)	ACE inhibitors ▪ 13 Oct 05 ACE/CCB combos ▪ 26 Apr 06 ARBs ▪ 24 July 07	ACE inhibitors ▪ 15 Feb 06 ACE/CCB combos ▪ 26 Jul 06 ARBs ▪ 21 Nov 07

Meeting	Drug Class	Non-Formulary Medications	BCF/ ECF Class	BCF/ECF Medications	Decision Date (DoD P&T minutes signed, effective date for BCF/ECF medications, NF to UF changes)	Effective Date for Non-Formulary Medications (Implementation period)
Aug 07	Newer Antihistamines	▪ desloratadine (Clarinex) ▪ desloratadine/pseudoephedrine (Clarinex D)	BCF	▪ MTFs required to carry at least one single ingredient agent from the newer antihistamine class (loratadine, cetirizine, or fexofenadine) on their local formulary, including at least one dosage form suitable for pediatric use	17 Oct 07	16 Jan 08 (90 days)
Aug 07	Leukotriene Modifiers	▪ zileuton (Zyflo)	BCF	▪ montelukast (Singulair)	17 Oct 07	16 Jan 08 (90 days)
Aug 07	Growth Stimulating Agents	▪ somatropin (Genotropin, Genotropin Miniquick) ▪ somatropin (Humatrope) ▪ somatropin (Omnitrope) ▪ somatropin (Saizen)	ECF	▪ somatropin (Norditropin)	17 Oct 07	19 Dec 07 (60 days)
Aug 07 (new drug update, original review Nov 05)	Nasal Corticosteroids	▪ beclomethasone dipropionate (Beconase AQ, Vancenase AQ) ▪ budesonide (Rhinocort Aqua) ▪ triamcinolone (Nasacort AQ)	BCF	▪ fluticasone propionate (Flonase)	19 Jan 06	19 Apr 06 (90 days)
		Recommended for non-formulary status Aug 07 ▪ fluticasone furoate (Veramyst)			17 Oct 07	19 Dec 07 (60 days)
May 07 re-review (Feb 05 original)	PPIs	▪ lansoprazole (Prevacid) ▪ omeprazole/sodium bicarbonate (Zegerid) ▪ pantoprazole (Protonix) ▪ rabeprazole (Aciphex) Automated PA requiring trial of omeprazole OR esomeprazole (Nexium) applies to new users of non-formulary PPIs (no use of PPIs in last 180 days)	BCF	▪ generic omeprazole 10 mg and 20 mg (excludes Prilosec 40 mg) ▪ esomeprazole (Nexium)	24 July 07	24 Oct 07 (90 days)
May 07	Antilipidemic Agents II	▪ fenofibrate nanocrystallized (Tricor) ▪ fenofibrate micronized (Antara) ▪ omega-3 fatty acids (Omacor) ▪ colesevelam (Welchol)	BCF	▪ gemfibrozil ▪ fenofibrate IDD-P (Triglide)	24 July 07	21 Nov 07 (120 days)
May 07 re-review (Feb 05 original)	ARBs	▪ eprosartan (Teveten) ▪ eprosartan HCTZ (Teveten HCT) ▪ irbesartan (Avapro) ▪ irbesartan HCTZ (Avalide) ▪ olmesartan (Benicar) ▪ olmesartan HCTZ (Benicar HCT) ▪ valsartan (Diovan) ▪ valsartan HCTZ (Diovan HCT)	BCF	▪ telmisartan (Micardis) ▪ telmisartan HCTZ (Micardis HCT)	24 July 07	21 Nov 07 (120 days)

BCF = Basic Core Formulary; ECF = Extended Core Formulary; MN = Medical Necessity; TMOP = TRICARE Mail Order Pharmacy; TRRx = TRICARE Retail Pharmacy program; UF = Uniform Formulary
ER = extended release; IR = immediate release; SR = sustained release; IDD-P = insoluble drug delivery-microParticle
ADHD = Attention Deficit Hyperactivity Disorder; ARBs = Angiotensin Receptor Blockers; ACE Inhibitors = Angiotensin Converting Enzyme Inhibitors; BPH = Benign Prostatic Hyperplasia; CCBs = Calcium Channel Blockers; EE = ethinyl estradiol; GI = gastrointestinal; GABA = gamma-aminobutyric acid; H2 = Histamine-2 receptor; HCTZ = hydrochlorothiazide; MS-DMDs = Multiple Sclerosis Disease-Modifying Drugs; OABs = Overactive Bladder Medications; PDE-5 Inhibitors = Phosphodiesterase-5 inhibitors; PPIs = Proton Pump Inhibitors; TZDs= Thiazolidinediones
*The topical antifungal drug class excludes vaginal products and products for onychomycosis (e.g., ciclopirox topical solution [Penlac])

Appendix B – Newly Approved Drugs. February 2008 DoD P&T Committee Meeting

Medication (Brand name; manufacturer) mechanism of action	**FDA Approval Date & FDA-Approved Indications**	**Committee Recommendation**
Sapropterin dihydrochloride tablets (Kuvan, BioMarin Pharmaceutical) Synthetic tetrahydrobiopterin, the enzyme cofactor for phenylalanine hydroxylase	Dec 07 To reduce blood phenylalanine levels in patients with hyperphenylalanemia due to tetrahydrobiopterin-responsive phenylketonuria. Kuvan is to be used in conjunction with a phenylalanine-restricted diet.	No UF recommendation at this meeting. Consideration of UF status deferred until prescription metabolic and vitamin drugs are reviewed; UF review not anticipated within the next 12 months. Quantity limits recommended: ▪ TMOP o Days supply limit of 45 days ▪ Retail Network o Days supply limit of 30 days

Appendix C – Existing Quantity Limits and Recommended QLs for Targeted Immunomodulatory Biologics

Quantity Limits	Adalimumab (Humira)	Etanercept (Enbrel)	Anakinra (Kineret)	Alefacept (Amevive)	Efalizumab (Raptiva)
Current Retail Network	Maximum quantity dispensed at any one time is 4 weeks supply (2 packs of 2 syringes). Does not apply to the Crohn's Disease starter pack (6 pens for the first 4 weeks of treatment), which is limited to 1 package (6 pens), with no refills.	4-week supply week supply in mail order (based on instructions for use on the prescription)	Maximum quantity dispensed at any one time is 4 weeks supply (1 package of 28 syringes) in retail	No current QL	No current QL
Current TMOP	Maximum quantity dispensed at any one time is 4 weeks supply (3 packs of 2 syringes). Does not apply to the Crohn's Disease starter pack (6 pens for the first 4 weeks of treatment), which is limited to 1 package (6 pens), with no refills.	6-week supply (based on instructions for use on the prescription)	Maximum quantity dispensed at any one time is 8 weeks supply (2 packages of 28 syringes)	Not supplied through TMOP	No current QL
Recommended Retail Network	4 wks supply (2 packs of 2 syringes)	4 wks supply (based on instructions for use)	4 wks supply (1 pack of 28 syringes)	4 wks supply (1 pack 4 syringes)	4 wks supply (based on instructions for use)
Recommended TMOP	8 wks supply (4 packs of 2 syringes)	8 wks supply (based on instructions for use)	8 wks supply (2 packs of 28 syringes)	Not supplied through TMOP	8 wks supply (based on instructions for use)
Other Issues	Crohn's disease starter pack includes 6 pens for first 4 wks, no refills	Not applicable	Not applicable	Not applicable	Not to exceed 200 mg/week 8 vials/ 4 wks 16 vials/ 8 wks

Appendix D– Basic / Extended Core Formulary (BCF/ECF) Review

Drug Class or Potential Drug Class	BCF listing	Recommended Action / Administrative Action

Antibiotics	Amoxicillin oral	• The current BCF listing does not clarify strengths and dosage forms.
		• Approximately 90% of MTF utilization is for the following strengths:
		  • 250 mg and 500 mg capsules
		  • 250/5 mL and 400mg/5 mL suspension
		• Administrative:
		  • Clarify BCF listing: "Amoxicillin oral (250 mg and 500 mg capsules; 250/5 mL and 400 mg/5mL suspension)"

Antibiotics	Cephalexin oral	• The current BCF listing does not clarify strengths and dosage forms.
		• Approximately 90% of MTF utilization data is for the following strengths:
		  • 250 mg and 500 mg capsules
		  • 250/5 mL suspension
		• Administrative:
		  • Clarify BCF listing: "Cephalexin oral (250 mg and 500 mg capsules; 250/5 mL suspension)"

Antibiotics	Doxycycline oral (Does not include Periostat)	• In Jun 2001 the BCF was clarified to exclude doxycycline 20 mg (Periostat), due to its mechanism in dental procedures as inhibiting collagenase, rather than antimicrobial effects.
		• In May 2006 a 40 mg formulation for rosacea (Oracea) was marketed.
		• The 100 mg strengths are used for antimicrobial effects.
		• Approximately 90% of MTF utilization data is for the following strengths:
		  • 100 mg doxycycline hyclate tablet & capsules
		• Administrative:
		  • Clarify BCF listing: "Doxycycline hyclate (100 mg tablets or capsules)"

Antibiotics	Nitrofurantoin macrocrystals oral (Does not include MacroBid)	• In Feb 2001 the BCF was clarified to exclude nitrofurantoin monohydrate/macrocrystals (MacroBid) due to cost and availability only in a proprietary formulation. • Nitrofurantoin monohydrate/macrocyrstalline (MacroBid) is now available in cost-effective generic formulations. • There are supply issues with nitrofurantoin macrocrystals (Furadantin). • A 6 month review of MTF data show that >60% of nitrofurantoin utilization is for MacroBid 100 mg. • Recommendation: • Clarify BCF listing: "Nitrofurantoin oral (50 mg macrocrystals; 100 mg monohydrate/macrocrystals)"
Antifungals	Nystatin (Does not include Mycostatin Pastilles)	• The original BCF listing for nystatin oral excluded nystatin pastilles (lozenges); the pastilles are no longer commercially available. • Administrative: • Clarify BCF listing: "Nystatin", (remove "Does not include Mycostatin Pastille")
Asthma agents, inhaled	Albuterol oral inhaler (Does not include hydrofluoralkane (HFA) products)	• The current BCF listing excludes hydrofluoralkane (HFA)-containing products. Chlorofluorocarbon (CFC)-containing albuterol inhalers will be discontinued in Dec 2008 as per an FDA Final Rule. • Most manufactures have already converted to hydrofluoralkane (HFA) as the most common propellant. • Administrative: • Clarify BCF listing: "remove (Does not include HFA products)"

Drug Class or Potential Drug Class	BCF listing	Recommended Action / Administrative Action
Contraceptives	Monophasics with 30 mcg EE; 0.15 mg levonorgestrel (Nordette or equivalent; excludes Seasonale) Monophasics with 20 mcg EE; 0.1 mg levonorgestrel (Alesse, Levlite, or equivalent)	• Proprietary formulations of monophasic contraceptives with 20 mcg ethinyl estradiol (EE) / 0.15 mg levonorgestrel (Allesse, Levlite) and 30 mcg EE / 0.1 mg levonorgestrel (Levlin) are no longer available. • There are continuing changes in the availability of branded generics, generics, and proprietary contraceptives. • Administrative: • Clarify BCF listing: "Specify hormonal content only, remove reference to product name unless designated non-formulary"
Cough and Cold Preparations	Chlorpheniramine 8 mg / pseudoephedrine 120 mg sustained release (Deconamine SR)	• There are availability issues with Deconamine SR which are not expected to resolve. • Currently there is low utilization of Deconamine SR with fewer than 300 Rxs dispensed monthly across all MTFs. • Recommendation: • Remove BCF listing for chlorpheniramine 8 mg/ pseudoephedrine 120 mg SR.
Miscellaneous Migraine Medications	Isometheptene 65 mg / dichloralphenazone 100 mg / acetaminophen 325 mg	• There are availability issues with isometheptene 65 mg / dichloralphenazone 100 mg / acetaminophen 325 mg (Midrin) which are not expected to improve, as only 2 manufacturers remain in the marketplace. • The FDA has warned several manufacturers regarding manufacturing of unapproved products containing ergotamine derivatives. • MTF utilization of Midrin dropped from 6,000 Rxs/ monthly to less than 3,000 Rxs monthly between Aug 2007 and Dec 2007, reflecting dwindling availability. • Recommendation: • Remove BCF listing
Miscellaneous Respiratory Medications	Insect Sting Kit, Injection (EpiPen is a commonly recognized brand name)	• The current BCF listing is designated as "insect sting kit" and lists one popular proprietary name. Kits containing epinephrine are used to treat multiple types of anaphylaxis (asthma, food, insects) and are called by different names. • Healthcare providers look for epinephrine (generic) or specific brand name kits (e.g., EpiPen, Twinject). • Administrative: • Clarify BCF listing: Change insect sting kit, injection to "Epinephrine auto-injection"
Ophthalmic Antibiotic and Combinations	Sulfacetamide sodium ophthalmic ointment	• The current BCF listing for sulfacetamide sodium lists both the ointment and solution. Sulfacetamide sodium ophthalmic ointment is no longer commercially available • Administrative: • Remove BCF listing: "Sulfacetamide sodium ophthalmic ointment"
Proton Pump Inhibitors	Esomeprazole (Nexium)	• May 2007 esomeprazole (Nexium) was added to the BCF. The current BCF listing does not clarify strengths or formulations. • Esomeprazole powder packets are now available, but are not cost-effective relative to the esomeprazole capsules. • Recommendation: • Clarify BCF listing: "esomeprazole (Nexium) 20 and 40 mg capsules"

Appendix E – Table of Abbreviations

ACE	angiotensin converting enzyme
AD1s	antidepressant 1 drug class
AF-DERMS	antifungal dermatologics drug class
ARB	angiotensin receptor blocker
AS	ankylosing spondylitis
ARB	angiotensin receptor blocker
BAP	Beneficiary Advisory Panel
BCF	Basic Core Formulary
CCB	calcium channel blocker
CFC	chlorofluorocarbon
CIMT	carotid intima-media thickness
CFR	Code of Federal Regulations
CR	controlled release (extended release)
DoD	Department of Defense
ECF	extended core formulary
EE	ethinyl estradiol
ER	extended release
FDA	Food and Drug Administration
FY	fiscal year
HCTZ	hydrochlorothiazide
HFA	hydrofluoralkane
IV	intravenous
IR	immediate release
MHS	Military Health System
MN	medical necessity
MTF	Military Treatment Facility
PA	prior authorization
PASI	Psoriasis Area and Severity Index
P&T	Pharmacy and Therapeutics
PEC	Pharmacoeconomic Center
RAA	renin-angiotensin antihypertensive drug class
PsA	psoriatic arthritis
OAB	overactive bladder drug class
QL	quantity limit
RA	rheumatoid arthritis
SR	sustained release
TIB	targeted immunomodulatory biologic
TMA	TRICARE Management Activity
TMOP	TRICARE Mail Order Pharmacy Program
TRRx	TRICARE Retail Pharmacy Program
UF	Uniform Formulary
XL	extended release

DECISION PAPER

DEPARTMENT OF DEFENSE

PHARMACY AND THERAPEUTICS COMMITTEE RECOMMENDATIONS

November 2007

1) **CONVENING**
2) **ATTENDANCE**
3) **REVIEW MINUTES OF LAST MEETING**
4) **ITEMS FOR INFORMATION**
5) **REVIEW OF RECENTLY APPROVED AGENTS**

A. Recently Approved Agents in Classes Not Yet Reviewed for the Uniform Formulary (UF) – The Pharmacy and Therapeutics (P&T) Committee was briefed on one new drug which was approved by the Food and Drug Administration (FDA) (see Appendix B). The Department of Defense (DoD) P&T Committee determined that this new drug fell into a drug class that has not yet been reviewed for UF status; therefore, UF consideration was deferred until the drug class review is completed. The P&T Committee discussed the need for a quantity limit (QL) for formoterol fumarate inhalation solution, based on existing QLs for other oral inhalation products and recommendations for use in product labeling. (See paragraph 5A on page 22 and Appendix B on page 73 of the P&T Committee minutes).

COMMITTEE ACTION: QL – The P&T Committee voted (15 for, 0 opposed, 1 abstained, 1 absent) to recommend a QL for formoterol fumarate inhalation solution of 60 unit dose vials per 30 days, 180 unit dose vials per 90 days.

Director, TMA, Decision: ■ Approved □ Disapproved

Approved, but modified as follows:

B. Renin Angiotensin Antihypertensive (RAA) – Valsartan/Amlodipine (Exforge)

Background – Exforge is a fixed dose combination product containing valsartan (Diovan) with amlodipine (Norvasc, generics). It is the first combination product containing an ARB with a dihydropyridine (DHP) calcium channel blocker (CCB). Valsartan/amlodipine is solely indicated for treating hypertension.

Treatment with valsartan/amlodipine has been shown in two randomized trials to produce additive blood pressure (BP) lowering and superior BP control compared to placebo and the individual components administered alone. Valsartan/amlodipine showed similar BP lowering as the fixed dose combination of lisinopril/hydrochlorothiazide (HCTZ) in one trial.

The adverse event profile of valsartan/amlodipine reflects that of the individual angiotensin receptor blocker (ARB) and DHP CCB components. In clinical trials, the

incidence of peripheral edema with valsartan/amlodipine is less than that seen when amlodipine is administered alone.

Studies evaluating the effect of valsartan/amlodipine in terms of patient convenience have not been conducted. Potential benefits of fixed dose combination drugs include reduced tablet burdens, simplified medication regimens, and improved adherence.

Relative Clinical Effectiveness Conclusion – The P&T Committee concluded (15 for, 0 opposed, 0 abstained, 2 absent) that, while valsartan/amlodipine offers a slight convenience to the patient in terms of decreased tablet burden and simplified medication regimen, it does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other anti-hypertensive agents included on the UF.

Relative Cost Effectiveness Conclusion – The P&T Committee concluded (13 for, 0 opposed, 3 abstained, 1 absent) that valsartan/amlodipine is not cost effective relative to the other agents in the RAA class. The weighted average cost of combined individual agents (UF ARBs and generic amlodipine) is more cost effective relative to Exforge.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (12 for, 0 opposed, 3 abstained, 2 absent) to recommend that valsartan/amlodipine be classified as non-formulary under the UF. (See paragraph 5B, pages 22-24 of the P&T Committee minutes).

   Director, TMA, Decision: ■ Approved □ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: MEDICAL NECESSITY (MN) CRITERIA*** – Based on the clinical evaluation of valsartan/amlodipine and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) MN criteria for valsartan/amlodipine. (See paragraph 5B, pages 24-25 of the P&T Committee minutes for the criteria).

   Director, TMA, Decision: ■ Approved □ Disapproved

   Approved, but modified as follows:

3) ***COMMITTEE ACTION: IMPLEMENTATION PERIOD*** – The P&T Committee voted (14 for, 0 opposed, 1 abstained, 2 absent) to recommend: 1) an effective date of the first Wednesday following a 60-day implementation period in the TRICARE Mail Order Pharmacy (TMOP) and TRICARE Retail Network Pharmacy (TRRx) programs, and at military treatment facilities (MTFs) no later than a 60-day implementation period; and 2) TMA letter to be sent to every

beneficiary affected by this UF decision. The implementation period will begin immediately following the approval by the Director, TRICARE Management Activity (TMA). (See paragraph 5B, page 25 of the P&T Committee minutes.)

Director, TMA, Decision: ■ Approved □ Disapproved

Approved, but modified as follows:

C. Attention Deficit Hyperactivity Disorder (ADHD)/Narcolepsy Agent – Lisdexamfetamine dimesylate (Vyvanse)

Background – Lisdexamfetamine is a pro-drug that is hydrolyzed in the gastro-intestinal tract to the stimulant dextroamphetamine and the amino acid l-lysine. It is approved for treating ADHD in children 6 to 12 years of age.

Lisdexamfetamine and a current UF product, mixed amphetamine salts extended release (ER) (Adderall XR), are manufactured by the same company; generic formulations of Adderall XR are anticipated in 2009.

With regard to efficacy, there is insufficient evidence to determine if there are clinically relevant differences between lisdexamfetamine and other ADHD stimulant products. With regard to safety, there is no evidence to suggest that the adverse event profile of lisdexamfetamine differs clinically from other amphetamine formulations, although no comparative trials are available. Up to 33% of patients report appetite suppression.

Lisdexamfetamine was designed to have less potential for abuse, diversion and overdose toxicity than amphetamine, as it requires activation in the gut. Two small manufacturer-sponsored studies in drug abusers reported that the doses of lisdexamfetamine used clinically produced similar "likeability" scores as placebo. However, lisdexamfetamine is a Schedule II controlled substance.

Relative Clinical Effectiveness Conclusion – The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that lisdexamfetamine does not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness, or clinical outcomes over other ADHD agents included on the UF.

Relative Cost Effectiveness Conclusion – The P&T Committee concluded (14 for, 0 opposed, 1 abstained, 2 absent) that lisdexamfetamine had similar relative cost effectiveness compared to the other UF once daily ADHD stimulants.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of lisdexamfetamine dimesylate and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (13 for, 1 opposed, 1 abstained, 2 absent) to recommend that lisdexamfetamine dimesylate be classified as non-formulary under the UF. This recommendation was primarily based upon the determination that lisdexamfetamine offers no significant, clinically meaningful therapeutic

advantage over other once daily ADHD stimulants. (See paragraph 5C on pages 25-27 of the P&T Committee minutes).

Director, TMA, Decision: ■ Approved □ Disapproved

Approved, but modified as follows:

2) ***COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation of lisdexamfetamine dimesylate and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) MN criteria for lisdexamfetamine dimesylate. (See paragraph 5C, page 27 of the P&T Committee minutes for the criteria).

Director, TMA, Decision: ■ Approved □ Disapproved

Approved, but modified as follows:

COMMITTEE ACTION: IMPLEMENTATION PERIOD – The P&T Committee voted (14 for, 0 opposed, 1 abstained, 2 absent) to recommend: 1) an effective date of the first Wednesday following a 60-day implementation period in TMOP and TRRx, and at MTFs no later than a 60- day implementation period; and 2) TMA letter to be sent to every beneficiary affected by this UF decision. The implementation period will begin immediately following approval by the Director, TMA. (See paragraph 5C, pages 27-28 of the P&T Committee minutes.)

Director, TMA, Decision: ■ Approved □ Disapproved

Approved, but modified as follows:

D. Contraceptive – Ethinyl estradiol 20 mcg/levonorgestrel 0.09 mg (Lybrel)

Background – Ethinyl estradiol (EE) 20 mcg/levonorgestrel 90 mg is the first FDA-approved contraceptive formulation specifically packaged for continuous use. Active tablets are taken 365 days a year, with the intent of eliminating cyclical bleeding periods.

Conventionally packaged contraceptives are commonly used on a continuous or extended cycle basis. Four conventional contraceptive packs are dispensed every 90 days, and the patient is instructed to discard the unneeded placebo tablets. This practice also provides access to the full array of oral contraceptive products, with varying estrogen levels and types of progestins.

Contraceptives containing 20 mcg of EE with 100 mcg of levonorgestrel are included on the Basic Core Formulary (BCF). The EE 20 mcg/levonorgestrel 0.09 mg product cannot be exactly duplicated by using conventional packages of EE 20 mcg/ levonorgestrel 0.1 mg or its equivalents, due to the 10 mcg difference in the levonorgestrel component; however, this difference in the progestin content is of questionable clinical relevance.

With respect to efficacy, there is no evidence to suggest that EE 20 mcg/ levonorgestrel 0.09 mg would differ from other similar contraceptives containing low-dose estrogen. With respect to safety, as with other continuous regimens, break-through bleeding is common with EE 20 mcg/levonorgestrel 0.09 mg, but decreases over time.

Relative Clinical Effectiveness Conclusion – The Committee voted (15 for, 0 opposed, 0 abstained, 0 absent) that EE 20 mcg/levonorgestrel 0.09 mg did not have a significant, clinically meaningful therapeutic advantage in terms of safety, effectiveness or clinical outcome over other oral contraceptives included on the UF.

Relative Cost Effectiveness Conclusion – The Committee voted (13 for, 1 opposed, 0 abstained, 3 absent) that the weighted average cost per day of treatment for EE 20 mcg/levonorgestrel 0.09 mg is significantly higher than other UF monophasic 20 mcg EE agents used on a continuous cycle basis.

1) ***COMMITTEE ACTION: UF RECOMMENDATION*** – Taking into consideration the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of EE 20 mcg/levonorgestrel 0.09 mg and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (14 for, 0 opposed, 1 abstained, 2 absent) to recommend that Lybrel be designated as non-formulary under the UF. (See paragraph 5D, page 29 of the P&T Committee minutes).

   Director, TMA, Decision: ■ Approved □ Disapproved

   Approved, but modified as follows:

2) ***COMMITTEE ACTION: MN CRITERIA*** – Based on the clinical evaluation of EE 20 mcg/levonorgestrel 0.09 mg and the conditions for establishing medical necessity of a non-formulary medication provided for in the UF rule, the P&T Committee recommended (14 for, 0 opposed, 1 abstained, 2 absent) MN criteria for Lybrel. (See paragraph 5D, pages 29-30 of the P&T Committee minutes for the criteria).

   Director, TMA, Decision: ■ Approved □ Disapproved

   Approved, but modified as follows:

   COMMITTEE ACTION: IMPLEMENTATION PERIOD – The P&T Committee voted (12 for, 2 opposed, 1 abstained, 2 absent): 1) an effective date of the first Wednesday following a 60-day implementation period in the TMOP and TRRx, and no later than a 60-day implementation period at MTFs; and 2) TMA letter to be sent to every beneficiary affected by this UF decision. The implementation period will begin immediately following approval by Director, TMA. (See paragraph 5D, page 30 of the P&T Committee minutes.)

   Director, TMA, Decision: ■ Approved □ Disapproved

   Approved, but modified as follows:

6) DRUG CLASS REVIEW – ADRENERGIC BETA-BLOCKING AGENTS (ABAs)

The P&T Committee evaluated the relative clinical effectiveness of the 22 ABAs marketed in the US (see Table 1). The ABA drug class was subdivided into three categories: ABAs evaluated (but not necessarily FDA-approved) for treating chronic heart failure (HF); ABAs not evaluated for HF (older ABAs used primarily for hypertension); and ABA/diuretic combinations (one combination product, timolol/ hydrochlorothiazide (HCTZ), has now been discontinued). The current BCF ABAs are metoprolol tartrate and atenolol.

The ABAs are all available in generic formulations, with the exception of carvedilol ER (Coreg CR), which was introduced to the market in March 2007. Generic formulations of carvedilol immediate release (IR) and metoprolol succinate ER were launched in mid- to late-2007.

Expenditures for the ABAs exceeded $140 million in FY 07, ranking them in the top 15 drug class expenditures for the Military Health System (MHS). In terms of 30-day equivalent prescriptions dispensed in FY 07, atenolol is the highest utilized ABA in the MHS (~225,000/month), followed by branded metoprolol succinate ER, and metoprolol tartrate (~100,000/month). Generic formulations of metoprolol succinate ER have exceeded 50,000 30-day equivalent prescriptions since August 2007. Since market introduction, carvedilol ER has seen a steady increase in utilization, which exceeded 12,000 30-day equivalent prescriptions dispensed in October 2007.

Relative Clinical Effectiveness Conclusion: The P&T Committee voted (16 for, 0 opposed, 0 abstained, 1 absent) to accept the following clinical effectiveness conclusion:

a) Labetolol was not clinically comparable to carvedilol, despite exhibiting alpha blocking properties, as it has not been evaluated for chronic HF.

b) Sotalol was not clinically comparable to the other ABAs, as it is not FDA-approved for treating chronic HF.

c) For treating hypertension, there is no evidence of clinically relevant differences in efficacy between the ABAs, when titrated to effect.

d) For treating chronic HF, metoprolol succinate ER, carvedilol IR and ER, and bisoprolol have been shown to reduce mortality. Bisoprolol is not FDA-approved for this indication. Based on the available evidence, there is no data to suggest that there are differences in the reduction in mortality between carvedilol, metoprolol succinate ER, or bisoprolol.

e) Clinically relevant differences in the safety and tolerability profile of the ABAs are not apparent. There is insufficient evidence to determine if there are clinically relevant differences in the adverse event profile between carvedilol IR and carvedilol ER.

f) Despite the convenience of once daily dosing of carvedilol ER, there is no compelling clinical evidence to suggest a benefit of carvedilol ER over carvedilol IR.

Relative Cost Effectiveness Conclusion: the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that:

a) All ABAs used primarily to treat hypertension are cost-effective, with atenolol, metoprolol tartrate, and propranolol IR being the most effective.

b) All of the ABAs with clinical evidence for heart failure are effective, with carvedilol IR being the most cost effective agent.

c) Sotalol, sotalol AF, and labetalol are cost-effective.

A. COMMITTEE ACTION: UF RECOMMENDATION – In view of the conclusions from the relative clinical effectiveness and relative cost effectiveness determinations of the ABAs, and other relevant factors, the P&T Committee, based upon its collective professional judgment, voted (15 for, 0 opposed, 1 abstained, 1 absent) to recommend the following: that atenolol, atenolol-chlorthalidone, metoprolol tartrate, metoprolol succinate ER, propranolol, propranolol/HCTZ, propranolol ER, timolol, timolol/HCTZ, bisoprolol, bisoprolol/HCTZ, nadolol, nadolol/bendroflumethiazide, acebutolol, betaxolol, penbutolol, carvedilol IR, and carvedilol ER be designated formulary on the UF. (See paragraphs 6A, 6B and 6C on pages 30-36 of the P&T Committee minutes.)

Director, TMA, Decision: ■ Approved □ Disapproved

Approved, but modified as follows:

B. COMMITTEE ACTION: BCF RECOMMENDATION – Based on the results of the clinical and economic evaluations presented, the P&T Committee voted (15 for, 0 opposed, 1 abstained, and 1 absent) to recommend that atenolol and metoprolol tartrate be maintained on the BCF, and that generic formulations of metoprolol succinate ER and carvedilol IR be added to the BCF. (See paragraph 6D on pages 36-37 of the P&T Committee minutes.)

Director, TMA, Decision: ■ Approved □ Disapproved

Approved, but modified as follows:

7) DRUG CLASS REVIEW – ALPHA BLOCKERS (ABs) FOR BENIGN PROSTATIC HYPERTROPHY (BPH)

The P&T Committee evaluated the relative clinical effectiveness of the ABs used for BPH currently marketed in the US. The BPH ABs comprise the non-uroselective agents terazosin and doxazosin (both available in generic formulations), and the uroselective agents alfuzosin (Uroxatral) and tamsulosin (Flomax). The BPH AB class was first reviewed by the DoD P&T Committee in August 2005.

Relative Clinical Effectiveness Conclusion: The P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that:

a) Based on randomized placebo-controlled trials, terazosin, doxazosin, tamsulosin, and alfuzosin were found to produce clinically significant and comparable symptom improvements when compared to placebo.

b) Based on limited head-to-head trials and indirect comparisons between the agents, existing evidence does not support clinically significant differences in efficacy between alfuzosin and tamsulosin.

c) There appear to be few differences in the incidence of adverse effects with alfuzosin and tamsulosin, based on placebo-controlled trials and limited comparative data. Both agents are well tolerated. The most common adverse events are vasodilatory effects.

d) There appear to be major differences in withdrawal rates due to adverse events between non-uroselective and the uroselective agents. Withdrawal rates reported in clinical trials were low overall for alfuzosin and tamsulosin.

e) The package labeling for alfuzosin contains cautions for QT prolongation effects. The effect of tamsulosin on the QT interval has not been studied.

f) Alfuzosin is contraindicated for use with potent CYP3A4 inhibitors such as ketoconazole, itraconazole, and ritonavir. Tamsulosin has potential drug interactions with cimetidine and warfarin.

g) Doxazosin should be used with caution in men with hepatic failure. Alfuzosin is contraindicated in men with moderate to severe hepatic impairment (Child-Pugh categories B and C). Tamsulosin does not require dosage adjustment in men with moderate hepatic dysfunction.

h) Package labeling for all four ABs contains information regarding the potential for IFIS. For patients receiving alfuzosin and tamsulosin consultation with an ophthalmologist is recommended prior to cataract surgery.

i) Terazosin and doxazosin have a low degree of therapeutic interchangeability with alfuzosin and tamsulosin in terms of safety/tolerability due to the higher incidence of discontinuation rates and vasodilatory effects seen with the non-uroselective ABs.

j) Alfuzosin and tamsulosin have a high degree of therapeutic interchangeability; either drug could be expected to meet the needs of the majority of MHS BPH patients requiring an uroselective agent.

k) Review of the clinical literature since 2005 does not add substantial new information or support changes in current clinical practice for the treatment of LUTS in men with BPH, or for safety profiles between the uroselective ABs.

l) Based on clinical issues alone, there are no compelling reasons to classify any of the AB agents as non-formulary under the UF.

Relative Cost Effectiveness Conclusion: the P&T Committee concluded (16 for, 0 opposed, 0 abstained, 1 absent) that:

a) UF scenario, under condition set #1, with alfuzosin as the one uroselective agent on the UF and BCF in conjunction with Step Therapy to be the most cost effective UF scenario considered.
