Deployment Health Assessments

U.S. Armed Forces

February 2013

(Data through January 2013)

Armed Forces Health Surveillance Center

Report Date: February 9, 2013

Update: Deployment Health Assessments, U.S. Armed Forces, February 2013

Since January 2003, peaks and troughs in the numbers of pre- and post-deployment health assessment forms transmitted to the Armed Forces Health Surveillance Center generally corresponded to times of departure and return of large numbers of deployers. Between April 2006 and January 2013, the number of post-deployment reassessment (PDHRA) forms per month ranged from 12,744 to 36,845 (Table 1, Figure 1).

During the past 12 months, the proportions of returned deployers who rated their health as "fair" or "poor" were 7-11 percent on post-deployment health assessment questionnaires and 10-14 percent on PDHRA questionnaires (Figure 2).

In general, on post-deployment assessments and reassessments, deployers in reserve components were more likely than their respective counterparts to report health and exposure-related concerns (Table 2, Figure 3). Active and reserve component members of the Navy and Marine Corps and Army Reservists were more likely to report exposure concerns three to six months after, compared to the time of return from deployment (Table 2).

At the time of return from deployment, soldiers serving in the active component of the Army were the most likely of all deployers to receive mental health referrals; three to six months after returning, reservists in all services were more likely than their active component counterparts to receive mental health referrals (**Table 2**).

Finally, during the past three years, reserve component members have been more likely than active component service members to report "exposure concerns" on post-deployment assessments and reassessments (Figure 3).
