Global Zika Virus Surveillance Summary #31
17 AUG 2016 (next report 24 AUG 2016)

DoD SURVEILLANCE: As of 17 AUG, there are 75 (+6) confirmed Zika virus (ZIKV) disease cases in Military Health System beneficiaries (see table for details), including one case in a pregnant Service member and one case in a dependent.

As per the AFHSB updated guidance for detecting and reporting DoD cases of ZIKV disease, confirmed and probable cases should be reported in DRSi as “Any Other Unusual Condition Not Listed,” with “Zika” entered in the comment field along with pertinent travel history and pregnancy status.

The CDC Zika IgM MAC-ELISA and CDC Zika Trioplex rRT-PCR are available under an Emergency Use Authorization (EUA) at DoD laboratories (see map on Slide 3).

Strategy for Control of Zika Virus Transmitting Mosquitoes on Military Installations is available from the Armed Forces Pest Management Board.

CASE REPORT: From 1 MAY 2015 to 17 AUG 2016, confirmed autochthonous vector-borne transmission of ZIKV has been reported in 47 (+1, Bahamas) countries and territories in the Western Hemisphere, eight in PACOM, and two in AFRICOM. CDC has issued Alert Level 2, Practice Enhanced Precautions travel notices for 54 (+1, Cayman Islands) of these areas and for travelers to the 2016 Summer Olympics and Paralympics. According to CDC, locations above 6,500 feet elevation in these countries and territories present minimal transmission risk. Past vector-borne outbreaks have been reported from other areas of Africa, Southeast Asia, and the Pacific Islands, where sporadic transmission may continue to occur. Eleven countries have reported person-to-person transmission, most likely through sexual contact.

On 26 JUL, following a significant decrease in the number of newly detected cases, the Colombia MOH declared an end to the Zika epidemic in that country and lifted its recommendation that women delay pregnancy because of the virus. According to PAHO on 11 AUG, all Caribbean and North, Central, and South American countries and territories reporting ZIKV transmission for longer than the last four weeks were reporting a decreasing trend in cases, except for Saint Barthelemy and Saint Martin.

As of 10 AUG, CDC (ArboNet) reported 1,933 (+131) travel-related cases, 22 (+6) sexually transmitted cases, six locally acquired mosquito cases, and one laboratory acquired case in 47 (+1, Idaho) states and the District of Columbia since MAY 2015.

As of 16 AUG, FL health officials have reported 30 (+9) ZIKV infections that were likely acquired through local mosquito transmission (as of 9 AUG, six met the CDC definition of a Zika case). TX reported a Zika case linked to the Miami-Dade outbreak on 15 AUG. These are the only cases likely resulting from local mosquito transmission in the 50 U.S. states and the District of Columbia. The FL DOH believes active transmission is confined to a one-square mile area of Miami-Dade County, just north of downtown Miami. However, the DOH is investigating four areas in Miami-Dade and Palm Beach Counties where local transmission of ZIKV may have occurred. On 1 AUG, CDC issued a health advisory for pregnant women and women of reproductive age traveling to or living in the affected area. As of 3 AUG, all county health departments in Florida are offering free Zika risk assessments and testing to pregnant women.

CDC has completed its investigation of a ZIKV infection in a caretaker of a fatal travel-related Zika case in Utah. Sexual and vector transmission were ruled out; it is suspected that transmission occurred via another bodily fluid while caring for the index case.

Text updated from the previous report will be printed in red; items in (+xx) represent the change in number from the previous AFHSB summary (10 AUG 2016).

All information has been verified unless noted otherwise. Additional sources include: Pacific Public Health Surveillance Network.

DEPARTMENT OF DEFENSE (AFHSB)
Global Zika Virus Surveillance Summary #31
17 AUG 2016

CASE REPORT (cont): As of 28 JUL, Puerto Rico DOH reported 10,690 (+1,924) confirmed ZIKV disease cases (2 deaths), with 1,035 (+134) cases in pregnant women. The U.S. Virgin Islands (USVI) DOH reported 79 confirmed cases to PAHO as of 11 AUG. According to CDC on 12 AUG, American Samoa has reported 44 confirmed cases, including six cases in pregnant women and one case of fetal demise. As of 4 AUG, the CDC’s U.S. pregnancy registry has recorded 510 (+34) pregnant women with laboratory evidence of a ZIKV infection in the 50 states and the District of Columbia; among these pregnancies, there have been 16 (+1) infants born with birth defects and five (-1) fetal deaths due to birth defects. CDC is tracking 521 (+28) additional pregnant women in the U.S. territories, with one fetal death due to birth defects.

As of 8 AUG, Gulf Coast Regional Blood Banks in Texas have tested 34,383 units for ZIKV, and none were positive. The American Red Cross has tested 32,700 units in CONUS; none were positive. In Puerto Rico as of 17 JUL, 1.0 percent of donors have screened positive for ZIKV. OneBlood continues to screen all donations in Miami-Dade and Broward Counties; no positives were reported as of 10 AUG.

MOTOR CYSTOVIAL: As of 11 AUG, Brazil (1,773 (+24) cases), Cape Verde (11 cases), Colombia (22 cases), French Polynesia (8 cases), the Marshall Islands (1 case), Martinique (8 cases), El Salvador (4 (+1) cases), French Guiana (2 cases), Panama (5 cases), Puerto Rico (1 case), and Paraguay (2 cases) have reported microcephaly and other fetal malformations potentially associated with ZIKV infection or suggestive of a congenital infection. The U.S. (21 +2), Canada (1), Spain (2), and Slovenia (1) have reported travel associated microcephaly cases. CDC has said, “a causal relationship exists between prenatal Zika virus infection and microcephaly and other serious brain anomalies.”

GUILLAIN-BARRÉ SYNDROME: According to WHO on 11 AUG, 16 countries (15 (+1, Grenada) in the Western Hemisphere and French Polynesia) have reported Guillain-Barré syndrome (GBS) cases that may be associated with ZIKV. CDC reported six (+1) GBS cases linked to ZIKV in the continental U.S.; Puerto Rico reported 30 (+3) cases.

USG RESPONSE: On 9 AUG, CDC published a slide presentation summarizing its updated interim guidance for pregnant women and data on contraceptive use to decrease Zika-affected pregnancies. On 5 AUG, FDA issued its final environmental assessment for genetically engineered (GE) mosquitoes, concluding that the use of GE Aedes aegypti mosquitoes will have no significant impact on the environment. On 1 AUG, CDC released advice for people living in or traveling to Wynwood, the neighborhood in Miami, FL, with local transmission. On 31 JUL, CDC updated its interim plan for response activities that would occur after local ZIKV transmission has been identified in the continental United States and Hawaii. CDC released two guidance updates on 25 JUL, one for health care providers caring for pregnant women with possible ZIKV exposure and one on the prevention of sexual transmission of ZIKV. Additional data, guidance, and information from CDC is available on its ZIKV web pages.

GLOBAL RESPONSE: WHO issued a revised Strategic Response Plan on 17 JUN that places a greater focus on preventing and managing medical complications caused by ZIKV infection. Following the third meeting of the WHO Emergency Committee concerning ZIKV and observed increases in neurological disorders and neonatal malformations on 14 JUN, WHO said that the clusters of microcephaly cases and other neurological disorders continue to constitute a Public Health Emergency of International Concern (PHEIC). The Committee said the risk of further international spread of ZIKV from the Olympic and Paralympic games is very low and reaffirmed its previous advice that there should be no general restrictions on travel and trade with countries, areas, and/or territories with ZIKV transmission. PAHO has created a searchable database of published primary research and protocols. For additional information, visit the WHO and PAHO Zika web pages.

MEDICAL COUNTERMEASURES: On 4 AUG, researchers from the Walter Reed Army Institute of Research (WRAIR) and Harvard University published a preclinical study in Science demonstrating the efficacy of a Zika purified inactivated virus (ZPIV) vaccine in rhesus monkeys. Results indicated complete protection from ZIKV with no detectable virus in blood, urine, or secretions; phase 1 clinical testing is expected to begin later this year. WRAIR is co-developing the vaccine with Sanofi Pasteur. On 26 JUL, Inovio Pharmaceuticals announced that it had started a phase I trial of its Zika DNA vaccine (GLS-5700). The trial will test safety, tolerability, and immunogenicity in 40 human volunteers.

Text updated from the previous report will be printed in red; items in (+xx) represent the change in number from the previous AFHSB summary (10 AUG 2016).

* Number of microcephaly and/or CNS malformation cases suggestive of congenital infections or potentially associated with ZIKV infection
** Brazil was investigating 3,062 suspected microcephaly cases as of 23 JUL; Colombia was investigating 225 suspected microcephaly cases as of 6 AUG.
† Reported increase in GBS cases associated with the introduction of ZIKV and/or GBS case(s) linked to ZIKV infection
‡ Excludes the U.S.; this data can be found elsewhere in this report.

All data was obtained from PAHO, Ministries of Health, and Departments of Health unless otherwise noted.
