Deployment Health Assessments U.S. Armed Forces November 2019

(Data through October 2019)

Armed Forces Health Surveillance Branch

Report Date: 21 November 2019

Update: Deployment Health Assessments, U.S. Armed Forces, November 2019

Since January 2003, pronounced fluctuations in the monthly numbers of pre- and post-deployment health assessment (PDHA) forms transmitted to the Armed Forces Health Surveillance Branch (AFHSB) generally have corresponded to times of departure and return of large numbers of service members who deployed. From October 2014 through October 2019, monthly counts of pre-deployment health assessments showed the greatest variation compared to the other deployment health assessment forms (Figure 1). Since June 2017, monthly counts of post deployment health reassessment (PDHRA) forms have been consistently lower than the monthly PDHA counts.

The average monthly number of PDHRA forms (7,568) during the most recent 12 months (November 2018–October 2019) was the single lowest 1-year average since July 2006 (Table 1, data not shown). The average monthly number of pre-deployment health assessment forms (20,040) during this period was the lowest 1-year average since July 2017 (Table 1, data not shown). For the purposes of this report about service members' responses to the assessment questions, it is important to note that the denominator is the total number of service members who completed deployment-related assessments, not the total number of service members eligible for the assessments.

During the past 12 months, the percentages of total returned deployers who rated their health as either "fair" or "poor" ranged from 7.2% to 10.1% on PDHA questionnaires and from 7.0% to 8.4% on PDHRA questionnaires (Figure 2). The percentages of total service members who rated their health as either "fair" or "poor" on pre-deployment questionnaires during this period varied between 3.5% and 4.8%.

In general, the percentages of "exposure concerns" self-reported on PDHA and PDHRA forms were higher among reserve component members than among active component members; a similar pattern is apparent for the percentages of "health concerns" self-reported on PDHA forms (Table 2, Figure 3). Active and reserve component Marine Corps members were 1.8 and 1.5 times as likely, respectively, to report 2 or more PTSD symptoms 3-6 months after deployment compared to the time of their return from deployment; active component Navy members were 1.5 times as likely to report 2 or more PTSD symptoms at the time of the PDHRA compared to the time of the PDHA (Table 2).

At the time of return from deployment, 17.4% of active component and 17.3% of reserve component service members reported any depression symptoms. Service members in the active and reserve components were 4.2 and 6.3 times as likely, respectively, to receive a mental health referral 3-6 months after deployment, compared to the time of their return from deployment. Moreover, at the time of the PDHRA, reservists were 1.8 times as likely to receive a mental health referral as members of the active component (Table 2).
