

DoD Consolidated Influenza Surveillance Report

Week 8 (18 February 2024 — 24 February 2024)

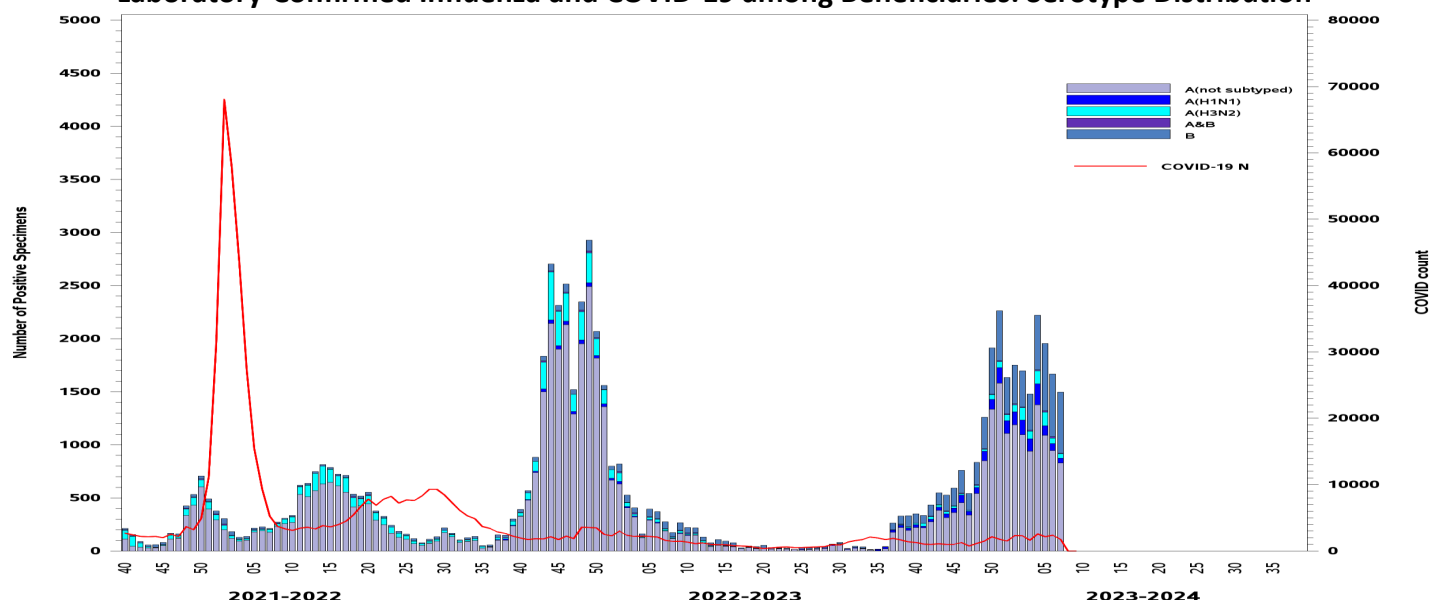

One Page Summary: Weekly Highlights

- Laboratory-confirmed influenza cases and hospitalizations overall were at normal activity levels. Among service members, laboratory cases and ILI outpatient visits were low.
- Influenza B cases have continued to increase since week 2.
- COVID-19 cases predominated among service members and beneficiaries 65 years or older. However, influenza is predominating this season among all other beneficiaries.
- There were 17 new laboratory-confirmed influenza hospitalizations reported for week 07 (Season totals: 459; 47 service members and 412 other beneficiaries).

Influenza Surveillance Indicators (2023-2024 season)

All Beneficiaries	Total Per Week	Trend	Activity Level
Laboratory Cases	1496		▼ Normal
Severity			
Inpatient Laboratory Cases	18		▼ Normal
Active Component			
Laboratory Cases	312		▼ Low
ILI Outpatient Visits	2%		◀▶ Low

Laboratory-Confirmed Influenza and COVID-19 among Beneficiaries: Serotype Distribution

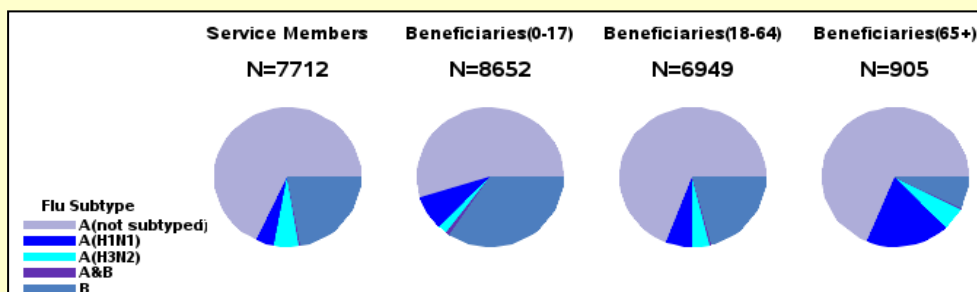

Confirmed Influenza and COVID-19 Cases (2023-2024 Season: Week 8)

*Reporting of laboratory data from MHS GENESIS is typically delayed by 2 weeks

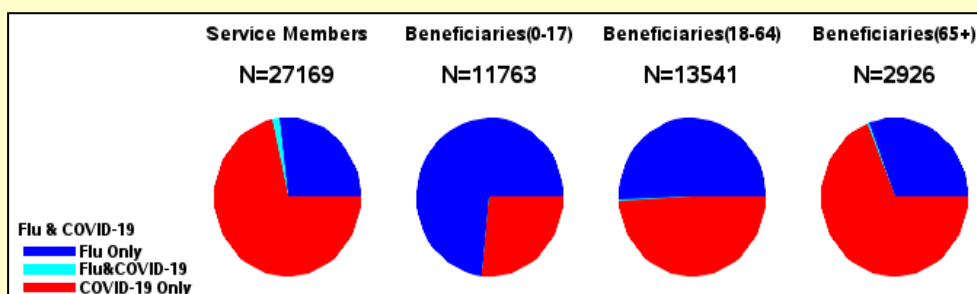

Number and Distribution of Influenza Positive Specimens since week 40, by Beneficiary Status and Serotype

- The number of laboratory-confirmed influenza positive specimens for the season to date was highest among children (8,652), followed by service members (7,712).
- Among subtyped specimens, A (H1N1) has predominated, except among service members where A(H3N2) has predominated.

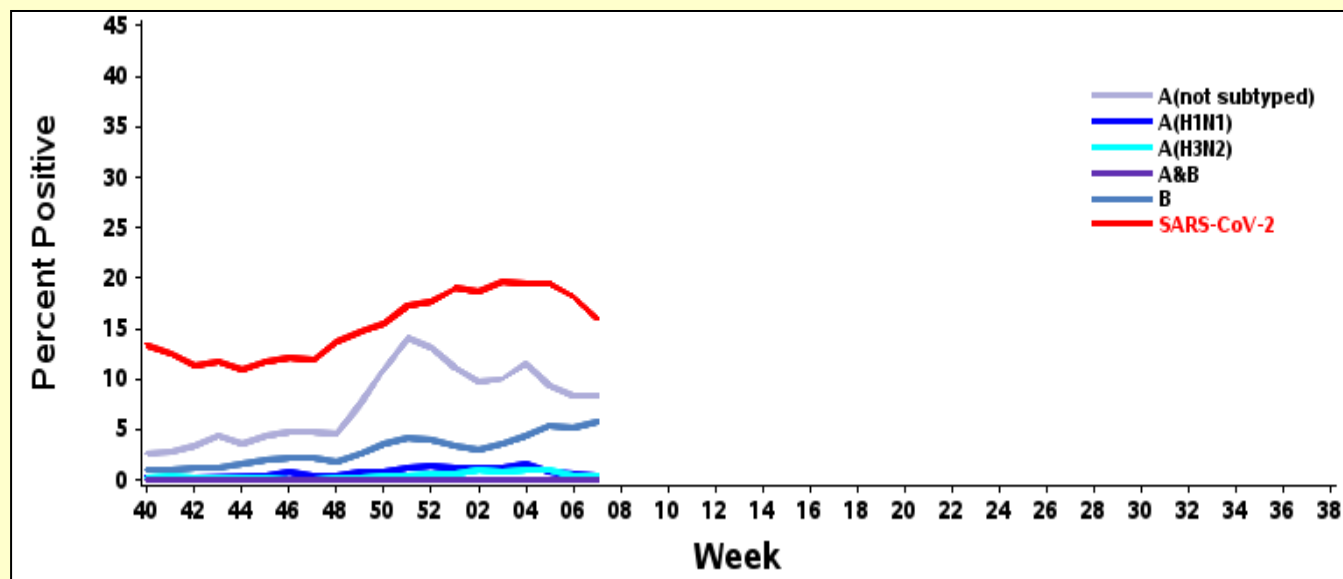

Number and Distribution of Influenza Positive Specimens and COVID-19 Cases since week 40, by Beneficiary Status

- COVID-19 cases predominated among service members and beneficiaries 65 years or older. However, influenza is predominating this season among all other beneficiaries.

Percent of Specimens Positive for Influenza (by Serotype) or SARS-CoV-2

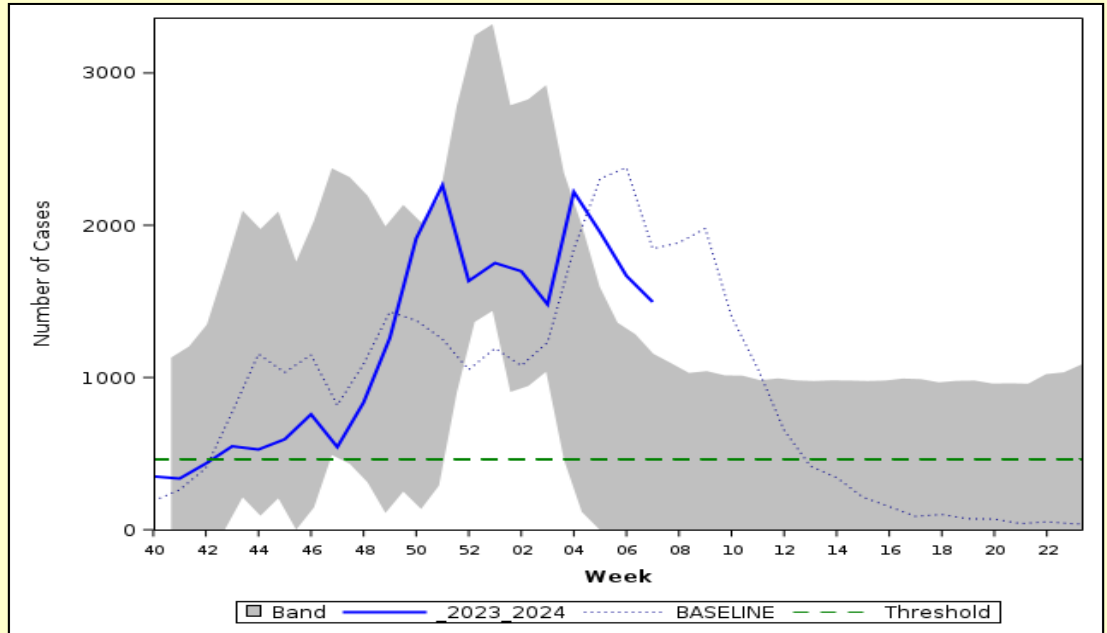

- The percent of specimens positive for SARS-CoV-2 decreased from the prior week, but remained higher than the percent positive for influenza. The percent of specimens positive for influenza increased for influenza B and remained stable for all other types and subtypes.

Laboratory-Confirmed Influenza (2023-2024 Season: Week 8)

*Reporting of laboratory data from MHS GENESIS is typically delayed by 2 weeks

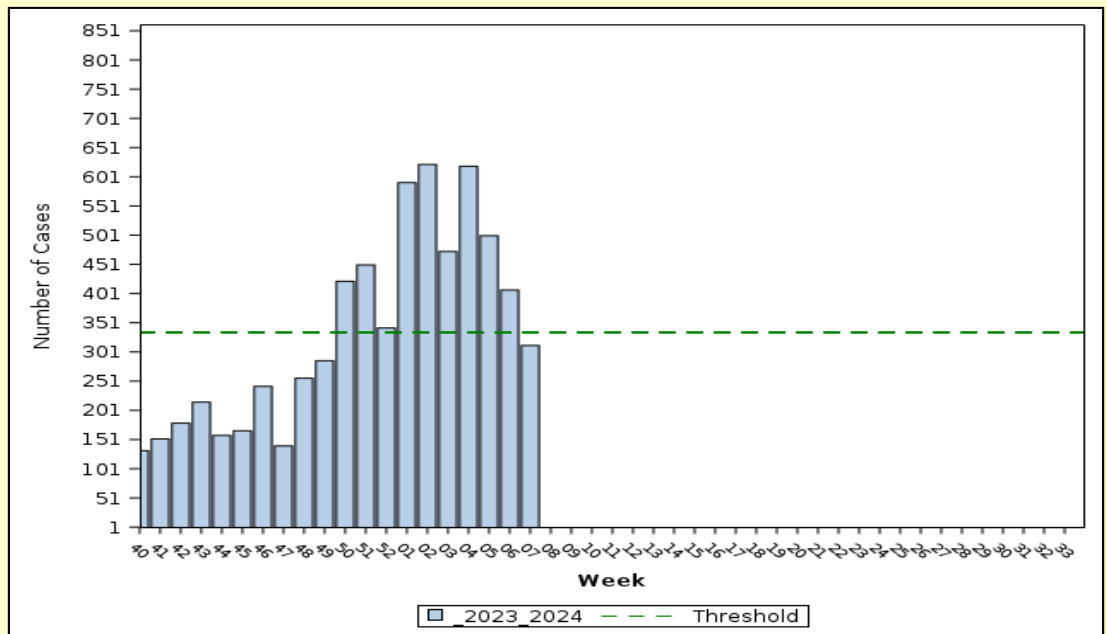

Laboratory-Positive Influenza Cases, All Beneficiaries

- The number of laboratory-confirmed influenza cases among all beneficiaries continued to decrease, but remained higher than the band and threshold.
- Band indicates one standard deviation above and below seasonal baseline estimates. Threshold indicates two standard deviations above off-season average.

Laboratory-Positive Influenza Cases, Active Component Service

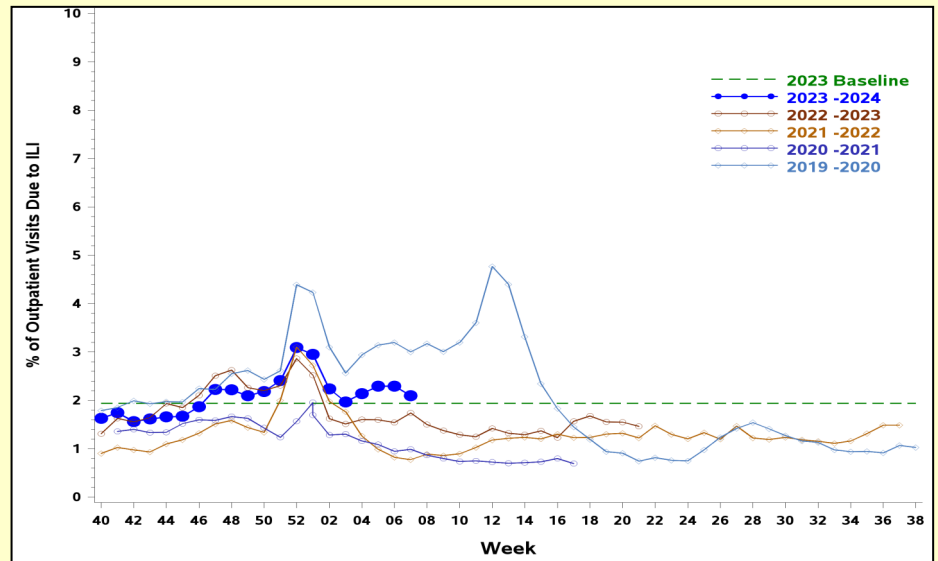

- The number of active component service member laboratory-confirmed influenza cases decreased from week 6 and was below the threshold.
- Threshold indicates two standard deviations above seasonal baseline estimates.

ILI and Hospitalized Influenza (2023-2024 Season: Week 8)

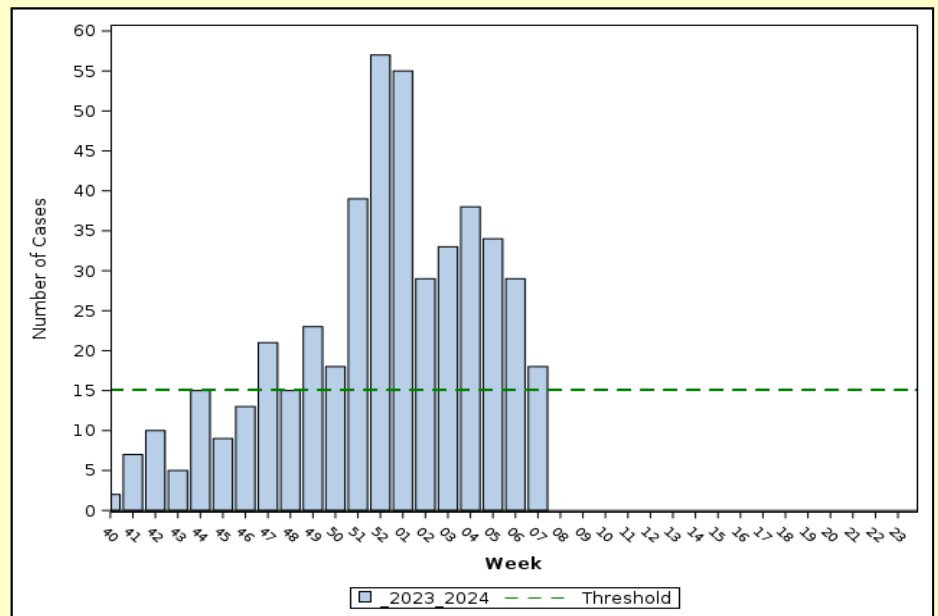

Percent of Outpatient Visits Due to ILI:

- The percentage of outpatient visits due to ILI decreased, but remained above baseline and higher than the previous 3 seasons.

Hospitalized Laboratory-Positive Influenza Cases, All Beneficiaries

- There were 17 new laboratory-confirmed influenza hospitalizations reported for week 7 (the last week with available data) (Season totals: 459; 47 service members and 412 other beneficiaries).
- Thresholds indicate one standard deviation above the overall weighted average during the season. However, there is not enough data for the season to calculate the threshold for the influenza-specific antiviral prescriptions metric.

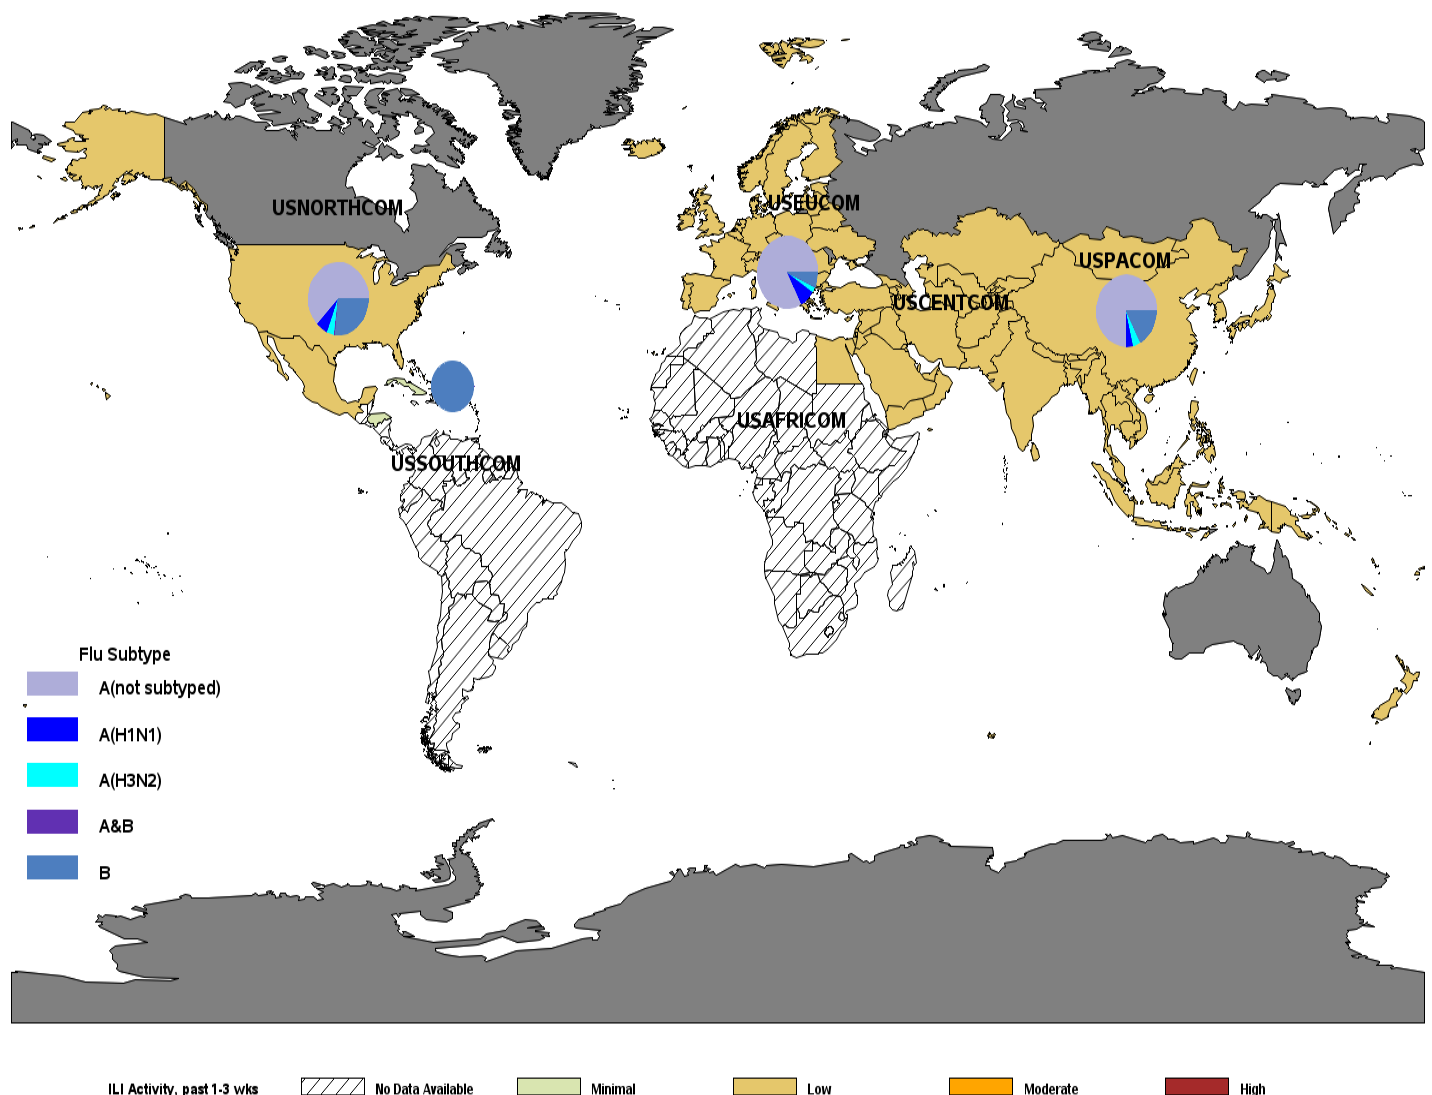

Influenza Activity: Geographic Combatant Command

(2023-2024 Season: Week 8)

- USNORTHCOM: ILI activity remained low. The majority of laboratory-confirmed influenza cases have been influenza A (not subtyped) and influenza B.
- USEUCOM: ILI activity remained low. The majority of laboratory-confirmed influenza cases have been influenza A (not subtyped) and A(H1N1).
- USINDOPACOM: ILI activity decreased to low. The majority of laboratory-confirmed influenza cases have been influenza A (not subtyped) and influenza B.
- USSOUTHCOM: ILI activity was low. Three specimens have tested positive for influenza this season and all were influenza B.
- USCENTCOM: ILI activity decreased to low.

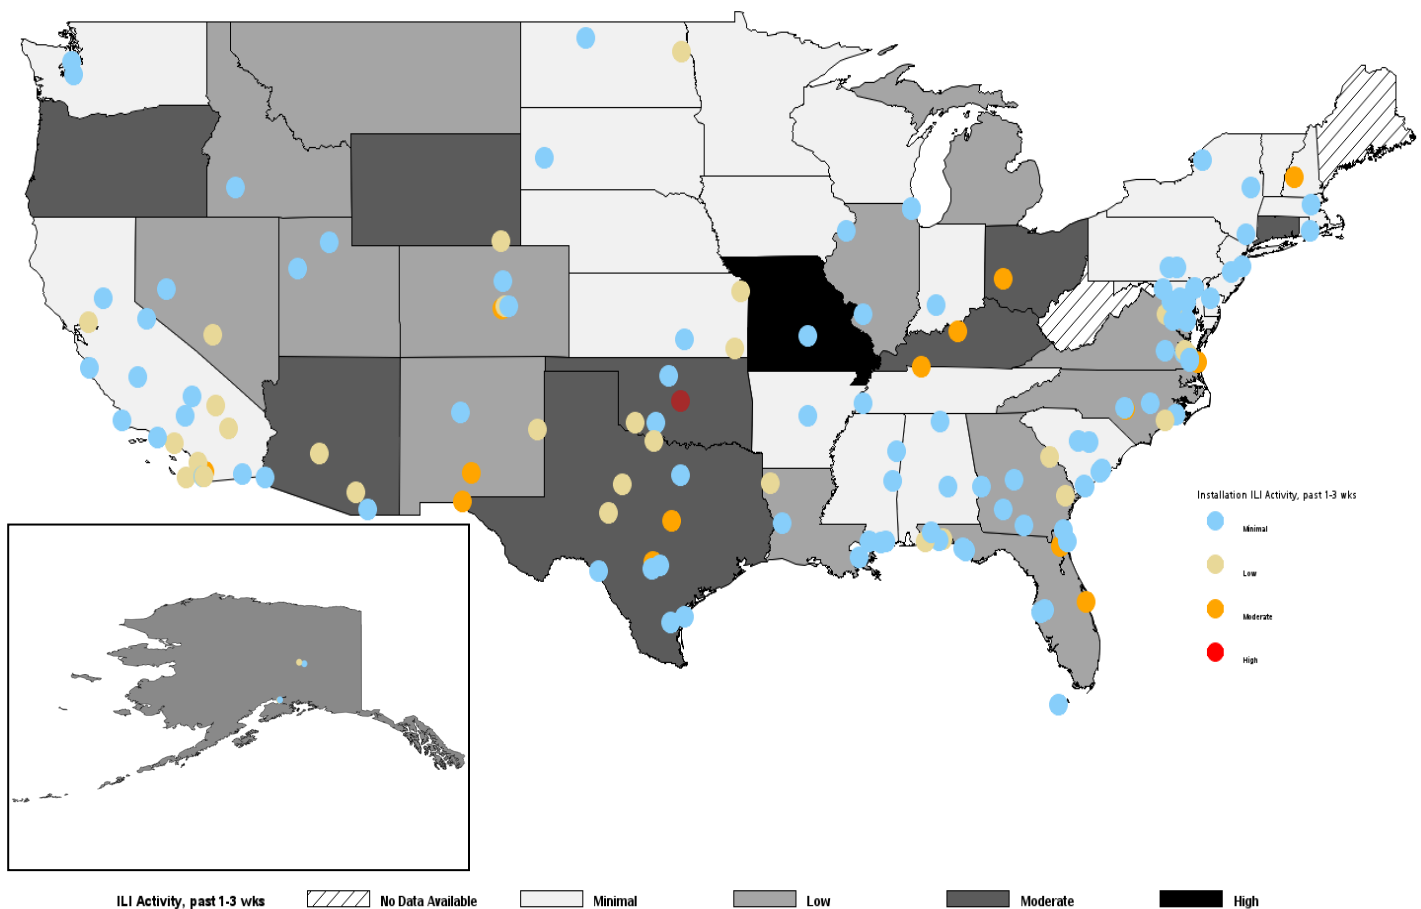

ILI Activity (Service Members) and Laboratory-Confirmed Influenza (All Beneficiaries)

Influenza Activity: USNORTHCOM (2023-2024 Season: Week 8)

- ILI activity at the installation level, averaged over weeks 5-7, was primarily minimal and low. However, several installations had moderate activity and one installation, Tinker Air Force Base, had high ILI activity.
- State level ILI activity, averaged over weeks 5-7, ranged from minimal to high, with Missouri continuing to experiencing high activity.
- State level data includes both Military Treatment Facility (MTF) and outsourced care. Therefore, state activity levels may differ from the installation level data.
- Installation-level laboratory-confirmed influenza and COVID-19 case data can be found on pages 13-19 of the report.

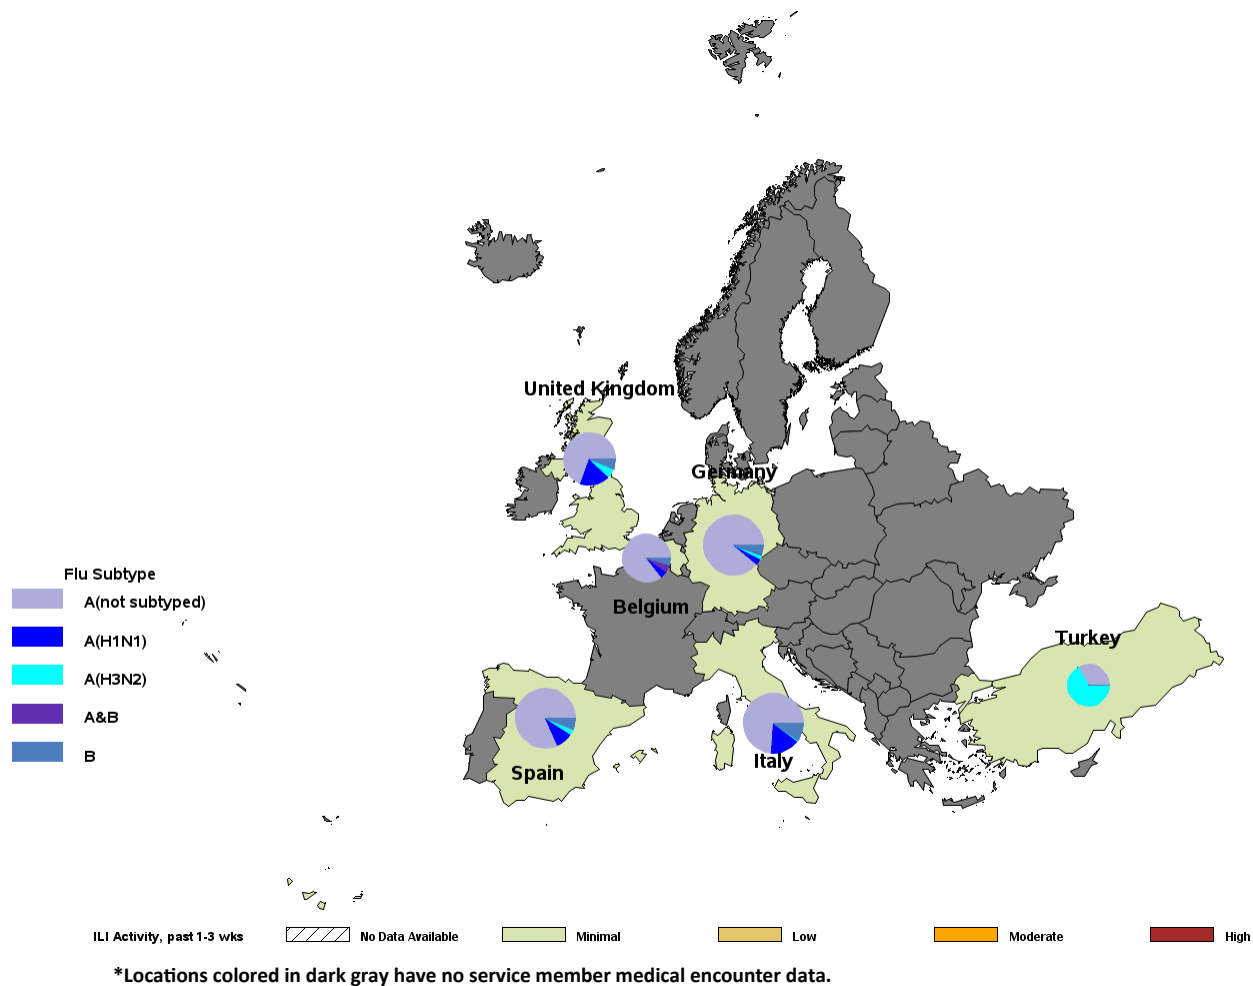

ILI Activity (Service Members) by State and Installation

Influenza and COVID-19 Activity: USEUCOM (2023-2024 Season: Week 8)

- ILI activity, averaged over weeks 5-7, was minimal across EUCOM.
- The majority of laboratory-confirmed influenza cases for USEUCOM have been Influenza A (not subtyped). Among subtyped specimens, A(H1N1) has predominated.
- Installation-level laboratory-confirmed influenza and COVID-19 case data for USEUCOM can be found on page 8 of the report.

ILI Activity (Service Members) and Laboratory-Confirmed Influenza (All Beneficiaries)

Confirmed Influenza and COVID-19: USEUCOM (2023-2024 Season: Week 8)

“2 wks” in the tables is defined as labs collected 7-21 days prior to the current week of the report. This delay is due to delays in receiving data from MHS GENESIS.

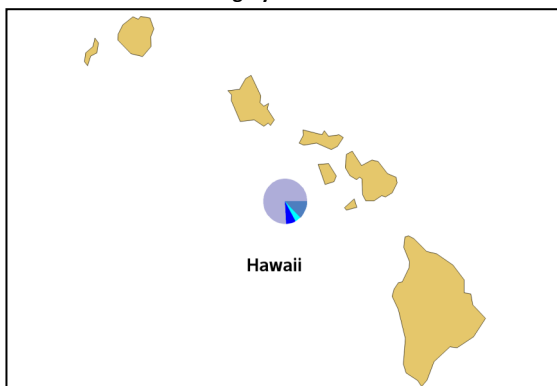

Influenza Activity: USINDOPACOM (2023-2024 Season: Week 8)

- ILI activity, averaged over weeks 5-7, was minimal to moderate in USINDOPACOM, depending on the country.
- The majority of laboratory-confirmed influenza cases for USINDOPACOM have been Influenza A (not subtyped). Among sub-typed specimens, A(H1N1) has predominated overall, but A(H3N2) has predominated in the Republic of Korea.
- Installation-level laboratory-confirmed influenza and COVID-19 case data for USINDOPACOM can be found on page 10 of the report.

ILI Activity (Service Members) and Laboratory-Confirmed Influenza (All Beneficiaries)

*Locations colored in dark gray have no service member medical encounter data.

“2 wks” in the tables is defined as labs collected 7-21 days prior to the current week of the report. This delay is due to delays in receiving data from MHS GENESIS.

Influenza Activity: USSOUTHCOM (2023-2024 Season: Week 8)

- ILI activity was low in Honduras and minimal in Cuba.
- Three laboratory-confirmed influenza cases have been reported in Cuba for the 2023-2024 season, all were influenza B.

*Locations colored in dark gray have no service member medical encounter data.

Surveillance Programs and Data Sources

Defense Health Agency / Armed Forces Health Surveillance Division (AFHSD):

The Armed Forces Health Surveillance Division (AFHSD) is the central epidemiologic resource for the U.S. Armed Forces, conducting medical surveillance to protect those who serve our nation in uniform and allies who are critical to our national security interests. The Epidemiology and Analysis Section of AFHSD, the Epi Data Center of the Defense Centers for Public Health—Portsmouth (DCPH-P), and the Defense Centers of Public Health—Dayton (DCPH-D) have compiled data for this report from the following sources below.

Influenza-like Illness Activity:

Medical encounter and demographic data from the AFHSD's Defense Medical Surveillance System (DMSS) are used to generate portions of this report. ICD-10 codes from outpatient encounters are used to identify influenza-like illness (ILI). ILI is defined using the following codes: B97.89, H66.9, H66.90, H66.91, H66.92, H66.93, J00, J01.9, J01.90, J06.9, J09, J09.X, J09.X1, J09.X2, J09.X3, J09.X9, J10, J10.0, J10.00, J10.01, J10.08, J10.1, J10.2, J10.8, J10.81, J10.82, J10.83, J10.89, J11, J11.0, J11.00, J11.08, J11.1, J11.2, J11.8, J11.81, J11.82, J11.83, J11.89, J12.89, J12.9, J18, J18.1, J18.8, J18.9, J20.9, J40, R05, R50.9.

The percentage of all outpatient visits that have an ILI code is calculated each week for all service members, regardless of component. These data are presented weekly for the current season and compared to the four prior seasons among service members. Due to delays in receiving the MHS GENESIS encounter data, the most recent data that can be presented is the 7-21 days prior to the reporting week. Influenza activity levels are calculated by comparing the mean reported percent of visits due to ILI for the previous 7-21 days to the mean reported percent of visits due to ILI during baseline weeks (defined as non-influenza weeks (weeks 22-39) over the past 3 years). Since the 2020-2021 and 2021-2022 influenza seasons were significantly reduced due to COVID-19 mitigation efforts, these seasons were excluded from the baseline calculations. The baseline weeks for the 2023-2024 report are from the years 2019, 2020, and 2023. There are four influenza activity levels, minimal, low, moderate, and high. The activity level corresponds to the number of standard deviations (SD) below, at or above the mean for the previous 7-21 day period compared to the mean of the baseline weeks. Minimal activity corresponds to an influenza percentage that is less than 2 SD above the mean. Low activity corresponds to an influenza percentage that is equal to or greater than 2 SD above the mean, but less than 4 SD above the mean. Moderate activity corresponds to an influenza percentage that is equal to or greater than 4 SD above the mean, but less than 6 SD above the mean. High activity corresponds to an influenza percentage that is equal to or greater than 6 SD above the mean.

Influenza activity levels are presented in the Geographic Combatant Command (GCC) maps, either by Installation, state, or country.

Influenza Positive Specimens:

Influenza lab results (HL-7 formatted data) are compiled and transmitted from the DCPH-P to AFHSD. Results obtained via PCR, viral culture, and rapid influenza assays are reported. Although the inclusion of rapid tests may underestimate the weekly and cumulative percent positive estimates due to false negatives, visibility of the positive rapid results provides valuable information for this surveillance report. Influenza types/subtypes are categorized as influenza A/not subtyped, influenza A(H1N1), influenza A(H3N2), influenza A and B co-infection, and influenza B. Additionally, laboratory-confirmed positive results are used to identify influenza-related hospitalization cases across the DoD.

The percent positivity is calculated by dividing the number of influenza positive specimens by the total number of specimens (positive and negative only; inconclusive results are excluded). The distributions of percent positive specimens by subtype are presented on a weekly basis for the entire influenza season. Due to delays in receiving the MHS GENESIS laboratory data, the most recent data that can be presented is the 7-21 days prior to reporting week. The distribution of subtypes for the previous 7-21 days are presented as pie graphs for states and countries. For installations, data are presented in tables with counts and percent positive by subtype for the previous 7-21 days and for the entire season. The "change from past 7-21 days" column reports the absolute difference in the percent positive from the prior week's report to the current week's report.

Surveillance Programs and Data Sources

COVID-19 Cases:

COVID-19 case data are compiled from the COVID-19 positive lab results (HL-7 formatted data) and cases reported in the DRSi. Due to delays in receiving the MHS GENESIS lab data, the most recent data that can be presented is the 7-21 days prior to reporting week. The percent positivity calculation is restricted to only COVID-19 cases reported through the lab data so that an accurate denominator can be obtained. The percent positivity is calculated by dividing the number of COVID-19 positive specimens by the total number of specimens tested for COVID-19. For installations, COVID-19 case data are presented in tables with case counts for the previous 7-21 days and for the entire influenza season (Week 40 to current). The “change from past 7-21 days” column reports the absolute difference in the number of COVID-19 case counts from the prior week’s report to the current week’s report.

Pharmacy Transactions for Dispensed Influenza Antiviral Prescriptions:

HL7-formatted pharmacy transactions are used to assess the number of dispensed influenza antiviral (AV) prescriptions. Four influenza AV medications approved by the Food and Drug Administration (FDA) are recommended by the CDC for use in the United States (US) for the 2023-2024 influenza season: oral oseltamivir (Tamiflu® or generic), inhaled zanamivir (Relenza®), and intravenous peramivir (Rapivab®), and baloxavir marboxil (Xofluza®). These prescriptions are included in this surveillance. The overall count of dispensed AV prescriptions by week is presented graphically for the influenza season. A seasonal baseline is displayed with dispensed AV prescriptions. Surveillance thresholds are displayed with the count of inpatient dispensed AV prescriptions. Additionally, counts of inpatient dispensed influenza AV prescriptions are presented weekly for the influenza season.

Influenza Baselines, Thresholds, and Trends:

Weekly baselines used a three-year average to compare results with those from the same week during the previous three seasons. Since the 2020-2021 and 2021-2022 influenza seasons were significantly reduced due to COVID-19 mitigation efforts, these seasons were excluded from the baseline calculations. The baseline calculations used the 2018-2019, 2019-2020, and 2022-2023 season data. Bands for one and two standard deviations above seasonal baseline estimates are displayed to indicate when trends diverge with respect to timing or volume from those of recent seasons. The ILI, lab, and dispensed AV prescription data thresholds are calculated by adding two standard deviations to the off-season average.

Inpatient thresholds (lab and dispensed AV prescription data) are calculated by adding one standard deviation to the overall weighted average for in-season weeks. Weeks that represent at least 2% of the total season’s laboratory-positive influenza cases for at least two consecutive weeks was considered to be “in-season” or influenza weeks; all other weeks are considered to be “off-season” or non-influenza weeks.
